THE
GENTLEMANS RECREATION
by
R. Blome.

THE GENTLEMAN's RECREATIONS:

In Three Parts.

The Firſt PART contains

A Short and Eaſie INTRODUCTION
TO ALL THE
Liberal Arts and Sciences, &c.

The Second treats of

HORSEMANSHIP,
HAWKING,
HUNTING,
FOWLING,
FISHING,
AGRICULTURE, &c.

Done from the moſt Authentick AUTHORS, eſpecially ſeveral lately Printed at *Paris*, as may be ſeen in the PREFACE; with great Enlargements, made by thoſe well Experienced in the reſpective RECREATIONS.

The Third is

A Compleat Body of all our FOREST, CHACE, and GAME-LAWS, as they are at this Time.

The Whole Illuſtrated with near an hundred Copper-Cuts relating to the ſeveral Subjects, particularly all Sorts of *Nets*, *Engines*, *Traps*, &c. are added for the Taking of *Wild-Beaſts*, *Fowl*, *Fiſh*, &c. not hitherto Publiſh'd by any.

The Second Edition Corrected, with near one Half of Additions.

LONDON:

Printed for *R. Bonwicke*, at the *Red-Lion* in St. *Paul*'s Church-yard; *J. Walthoe*, in the *Middle-Temple-Cloyſters*; *W. Freeman*, *T. Goodwin*, *M. Wotton*, and *B. Tooke*, in *Fleet-ſtreet* near *Temple-Bar*; *J. Nicholſon*, at the *Queen's-Arms* in *Little-Britain*; *S. Manſhip*, at the *Ship* in *Cornhil*; and *R. Parker* and *R. Smith*, under the *Royal-Exchange*. 1710.

THE

PREFACE.

THE *Additions* and *Improvements* that are made to this Edition of the *Gentleman's Recreations* being ſo many as to make it nigh as big (or large) again as it was before, as will appear to any that will compare the former Edition with this; we think it neceſſary briefly to enumerate what *Authors* were made uſe of herein, which are generally ſuch as were not publiſh'd when the former Edition was printed; and, we hope, will ſufficiently demonſtrate the Care taken to make this Edition as compleat as poſſible.

The Firſt Book contains, *A ſhort Introduction to all the Liberal Arts and Sciences*, &c. It begins with GRAMMAR, wherein Dr. *Wallis*'s Grammar, and that of the *French* Academy are chiefly made uſe of.

POETRY is a *New Eſſay*, not in the former Edition; and as great Pains have been taken in it, we hope 'twill anſwer the Reader's Expectation.

For RHETORICK we follow'd *Pere Lamy*, in great Eſteem in *France*; and his Method being more accommodated to *Gentlemen* than to the *Schools*, was thought properer for this Deſign than *Ariſtotle*'s, or others who follow his Manner.

LOGICK was done from *The Art of Thinking* of Meſſieurs *du Port Royal*, which has obtain'd lately more than any of the *Ancients* or *Moderns*.

THEOLOGY and METAPHYSICKS were done a-new by a Divine of the Church of *England*, whoſe Learning and Abilities ſufficiently qualified him for the ſame: In the latter he was guided by *Pere Malebranche* and *Fromenius*.

PHILOSOPHY *in General* was taken from *Pere Rapin*, and not in the former Edition.

MORAL PHILOSOPHY or ETHICKS from the ſaid M. *Rapin* and M. *Pufendorf*.

NATURAL PHILOSOPHY and PHYSICKS from the Tracts of the Honourable Mr. *Boyle*, thoſe of our *Royal Society*, Sir *Iſaac Newton*, Capt. *Halley*, *Bartholinus*, &c.

In ARITHMETICK, ALGEBRA, GEOMETRY, GAUGING, and SURVEYING, we are beholding to Dr. *Harris* and Mr. *Ward*.

COSMOGRAPHY, ASTRONOMY, and GEOGRAPHY, were Tranſlated and Abridged from M. *Bien*, whoſe Treatiſe is approv'd of by the *Academy of Sciences* at *Paris*, *Varenius*, M. *Robbe*, &c.

In NAVIGATION and DIALING we were beholden to the Writings of Dr. *Harris*, Capt. *Halley*, and others.

ARCHITECTURE, and SCULPTURE, is done from *Felibien*, as is alſo ENGRAVING, PAINTING, DESIGN, *&c.* moſt of which were not in the former Edition.

OPTICKS is done from Sir *Iſaac Newton*.

WAR, GUNNERY, *&c.* from *Coehorne*, *Ozanam*, *Guillet*, &c.

MUSICK, CHRONOLOGY, HISTORY, HERALDRY, *&c.* from ſeveral particular Treatiſes of the beſt *Modern Authors*.

The Second Part begins with HORSEMANSHIP, which has receiv'd very large *Additions*, from the laſt Edition of the *Compleat Horſeman*, written by M. *de Solleyſel*, Querry to the preſent *French* King, and one of the *Academy Royal* of *Paris*, which is deſervedly eſteem'd the beſt of that Kind extant.

HAWKING and FALCONRY, as alſo HUNTING, FOWLING, and FISHING, are much Improv'd from ſeveral *French* Tracts lately printed at *Paris*; as *Les Ruſes Innocentes*, in *Octavo*, with many Cuts; *La Venerie Royale*, *Traite de la Chaſſe*, *Plaſirs Innocens de la Campagne*, *Merveilles de Nature*, &c.

The Treatiſe of AGRICULTURE is Enlarged throughout, from *l'Oeconomie de la Campagne, ou la nouvelle Maiſon Ruſtique*, *The new Country Farm*, lately printed at *Paris*, which is very particular and uſeful in whatever relates to Country Affairs; as all manner of Ploughs, Tools and Engines; of Buildings, Mills, *&c.* of Manures, Dungs, *&c.* of all Sorts of Trees; of Cattle, Liquors, Malting; and what is requiſite to be known in *Huſbandry* or a Country Life. Illuſtrated with new Cuts.

The Third and Laſt Book is a Compleat Body of our FOREST, CHACE, and GAME-LAW, done from *Manwood's Foreſt-Law*, and continued down to this time; whatever *Acts of Parliament* have been made ſince *Manwood* was printed, being here Abſtracted, in there proper Places.

In ſhort, whatever of Uſe was in the firſt Edition is in this, with the large *Additions*, as above; Done by ſeveral Hands that did the different Parts, to make it the *Beſt* in this Kind yet extant in any Language.

The NAMES of thoſe Perſons of Honour and Gentlemen, whoſe *Coats of Arms* are in this Book, as Contributers towards the PLATES; and the Pages where to find them.

Note, *Thoſe Pages without a * refer to the Firſt Book, and thoſe with a * to the Second Book.*

GRAMMAR.

PART I.

G*RAMMAR* is the Art of Speaking purely and correctly, and it has for this Reaſon been always in Eſteem in all Countries where the *Sciences* flouriſh'd, it being that which ſerves to introduce all the others, and is as the *Key* to them all.

The moſt *Learned* Men among the *Greeks*, particularly *Plato* and *Ariſtotle* were the firſt that Cultivated or broke up the Ground. Others after them endeavour'd to bring what they had done to Perfection, and when the Method of it was carry'd to *Rome*, after the Second *Punick* War, the Greateſt of the *Romans* did not diſdain to make it one of their Principal Studies.

Aulus Gellius tells us of a Diſpute which happen'd at *Rome* among Four of the moſt Famous *Lawyers* of that *Common Wealth*, to determine whether a Word was of the Preterimperfect or the Future Tenſe. This Word was in the *Atinian* Law, and no leſs Men than the Father of *Quintus Scævola*, *Brutus*, *Manilius* and *Nigidius Figulus*, buſy'd themſelves to find out what *Tenſe* it was of, which is a Proof that *Grammar* is by no means ſo Inconſiderable a Study as thoſe who Learn it only at the *College* imagine. *Voſſius* condemns ſuch as have ſo mean an Opinion of it, and pretend to decide eaſily all the Difficulties of the *Latin* Tongue, which was ſo difficult to the Greateſt of the *Latins* themſelves.

The ſame *Aulus Gellius* reports that when *Pompey* was the Third Time Conſul, and wou'd have Notice taken of his Third *Conſulate*, by an *Inſcription* on the *Temple* of *Victory*, 'twas diſputed whether it ought to be *Tertium* or *Tertio*, and the Moſt Learned Men being Conſulted upon it were divided in their Judgments; and *Cicero*, not to determine the Matter by his own Opinion, gave his Advice that the Word ſhould be abridg'd and put *Tert.* That thoſe who thought *Tertium* beſt might ſo read it, and thoſe who were for *Tertio*, Cuſtom juſtifying both of 'em, might read *Tertio* if they pleas'd.

Thus we ſee that what ſome Modern *Pædagogues* wou'd take upon them to decide as to the *Grammar* of a *Dead* Language, puzzled the Learned Men who ſpoke it when *Living*; and that *Grammar* is not ſo mean a Study as ſome imagine who do not underſtand it. *Cæſar* Himſelf when he was in the midſt of his Expedition in *Gaul*, wrote Two Books of the *Analogy* of *Words*. The Conſul *Meſſala* wrote alſo Entire *Books* upon *Words* and *Letters*; and *Quinctilian* ſays it do's no Injury to the one's *Glory* nor the other's Reputation.

Of LETTERS.

THERE are Two Things to be conſider'd in Letters, the *Sound* or *Pronunciation*, and the *Character* or *Figure*. The *Sound* belongs to Letters as Pronounc'd, the *Character* as they are written: And ſince we are to ſpeak of the former but as the Means of the latter; or rather that as in Muſick one can give no *Idea* of *Sounds* but by Means of the *Signs*, we ſhall in the Firſt Place treat of *Letters*.

There are in our Language Four and Twenty, *a, b, c, d, e, f, g, h, i, k, l, m, n, o, p, q, r, ſ, t, u, w, x, y, z*, Of theſe Letters Five *a, e, i, o, u*, are call'd *Vowels*, becauſe they form a *Sound* by themſelves without the help of any other Letters. The other Letters not being able to form any *Sound* but by the Help of a *Vowel*, are call'd *Conſonants*; of theſe there are Eighteen, *b, c, d, f, g, h, k, l, m, n, p, q, r, ſ, t, w, x, z*; as to *y* it is *Greek*, and rather a Vowel than *Conſonant*. Out of the Five *Vowels* variouſly diſpos'd, are compos'd Five *Diphthongs*, viz. *æ, au, œ, ei, eu*, beſides *Triphthongs*, compos'd of Three *Vowels* joyn'd together, as *eau*.

Of the *Conſonants*, Eight are call'd *Mutes*, viz. *b, c, d, g, k, p, q, t*; Seven are *Semi-vowels*, viz. *f, l, m, n, r, ſ, x, z*.

Of the *Semi-vowels*, ſome are call'd *Liquids*, as *l, m, n, r*; and ſome *Solids*, as, *ſ, x, z*.

The *Liquids* are ſo call'd, not as being never ſolid; but becauſe they are ſometimes liquify'd, and as it were diſſolv'd in their Sounds.

S is a *Letter* that has its proper Power.

The *Solids* are thoſe which are never *liquify'd*, as *F*, and alſo *J* and *V*, which often become *Conſonants* when they are ſet before other *Vowels* in the ſame *Syllable*, as *Juno*, *Voluntas*, &c.

The *Mutes* are ſo call'd, becauſe they begin by their own Power, and have the Sound of the *Vowel* after them, of which ſome are pronounc'd more open and from the *Teeth*, as *T* and *D*; others from the *Palate* as *K* and *Q*; and ſome more cloſe and from the *Lips*, as *B* and *P*. *H* is not properly a Letter, but a Note of Aſpiration before a *Vowel*, only ſometimes amongſt the *Poets* it obtains the Power of a *Conſonant*: and it never comes before a *Conſonant*, but always before one of the Five *Vowels* and *y*; as in *Habeo, Habes, Hiatus, Hora, Humus, Hydra*, &c.

The Letters of the *Alphabet* are written in greater or leſs *Characters*; and with the greater are generally begun all proper Names, every Sentence after a full Period, and each ſeveral *Verſe* in *Poetry*.

A *Syllable* is that which expreſſes one entire Sound in a *Word*, and conſiſts either of one *Vowel* only, or of *Vowels* joyn'd one with another, or of *Vowels* and *Conſonants* together, as *Simple*, *Double*, *Triple*, *Quadruple* and *Quintuple*.

A joyning together of Two *Vowels* is call'd a *Diphthong*, as *æ*, *ai*, *ei*, *œ*, *oi*, *ou*, and of Three a *Triphthong*; but this is never known in *Latin*, but ſometimes in *French*, as *aou*, *eau*, *jau*, *jeu*.

A *Syllable* is either long, and then it is thus mark'd ‒; or ſhort, which is thus mark'd ˘; or Common.

A *Word* conſiſts of one or more Syllables, and admits of *Accent*, *Apoſtrophe*, and *Notation*.

Accent is the Harmony of Language, and is otherwiſe call'd *Tone*, being either Acute, markt thus ´; or Grave or Mean, and markt thus `.

Apoſtrophe is a cutting off of any of the Five *Vowels*, eſpecially of the Four firſt, as *a*, *e*, *i*, *o*, when the following Word begins with a *Vowel*. This *Apoſtrophe* is ſeldom markt, in the *Latin*, but only intimated by a quick paſſing from one *Vowel* to the other, and that chiefly in *Verſe*.

Notation is that, by which the *Species* or *Figure* of a Word is diſtinguiſh'd. The *Species* denotes, whether it be Primitive or Derivative; the *Figure*, whether Simple or Compound.

Words are Signs invented by Men to expreſs their *Thoughts*, and are communicated one to another by *Speech* or *Writing*. It does not conſiſt with the Intended Brevity of this Undertaking to enter here into an Inquiry after the *Origin* of *Languages*. 'Tis ſufficient to obſerve that when ſeveral Tongues were ſettled, each Language kept it ſelf more or leſs free according as each Nation had Correſpondence and Intercourſe with others; and was more or leſs ſpoken according as each Nation that ſpoke it encreas'd its *Commerce*, its *Gout* for the *Arts* and *Sciences*, its *Religion* and *Empire*. Not to ſpeak of the Languages of the *Eaſt*; 'twas by theſe Means the *Greek* and *Latin* Tongues made a great Progreſs over all *Europe*, there being hardly one *European* Tongue or Language but what borrows from one or other of thoſe Languages the greateſt Part of its Terms of Arts and Sciences, and of Religion. And as the *Latin* Tongue, by the *Roman* Conqueſts Extended much farther than the *Greek*, in the *Weſtern* Empire, ſo from thence it comes, that not only all the *Languages* of *Europe* borrow abundance of Words from the *Latin*, but that it makes the Foundation of the Three Languages, which of all the *Living* Tongues have moſt Currency in this Part of the World, *viz.* the *Italian*, *Spaniſh* and *French*, whoſe Languages have been alter'd at different Times, according to the Genius of each Nation.

As to the *Engliſh* Tongue, the Reader is ſo nearly concern'd in it that he will doubtleſs be pleas'd with an Account of the Original and Progreſs of it, as we ſhall abſtract it from Dr. *Wallis*, [*Preface to his Grammar.*] We ſhall not take any Notice of what he ſays of the *Britiſh*, which was indeed the *Gauliſh* Language, not only becauſe 'tis not known among us, nor has been known in its Purity ſince the *Saxon* Invaſion; but alſo becauſe the preſent Language we ſpeak has no Relation to it.

“ When the *Engliſh* and *Saxons* (*according to the before-mention'd Author*) came into *Britain*, about the ſame time as the *Franks* poſſeſs'd themſelves of *France*, and after continual Wars ſubdu'd the greateſt Part of this *Iſland*, the *Britains* and their Language were both expell'd at once. The *Conquerors* call'd their New Country *England*, and the Tongue which they brought with them *Engliſh*; and this Tongue is commonly call'd by the Learn'd the *Saxon* or *Anglo-Saxon*, to diſtinguiſh it from the *Engliſh* us'd now among us. That Tongue was deriv'd from the Old *Teutonick*, as was likewiſe the *French* which was brought into *France* by *Pharamond*. So is the preſent *German*, *Dutch*, *Daniſh*, *Swediſh*, *Pruſſian*, &c. which bear Affinity with one another. This *Engliſh* Tongue remain'd in a manner pure and unmixt till the Time of the *Normans*, excepting that it receiv'd ſome *Welſh* Words, as on the contrary the *Welſh* receiv'd ſome *Saxon*.

“ When the *Normans* became Maſters in *England*, they did their utmoſt to introduce their Tongue, which was the *French* us'd in *Normandy*. *William* the Firſt order'd all *Edicts* and *Laws* to be written in the *Norman* Tongue, yet the *Engliſh* Language ſtill maintain'd its Ground in a great Meaſure. Several *French* Words, which however were of *Latin* Original, crept into the *Engliſh* Tongue. And ſeveral Old *Engliſh* Words were diſ-us'd. *The Doctor continues thus*; “ Nor do I think it lightly happen'd that the Names of Living Creatures are originally *German*, and yet when they are dreſt and ſerv'd up to Table, we call them by *French* Names, as for Inſtance, *Ox*, *Cow*, *Calf*, *Sheep*, *Hog*, *Boar*, *Deer*, &c. are *German*; but *Beef*, *Veal*, *Mutton*, *Pork* and *Veniſon* are *French*. The Reaſon of which I ſuppoſe to be that the *Normans* did not concern themſelves with *Paſtures*, *Sheep-folds*, *Parks*, and other Places where thoſe Living Creatures above-nam'd were look'd after (which therefore kept up their ancient Names) as with *Shambles*, *Kitchins*, *Tables* and *Feaſts* where Food was to be had, which got thoſe New Names they now go by. But from that time an Infinite Medley of Foreign Words has ſtoll'n into our Language; not that the *Engliſh* is of it ſelf Poor and Barren, for 'tis ſufficiently enrich'd with Words and Elegancies, and Copious almoſt to Exceſs. Nor does it want any thing which it cannot furniſh out of its own proper Store-houſe, as is plain from the Works of our Beſt Poets of Elder Times, which are full of Elegance and Variety of Phraſes, pure and unadulterated with *Foreign* Dreſs. However, a Mixture could not be avoided by reaſon of our Various Commerce with *Foreigners*, and eſpecially the frequent Marriages in Royal Families, partly out of an immoderate Affectation of Novelty, at leaſt in this laſt Age, which has introduc'd many *Foreign* Words without any manner of Neceſſity, there being too many, who fanſie nothing can be ſpoken Fine and *a Propos*, which has not a *French Turn*, and carries with it ſome new uncommon Sound. Thus the Old *Saxon* Tongue was Excluded by the Modern *Engliſh*, but it found Reception in the Chief Parts of *Scotland*, which I imagine happen'd at the time when the *Normans* Invaded *England*; for the *Engliſh* Royal Family, and ſeveral of the Nobility, with ſome of

“ the Common People, being driven out of *England*, “ retir'd into *Scotland*, and ſettled their Tongue there, “ which being improv'd by continual Commerce, “ prevail'd ſo far that the *Engliſh* and *Scots* Tongues “ are now the ſame, excepting that the latter may “ be ſaid not to be ſo much debaucht by *Foreign* “ Mixtures.—— To this may be added, that the *Engliſh* has made an advantageous Uſe of the Liberty it took, and ſhar'd all the Significant and Beautiful Words of her Neighbours which could be Incorporated with her own. This Digreſſion cannot but be thought equally pleaſant and uſeful in a Treatiſe of this Nature, to which we return, and to that Part of it that relates to Words.

A Word in all Languages is conſider'd by Grammarians as what makes or may make a Part of a Diſcourſe, and accordingly as the *Latin* Grammarians found Eight Words of a different Nature in that Tongue, they plac'd them in Eight *Claſſes* or different Diviſions, which they call Eight *Parts* of *Speech*; and moſt of the Modern Grammarians have done the ſame in treating of their own Languages, making them agree with the *Latin*, as *Noun*, *Pronoun*, *Verb*, *Participle*, *Adverb*, *Conjunction*, *Prepoſition*, *Interjection*.

The *Greeks* made the *Article* a *Part* of *Speech*, and rank'd the *Interjection* with the *Adverb*; and the *Latins* who did not uſe the *Article* commonly made the *Interjection* a Part of *Speech*. The Moderns, as the *Italians*, *French*, &c. who make great Uſe of the *Article* generally make their Eight Parts of Speech conſiſt of *Article*, *Noun*, *Pronoun*, *Verb*, *Participle*, *Adverb*, *Prepoſition* and *Conjunction*. But we in *England* follow the Diviſion of the *Latins*, as the *French*, *Italians*, &c. do that of the *Greeks*, making little or no Uſe of the *Article*, except *of* and *the*, which generally goes before the *Noun Subſtantive* in the *Nominative* and *Accuſative Caſe*, and *A* the Mark of a *Nominative* only when by itſelf; there will be no occaſion of ſpeaking more of it, ſo we proceed to *Nouns*.

A *Noun* is a Part of Speech that has Gender and Number; and becauſe all *Nouns* denote either Subſtance or an Attribution of *Quality*, they are divided into *Subſtantives* and *Adjectives*.

A *Noun Subſtantive* is that which ſignifies ſome Subſtance, and may be made uſe of in Diſcourſe without the help of any other *Noun*, as a *Man*, a *Woman*, a *Lyon*, an *Eagle*, *Heat*, *Cold*, &c.

A *Noun Adjective* is that which does not ſignifie any thing of itſelf, but only denotes what another thing is, as *Great*, *Little*, *Fair*, *White*, *Red*, &c.

Noun Subſtantives are divided into Proper Names and Appellative Names. Proper Names are ſuch as agree only to a particular Perſon or Thing, as *Cæſar*, *William*, *London*, *Briſtol*. Appellative Names or Nouns are ſuch as agree with ſeveral Perſons or ſeveral Things, as *Animal*, *Man*, *Beaſt*, *Bird*, *City*, *Province*, *River*, and generally all Names of Dignity, Employment, Profeſſion, Trade, *&c.* as *King*, *Prince*, *Duke*, *Biſhop*, *Doctor*, *Lawyer*, *Merchant*, *Mercer*, *Soldier*, *Poet*, *Painter*, *Orator*, and the like.

For tho', properly ſpeaking, there are no true *Noun Subſtantives* but thoſe that directly and by themſelves, without having occaſion of ſuppoſing a Subject which ſuſtains them, ſignifies a Subſtance, yet the Uſe of Language is ſuch, that the Names or Nouns before-mention'd are lookt upon and made uſe of only as *Noun Subſtantives*.

The *Nouns* which the Grammarians call *Appellative* may perhaps be better term'd *Common* or *Communicative*, becauſe Proper Names, as *Cæſar*, *William*, *John* and *Thomas*, are as much *Appellative* as *Man*, *City*, *Province*, but 'tis thought moſt convenient to accommodate our Method to receiv'd Uſages and Cuſtoms. *Appellative Nouns* are further divided into *Abſtracted* and *Collective*. *Abſtracted Subſtantives* are thoſe that denote a thing whoſe Exiſtence not being real, and in the Nature of Things ſubſiſt only in the Underſtanding, as *Humanity*, *Vigilance*, *Truth*, &c. all theſe *Subſtantives* are form'd of *Adjectives*, as *Humanity* of *Humane*, *Vigilance* of *Vigilant*, *Truth* of *True*. All *Nouns Subſtantives*, which being put but in the *Singular* Number, and yet give the Mind an Idea of ſeveral Things, as Collected and gathered together are term'd *Collective Nouns*, as *Army*, *Fleet*, *People*, &c.

A *Noun Adjective* ſerves only to Qualifie a *Noun Subſtantive* one way or other, according to the Idea we have form'd of it or conſider it in. Thus when we ſay ſimply a *Flower*, we only denote the Thing we ſpeak of. If we wou'd not only give a ſimple Idea but ſhew its Qualification, we add another Term to this *Flower*, as for Inſtance that of *Fair*, and this Term ſo added, in Conſtruing it with the *Gender* and *Number* of the *Noun Subſtantive* is what is call'd *Adjective*.

All *Nouns* may be conſider'd as *Simple* or *Primitive*, or *Derivative* and *Compound*, and further as *Abſolute* and *Derivative*.

Simple or *Primitive Nouns*, as well *Subſtantive* as *Adjective*, are ſuch as don't derive their Origin from another *Noun* in the ſame Language, but owe their Signification to the Firſt *Inſtitution* of that *Language* either borrow'd from others or originally its own, as *Law* which comes from *Loy*, and that from *Lex*, is as much *Engliſh* as *Town* and *Down*, which are *Saxon* Terms *Ton* and *Dun*, and 'tis the ſame with *Noun Adjectives*.

Derivative Nouns are thoſe that are form'd of ſome *Primitive* Word, as *regularly* from *Rule*; and when theſe *Nouns*, either *Subſtantive* or *Adjective*, are form'd of a *Verb*, as *Government* from *to Govern*; or of *Latin* Derivation, as *Donation*, *Apprehenſion*, or as the Adjective *Poſſible*, they are then by ſome Grammarians call'd *Verbal Subſtantives* and *Verbal Adjectives*, whether the *Verb* of which they were form'd be *Simple* or *Primitive*, *Derivative* or *Compound*.

Compound Nouns are ſuch as beſides their *Derivation* have ſome *Particle*, *Prepoſition*, *Noun*, &c. ſo prefix'd to them, that commonly they cannot be ſeparated from them without deſtroying their Signification when together, as *Immortality* and *Immortal*, *Irregularity* and *Irregular*, *Enterprize*, *Surprize*, *Enterprizing* and *Surprizing*, which are both *Derivative* and *Compound Nouns*. The *Latter* are alſo form'd of *Noun Subſtantives*, as *Wood green*, *Wood-houſe*, *Well-cloſe*, or of *Noun Adjectives*, as *Goodneſs*, &c. By *Abſolute* and *Relative Nouns* is underſtood in this Place a *Noun* whoſe Signification implies a ſimple Idea, as *Man*, *Birth*, *Earth*, *Air*, are Abſolute *Noun Subſtantives*; and *Great*, *Little*, Abſolute *Noun Adjectives*. On the contrary, *Father*, *Son*, *Husband*, are *Relative Subſtantives*; and *Better*, *Worſe*, *Equal*, *Unequal*, are *Relative Adjectives*.

As to *Augmentative* and *Diminutive Nouns*, they were frequent in the *Greek* and *Latin* Tongues; but no Language abounds with them ſo much as the *Italian*. In *Engliſh* we have very few *Diminutives*, and thoſe generally Names of Perſons, as *Harry*, *Jemmy*, &c. and almoſt all our *Augmentatives* are borrow'd from other Languages.

There are ſome *Nouns* that are ſometimes *Subſtantive* and ſometimes *Adjective*, as *Innocent*, the *Soveraign Good* or the *Good Soveraign*; but the *French* above all People make uſe of theſe *Nouns* in Writing and Speaking, Examples of which we have lately met with, as, *il n'y a rien de ſi beau que le vray, une accuſation de faux, le bon de l'affaire, le Mauvais de tout cela, le ſublime, dans le Style, Il y a du marveilleux dans ce que vous racontez, faire le Poſſible, tenter l'impoſſible.* Here *Vray True* is put for *Truth*, *Faux Falſe* for *Falſhood*, *Bon Good* for *Goodneſs*, *Mauvais* Wicked for *Wickedneſs*, *Sublime* for *Sublimity*, and this Phraſe we have made *Engliſh* as *The Sublime in Stile conſiſts of*, &c. The Word *Antique* is alſo *Subſtantive* in our Tongue, as a Beautiful *Antique*, a True *Antique*, but we have borrow'd it from the *French*.

A *Noun Adjective* admits of Three Degrees of Compariſon, *Poſitive*, *Comparative*, and *Superlative*. A *Noun Adjective Superlative* is a *Noun* one Degree above the *Comparative*, as the *Comparative* is a Degree above the *Poſitive*. But it may be better defin'd by ſaying 'tis a *Noun Adjective* which by itſelf or with the help of ſome Particle, denotes the greateſt Exceſs, the greateſt Amplification which the thing ſpoken of will bear. The *Latins* abounded with *Nouns Adjective Superlative* by themſelves, as moſt of the Words in *mus*, *ma*, and *mum*. In our Language we have *Noun Adjectives Superlative* by themſelves, without any Augmentation of the Termination, but rather a Decreaſe, as *Beſt* and *Leaſt*; but the general way of terminating theſe *Adjective Superlatives*, is in *Eſt*, as *Rude, Ruder, Rudeſt, Vile, Viler*, and *Vileſt*. Tho' generally in the *Engliſh* Tongue, *More* and *Moſt* are the Signs of the *Comparative* and *Superlative Adjectives*.

Of *Nouns* of *Number* there are *Five* ſorts. The firſt *Principal* or *Cardinal*, as *One, Two, Three, Ten, Twenty*, a *Hundred* a *Thouſand*. The ſecond *Nouns* of Order, as *Firſt, Second, Third, Fourth*, a *Hundredth*, a *Thouſandth*. The third *Collective*, as a *Dozen*, a *Score*, &c. The fourth of *Partition*, a *Third*, a *Fourth*, a *Fifth*. And the fifth of *Encreaſe*, as *Double, Treble, Quadruple*, &c. Of theſe *Five* ſorts of *Numeral Nouns*, the three laſt are always *Subſtantives*; the other two *Adjectives* of themſelves, however they are ſometimes us'd alſo as *Subſtantives*.

The *Gender* of *Nouns* has for its *Foundation* the difference of the two *Sexes*; and there being but Two in Nature, *Maſculine* and *Feminine*, there are but Two in *Grammar* in moſt Languages. The *Greeks* and *Latins* have another, which they diſtinguiſh'd from the other by the Name of *Neuter*; and the *Engliſh* make uſe of the ſame Term. Thus, *Homo* a Man, is *Maſculine*; *Mulier* a Woman, *Feminine*; and *Saxum* a Stone, *Neuter*. The *Latins* mark the difference of *Gender* by three Articles, *hic, hæc*, and *hoc*; but in our Language 'tis a hard matter to diſtinguiſh the *Gender*, for there's no Tongue in the World, except our own, which admits no difference of *Gender* in its *Articles* and *Nouns*; all the Diſtinction there is in our Language, for the *Maſculine* and *Feminine*, conſiſting in the *Pronouns*, *He* and *She*, which ſometimes anſwers to the *French Pronouns*, *Luy* and *Elle*, *He* and *She*; and ſometimes to the *Pronouns*, *Celuy* and *Celle*, *That* and *This*, *Maſculine* and *Feminine*. There's no difference in the Termination of the *Adjectives* of either *Gender* in *Engliſh*. *Good* is both *Maſculine* and *Feminine*. *Bonus, Bona*, and *Bon, Belle, Good*, in *French* and *Latin* ſhew how much our Tongue differs from others in the Termination of the *Genders*. 'Tis the ſame with *White*, which is *Maſculine* and *Feminine*, *Albus Alba, Blanc Blanche*, and ſo with all other Words.

We come now to the *Numbers*, Singular and Plural, which are generally diſtinguiſh'd in our Tongue by the Termination in *s*, and in the *French*, in *z*. But we have ſome Words that are both Singular and Plural, as *Sheep, Fiſh, Fowl*, &c.

The next thing to be treated of is the *Declenſion* of *Nouns*. The difference of the *Caſe* which is mark'd in *Latin* by the different Terminations of the ſame *Noun*, is not ſo diſtinguiſh'd, either in our Language, the *Italian*, *Spaniſh*, or *French*. From whence it has been pretended, that theſe Tongues have no difference of Caſe. This difference is only in its ſelf the Sign of different Relations, under which a *Noun* may be conſider'd; and theſe Relations being chiefly Six in Number, ſix Caſes are ſettled in all *Nouns*, including the Denomination of each; and in *Engliſh* are denoted by the Particles, *The, Of, To, Oh, From*, or *Of*, viz. *Nominative, Genitive, Dative, Accuſative, Vocative, Ablative*. Nominative, *the Lord*; Genitive, *of the Lord*; Dative, *to the Lord*; Accuſative, *the Lord*; Vocative, *oh the Lord*; and Ablative, *from*, or *of the Lord*. The Particles in *Engliſh* are the ſame both in the Singular and Plural Number. There's no difference alſo in the Declenſion, with reſpect to the *Gender*, *Maſculine*, and *Feminine*, having the ſame Particles.

There are ſome Grammarians, who don't look upon *Pronouns* as a Part of Speech diſtinct from the others, but place them among the *Nouns*. Of this Opinion was a Famous *Spaniſh* Grammarian, nam'd *Sanctius*, who flouriſh'd in the Fifteenth Century. And indeed, if one wou'd take the Word *Noun* in its full Extent, not only *Pronouns*, but *Participles* may be plac'd under the Claſs of *Nouns*: But not to enter into that Diſpute, in a Tract wherein we are circumſcrib'd to a narrow Compaſs, let us proceed to the Definition of a *Pronoun*.

The Word *Pronoun*, or *Prænomen* in *Latin*, does in ſome manner ſerve to define it, ſince it ſignifies a Word that ſtands inſtead of a *Noun*, or repreſents a *Noun*; but becauſe it cannot be always ſaid to repreſent a *Noun*, we will give the Definition of it from Learned *Voſſius*, in his *Analogy of the Latin Tongue*. He ſays, a *Pronoun is a Word, which in the firſt place relates to the Noun, and in the ſecond ſignifies ſome Thing*. There are [according to a Modern Grammarian] Five ſorts of *Pronouns*, *Perſonal, Poſſeſſive, Demonſtrative, Relative*, and *Indefinite*. *Pronouns Perſonal* are ſo call'd, becauſe they are us'd in Speech to denote Perſons, as *I* and *Me* for the firſt Perſon, *Thou* and *Thee* for the ſecond, *He* and *Him* for the third, with the *Feminine*, *She* and *Her*. *Poſſeſſive Pronouns* are deriv'd from *Perſonal*, and ſo call'd becauſe they denote that the Thing talk'd of belongs to the Perſon whom it ſerves to diſtinguiſh. The *Latin* and *Italian* Tongues have but One ſort of *Poſſeſſive*,

ſeſſive, but the *Engliſh* and *French* have more, as *My*, *Thy*, *Mine*, *Thine*; *Mon*, *Ton*, *Mien*, *Tien*.

Demonſtrative Pronouns are thoſe that are made uſe of when we wou'd point to a Thing, as if with one's Finger, as *This*, *That*, with their Plurals.

A *Pronoun Relative*, is that which has Relation to a preceding Noun, as, *He*, *Him*, *That*, *Which*, *Who*, with their Numbers.

Indefinite Pronouns, are ſuch as have a looſe and indeterminate Signification, and Grammarians differ as to their Number; ſome take in ſeveral Noun *Adjectives*, and others add even *Adverbs*. But as a Pronoun can never be reckon'd juſtly, but when it ſtands for the Name of a Perſon, or a Thing, which neither *Adjective* nor *Adverb* do; *Adverbs* and *Adjectives* muſt be excluded this Claſs. *Indefinite Pronouns Perſonal*, are, *Whoſoever*, *Whatſoever*, *Each*, *Other*. And *Pronouns Indefinite*, relating both to Perſon and Thing, are *None*, *Any*, *One*, and the *Other*; as for *Some* and *Ev'ry*, they being never to be us'd without a *Subſtantive* properly, they may be plac'd among *Noun-Adjectives*. A *Few*, *Several*, a *Great Deal*, a *Great Many*, are no more *Pronouns*, than other Nouns of Number. To theſe ſome add a ſixth ſort of *Pronoun*, by the Name of *Pronoun-Interrogatory*, as, *Why*, *Who*, *What*.

Pronouns are one of the moſt difficult as well as the moſt extenſive Parts of in *Grammar*; and whoever wou'd be Maſter of it, muſt be Maſter of them. Wherefore the Learner ſhou'd take great care in the choice of his Guide, and follow it carefully when he has ſo choſen. The next Thing to be ſpoken of, is the

Verb, and of all the Parts of Speech, there's none which has been ſo variouſly defin'd, each Grammarian that has treated of it, having given it a different *Definition*; ſome, as *Scaliger*, after *Ariſtotle*, have only conſider'd it with Reſpect to the different *Tenſes*, which it ſerves to denote. Others, as *Sanctius*, to the *Tenſes*, have added the difference of Perſons and Number. Others, as *Diomedes*, conſider'd it as 'tis moſt diſtinguiſh'd in its exterior Form, which is in its having no Caſe, ſaying 'tis a *Part of Speech without Caſe*. And *Voſſius* having to this Definition added, *Which ſerves to mark the Tenſe or Time*, propoſes one of his own, which is this, *A Verb is that which ſignifies to do*, *to ſuffer*, and *to be*. The *French* Academy, in their Dictionary, ſay, *'Tis a Part of Speech conjugated by Moods and Tenſes*. Which Definition wou'd have been more to their Honour if it differ'd more from what is in the common *Engliſh* Accidence, *A Verb is a Part of Speech declin'd with Mood and Tenſe*, &c. All *Verbs* are in our, as well as other Languages, divided into *Perſonal* and *Imperſonal*. A *Verb Perſonal* is that which carries before it the mark of ſome *Perſonal Pronoun*, as, *I am*, *you are*, *we love*, *they hate*; and *Imperſonal* are thoſe that generally have no other Sign but that of the *Third* Perſon Singular, as, *It Snows*, *it Freezes*, *it Thaws*, *it Rains*, *it Thunders*, *it Lightens*. But this Diviſion muſt give way to one more common, and that is that of *Verbs Active*, *Paſſive*, and *Neuter*. By *Verb Active* muſt not here be underſtood a *Verb* which ſignifies *Action*, for that's not enough to make a *Verb Active*; it muſt further govern that Noun in the Accuſative Caſe, which is the Subject of the *Action* the *Verb* ſerves to denote. Thus, to *love*, to *ſuffer*, are *Verbs Active*, becauſe to *love ſomebody*, to *ſuffer ſomething*, are there in the Accuſative Caſe; whereas to *depart*, to *act*, tho' they ſignify *Action*, as well as to *love* and to *ſuffer*, are nevertheleſs *Verbs Neuter*, becauſe they can't govern the Noun in the Accuſative Caſe, we ſay *ſomebody departs*, but never *to depart ſomebody*. Further, theſe three ſorts of *Verbs*, *Active*, *Paſſive*, and *Neuter*, are thus defin'd. An *Active Verb* is a *Verb Perſonal*, which governs the Term or Subject of the Action and Impreſſion which it ſerves to denote, in the Accuſative Caſe, as to *love ſomebody*, to *ſay ſomething*, to *receive a Wound*. A *Verb Neuter*, is a *Verb Perſonal*, which compriſing in its ſelf the Term of Action, Impreſſion, or State it ſerves to denote, governs no Noun in the Accuſative Caſe, as to *act*, to *depart*, to *ſleep*. A *Verb Neuter Paſſive* is chiefly us'd in the *French* Tongue, and is that which governs only the *Pronoun*, as *ſe repentir*, *ſe ſouvenir*, to *remember* himſelf, to *repent* himſelf, by which it appears that the *Pronoun* in *Engliſh* is govern'd by it without governing. Theſe ſort of *Verbs* are very frequent in the *French* Tongue, for *ſe* before any *Verb*, almoſt makes it *Neuter Paſſive*. In our Languge 'tis very rare. As to the Verb *to be*, beſides its own Signification, it is in our Tongue put to a uſe which diſtinguiſhes it entirely from all other *Verbs*. *Verbs Paſſive*, which are ſo well known in the *Greek* and *Latin* Tongues by their Terminations only, as Φιλέω, Φιλέομαι, *amo*, *amor*, I love, I am beloved, are entirely loſt in ours, and all Modern Languages; and the *Verb Subſtantive*, as 'tis call'd, *to be*, ſupplies it with the *Paſſive Participle* of each *Verb Active*: By which means this *Verb* is of much greater uſe in our Tongue, than 'tis in *Latin* or *Greek*. As is alſo the Verb *to have*, which being joyn'd to the *Paſſive Participle* of each *Verb Active*, ſerves to mark ſeveral *Tenſes* with an *Active Signification*, as, *I have lov'd*, *I have made*. It will not be improper to obſerve, that the firſt Perſon in the *Preſent Tenſe* of the *Indicative Mood*, and the *Preſent Tenſe* of the *Infinitive Mood* of a *Verb Active*, have, in *Engliſh*, the ſame Termination, with the difference of *I* and *To* before it, as *To love* and *I love*; whereas the *Infinitive Mood* is diſtinguiſh'd in the *Preſent Tenſe* by its Terminations in other Languages as well as the other *Moods*, as *Jaime* I love, *Aimer* to love, &c.

This brings us to the *Moods* of *Verbs*, and it muſt be obſerv'd that every thing that relates to the different Variations of *Verbs*, is term'd *Conjugation*, a Word taken from the *Latin* Grammarians; ſo that to *Conjugate* a *Verb*, is to carry it thro' all the Variations of which it is ſuſceptible.

There are Four Principal Things to be conſider'd in the Conjugation of *Verbs*, *Moods*, *Tenſes*, *Perſons* and *Number*. *Moods* are the different Uſes that are made of *Verbs*, either directly and poſitively, or indirectly and conditionally, or after a looſe and indeterminate manner. Grammarians do not agree among themſelves as to the Number of *Moods*; not only becauſe of the Difference in Languages, ſome of which are ſuſceptible of more different Variations than others, but alſo on account of the Diverſity of Ideas under which they were conſider'd by them.

The *Greek* Grammarians have eſtabliſh'd Five *Moods* in their *Verbs*, and the greateſt part of the *Latins* have follow'd them. The Names they gave them were *Indicative*, *Imperative*, *Optative*, *Subjunctive*, and *Infinitive*.

They call'd that Mood *Indicative*, which ſerves to indicate or declare a Thing, as *I Love*.

The *Imperative Mood* ſpeaks alſo directly and poſitively, but either by way of *Command* or *Demand*, as *Love, Do*.

The *Optative Mood* is that which ſpeaks indirectly only, and by wiſhing, as *Grant I Love*.

The *Subjunctive Mood* ſpeaks alſo indirectly, and is joyn'd with ſome Conjunction, as *When I Love*.

The *Infinitive Mood*, is that which does not determine the Signification of the *Verb* but imperfectly, as *To Love*. Several *Latin* Grammarians have added other *Moods* to theſe *Five*, looking on the different Variations that are made uſe of, to *Submit*, to *Promiſe*, to *Exhort*, to *Ask*, as ſeveral *Moods* of the ſame *Verb*. And others, as *Sanctius*, that the Diſtinction of *Moods* in *Verbs* is uſeleſs, becauſe not Eſſential, and have made no difference in them, only as to the *Tenſe* and *Perſon*. But as ſome, by adding too many *Moods*, occaſion more Confuſion than Order; Others, by ſuppreſſing all of them, wou'd deprive Grammarians in all Tongues of a very uſeful Diſtinction. The *Potential Mood*, us'd in our Vulgar Grammars, ſeems to be of the kind of thoſe that may be ſpar'd, the *Optative*, *Potential*, and *Subjunctive*, having the ſame Terminations in *Latin*. The Opinion of the Great *Voſſius* will warrant what has been ſaid; for in his Grammar he makes but One *Mood* of the *Optative* and *Subjunctive*, for that very Reaſon, that their Variations are the ſame. And the *French* have but Four *Moods* in their Beſt Grammar, the *Indicative*, *Imperative*, *Subjunctive*, and *Infinitive*. As to the *Engliſh* Tongue, it accommodates itſelf both to thoſe who are for more *Moods*, and to thoſe who are for leſs; but we having no *Eſtabliſh'd Grammar*, the moſt Correct one that has yet been Publiſh'd, being nothing more than an *Eſſay*, 'twill not be expected that we, who can have no greater Ambition than to Copy faithfully, and as judiciouſly as we can, from what has been ſaid by the beſt Authors already on this Subject, ſhould pretend to decide in ſo difficult an Affair.

The next Thing to be treated of, is the *Tenſe* of *Verbs*. And as there is in the *Compaſs* Four Cardinal Winds, which are ſubdivided into others, ſo there are in *Grammar* Three *Tenſes*, the *Preſent*, the *Paſt*, and the *Future*; which, at leaſt Two of 'em, are ſubdivided in all other *Tenſes* in other Languages; and one of them the *Paſt*, in our own, as well as the *Latin*, may bear a threefold Diviſion, *viz.* into *Preterimperfect Tenſe*, *Preterperfect Tenſe*, and *Preterpluperfect Tenſe*. The *French* divide the *Paſt* into *Five* Parts, *Preterit Imperfait*, *Preterit Indefini*, *Preterit Perfait*, *Preterit pluſque Perfait*, *Preterit Indefini Compoſé*; and the *Future Tenſe*, with them, has alſo Two *Variations*, as the *Simple Future* and *Compound Future*; inſomuch, that there are Eight *Tenſes* in the *Indicative Mood* of their *Verbs*. The *Imperative Mood* has but One *Tenſe*, which is commonly call'd the *Preſent Tenſe*: But there are ſome able *Grammarians*, who will not allow that *Tenſe* to have that Name, and call it the *Future Tenſe*. If what they alledge is a ſufficient Reaſon, let others determine. They ſay that, where the *Imperative Mood* is made uſe of to command or deſire, the Things that it ſpeaks of are *to be done*, and conſequently cannot be look'd upon as *Preſent*. The Grammars in uſe make Five *Tenſes* in the other *Moods*. The *French* add One in the *Optative*, making it conſiſt of Three *Simple* and Three *Compoſite*, which is only obſerv'd to mark the difference between them and the Latin, and other Languages. But let Grammarians tell us what they pleaſe on this Matter, it were to be wiſh'd, for the Eaſe of Learners, that *Tenſes*, as well as *Moods*, were either leſs in Number, or more Certain. For we may often meet with one *Tenſe* employ'd for another, and almoſt all Languages make uſe of the *Preſent* for the *Future Tenſe*. There are ſeveral Examples of it in the Latin Tongue; *Cicero* himſelf ſupplies ſome of them, as when he ſays, *Antequam pro Muræna dicere inſtituo, prius quam de Republica dicere incipio. Before I undertake to ſpeak for Murena, before I begin to ſpeak of the Common-wealth.* For in both theſe places, *inſtituo* and *incipio*, which are in the *Preſent Tenſe* of the *Indicative Mood*, without doubt denote the *Future Tenſe*, which is alſo deſign'd by *Violo* and *Reſolvo* in this Verſe of *Virgil*,

Ante pudor quam te violo aut tua jura reſolvo.

If ſuch was the Uncertainty of the Uſe of the *Tenſe* in the *Latin* Tongue, 'tis yet much greater in all the Moderns, none of 'em having a Grammar ſo well Eſtabliſh'd, eſpecially the *Engliſh*, which of all the Languages worth learning, is moſt in want of one; Whether the Labour and Science of one Man will ever be able to effect it, at leaſt without great Encouragement from the Publick, is a Matter of ſtill much more Uncertainty.

A *Verb* may be us'd in the *Singular* Number, as *I love*, *You love*, *He loves*; or in the *Plural*, as *We love*, *Ye love*, *They love*. The putting a *Pronoun* before the *Verb*, makes it *Perſonal*, it being what is call'd the *Perſon* of the *Verb*.

Gerunds of *Verbs*, as they are chiefly in the Ancient Tongues, ſo the Word ſhews it to be of Latin Original, *Gerere*, to *make*, *adminiſter*, *govern*; and in that Tongue the *Gerund* ſerv'd to denote a Thing to be done according to the Signification of each *Verb*, as *Pugnandum eſt*, *We muſt Fight*. But there is no need of entring farther into the Nature and Properties of *Gerunds* in *Latin*, ſince this Diſcourſe is intended rather to give a general Idea of Grammar, than a particular Account of the Grammar of any particular Language. The Termination of the *Gerund* in *Engliſh*, is *Ing* or *Ed*; and if the latter, is diſtinguiſh'd by the Verb *to be*, or its Participle *being*, as *to be lov'd*, or *being lov'd*. Further, it muſt be obſerv'd, that in our Tongue, the Termination of the *Participle* and *Gerond* is the ſame, and the latter is commonly diſtinguiſh'd from the former by the Particle *in*. In ſhort, a *Gerund* is thus defin'd; 'Tis a part of a *Verb*, which admits of no *Variation*, and governs the ſame as the *Verb*, but has neither *Tenſe*, *Number*, nor *Perſon*, as *in doing*, *in loving*, *in ſpeaking*.

A *Participle* is a *Part* of *Speech* deriv'd from a *Verb*, and partaking of the Qualities of a *Noun* and *Verb* together, having *Tenſe* and *Signification* as a *Verb*, and *Gender*, *Caſe* and *Declenſion* as a *Noun*; but this Definition agreeing only to the *Latin* Tongue, in all the Parts of it, we muſt take Notice here that in *Engliſh*, *Participles* and *Gerunds* are the ſame in Termination, and have no other Diſtinction but the *Particle* and *Noun Subſtantive*, which always follow and precede the one and the other;

for *Loving* is both a *Gerund* and a *Participle*, when thus written, *in Loving him*, *a Loving Man*; the *Participle* in our Language anſwering the Uſes of a *Noun Adjective*. The *Termination* of the *Engliſh Participle* alters in the *Tenſe*, as *Loving* is the *Preſent Tenſe*, and the *Preter Tenſe* ends in *d*, *t*, or *n*, as *Lov'd*, *Taught*, *Slain*.

As to the *Conjugations* of *Verbs* in thoſe Tongues where the *Termination* varies often, as in the *Latin*, the *French*, and all other Tongues deriv'd from the *Latin*, great Care muſt be taken by the Learner throughly to acquaint himſelf with all thoſe Variations than which nothing is more uſeful in *Grammar*. In *Engliſh* the Variation is perform'd only by the *Particles Eſt*, *Eth* and *Ed*, and the *Conjugation* of the *Auxiliary Verb to have*, as *I love*; *thou loveſt*, *he loveth*, *I loved*, &c. But lately all who underſtand any thing of Cadence, or Harmony of Language, leave out the *Eth* and put in *Es*, as *he loves*, and make *'d* ſerve inſtead of *Ed*, as in the *Preterimperfect Tenſe*, *I loved*, *Belov'd* with an Apoſtrophe to note the cutting off of the *E*. The Learner will know little of *Conjugation*, and the Nature of it by the Practice in *Engliſh*, wherefore we ſhall keep to the *Latin*. *Conjugation* in that *Tongue* is a fit Varying of *Verbs* by their Final *Termination* in both *Numbers*, and every *Perſon* in each *Mood* and *Tenſe*, as *Amo I love*, *Amas thou loveſt*, *Amamus we love*, &c. *Amabam I lov'd*, *Amabamus we lov'd*, &c. The *French* alter the *Termination* in *Conjugating Verbs* as well as the *Latins*, but not ſo often making uſe of the Word *Avoir to have*, as well as the *Engliſh* in many of their *Tenſes*. The *Declining* a *Verb* is the Rehearſing of the Firſt and Second *Perſons* of the *Preſent Tenſe* of the *Indicative Mood*, as *Amo Amas*, with the Firſt *Perſon* of the *Preterperfect Tenſe* of the ſame *Mood*, *Amavi*; the *Preſent Tenſe* of the *Infinitive Mood*, *Amare*; the *Gerunds Amandi*, *Amando*, *Amandum*; the *Supines*, *Amatum*, *Amatu*; the *Participles*, *Amans*, *Amaturus*. The *Forming* or *Conjugating* a *Verb* is, the Varying of the *Termination* according to *Perſon*, *Mood* and *Tenſe*, as has been hinted already.

This is what our Compaſs will allow us to ſay of *Verbs*, to which muſt be added *Adverbs*.

An *Adverb* is a *Part* of *Speech* which admits of no Variation, and ſerves to modifie a *Noun Adjective*, a *Verb*, or a *Participle*; that is, to mark ſome Quality, Manner, or Circumſtance of what is ſignify'd by the one and by the other, as in theſe Phraſes, *to be extreamly happy*, *to be often ill*, *to ſpeak well*, *to write ill*, *A Man very much fearing God*, *He has always done his Duty*; *theſe Seven*, *extreamly*, *often*, *well*, *ill*, *very*, *much*, *always*, are there all *Adverbs*, which mark the different Manners and Circumſtances of what is ſignify'd by thoſe *Nouns*, *Verbs* and *Participles*. We may conſider *Adverbs* either with Reſpect to their *Form*, or with Reſpect to their *Signification*. As to their *Form* they may, like all other Words, be diſtinguiſh'd into *Primitive* and *Derivative*, *Simple* and *Compound*; but the former having no Relation to the Uſe of *Adverbs*, we ſhall only ſpeak of the latter. By a *Simple Adverb* is underſtood one which of itſelf, or by long Uſe in a Language makes but one Word, as *Yes*, *No*, *When*, *How*, *Never*, *Always*, *Wiſely*, *Senſibly*. And by a *Compound* One, an *Adverb* form'd of ſeveral Words which uſe Separates in Writing, as, *at preſent*, *at firſt*, *at laſt*, *by little and little*, *as ſoon*, and the like. As to the Signification of *Adverbs*, they may in that Reſpect be divided into almoſt as many different Claſſes as there are different Phraſes in a Tongue. But to prevent the Confuſion of too many Diviſions, let them be diſtinguiſh'd by *Time*, *Place*, *Situation*, *Order*, *Rank*, *Quantity*, *Number*, *Quality*, *Manner*, *Affirmation*, *Negation*, *Doubt*, and *Compariſon*. For there's hardly any *Adverb* but may be plac'd under one or another of theſe *Diviſions*. *Adverbs* of *Time* relate to what is *Paſt*, *Preſent*, *Future*, or *Undetermin'd*. As for the *Paſt*, *Yeſterday*, *Formerly*, *Laſtly*, *Newly*, *Lately*, &c. For the *Preſent*, *To Day*, *Preſently*, *for the Preſent*, &c. For the *Future*, *To Morrow*, *Suddenly*, *In a little while*, &c. For the *Undetermin'd*, *Often*, *Sometimes*, *Rarely*, *Never*, *Always*, *Inceſſantly*, *Commonly*, *Ordinarily*, *Late*, *Since*, &c. *Adverbs* of *Place* belong to all ſorts of Places indifferently, and ſerve only to mark the Difference of *Diſtances* and *Situations*, with Reſpect either to the Perſons *Speaking*, or the Things *Spoken* of, as *Here*, *There*, *Near*, *Far off*, *Before*, *Behind*, *Within*, *Without*, *Above*, *Below*, *Elſewhere*, *Every-where*. *Adverbs* of *Order* are of two ſorts, one relates both to Place and Order, as *Before*, *Behind*, *at Bottom*, &c. and the other to Order only, as *Firſtly*, *Secondly*, *In the End*, *Together*. And under the Name of *Adverbs* of *Quantity* are here Comprehended, not only all *Adverbs* of *Numeral Quantity Definite*, but alſo all thoſe that ſerve to denote either any Quantity whatſoever, or the Price and Value of Things. There are as many *Adverbs* of *Numeral Quantity Definite*, as there are Numbers with which the Word *Times* is joyn'd, as *Three Times*, *Six Times*, *Ten Times*, *Fifty Times*, &c. All other *Adverbs* have an Indefinite and Relative *Signification*, as *too much*, *too little*, *enough*, &c. As to *Adverbs* of *Quality* and *Manner*, there are few *Noun Adjectives* in our Language, out of which theſe ſort of *Adverbs* are not form'd, *Wiſe*, *Juſt*, *Prudent*, *Conſtant*, *Strong*, *Great*, *Aſſured*, *Infinite* and *Abſolute*, of which are form'd *Wiſely*, *Juſtly*, *Prudently*, *Conſtantly*, *Strongly*, *Greatly*, *Aſſuredly*, *Infinitely* and *Abſolutely*. This Termination in *ly* ſerves for almoſt all the *Adverbs* which ſignifie *Quality* and *Manner*. The next Thing to be treated of are *Adverbs* of *Affirmation*, *Negation* and *Doubt*. There are not many of theſe, and moſt of them are form'd of a *Noun Adjective* or *Participle*. As thoſe of *Affirmation*, *Aſſuredly*, *Infallibly*, *Certainly*, *Willingly*, &c. *Yes* is the Firſt in the Number of the *Affirmative Adjectives*, and *No* of the *Negative*; to which may be added, *Not*, *Not at all*, *Neither*, *In no wiſe*. As to the *Adverbs* of *Doubt*, *Perhaps*, *Perchance*, and two or three more are all that come under that Head. *Adverbs* of *Compariſon* are ſuch as denote different Degrees in Perſons and Things, as *More*, *Leſs*, *Worſe*, *Better*, *Very*, *Almoſt*. In Speaking of Simple *Adverbs* under their different Forms we have been oblig'd to mention ſome, as *Perhaps*, *Perchance*, which are Compound, but having been long join'd by Cuſtom are look'd upon as One Word, and ſo are many others of the ſame Kind. Compound *Adverbs* ſo eſteem'd at this time relate to all the Denominations of *Time*, *Place*, *Quantity*, &c. as before mention'd, *In a little while*, *In Time*, *Far off*, *A-ſhoar*, *In Order*, *At Six Times*, *Never ſo little*, *A-thwart*, &c.

Prepoſitions are diſtinguiſh'd from *Adverbs*, inaſmuch as *Adverbs* govern no *Caſe* and *Prepoſitions* do. That *Adverbs* govern no *Caſe* is a Rule receiv'd among almoſt

moſt all Grammarians in all Languages, and that *Prepoſitions* do. With reference to the former ſome Learn'd *Latin* Grammarians have been ſo wedded to that Rule, that when we read in the Beſt *Roman* Authors, *Satis Eloquentiæ, Sapientiæ parum, Enough of Eloquence, very little of Wiſdom* (we leave out the *of* in *Engliſh*) and ſome other ſuch like ways of Speech. They pretend that *Satis* was an old Word, which being no more us'd as a *Noun* was turn'd into an *Adverb*, and ſtill govern'd the *Genitive Caſe*. Others imagin'd that in theſe Two Examples the Word *Res* or *Negotium* ſhould be underſtood, and ground it upon the ſame Words being ſometimes us'd with the like *Genitives* in Ancient Authors. *Scioppius* when he talks of the *Syntax* of *Adverbs*, after having Quoted theſe Two Examples, *Satis Eloquentiæ, Sapientiæ parum*, ſays that in thoſe Places the *Genitive* is not govern'd by the *Adverb*, but by a *Noun Subſtantive* not expreſs'd, which is either *Res* or *Negotium*, ſome Authors having heretofore ſaid *Res Fraudis* for *Fraus*; *Res cibi* for *Cibus*, &c. Though this relates only to the *Latin* Tongue, yet it clears the Difference between *Adverbs* and *Prepoſitions* ſo well, that 'twill not be look'd upon as a needleſs Digreſſion.

There are ſome *Adverbs* in *Engliſh* as well as in *French*, that always govern ſome *Caſe*, and are never us'd without it, as *Dependently, Independently, Preferably, Relatively, Agreeably* and *Conformably*. The Three firſt of which are conſtru'd with the Article of the *Ablative Caſe*, and the reſt with that of the *Dative*; for in both Languages the *Caſe* is diſtinguiſh'd by the Article. As to the Uſe of *Adverbs* Cuſtom is the Judge, but generally they are plac'd before *Noun Adjectives* and *Participles*, and behind *Verbs*, as *extreamly Happy, greatly Good, extreamly Loving*, &c. As to *Engliſh*, the *Adverb* ſometimes goes before the *Verb*, particularly in Poetry and Eloquence, *He's greatly Enrag'd, ſenſibly Touch'd, ſtrongly Acted*, &c. There remains Three other Parts of Speech to be handled, *Conjunction, Prepoſition, Interjection.*

Conjunction is an Indeclinable Part of Speech, which is as the Knot that ties the ſeveral Members of the Diſcourſe together. In the common way of dividing *Conjunctions* there are Twelve of this Kind, *Copulative, Diſjunctive, Diſcretive, Cauſal, Conditional, Exceptive, Interrogative, Illative, Adverſative, Redditive, Elective, Diminutive. Conjunctions Copulative* are ſuch as ſerve to gather and Couple Two *Terms* together, as *And, Alſo, Neither. Diſjunctives* joyn the Parts of Diſcourſe together ſo that they at the ſame time mark Partition and Diſtinction in the Senſe of the Things ſpoken of, as *Either, Or*, and the like. *Diſcretive* are ſuch as lightly divide the Parts, as *But, Truly. Cauſals* are thoſe that always go before the *Reaſon*, and mark the Cauſe why, as *For, Becauſe. Conditional* are ſuch as in joining One Part of a Diſcourſe to another, put between the Senſe which they join a Condition, in which what is expreſs'd in the Two Principal Members of a Diſcourſe ceaſes to have its Effect, as *If, So that, According as, In caſe that*, &c. *Exceptive* Excepts againſt ſomething going before, or from ſomething following, as *Except*, the Word made uſe of, *Unleſs*, and the like. *Interrogative* asks a Queſtion as the Word implies, as *Whether, Why*, &c. *Illatives* bring in ſome Concluſion or ſhew ſomething, as *Wherefore, Therefore. Adverſatives* mark ſome Diverſity of Things, as *Tho', So be it. Redditives* anſwer to the *Adverſatives*, as *Notwithſtanding. Elective* may be alſo term'd *Comparative*, as the *French* call them, ſuch are *As, Than. Diminutive* leſſen the *Proportion*, as *At leaſt.* And we may add *Augmentatives*, as *Yet, Beſides, Moreover, Furthermore.*

Prepoſitions come next and are with *Conjunctions*, the Nerves and Sinews of a Diſcourſe, and without underſtanding them both very well, 'twill be impoſſible to arrive at the Knowledge of any Language. All the other Terms are like Materials prepar'd for a Building, *Prepoſitions* are like the Mortar which cements them together. True it is, Conjunctions by their Name and Nature ſeem to have the Chief Part of the Binding of the Members of a Diſcourſe together: However, *Prepoſitions* have a great Share in it, not only thro' the frequent Uſe we are oblig'd to make of them, and the Importance of knowing how to place them, but becauſe they are often employ'd as *Conjunctions.* What is here ſaid of *Prepoſitions* don't relate to ſuch as are inſeparable from Words which indeed are not, properly ſpeaking, *Prepoſitions* in our Language, nevertheleſs it will not be improper to take Notice of ſome of them, as *Abandon*, which is a very good Word borrow'd by us from the *French*, and by them in Part from the *Germans*. There is the *Prepoſition* to *a, Ban*, the High *Dutch* Word ſignifying *Baniſhment*, and *Donner* the *French* Word *to Give*, as *Abandon* in our Language; as alſo *Declare, Abuſe, Refuſe, Adjoyn, Subjoyn*: But 'tis to be obſerv'd, that almoſt all thoſe Words are taken from the *French* by us, and from the *Latins* by them; for 'tis not likely that we ſhould go ſo far as an Ancient Language for them, when our bad and good Fortune have given us ſo much Commerce with our Neighbours. Almoſt all the Words beginning with *Eſſ, Eff, Em, En, In, Enter, Inter, Contra*, &c. are of the ſame Extraction, as *Eſſence, Efficacy, Embrace, Encounter, Enterprize, Interrogate, Contraband, Contradict*, &c. But as to the Words beginning with *Mis*, notwithſtanding what Dr. *Wallis* ſays in his *Grammar*, that we borrow'd that *Particle* from the *French Mes*, they themſelves confeſs they are indebted to the *Saxons* for it. The Reader will not be diſpleas'd to ſee what the *French* Academy, in the *Grammar* Publiſh'd by their Secretary, ſay of it, [*Amſt. Edit.* Pag. 577.]
" The Learn'd M. *du Cange*, in his Gloſſary on
" the Word *Miſdicere, Meſdire*, to *Revile*, obſerves
" expreſly that *Mis* in the Signification of *Failing*
" or *Fault* is of very Ancient Uſe in the *Northern*
" Languages. And to this Purpoſe he quotes the
" *Gothick* Gloſſary of *Ulphilus*, who ſays that *Miſſa*
" in the *Daniſh* Tongue ſignifies *Failing* or *Defect.*
" Further, on the Word *Miſdocere*, after having ci-
" ted the Third Chapter of *Alfred*'s Laws and *Go-*
" *din*'s, where it is ſaid, *Si Presbyter Populum ſuum*
" *miſdoceat de feſto vel de jejunio, reddat triginta ſo-*
" *lidos, If the Prieſt fails to give his Congregation*
" *Notice of a Feaſt or Faſt-day he ſhall pay thirty*
" *Pence*, He obſerves that the *Saxon* Edition proves
" that *Miſpiſſian* to *Ill-inſtruct* comes from *Piſſian*
" to *Inſtruct*, and *Miſ* which ſignifies *Ill*. Thus
" alſo *Miſſe* in the *Engliſh* Language, which is de-
" riv'd partly from the *Daniſh* and partly from
" the *Saxon*, ſignifies *want* of or *Fault*, from the
" *French Faillir* to *Miſs*. For which Reaſon I be-
" lieve

“lieve the Famous *Wallis* is miſtaken, when treating of *Etymology* in his *Engliſh Grammar*, He ſays that *Mis* which the *Engliſh* make uſe of in ſeveral Words as we do of *Mes* is taken from us. 'Tis very true, they have borrow'd ſeveral Words from us, in which we uſe the Particle *Mes*, and their Neighbourhood to Us, and the *Norman* Conqueſts may probably have carry'd thoſe Words into *England*: But there's no Likelihood that the *Engliſh* ſhould take a *Particle* from us, which, when alone, is of no Signification in our Language, and which in theirs has ſo diſtinguiſh'd a one, and is either Original in their Tongue, or which is more probable, comes to them from the *Saxons* and *Danes*, who Reign'd a long time in *England*.

Tho' there are ſome Things in this Conceſſion of the *French* Academy, as to the Particle *Mis*, in our Favour, yet they ſeem to be great Strangers to our Tongue; for what can they mean by *Original* in our Language, ſeparate from the *Saxon*, unleſs 'tis *Welſh*? and they might know by their own *Gauliſh* Tongue whether this Particle was ſo Ancient. As to our borrowing it from the *Danes*, what has been ſaid already out of Dr. *Wallis* concerning that Tongue and ours, is ſufficient to prove we did not admit of many of their Words; and beſides, the Word *Miſdoceat* before-mention'd us'd by King *Alfred*, ſhews, that *Mis* was rather of *Saxon* than *Daniſh* Original, for the *Danes* had not then ſettled themſelves here long enough to Innovate any thing in Language. 'Tis not unlikely but this Particle may be both *Daniſh* and *Saxon*, for the Two Tongues were nearly related, and both of the ſame *Deſcent*. To return to our Subject, from which we ſhould not have digreſs'd, but to let the Reader ſee that *Mes*, which introduces no Inconſiderable Number of Words into the *French* Language is *Engliſh*, and will help a little towards paying the vaſt Debt we owe it.

Præpoſitions that are ſeparable, which indeed are the true *Præpoſitions*, come next to be treated of. 'Tis a Part of Speech Indeclinable, which being added to another Part of Speech governs it, and ſhews the ſeveral Relations it has with the others. Every *Prepoſition* governs the Term to which 'tis joyn'd, whether it be *Noun*, *Pronoun*, *Verb* or *Adverb*. It governs the *Noun* and *Article* at the ſame time thus, *With the Help of his Friends*. The *Noun* only thus, *To act by Conſtraint*. The *Pronoun* thus, *He's out of himſelf*. The *Verb* thus, *After he had talk'd*. Thus the *Adverb*, as, *From whence it comes to paſs*. Sometimes the *Præpoſition* follows the Term it governs, as *A little while after*. It ſerves to ſhew the different Relation, as is ſaid before, becauſe it determines the Senſe, and ſo ſtrongly, that if it was taken away, there wou'd be no Meaning in the Phraſe. *Præpoſitions* may be conſider'd either with Reſpect to their *Form*, their *Uſe* or *Signification*. As to their *Form* they admit of a Sub-diviſion into *Simple* and *Compound*. As to their *Uſe*, they may be diſtinguiſh'd into *Præpoſitions* that do govern and thoſe that do not govern. And as to their *Signification*, they may be divided into as many different Kinds as there are different Relations which they ſerve to denote. Theſe following are reputed *Simple Præpoſitions*, as *To*, *From*, *At*, *Between*, *Within*, *Without*, *Far*, *Near*, *Under*, *Over*, *Towards*, *Before*, *After*, *With*, *Againſt*, *Behind*, *Since*, *About*, *Except*, *Till*, *Amongſt*, *According*, &c. for tho' *within* may be reckon'd *Compound*, being Compos'd of *With* and *In*, yet Uſe makes one Word of it, and ſo of others of the like Nature, as *Notwithſtanding*, *Nevertheleſs*. *Compound Præpoſitions* ſpeak what they are by their Name, thus, *Over-againſt*, *In the mean while*, *Very ill*, as *Very ill ſatisfy'd*, and the like, are of this ſort, becauſe Compos'd of ſeveral Words. As to the *Uſe* of *Præpoſitions* and their *Governing Caſes*, in thoſe Languages wherein *Caſes* are diſtinguiſh'd by *Terminations* and not by *Articles*, as in the Modern, eſpecially our own, 'tis very neceſſary for the Young *Grammarian* to be well acquainted with the ſeveral *Regimens* of *Prepoſitions*, as that *Ad* in the *Latin*, *Apud* and *Ante* Govern an *Accuſative*; but in *Engliſh*, *Ad Cæſarem To Cæſar*, *Apud Londinum At London*, *Ante Diem Before Day*, can only be known to be the *Accuſative Caſe* by the *Præpoſition*, there being no Alteration in the *Termination*, it will therefore be very hard to diſtinguiſh thoſe that have a *Regimen* from thoſe that have not.

Præpoſitions are ſometimes *Comparative*, as *Near*, *Nearer*, *Next*, &c.

The *Interjection*, according to the uſual Diviſion of the Eight Parts of *Speech*, is the Laſt. And ſome *Grammarians* do not allow it to be one of them. Theſe place it among the *Adverbs*, in which they follow the *Greeks*, who did not aſſign it a Place by itſelf. *Sanctius* before-mentioned, is at the Head of the Moderns of this Opinion; but the Number is not great: And the *Latin Grammarians* aſſigning it a Place among the Eight Parts of Speech, have been follow'd by almoſt all that come after them. Nay, *Julius Cæſar Scaliger* lookt upon it as the Firſt and Principal Part of Speech, becauſe 'tis that which ſhews the Paſſions moſt. Both the one and the other have their Reaſons, and the Difference of their Sentiments proceeds only from the different Ways after which each of them conſider'd the *Interjection*; for with reſpect to Nature, 'tis perhaps the Firſt Articulate Voice which Man made uſe of; but with reſpect to *Grammar*, it ſerves ſo little by itſelf towards the Connexion of Diſcourſe, that it may be taken away, and the Senſe not ſuffer by it. To this may be added, in Favour of ſuch as will not have *Interjections* to be a particular Part of Speech, that there's ſo ſmall a Number of 'em 'tis hardly worth while to ſeparate them from *Adverbs*. An *Interjection* is nothing but an Expreſſion which ſerves to ſhew a ſudden Emotion of the Soul: and as the greateſt Part of thoſe Expreſſions are taken from Nature only, the true *Interjections* in all Languages conſiſt generally of One Syllable. The *Latin* Tongue borrow'd moſt of her's from the *Greek*, and the Moderns deriv'd theirs from the *Latin*. We in *England* have ſome of our own, but very few. As among all the Emotions of the Soul thoſe which moſt ſuddenly are outwardly diſcover'd are *Grief*, *Joy*, *Deſire*, *Fear*, *Averſion*, *Admiration*, *Wonder* and *Surprize*, ſo the ſudden Expreſſions which they cauſe include all the *Interjections* that are to be found in any Tongue: And as the ſame Word, according as it is differently Pronounc'd, may have different Significations, ſo the ſame *Interjection*, according as 'tis ſpoken, may expreſs the ſeveral Sentiments of *Grief*, *Joy* or *Admiration*.

The *Interjections* that denote *Grief*, are *Ah*, *Oh*, *Alas*, *Oh Heaven*, &c. The *Interjections* of *Joy* and *Deſire*, are *Oh Good*, &c. The *Interjections* of *Fear*, *Averſion*, and *Deriſion*, *Hah*, *Fi*, *Haha*, &c. Of *Admiration* and *Surprize*, *Oh*, *How*. &c. There are others which are not ſettled, but are the Effects of the ſudden Emotion of the Soul, and various, according to Perſons and Things. There are alſo ſome *Interjections* in our Language, as well as others, by which we endeavour to excite the ſame Emotions in others as we feel in our ſelves, as *Courage*, *Joy*, &c. To theſe we muſt add ſuch as do not ſhew any particular Emotion of Mind, but are made uſe of by way of *Appellation*, as *Hem*, *Ho*; and others, to impoſe Silence, *Huſh*, *Silence*; or to forbid a Thing, as *Hold*. There are ſome Grammarians, who extend the *Interjection* as far as to whole Phraſes, as *Ah*, *how fine it is*, and the like, but that will not be a ſufficient Warrant for others to imitate them.

It muſt be confeſt, that there are very little Helps in our Language to any one that wou'd Treat of *Grammar*, with reſpect to the *Eight Parts of Speech* only, but as to the *Syntax* and *Proſodia* we have ſtill leſs; therefore ſuch as wou'd know any thing of thoſe Parts of *Grammar*, muſt underſtand it chiefly with Reference to the Ancient Tongues, which give all the Rules for both the one and the other.

Next follows *SYNTAX*, which is the Second Part of *Grammar*, teaching the *Conjunction* of Words one with another, as to Concord and mutual Propriety; as of a *Noun* with a *Noun*, in *Number*, *Caſe* and *Gender*; of a *Noun* with a *Verb Perſonal*, in *Number* and *Perſon*; of an *Adverb* and *Præpoſition*, with the reſpective Words which they attend upon.

This *Conjunction*, or Intercourſe of *Words* one with another, is call'd by *Grammarians*, *Oratio*, or *Speech*, being either Simple or Compound, the Form whereof is either continu'd or interrupted, which laſt is call'd *Dialogue*; and theſe two manners of *Speech* are indifferently us'd both in *Proſe* and *Verſe*. Right diſtinguiſhing of *Sentences* are very neceſſary in *Grammar*; and there are three *Notes* of Diſtinction generally in uſe, but receiv'd from the *Latins*, as *Sub-diſtinction*, the *Middle-diſtinction*, and the *Plenary* or *Full-Diſtinction*; but known by their *Greek Appellations*, viz. *Comma*, *Colon*, and *Period*.

The *Sub-diſtinction*, or *Comma*, is only a very ſhort Pauſe of Reſpiration, or Breathing time; and is expreſs'd by this Note or Mark (,).

The *Middle-diſtinction*, or *Colon*, is that which ſtops the *Career* of a *Sentence* much about the Mid-way, leaving as much of the Senſe behind, as has been already paſt over, and this is thus Mark'd (:).

A *Full-diſtinction*, or *Period*, is that which comes after the perfecting or finiſhing of a *Sentence*, and is Mark'd only with one ſingle Prick (.)

To theſe ſome add a *Semi-Colon*; which indeed is much the ſame with a *Colon*, or at leaſt but a ſmall diminution of it, only differently Mark'd, as thus (;).

There are alſo ſome other Diſtinctions of *Grammatical* Obſervations in Sentences, as firſt, *Interrogation*, or asking of a *Queſtion*, the Note whereof is thus (?). Secondly, *Admiration*, or denoting a Wonder at a Thing, the Note whereof is thus (!) Thirdly, *Union*, or the joyning of two *Syllables* together for the making up of a Word, being one of them at the end of a *Line*; and this is thus Mark'd (-) Fourthly, *Parentheſis*, which is the including of one *Sentence* within another; the ſaid *Sentence* being ſo entire of it ſelf, that it may be wholly taken away, without ſpoiling or doing any great Prejudice to the reſt of that which remains.

There is alſo belonging to *Grammar* that which is call'd *Proſodia*, which may alſo be reckon'd an Introduction to *Latin* and *Greek Poeſie*, becauſe it directs to the Knowledge and Compoſition of *Latin* and *Greek Verſe*, in order to which it Treats of the quantity of *Syllables*, of the various Denomination of *Feet* in Verſe, of the Diſtinction and Names of Verſes; and generally, what belongs to the ancient Poetry, conſider'd only as Numbers.

Of *Syllables* ſome are long, ſome ſhort, ſome doubtful or common, that is, either long or ſhort at pleaſure. Long and ſhort *Syllables* amongſt the *Latins* and *Greeks*, are known Eight ſeveral ways. Firſt, By *Poſition*, that is, when two *Conſonants*, viz. a *Mute* and a *Liquid*, or a double *Conſonant* follow a *Vowel*. Secondly, By a *Diphthong*; a *Diphthong* is long among the *Latins*, except a *Vowel* follow, but among the *Greeks* it varies. Thirdly, By *Præpoſition*, for the *Præpoſitions a*, *de*, *e*, *di*, *dis*, *pro*, and *ſe*, are long only in ſome few Exceptions, unleſs a *Vowel* follow. Fourthly, By *Derivation*, *Derivatives* follow generally their *Primitives*. Fifthly, By *Compoſition*, *Compoſites* follow the Rule of their *Simples*. Sixthly, By a *Vowel* before a *Vowel*, which in the ſame word is for the moſt part ſhort. Seventhly, By *Rules*, as *Diſſyllable Preterperfect Tenſes* are long except *Scidi*, *Fidi*, *Tuli*, *Steti*, *Dedi*. The firſt Syllable of a *Double Preterperfect Tenſe* is ſhort, as in *Momordi*, *Fefelli*, *Pependi*, *Totondi*. The firſt Syllable of a *Diſſyllable Supine* is long, as in *Satum*, *Cretum*, *Itum*, *Motum*. The final *Syllable* in *A* of the *Ablative Caſe* Singular of the firſt *Declenſion*, as *Petrâ*. The final Syllable in *O*, of the *Dative* and *Ablative* Singular of the ſecond *Declenſion*, as in *Animo*. The final Syllable in *I* of the *Nominative* Plural, as in *Animi*; In *Is* of the *Dative* and *Ablative* Plural of the ſame *Declenſion*, as in *Animis*. The final in *As* of the *Accuſative* Plural of the firſt *Declenſion*, as in *Menſas*; of the *Nominative* Singular of acute Creſcents of the third *Declenſion*, as in *Bonitas*; and the final Syllable in *Es* in moſt Words are all long. The final Syllable of Words in *B*, *C*, *D*, and *T*, are ever ſhort. The final Syllable in *Us* of moſt Words is ſhort. The final Syllable in *U*, for the moſt part is long. Eightly, By Examples and Authority of the Ancients; thus the firſt and middlemoſt *Syllables* of Words are known by the frequent Reading, and Obſervation of Authors, as *Ma* in *Mater*; *Mu* in *Muſa*; *No* in *Nobis*; *Pa* in *Pacis*, *Pu* in *Pudor*, &c. are long. *A* in *Aqua*, *E* in *Equus*, *Pa* in *Pater*, *O* in *Opus*, are ſhort.

From *Syllables* of various *quantity*, various *Feet* ariſe, which are of two ſorts, *viz.* Simple, and thoſe compounded of the Simple: The *Simple Feet* are either *Diſſyllable* or *Triſſyllable*; the *Diſſyllable* a *Spondee*, conſiſting of two long *Syllables*, as Mūſās; a *Pyrrichius*, conſiſting of two ſhort, as Sămŭs; a *Trochee*, conſiſting of one long and one ſhort, as ārbŏr; an *Iambus*, conſiſting of one ſhort and one long, as Mĕōs; the *Triſſyllable* are the *Moloſſus*, conſiſting of three long, as Prædīcō; *Tribrachys*, conſiſting of three ſhort, as ănĭmŭs; a *Dactyl*, conſiſting of one long and two ſhort, as Cārmĭnă; an *Anapæſtus*, conſiſting of two ſhort and one long, as Dŏmĭnī; *Bacchius*, conſiſting of one ſhort and two long, as Quĕrēlă; *Antibachius*, conſiſting of two long and one ſhort, as Mōrtālĕ; *Amphibrachys*, conſiſting of one long in the middle and two ſhort, *viz.* the beginning and end, as Prŏtērvŭs; *Amphimacrus*, conſiſting of one ſhort in the middle and two long at the beginning and end, as Vīrgĭnēs. The *Double* or *Compound Feet* are *Diſpondees*, conſiſting of two *Spondees*, as Cōntūrbābānt; *Proceleuſmaticus*, conſiſting of two *Pyrrichius*'s, as Vĕnĕrĕŭs; *Diiambus*, conſiſting of two *Iambus*'s, as Mĭnōrĭtās; *Ditrochæus*, conſiſting of two *Trochees*, as Trānsĭĕrĕ; *Antiſpaſtus*, conſiſting of an *Iambick* and a *Trochee*, as Rĕpēntīnŭs; *Choriambus*, conſiſting of a *Trochee* and an *Iambus*, as Sōllĭcĭtī; *Ionicus Minor*, conſiſting of a *Pyrrichius* and *Spondee*, as Prŏpĕrāntēs; *Ionicus Major*, conſiſting of a *Spondee* and *Pyrrichius*, as Clārĭſsĭmŭs; *Pean* firſt conſiſting of *Trochee* and *Pyrrichius*, as Sūſtĭnĕŏ; *Pean* ſecond, conſiſting of *Iambus and Pyrrichius*, as Ĭmāgĭnĕ; *Pean* third, conſiſting of *Pyrrichius* and *Trochee*, as ănĭmātŭs; *Pean* fourth, conſiſting of *Pyrrichius* and *Iambus*, as Mŏnŏcĕrōs. Theſe *Feet* are common to *Greek* and *Latin* Verſe.

Latin Verſes are variouſly denominated, either from the ſort of *Feet* of which they are compos'd, from the *Inventor*, or from the kind of *Poem* to which they are moſt proper, and in which they are moſt us'd, and ſometimes from the Number of *Feet* or *Syllables* whereof they conſiſt, as *Iambick* or *Trochaick* Verſes, from the *Iambick*'s or *Trochees* of which they are compos'd: *Sapphick* from *Sappho*, who invented that kind of *Verſe*; *Pindarick* from *Pindar*; *Heroick* and *Elegiack* from *Poems* of that Nature; *Hexameter* and *Pentameter*, from the Number of the *Feet*, the one ſix, the other five; *Hendecaſyllable*, viz. *Eleven.*

The moſt uſual ſorts of *Latin* Verſes, are theſe that follow, the *Hexameter*, the *Pentameter*, *Iambick*, *Sapphick*, *Adonick*, *Phaleucian* and *Aſclepiadean.*

The *Hexameter* is compos'd of ſix Feet, *Dactyl* and *Spondee*, only variouſly diſpos'd at pleaſure; but in the fifth place a *Dactyl*, and in the ſixth a *Spondee*, as *Virgil*,

Incipe Mænalios mecum, mea Tibia, Verſus.

Yet not always, for ſometimes, though very rarely, a *Spondee* is found in the fifth place; as in *Ovid*,

Hanc decet ornari teſtudine Cyllenea.

This kind of *Verſe* is alſo call'd *Heroick*, as being commonly us'd in *Poems* of an *Heroick* kind.

The *Pentameter* is ſo call'd, as conſiſting of five Feet, reckoning the two long *Syllables* in the middle and end, which put together, make a *Spondee*,

Nonâ ſigna dabunt exoriente Lyra.

This ſort of Verſe is ſeldom or never us'd alone, but ſtill following an *Hexameter*; as,

Ex ego non paucis quondum munitus amicis,
Sic flavit velis aura ſecunda meis.
Cùm fera nimboſo tumuerunt æquora vento,
In mediis lacer naveâ relinquor aquis.

The *Iambick*, ſo call'd from the *Iambick* Feet, of which it chiefly conſiſts, is the moſt various of all other ſorts of *Verſe*, being either *Diameter*, *Trimeter*, or *Senarie*; the moſt uſual of all is the *Senarie Iambick*, conſiſting chiefly of *Iambick* Feet, but now and then a *Spondee*, or a *Trochee*: The moſt Genuine is only compos'd of *Iambick* Feet; as,

Suis & ipſa Roma viribus ruit.

Diameter is ſeldom us'd, but with other Verſes; but the *Trimeter* is a lofty ſort of *Iambick*; as,

O carminum dulces notæ,
Quas ore pulchra melleo
Fundis, Lyræque ſuccinis.

The *Sapphick*, ſo call'd from the *Greek* Poet *Sappho*, who invented and us'd it, conſiſts of five Feet, a *Spondee* in the firſt and ſecond place, a *Dactyl* in the third, a *Trochee* in the fourth and fifth; as,

Nullus argento dolor eſt avaris.

The *Adonick* is a Verſe conſiſting only of *Dactyl* and *Spondee*, and is ſeldom or never us'd but with *Sapphicks*, that is, after every third Verſe; as,

Jam ſatis terris nivis atque diræ
Grandinis miſit pater, & rubenti
Dextera ſacras jaculatus arces,
Terruit Orbem.

The *Phaleucian* conſiſts as the *Sapphick* does of five Feet, made up of eleven *Syllables*, and therefore is call'd as the *Sapphick* alſo might be, *Hendecaſyllabum*; the Feet of the *Phaleucian* are in the firſt place a *Spondee*, in the ſecond a *Dactyl*, in the third, fourth and fifth a *Trochee*; as,

Paſſer deliciæ meæ puellæ.

The *Aſclepiadean* conſiſts of four Feet, a *Spondee*, a *Choriambus*, and two *Dactyls*; as,

Sublimi feriam Sydera vertice.

This ſort of Verſe and the *Sapphick* are very much us'd by *Horace* in his *Odes*, as the *Phaleucian* by *Catullus.*

It follows in the next Place to give the Reader a ſmall Eſſay on *Poeſy*, not only as it includes Number and Meaſure, but Fable, Moral, Figure, and ſeveral kinds of Poems.

POETRY.

IT is not Pretended here to Enter into a Critical Diſſertation on the ſeveral ſorts of *Poeſy*, nor to Copy what *Ariſtotle*, *Horace*, and their *Commentators* have ſaid upon it; but only to hint at ſome of thoſe Things which are moſt Plain, Eaſy, and Obvious to Gentlemen whoſe Chief Delight is the Study of *Poetry* and *Eloquence*: In Treating of *Rhetorick* and *Logick* we muſt neceſſarily Treat of *Eloquence*, and ſhould have plac'd *Poetry* after theſe Two Sciences; but having touch'd on the *Proſodia* of the *Greek* and *Latin Poeſy*, we thought it more for the Connection of the Deſign to let *Poetry* have the next Place in it.

Of SYLLABLES.

THE Difference of Time in Pronunciation, which forms the Cadence in *Verſe* and *Proſe*, is moſt diſtinguiſhable in the *Greek* and *Latin* Tongues, and very little in the Living Languages, tho' 'tis not ſo generally undiſtinguiſhable, as a Late Author ſays, *Dans Les Langues vivantes on ſ'arrête egalement ſur toutes les Syllables, ainſi les Temps de la Pronunciation de toutes Les Voielles ſont egaux; In the Living Languages we ſtop equally upon all Syllables, thus the time of Pronouncing all Vowels are equal.* We ſhall prove the contrary in *Engliſh*, whatever may be ſaid of the *French* Tongue, tho' even in that we ſhall find all the *French* Criticks are not agreed. *Syllables* are term'd long or ſhort, long when they take up ſome time in Pronouncing, ſhort when they are Pronounced faſt. This Cadence is remarkable in *Proſe* as well as *Verſe*, but there can be no *Verſe* without it ſhines in it. In Complacency to thoſe who make *Poetry* conſiſt wholly in the Fable, we have been cautious not to uſe that Word, but to put *Verſe* in its Place; for theſe *Intrigueing Poets* muſt allow that there can be no *Verſe* without Cadence if there may be *Poeſy*. As to the Meaſure of the Ancients, we muſt not imagine that we Pronounce *Greek* and *Latin* as the Ancient *Greeks* and *Latins* did; they diſtinguiſh'd the Quantity of each Vowel in ſpeaking it. When we Pronounce a *Latin* Word we only mark the Penultimate Vowel of that Word. We have no other way of Pronouncing a ſhort Final than as we Pronounce a long; and yet St. *Auguſtin* (for the Fathers it ſeems Study'd the Heathen *Poetry* as well as their own *Theology*) ſays, that whoever in Pronouncing this Verſe of *Virgil*,

Arma Virumq; cano, Trojæ qui primus ab Oris.

ſhould Pronounce *primis* for *primus*, *is* being long and *us* ſhort, wou'd ſpoil all the Harmony of the Verſe, which does not appear to be a very extraordinary Piece of Criticiſm; for in the *Latin Poeſy* a Syllable out of Time is like a Note out of Tune in Muſick. *Meaſure* is a certain Number of Syllables which the Ear diſtinguiſhes and hears ſeparately from another Number of Syllables. The Union of Two or more Meaſures make a Verſe, a Word taken from the *Latin*, *Verſus*, which ſignifies properly placing in Order or Ranks. Each Meaſure in the *Latin Poeſy* is heard ſeparately, and term'd Feet on Account of the Cadence. The *Romans* kept Time in reciting their Verſes, *Plaudendo recitabant, Pedis pulſus ponebatur tollebaturq*; We have treated already of the different Meaſures and Feet of Ancient Verſe, in the ſhort *Proſodia* preceding this Eſſay. We ſhall here take Notice only of ſomething relating to it, which may ſerve to Explain what has been there ſaid. The Chief Harmony of Verſe conſiſts in the Variety of the Meaſure; and this Variety is ſo neceſſary to prevent the Diſguſt we are apt to take at the moſt agreeable things, that *Muſicians* who ſtudy ſo carefully the Proportion and Conſonance of Sounds, affect from time to time ſome Diſſonance in their Concerts. When *Poets* break thro' the Settled Rules of Meaſure and Feet in their Works, if any ſuch Rules are ſettled, they are far from being blameable, for the Change of the Meaſure is often one of the greateſt Charms of the Harmony.

A Pacing Pegaſus on Carpet Ground,

is very apt to throw the Reader into an Untimely Slumber. Not to ſpeak of the Ancients, we have the *Alexandrine* in our *Heroicks* to vary the Meaſure, as indeed in all our *Pentameter* Verſes, which are better known with us by the Term of *Heroicks*, tho' that Meaſure ſeems by the Term to be adapted to *Dramatick* and *Epick Poetry*, yet we uſe it in almoſt all Sorts, the *Lyrick* hardly eſcaping. This *Alexandrine* conſiſts of Two Syllables more than the Common *Heroick*,

The ſame the Fate of Arms and Arts you'll find,
They roſe with equal Pace, with equal Pace declin'd.

Sometimes the Meaſure is Four Syllables longer than the *Pentameter*.

Thou leapſt o'er all Eternal Truths to thy Pindarick Way.

But this is not to be done often, nor by any Injudicious *Poet*; for where the Senſe does not as it were ſtart beyond its due Bounds, nor is too ſtrong to be confin'd to any, and where the Ear do's not require ſuch an Excurſion, the *Alexandrine* will be found to be long enough.

The *Latins* in the Meaſure of their Verſe made uſe of the *Cæſura*, which is a cutting off ſome Syllables of a preceding Word, to form a Foot with thoſe that begin the next, as in this Example, *Ille meas errare boves,* &c.

Cæſure comes from *Cædo* to cut. The Syllable *as* in *meas* is a *Cæſure* with the Syllable *er* in *errare*, forming together a *Spondee*; but how theſe *Cæſures* were form'd will be beſt ſeen by cutting off the Syllables mutually as in the following Verſes.

Ille me|as er|rare bo|ves ut | cernis & | ipſum
Ludere | quæ vel|lem cala | mo per | miſit a|greſti.

A Verſe without *Cæſure* wou'd not be taken for a Verſe; becauſe the equality of Meaſures is not ſenſible, and, is that which makes all the Beauty of it. One would read the following Verſe as if it was none, becauſe it has no *Cæſure.*

Urbem | fortem | cepit | nuper | fortior | hoſtis.

But this *Cæſure*, tho' 'tis to be diſtinguiſh'd in our Language, is not a Rule as it is in Latin, and indeed it wou'd be a hard matter for us to accommodate our Poetry to the Latin Rules as to the *Proſodia.* Mr. *Dryden* talk'd of giving us an Engliſh *Proſodia,* but he never did it; and whoever of leſs Authority ſhall undertake it, will find it very difficult to have his Rules eſtabliſh'd.

What *Dryden* obſerv'd has been the Obſervation of all who know any thing of the *French* and *Italian* Poeſy, that their Poets are unacquainted with *Feet* and *Quantity*, and ſome have been ſo weak as to imagine we have none in *Engliſh*; but we ſhall find by a very little Alteration that the Harmony of the ſweeteſt Verſe is ſpoil'd, which ſhews that the meaſure of *Feet* and *Quantity* truly obſerv'd makes the Muſick, as for inſtance;

When Man on many multiply'd his Kind.

Read——*When Man multiply'd his Kind on many.*

And from an harmonious Verſe you ſpeak nothing but plain Proſe. *Ben Johnſon*, who wrote good Verſes for his *Day*, knew the variety and force of our Numbers ſo well that he thought he might write Hexameters as well as the *Latins*

Arma virumq; cano Trojæ qui primus ab oris.

Benjamin, *Immortal* Johnſon, *moſt highly renowned.*

To which has been added,
Immortal Johnſon, Benjamin, *highly renown'd.*

Harry Stephens, the *French* Critick, was of the ſame Opinion with reſpect to his Tongue, and gives us this Example;

Phoſphore redde diem, cur gaudia noſtra moraris,
Cæſare venturo, phoſphore, redde diem.

Aube rebaille le jour: pourquoi nôtre aiſe retiens tu
Cæſar doit revenir, Aube rebaille le jour.

Upon which a more Modern Critick of the ſame Nation writes thus, "If we ſhould own that *French* Vowels might make different Meaſures, and that 'tis not by the Accent alone that the ſame Vowel may differ from it ſelf; but becauſe it may alſo be pronounc'd in a different manner, in a little time or in a longer time, no body would be able to deny that we almoſt always pronounce our Vowels equally, and make 'em almoſt all ſhort, ſo that there are not long Vowels enough to form different Meaſures. *Latin* Verſes are not to be made of ſhort Vowels only, and we are oblig'd to give harmony to our Words after a manner different from the *Greeks* and *Latins.* The Art which we follow is very much the ſame with that of all Nations in the World. For theſe ſeveral Ages here in *England* we muſt oppoſe him, for we certainly have our Feet, Quantity and *Cæſure* as well as the *Latins.*

What follows is a Truth which this *French* Gentleman ſaid when he did not deſign it, *Notre Poeſie ne conſiſte que dans une certaine nombre de Syllables & dans les Rhimes.* Our Poetry conſiſts only of a certain Number of Syllables and Rhimes. He is not talking of the Senſe of it, but if he will except *Corneille*, *Racine*, *Boileau*, and Two or Three of their Lyricks, what he ſays will ſerve for both Number and Meaning. As for our dividing the *Engliſh* Numbers into *Dactyles*, *Spondees*, *&c.* that it can be done with great certainty we fear is not to be prov'd, nor that that which is a *Dactyle* or *Spondee* in one Verſe ſhall be the ſame in all. In this and the different Meaſures of our Vowels we do not differ ſo much from the *French* as ſome imagine, tho' we do indeed differ for the better. We have ſaid as much as conſiſts with the Brevity of theſe Eſſays on the Article of Quantity and Feet. We ſhall add ſomething on *Rhimes* which are generally thought to be a Modern Invention; but others are of a contrary Opinion, and *Le Clerc*, ſays *Dryden*, *has made it out that* David's *Pſalms were written in as errant Rhime as they are tranſlated into.* However it be, Mr. *Skinner* thinks the *Arabians* firſt brought it into Europe; but he muſt place the Time much higher than the Invaſions of the *Saracens*, for 'twou'd not be hard to give inſtances of *Rhimes* in the *Saxon* Poetry long before the *Arabians* made ſuch a Figure in the World. Whoever introduc'd 'em they are of ſo much importance in Modern Poetry that it may be ſafely affirm'd nine Parts in ten of it have no pretence to that Title but for ſake of the Rhimes.

That Rhimes are eſſential in Poetry none will pretend, becauſe the beſt Poem in our Tongue, *Milton's Paradiſe Loſt*, is without Rhime, and where the Poet pleas'd to exert his Art in the Part of Harmony no Numbers are finer either in the high Tone or the low. My Lord *Roſcommon*, our beſt Judge of Numbers, becauſe our beſt Poet and beſt Critick, was of the ſame Opinion, and his excellent Tranſlation of *Horace's Art of Poetry* is in blank Verſe. *Milton* ſhook off the ſlavery of *Rhimes* firſt, and *Dryden* [*Pref. to Æneids*] who had certainly the beſt Ear ever *Engliſhman* cou'd boaſt of, confeſſes, *He who can write well in Rhime can write better in Blank Verſe.* Our Dramatick Poets have lately entirely thrown off this conſtraint, unleſs when to pleaſe the Actors they let 'em go off with a Rant and a Rhime, which one of the moſt Eminent of 'em calls a *Clap-Trap*. In a Word, we have ſeen ſeveral Modern Poems of the firſt Rank without *Rhime,* and if any Poet values himſelf on rhiming, 'tis to be fear'd he has not many greater Qualities to ſhine with in his Poetry. Some Verſes as Satyrs, Elegies, Paſtorals,

ſtorals, and all the *Lyrick* Poetry may bear Rhimes, and perhaps want 'em; but *Epick* Poetry and *Dramatick* will always maintain their Character of Sublime much better without than with 'em. 'Tis not a little Advantage which our Language has over the *French* and *Italian*, that the *Engliſh* Poetry does not ſtand in need of the *Gothick* Ornament of *Rhimes*, whereas, the *French*, in all parts of their Poetry, and the *Italians* in moſt, have hardly any other way of diſtinguiſhing their Proſe from their Verſe. It may be ſaid without vanity, that whatever ſuperiority they have over us in *Judgment*, we have much more in *Genius*. *Regularity*, according to Mr. *Dryden*, *is the Excellence of the* French *and* Italians, *Strength and Elevation ours.* Some People we know are very fond of the *French* Poetry, and fanſie there's ſomething very harmonious in their Numbers. Their long winded Lines run off, with 'em, without the *Cæſure*.

Je chante cette guerre | en cruanté feconde
Oû Pharſale jugea | de l'Empire du Monde.
Bræbœuf.

Now let us ſee what the *Italians*, a Language ſo much boaſted of for Harmony by all that have paſt the *Alps*, produce in their Heroicks.

Fummo (io n' ol nego) in quel conflitto vinti
Pur non mancò virtute al gran penſiero,
Hebbero i più felici allor vittoria
Rimaſe à noi d'invitto ardir la Gloria.
Taſſo.

We need not have recourſe to our Modern Poets to ſhew the Harmony of our Numbers. *Shakeſpear*, who wrote a hundred Years ago, ſhall ſerve for an Example of the Dignity of Verſe, and the Muſick of Poetry without the Ornament of *Rhime*,

Are you not mov'd when all the ſway of Earth
Shakes like a thing unfirm. Oh Cicero!
I have ſeen Tempeſts, when the ſcolding Winds
Have riv'd the knotty Oaks, and I have ſeen
Th' Ambitious Ocean ſwell, and rage, and foam,
But never till to Night; never till now,
Did I go through a Tempeſt dropping Fire.

Again ſpeaking of *Brutus*:
Oh he ſits high in all the Peoples Hearts.

There's no body ſo little acquainted with our *Engliſh* Poetry, but can tell we might bring inſtances enough of the Harmony of our Language out of *Milton*, *Waller* and *Dryden*, nay even out of old *Fairfax*.

Waller—*By the loud Trumpet which our Courage aids*
We learn that Sound as well as Senſe perſwades.

By Sound here is not meant that *vox & præterea nihil*, which is the Eſſence of our Modern *Opera's*; but the martial Harmony that fires the Soldiers in Battle. Nor can it be ſuppos'd that Mr. *Waller*, when he went to ſee a Dramatical Entertainment wou'd have been perſwaded with *Sound* inſtead of *Senſe*. The Cadence of Numbers as well as of Note, is certainly perſwaſive. And Mr. *Waller* was a great Maſter of the former, to whom Mr. *Dryden* was very much indebted, as *Waller* to *Fairfax*.

Fairfax—*A Foreſt thick of Spears about us grew,*
And over us a Cloud of Arrows flew;
Thus conquer'd Godfrey, *and as yet the Sun*
Div'd not in Silver Waves his golden Wain;
But Day-light ſerv'd him to the Fortreſs won
With his victorious Heart to turn again.
His bloody Coat he put not off, but run
To the High Temple with his noble Train;
And there hung up his Arms, and there he bows
His Knees, there pray'd, and there perform'd his Vows.

Let any one compare theſe Verſes with the Poetry ſo highly commended in King *Charles* I's. Reign, and perhaps with Sir *William Davenant's*, and he will find that as to the Numbers, *Fairfax* who was contemporary with *Shakeſpear*, had as good an Ear as thoſe who wrote fifty Years after him. We might aſcend as high as *Chaucer*, who has in ſome places prov'd that even the *Saxon* Poetry, which is thought barbarous by the polite World, was capable of the Harmony of Numbers.

Up roſe the Morn, and up roſe Emily.

But *Chaucer*, whoſe Wit was too abounding to be confin'd to Feet, was not always equal in his Verſe, and 'twill be a hard matter to ſhew one Poem of his wherein Equality of Meaſure is obſerv'd, tho' in thoſe kinds of Poeſie where Equality is inſeparable from the Perfection of Numbers, unleſs in ſome places where the Senſe drives out the Meaſure, which is lengthen'd to expreſs the ſtarting of the Thought, as has been already hinted. We will now look into Mr. *Dryden's* Verſes and we ſhall there find the Harmony to be the moſt ſhineing part of his Poetry, and of all his Verſes the *Georgicks* of *Virgil* tranſlated by him are thought to be his Maſter-piece. The Poet is treating of the Souls in Animals.

Not that, I think, their Breaſts with heavenly Souls
Inſpir'd as Man, who Deſtiny controuls;
But with the changeful Temper of the Skies
As Rains condenſe, and Sun-ſhine rarifies.
So turn the Species in their alter'd Minds
Compos'd by Calms, and diſcompos'd by Winds.
From hence proceeds the Birds harmonious Voice,
From hence the Cows exult, and friſking Lambs rejoice.

Theſe Verſes were choſen not only becauſe they are muſical and well turn'd, but ſhew how great Poets are confin'd by Meaſure ſometimes as well as Rhime; for 'tis plain Mr. *Dryden* wou'd have ſaid as *Rain condenſes* had he been able to have accommodated the ſingular Number with the Feet of the Verſe. The ſecond Verſe of theſe Two.

Not that, I think, their Breaſts with heavenly Souls
Inſpir'd as Man, who Deſtiny controuls.

ſeems to be at beſt obſcure. Does Man there controul Deſtiny, or Deſtiny Man? If the latter, as agrees with common Senſe as well as Religion, it ſhould be *whom Deſtiny controuls* to make it Grammar; but this is not a place for Reflections of this Nature, we may perhaps meet with a better opportunity in a little time. We are now only to ſay as much of Poetry, and eſpecially our own, as will give a Gentleman a convenient Notion of the Art: So we continue our Obſervations on Numbers and Rhimes. In the ſame Tranſlation of Mr. *Dryden*, we find a great many Verſes, the Harmony of which can only be match'd by the Original.

When Winter Rage abates, when chearful Show'rs
Awake the Spring, and Spring awakes the Flow'rs.

His *Fables* are full of Harmonious Verſes, and it may be modeſtly affirm'd, there are none in the *Heroick* or *Lyrick* kind, in any Modern Language, that can be compar'd to 'em for Majeſty, and ſweetneſs of Verſe; in a word, for all the Charms which, by pleaſing the Ear, affect the Soul, and give that Delight which no Words, however rang'd, in a round Period in Proſe, ever gave. We have had another great Poet, who ſometimes was happy in his Numbers, we mean Sir *John Denham*, whoſe *Cooper's Hill* is reckon'd one of the beſt Poems in our Tongue; and Two of his Verſes, the moſt Muſical in our Poetry. He ſpeaks of the *Thames*.

Tho' deep yet clear, tho' gentle yet not dull,
Strong without Rage, without o'erflowing full.

Mr. *Dryden* pretended there was a Secret in the diſpoſition of theſe Words and Feet, which made the Harmony, and valu'd himſelf on his finding it out; we believe all the Myſtery, conſiſted in that happy Chance, which in all the Arts, is often ſo kind to Artiſts, as to make 'em light upon what they never thought of. 'Tis too common with them to make a Myſtery of their Fortune, and to be loath to own that to be the Gift of ſo blind a Goddeſs, which they aſcribe to the Inſpiration of the God of Light, *Apollo*. We muſt not forget the Immortal *Milton*, and refer the Reader to that Simily of his which begins thus,

As when the Sun new riſ'n,
Looks thro' the Horizontal miſty Air,
Shorn of his Beams, &c.

Shorn of his Beams, is a Phraſe we take the more Notice of, becauſe Mr. *Dryden* was ſo fond of it, and *Aghaſt* another Antique Word, reviv'd by Mr. *Milton*, that he borrow'd 'em in one Sentence in his *State of Innocence*.

Lucifer ſpeaks,

I am become ſo monſtrous, ſo disfigur'd,
That Nature cannot ſuffer my Approach,
Or look me in the Face, but ſtands Aghaſt;
And that fair Light which guides this new-made World,
Shorn of his Beams, ſhrinks, Oh accurs'd Ambition.

Excepting the Gift of Numbers, which *Dryden* poſſeſs'd in a Soveraign degree, there's certainly as much difference between him and Mr. *Milton*, as between the Verſes quoted out of the *State of Innocence*, and thoſe out of *Paradiſe Loſt*.

By what has been ſaid, it will appear we want no Advantage of Harmony in our Language for the forming a Poet; and tho' Rhimes may be very well ſpar'd, yet ſuch of the *Engliſh* Poets as have Rhim'd well, have excell'd the *French* and *Italians* in that too. The *French* particularly tire the Reader by their Rhiming eternally with Words of the ſame Sound, as in *Boileau*,

Nette,
Pierre, Ete,
Pierre, Net,
Net.

Such as our

Preſerve, Reſtrain,
Serve, Conſtrain,

which we avoid in *Engliſh* as much as poſſible; but in *French* we meet with 'em almoſt in every Page two or three times, not only in ordinary Poets, but their *Racines*, *Boileaues*, *Corneilles*, &c. We have ſeveral ſorts of Meaſures in *Engliſh* Poetry as various perhaps as thoſe of any Language, Ancient or Modern; but the *Heroick* is that which is generally made uſe of, and having ſaid enough of that, we ſhall add ſomething of the greater Parts of Poetry.

The firſt in order is *Heroick*, or *Epick Poetry*; for we ſhall not undertake to decide the difference between ſuch as prefer *Dramatick* to *Epick*, or *Epick* to *Dramatick Poetry*, but take 'em both in the order the Criticks generally place them.

An Epick Poem, therefore according to *Boſſu*, *is a Diſcourſe invented with Art, to form the Manners of Men by Inſtruction, diſguis'd under the Allegories of ſome important Action, which is related in Verſe after a probable, diverting, and wonderful manner.* To which, if we follow *Ariſtotle* and *Dacier*, we may object, that 'tis not Eſſential for an *Epick* Poem to have the Narration in Verſe. *Ariſtotle* ſays, *Epick Poeſy makes uſe of Diſcourſes in Verſe and Proſe.* And *Dacier*, in his Comment, adds, *Ariſtotle* has very well compriz'd under *Epick* Poeſy, Diſcourſes in Proſe, becauſe they are in effect true *Epick* Poems. What elſe are our Romances? Thus we ſee that the greateſt Criticks do not always accord, but *Boſſu's* Definition agrees with our Idea of an *Epick* Poem. We have no Notion of the Grand *Cyrus*, or Sir *Phillip Sidney's Arcadia's* being *Epick* Poems. We muſt have all our Poetry in *England* in Verſe at leaſt, if not in Rhime; and for that reaſon muſt beg Monſieur *Dacier* and his Maſter *Ariſtotle's* Pardon if we rank Diſcourſes in Proſe, notwithſtanding there's the Texture of a Fiction in them, among what we call *Fables*, and allow nothing to be *Epick* Poetry, but what, as *Boſſu* defines it, is related in Verſe. It agrees alſo with his general Definition of a Poem, *A Poem is a Diſcourſe in Verſe, and a Verſe is part of a Diſcourſe meaſur'd by a certain Number of long and ſhort Syllables, repeated with an agreeable Cadence, and the Repetition continu'd without ceaſing.* An *Heroick* Poem may be divided into theſe ſix Parts; 1. The *Fable*, 2. The *Action*, 3. The *Narration*, 4. The *Characters*, 5. The *Machines*, and 6. The *Thoughts* and *Expreſſions*.

The *Fable* is the principal Part or Soul of the Poem. The firſt thing a good Poet thinks of in forming a Fable, is the Inſtruction he would give by the Moral; which Moral muſt be afterwards reduc'd duc'd into Action: And this Action, which is preſented by the Recital, muſt be Univerſal, Imitated, Feign'd, and the Allegory of a Moral Truth. It muſt be alſo Simple; but by Simplicity is not to be underſtood that it ſhould be ſo entirely One, as not to admit of an inferior Action; for when any part of the Story is ſo ſingular, as that of *Niſus* and *Eurialus* in *Virgil*, as to form an Action of it ſelf, dependent on the main Action, 'tis very juſtifiable and very beautiful; and ſuch *Under Actions*, as we more intelligibly call them in *Engliſh*, are term'd *Epiſodes*. We are not now writing to ſuch as are very well acquainted with *Ariſtotle*, *Horace*, *Dacier*, and *Boſſu*, for theſe will expect a long Diſſertation on the Fable and Moral; as alſo on the Unity and Properties of Action; but what we ſay, is addreſs'd to thoſe, who reading *Virgil*, *Taſſo*, or *Milton*, may deſire to underſtand of what their Art conſiſts, and diſtinguiſh one part from the other. The Action of an *Epick* Poem ſhould have a Plot and Cataſtrophe, as well as that of Tragedy. As to the Unities of Time and Place, they are not obſerv'd in *Epick Poeſy*; *Ariſtotle* declares *it has no ſettled Time, and in that is different from the Dramatick*. Neither the Unity of Place is obſerv'd, becauſe 'tis not neceſſary; the Poem being read as a Hiſtory, which may be left off when the Reader pleaſes. The Time of *Homer's Ilias* is Forty-ſeven Days only; that of the *Odyſſes*, Eight Years and a half; that of *Virgil's Æneis*, Six Years and ſomewhat above half. The Action muſt always be important, that the Dignity of the Subject may engage the Attention of the Reader, by giving the Poet an opportunity to introduce ſuch Characters as may concern him in all their Fortunes.

'Tis too common for the Criticks to run their Rules of Art into unneceſſary Diviſions; they affect it out of a Vanity to be thought Learn'd, and underſtand to the very bottom of a Thing. The third Part of an *Heroick* Poem is term'd the *Narration*; and that *Boſſu* divides into, 1. The *Title*, 2. The *Propoſition*, 3. The *Invocation*, and 4. The *Body* of the Poem or *Narration*, properly ſo call'd. There is too much Myſtery made of this Diviſion by that famous Critick. As to the Title, we ſhall only ſay, ſome call their Poem from their Hero, as the *Æneis*, and *Cowley's Davideis*; ſome from the Place of Action, as the *Ilias*, or *Taſſo's Jeruſalem Deliver'd*. The Propoſition is the naming the Subject the Poet intends to treat of.

Arma virumque cano Trojæ qui primus ab oris,
Italiam fato profugus, Lavinaque venit
Littora: Multum ille & terris jactatus & alto,
Multa quoque & bello paſſus.

The next part of the Poem is the *Invocation* which all Poets, in Imitation of *Homer*, have begun their Poems with. *Homer* join'd his *Invocation* with his *Propoſition*, *Virgil* ſeparates them.

Arma virumque, &c.
Muſa, mihi cauſas memora,
Inſignem Pietate Virum.

Again, in his Seventh Book, wherein he begins a new Matter, and in other Places.

Nunc age qui Reges, Erato, quæ tempora rerum,
Quis Latio Antiquo fuerit ſtatus, &c.
Quis Deus, O Muſæ, tam ſæva incendia Teucris
Avertit; tantos ratibus quis depulit ignes,
Diſcite. Priſca fides facti, ſed fama Perennis.

Homer doubtleſs thought this Invocation wou'd give a ſort of Sanction to what he ſhould ſay, as coming from a Divine Inſpiration; and *Virgil*, and thoſe that have come after him, either for the ſame Reaſon, or to imitate his Example, have done the ſame. This is enough for the Criticks to eſtabliſh it as a particular part of *Epick* Poetry; and our little Poets think it ſo conſiderable a one, that every Ten or Twenty Lines we are accoſted, thus, *Say Muſe*, *Proceed my Muſe*, and ſuch like pleaſant Invocations to Nothing: For the poor Gentlemen have generally no Muſe to ſpeak for 'em. The other part of the Poem, is the Narration or Body of the Poem, which expreſſes the Action, Paſſion, and Sentiments. This Narration ſhould contain a juſt Mixture of Pleaſure and Inſtruction; which depends not on the Beauty of the Verſe, the Diction and the Thoughts, but the Manners and Paſſions of the Perſons introduc'd, and the Things treated of. We might enter farther into the ſeveral Qualities of Narration, as handled by the Criticks, but ſhall obſerve only what is obvious to an *Engliſh* Reader. The Narration ſhould every where agree with the Subject,

Fall where it falls, and where it riſes riſe.

As the Lord *Roſcommon* ſaid on tranſlated Verſe. It ſhould be Great and Sublime when the Things or Perſons ſpoken off are of that kind: Nothing Mean or Proſaick muſt be admitted. It ſhould be Warm and Pathetick when Paſſion is to be ſhew'd, flowing and elegant in Deſcriptions, and in all Places free from any thing flat and vulgar. The Narration is that part of *Epick* Poetry which every one thinks he's able to judge of. Who is there that will confeſs he does not know when a Thing is well or ill ſaid? Who is there that is not ready to ſay ſuch a Poem, ſuch a Play is fine, and immediately repeats two or three Couplets to prove that he has Judgment? Do our common Judges commend any thing for the Greatneſs of the Deſign, for the Fable and Action, for the Moral that may be deduc'd from it? No, they cry, that's a fine Line! What Verſes are there! The Diction comes the neareſt to their Senſes; it ſtrikes their Ears, and what reaches ſo far as that has often a better Effect than what ſhou'd go farther. For, when the Underſtanding is to be pleas'd when the Soul muſt be come at, before the Poet can move, How much Matter muſt be penetrated to make way for him? Who gives himſelf the trouble to look into the Excellence of a Fable and Moral, to diſtinguiſh the main Action from the Epiſodes? But a rumbling Verſe, a bald Expreſſion, a mean Word ſhock them immediately; a ſweet Cadence tickles, and fine Language charms them. We know very well that this is all falſe; What then? We know alſo that there never was a Poet who cou'd write harmoniouſly, who cou'd make a beautiful Narration, but he always did, what all Poets ought to do, take care to cultivate his Talent for Eloquence, and ſuch as have none, if they muſt write, let 'em retreat to

Proſe; for there's no Writer in any Art ſo deſpicable as he who pretends to write Verſe without Numbers, let him talk what he pleaſes of his *Deſign* and *Fable.* Not but that there never was a great Poet who did not in the firſt Place carefully form his Deſign, and expect his chief Glory from the Succeſs of it; but then thoſe Poets were bleſt with Genius's of that extent, that their Expreſſion was as wonderful as their Invention. *Homer, Virgil, Taſſo* and *Milton,* who are only worthy of the Name of Heroick Poets, were poſſeſt of both Qualities in an eminent Degree. All thoſe Poets had their different Talents. The Ancients, in their Deſigns, perhaps excell'd the Moderns; but *Milton*'s Painting the Sublimity and Brightneſs of his Images, qualify him to be put in the Balance with the beſt of them. And he knew the Power of Numbers ſo well, that where they were of abſolute neceſſity to anſwer the Beauty of his Ideas, who ever ſucceeded better? True it is; he is not ſo equal, and the choice of his Subject was ſuch, that he cou'd not maintain the Dignity of his Verſe in ſome Places, and the Softneſs of it in others every where alike. Tho' we have ſaid ſomething already of the Numbers, and ſhall ſtill add ſomething more in the Sequel, yet we cou'd not avoid making theſe Reflections as they came in our way.

The Manners comprehend all the natural or acquir'd Inclinations of Men by which they are carry'd to good, bad, or indifferent Actions. Theſe Manners are what form the Characters; and it muſt be the Poets great Care not to offend againſt them, but ſupport them alike from the beginning to the end of his Fable. An *Achilles* muſt be always Cholerick, an *Æneas* always Pious. The Manners of Man muſt be diſtinguiſh'd from thoſe of Women, and thoſe of Ages and Degrees from one another; a Prince muſt not have the Inclinations of a Peaſant, nor a young Man that of an old one, and ſo *vice verſa.* The Manners of different Nations, Times; in a Word, every thing which in Life diſtinguiſhes the Inclinations of ſome Perſons from others, muſt be obſerv'd by the Poet with the utmoſt exactneſs, according as the Fable requires it in all the Characters. He muſt never go out of them, nor amplify, nor exaggerate them beyond Nature. This is a difficult Task, and what moſt of the Modern Writers of *Epick* Poetry know little of. The Rules for *Epick* and *Dramatick* Poetry are the ſame in this, and 'twill be eaſie to perceive that the *French* Poets have eſpecially offended againſt the Manners in almoſt all the Plays wherein they have handled any ancient or foreign Subject. *Dryden* tells us, [*Pref.* to *Troilus* and *Creſſida*] That *the* Seraglio *and* Verſailles *are reconcil'd in* Racines *Bajazet,* and that his *Hyppolitus* in *Phædre* is a perfect Monſieur *Hyppolite,* which Charge is in many Places true in their other Poets; *Corneille,* who had ſtudy'd the Manners of the *Romans* induſtriouſly, is the beſt Poet they have for maintaining his Characters, and yet he is not always free from tranſgreſſions of this kind; even his famous *Don Rodrigo,* and *Donna Chimena,* in the *Cid,* may very well be term'd Monſieur *Rodrigue,* and *Madamoiſelle Chimene*; for they are the very ſame talkative gallant Perſons we meet with in *France.* We wonder why they ſhould err in this, becauſe they cannot complain of the Neceſſity they lie under to fill their Scenes with Buſineſs, ſince it is not difficult to inſtance *Soliloquies* of above 100 Lines, and other Speeches of 150 Lines long in their *Dramatick* Poems; of which we ſhall ſpeak next, becauſe there's no other Part of *Epick,* but what has been aſſum'd by the *Drama.* The Reader is not to expect a regular Treatiſe, but a true Eſſay on Poetry, in which the Writer is at liberty to ſay what comes into his Thoughts on this Subject, whether it be in its exact Place or not. *The Manners can never be evident where the ſurpriſes of Fortune take up all the Buſineſs of the Stage, and where the Poet is more in pain to tell you what happen'd to ſuch a Man, than what he was,* ſays *Dryden.* Who, however, has err'd as much againſt the Manners in all the Parts of 'em as ever Poet who knew what Error was, ever did; he adds, *Manners was* Shakeſpear's *Excellence.* In *Fletcher, they were either good, bad, or indifferent as the preſent Scene requir'd.* In *Ben: Johnſon, the Manners even of the moſt inconſiderable Perſons are every where apparent.* The Reader muſt not always take Mr. *Dryden*'s word in every thing. He will find *Shakeſpear's Lear* not ſuch a ſalvage *Britain* as our Iſlanders were two thouſand Years ago, and all the *Britiſh* Court at that time were not ſuch Perſons as *Shakeſpear* is pleas'd to paint them. Many more like Errors in the Manners might be inſtanc'd; but this is not intended for a *Critick* on Poets, but an Endeavour of one who wiſhes the Art well, to give thoſe who are deſirous to know ſomething of it, ſuch an Idea as they will meet with in this deſign of the other Arts, a ſlight and clear one as far as conſiſts with the Nature of any thing which Brevity obliges to be made ſlight.

Tragedy is an Imitation of one juſt, great, and probable Action, not told, but repreſented; which by moving terror and pity is conducive to purge theſe two Paſſions in our Minds. The Fable, or Deſign is the principal Part of *Dramatick* Poetry, of which Tragedy is Chief, and the Unity of Action the firſt of the three Unities appropriated to the *Drama*, *viz.* the Unity of Action, the Unity of Time, and Unity of Place. The Fable muſt not be the Story of one Man's Life, but one ſingle Action of the Hero. Two different independant Actions diſtract the Attention and Concernment of the Audience, and conſequently deſtroy the Intention of the Poet, whoſe Buſineſs is to move Pity and Terror. Mr. *Dryden* adds this, *If One of his Actions be comical, the other tragical, the former will divert the People, and utterly make void his purpoſe.* Of what ſignification is it for a Man to know the Rules of an Art, if he does not follow them. Pray what are *Torriſmond* and *Lorenzo, Leonora* and *Elvira,* in the *Spaniſh Fryar,* the Prince and Queen, the Colonel and Coquet, with all the variety of comical and tragical Intrigues.

Gomez. *No* Carnavals *nor* Chriſtmas *ſhall appear,*
But Lents *and* Ember-weeks *ſhall fill the Year.*

Torriſmond. *Alas thou know'ſt not what it is to Love.*
When we behold an Angel, not to fear
Is to be impudent—— No I'm reſolv'd,
Like a led Victim to my Death I'll go,
And dying bleſs the Hand that gave the Blow.

Elvira. *Pray, Wives and Virgins, at your time of need*
For a true Guide of my good Father's breed.
Leonora. *Go raiſe the Miniſters of my Revenge;*
Guide with your Breaſts this whirling Tempeſt round,
And ſee its Fury fall where I deſign.
At laſt a Time for juſt Revenge is given.
Revenge, &c.

The Action ought in Tragedy to be important, for the ſame Reaſon as in *Epick* Poetry. 'Tis not neceſſary there ſhould be Hiſtorical Truth, but always neceſſary there ſhould be Veriſimility or Likeneſs of Truth, and to preſerve this Veriſimility, and yet make it wonderful, is one of the moſt difficult Undertakings in Poetry. 'Tis certain, that the Three Unities before-mention'd, Eſtabliſh'd by Ancient and Modern Criticks in the *Drama*, are nothing but the Reflections of Men of great Judgment on the Art, to bring it as near Nature as poſſible; for the nearer Nature, Poetry, which is the Imitation of it, is, the more Perfect muſt it be; as a Picture, the more it reſembles what it imitates, is the more valuable. The Unity of Action is ſettled for the Reaſon mention'd already, and many others that might be added in both *Epick* and *Dramatick* Poetry.

The Unity of Time is the next. Mr. *Dryden* in his Eſſay on *Dramatick* Poetry, aſcertains the Unity of Time *to be twenty four Hours, one Act not to take up half a day, but the Time of every Act to be equally divided.* The Reader muſt be caution'd not to depend on this great Poet's Criticiſms in this Eſſay, or in his Prefaces to his Plays. For as 'tis ſaid of the *Examens* of *Corneilles*'s Plays, written by that Author, that every *Examen* was accommodated to every Play; ſo Mr. *Dryden* had ſeldom any thing more in his View than to vindicate the preſent Play; accordingly he made Rules, alter'd them, and claſh'd with his own Opinion, as it ſerv'd a preſent Turn. This is ſaid with all the deference in the World to Mr. *Dryden*'s Merit, as a wonderful Genius for *Verſification*, and a Man of Wit and Senſe, but as a *Critick* or *Dramatick* Poet, he ſeems to have been fonder of both theſe Names than ſome think he had reaſon to be. Where did he learn, that the Unity of Time was twenty four Hours, and every Act to be equally divided? *Ariſtotle* ſays, *The Time of Tragedy ought to be included in that which the Sun takes to perform his Career in, or very near it.* Now Mr. *Dryden* has got ten Hours upon him; but as to that, ſeveral Poets have miſtaken *Ariſtotle*, ſo far as to think he means a whole Day and Night. Let us hear what *Dacier* has to ſay on this Occaſion, " This is not only contradicted by the conſtant Practice of all the Greek Poets, whoſe Works are remaining, upon which *Ariſtotle* form'd his Rules, but is againſt common Senſe, which will not allow that a continu'd Action which ought all to be expos'd to our View, ſhould laſt ſo long. To have the Spectators amus'd a whole Day and Night, is againſt all Probability, is one of the principal Foundations of this Poem." He afterwards proves that *Ariſtotle* meant only the Courſe of the Sun in a Day, from Sun-riſe to Sun-ſet, fourteen or fifteen Hours time; but even that is too long: For, continues he, " The moſt perfect Pieces are doubtleſs thoſe which, like *Sophocles*'s, require no longer Time for the Action than the Repreſentation takes up. The Action of *Sophocles*'s fineſt Plays is not above four Hours in length." And *Boſſu* ſpeaking of the difference between *Epick* and *Dramatick* Poetry, with reſpect to this Unity, ſays, " 'Tis much more neceſſary that an Action which is to be ſeen, ſhou'd be continu'd without Interruption, than one that is to be read. 'Tis not natural for one to imagine we paſs whole Days and Nights without Sleeping, Eating, or Drinking, or are Tranſported from Place to Place without ſtirring off of ones Seat. From whence it comes that the Unities of Time and Place are neceſſary to the Theatre." Mr. *Dryden* complains that this is a difficult Rule to be follow'd; and yet he takes the Latitude of the Conſtruction of *Ariſtotle* no leſs than twenty four Hours, which however have ſeldom or never done his Buſineſs. For to keep to his *Spaniſh Fryar*, we begin in the Night.

Alp. Pedro, *How goes the Night?*
Ped. *She wears apace.*

That Day being over, and abundance of Buſineſs done, we come to another.

Dom. *Good Even*, Gomez.

This opens a way for another Night and Day, which are indeed little enough for the Revolutions that happen. We do not hint at theſe Errors, as thinking they are new to any one, or valuing our ſelves on a Diſcovery which has been made ever ſince the Play was acted, we might have nam'd ſome much more Enormous, but we choſe rather to keep to one of his *Dramatick* Poems; for 'twill be impoſſible to name any, where the Unities are obſerv'd in the leaſt degree of Regularity. Mr. *Dryden* had ſuch an excellent Talent for *Language* and *Verſification*, he thought it wou'd anſwer for any Fault in Conduct; and tho' he knew what was Regular, ſacrific'd his Knowledge to his own Eaſe, or the Taſte of the Town, which was never truly touch'd with the Severity of Rules. One Reaſon may be, becauſe ſuch as have ſtudy'd them moſt, have either neglected the Graces of Diction and Numbers, or had no Genius that way, an Ear being the Gift of Nature. But perhaps Regularity and Deſign may be acquired better by one who has no Genius for Poetry, than one who has. *Dryden*, like the Prince of the Britiſh *Parnaſſus*, ſet up for an Arbitrary Monarchy, a Government without Rules; thinking, like Princes of the ſame Principles, that a fair Outſide, and ſhining Court, wou'd dazzle, and make the Spectator blind to what was falſe. To excuſe himſelf, he ſays Unity of Time was not obſerv'd by the Ancients, and hints the *Heautontimoreumenos* of *Terence*, which took up two Days. The Reader will ſee that he does wrong to the Ancients, by what *Dacier* has ſaid of *Sophocles*, which has been already quoted in this Eſſay.

Unity of Place requires *that the Scene ought to be the ſame at the end as at the beginning of the Play. The ſame throughout.* This is Mr. *Dryden*'s own Rule, which he has broken in his *Spaniſh Fryar* almoſt as often as the Scene chang'd; ſometimes a Street, ſometimes the Court, ſometimes *Gomez*'s

Houſe, and as many Rooms of the Court as 'twas proper for Company to viſit. This Unity is indeed ſeldom obſerv'd in any of our *Taking* Plays: The Poets wou'd want *Intrigue-Room* if they were confin'd to it, and therefore change the Place as often as they pleaſe, the Audience very contentedly Travelling twenty or thirty Miles in a Scene, even in Comedy; and from *Covent-Garden* to *Cheapſide*, is ſo common, that one wou'd think they cou'd do it as eaſily as the young Fellows turn about in the *Pit* to face the *Boxes* between the Acts. The *French* generally obſerve this Rule in their Tragedies; as to their Comedies, *Moliere* himſelf has often broke the Unity of Place; and our *Engliſh* Poets find their Audiences ſo little concern'd about it, that they break it, and with the greateſt ſucceſs ſometimes.

What if the Ancients had not obſerv'd this or any other *Rule*, wou'd that juſtify the Moderns? Rules are nothing but the Obſervations of Criticks on Nature, and there's no Poet ſo ridiculous as to think he is not oblig'd to make Nature his Guide. Wherefore 'tis very plain, whoever breaks any one of theſe Unities, does it out of Ignorance or Idleneſs, and not out of Choice; and that ſuch as pretend to vindicate themſelves in it, do like thoſe Children, who having committed a Fault, endeavour to excuſe themſelves by a Lye, and commit a worſe to avoid Reproof. We have ſaid enough of the *Unities*, and ſhall in the next place ſpeak of the *Paſſions*, which are the moſt *ſhining* Part of *Dramatick* Poetry. Paſſion is neceſſary in all the great Poetry, as Admiration in an *Epick* Poem; Terror and Pity in Tragedy, and Joy and Surprize in Comedy. *Epick* Poetry is ſuſceptible of all of them, but Tragedy and Comedy are not. The one muſt never Weep, nor the other Laugh. The Paſſions muſt always correſpond with the Manners, and be always well Tim'd. *Longinus* tells us, nothing is more ridiculous than a great Paſſion out of ſeaſon. We have ſeen Plays in our own Tongue, as *Shakeſpear*'s and *Otway*'s, wherein the Paſſions have been as throughly touch'd as in *Sophocles* and *Euripides*. But our Poets commonly fall into Rants and Similies, which are the moſt unnatural Things in the World, Rants tranſporting the Perſon repreſented to Madneſs and Nonſenſe; and Simily unbends the Mind, which was before attentive to the Paſſion, to hearken to ſome fine Metaphor, or Poetical Deſcription.

> *Why trembles thus my Limbs? Why faints my Heart?*
> *Why am I thrill'd with Fear, 'till now unknown?*
> *Where's now the Joy, the Extaſy, the Tranſport,*
> *That warm'd my Soul, and urg'd me unto* Phædra?
> *O! had I never lov'd her I'd been bleſt.*
> *Sorrow and Joy in Love alternate Reign,*
> *Sweet is the Bliſs, diſtracting is the Pain.*

This is a paſſionate, tho' ancient Lover returning, after he had been thought dead, to the Arms of one he doated on almoſt to Madneſs. This is in a word, a Lover who is in the laſt Impatience, as appears by the Coolneſs of the Simily.

> *So when the* Nile *its fruitful Deluge ſpreads,*
> *And genial Heat informs its ſlimy Beds:*
> *Here yellow Harveſts crown the fertile Plain,*
> *There monſtrous Serpents fright the lab'ring Swain.*
> *A various Product fills the fatten'd Sand,*
> *And the ſame Floods,* &c.

We do not repeat theſe Lines for the abundance of the *Epithets*, tho' in Paſſion, perhaps *Epithets* are as unnatural as *Simily*; for ſo many of 'em can never come together without Reflection. And Mr. *Dryden* owns, *No Man is at leiſure to make Sentences and Similies when his Soul is in an Agony*. Which ſhews that no Man knew better how to keep within Bounds, yet no Man more often Tranſgreſs'd.

> *Deſpair, Death, Hell, have ſeiz'd my Tortur'd Soul.*
> *When I had rais'd his groveling Fate from Ground,*
> *To Power and Love, to Empire and to Me,*
> *When each Embrace was dearer than the firſt;*
> *Then, then to be contemn'd, then, then thrown off:*
> *It calls me old, and wither'd, and deform'd,*
> *And loathſome, Oh! what Woman can bear loathſome?*

Tho' there is not much Delicacy in this Paſſion, there's Rage. And whoever had heard Mrs. *Barry* labouring with theſe Lines, little thought the next would have been,

> *The Turtle flies not from his billing Mate,*
> *He bills the cloſer,* &c.

The *Rehearſal* has a Touch upon this ſort of Writing.

Prince *Prettyman* being fall'n aſleep in the fair *Cloris*'s Preſence, ſays,

Bayes, *Now here ſhe muſt make a Simily.*

Smith, *Where's the neceſſity of that, Mr.* Bayes?

Bayes, *Becauſe ſhe's ſurpriz'd. That's a general Rule, you muſt ever make a Simily when you are ſurpriz'd; 'tis the new way of Writing.*

> Cloris. *As ſome tall Pine which we on* Ætna *find,*
> *T' have ſtood the Rage of many a boiſterous Wind,*
> *Feeling without that Flames within do play,*
> *Which wou'd conſume his Root and Sap away,*
> *He ſpreads his* worſted *Arms unto the Skies,*
> *Silently grieves, all pale, repines and dies.*
> *So ſhrouded up, your bright Eye diſappears,*
> *Break forth bright ſcorching Sun and dry my Tears.*

Johnſon, *Mr.* Bayes, *methinks this Simily wants a little Application.*

Bayes, *No Faith, for it alludes to Paſſion, to Conſuming, to Dying, and all that, which you know are the Natural Effects of an Amour.*

If a Gentleman, when he hears or reads a Simily in a Play, will remember what is ſaid of Mr. *Bayes*, and what he ſays himſelf, he'll ſoon find out, that tho' there are not many *Johnſons*, there are many *Bayes*'s. For 'tis certain, moſt Poets are ſo fond of Similies, that they never conſider whether they are

Natural or Unnatural; they fanſie they ſhew'd their Wit, and too many of 'em are contented to be Fools to Wits, provided they can be Wits to Fools. For the Majority will be on their ſide; *Dryden* ſays, "The Roar of Paſſion may pleaſe an Audience, three parts of which are Ignorant enough to think all is moving which is Noiſe; it may ſtretch the Lungs of an ambitious Actor, who will die upon the Spot for a thundering Clap, but will raiſe no other Paſſion than Indignation and Contempt from the Judicious." Can any thing be more juſtly ſaid? And can any one think that Reflection, and the following Inſtances cou'd come from the ſame Perſon?

Anthony, *Dye—Rather let me periſh: Love and Nature*
Leap from its Hinges, ſink the Props of Heaven,
And fall the Skies to cruſh the nether World.

But this is in *All for Love*, which is, taken altogether, an excellent Play, at leaſt, for the moſt Charming Beauties of the Stage.

Alman. *I'll take his Heart by th' Roots and hold it faſt.*
Again, *At once beat thoſe without and thoſe within.*
Again, *Good Heaven, thy Book of Fate before me lay,*
But to tear out the Journal of this Day.
Again, *Thou ſhalt not wiſh her thine, thou ſhalt not dare*
To be ſo Impudent as to deſpair.
Again, *There's not a Star of thine dare ſtay with thee,*
I'll whiſtle thy Fame Fortune after me.

If ſuch Pathetick Strokes as theſe wou'd divert the Reader, we cou'd furniſh him with as many as he pleas'd; not only out of the *Jeruſalems*, the Heirs of *Morocco*, and Plays of that Rank, but out of Mr. *Dryden*, who knew better, which 'tis to be fear'd the reſt did not.

We hope what has been ſaid is ſufficient to convince every Man of Senſe, That the Similies of this Poet, the *Sentences* and *Speeches* of that, which have been the Chief Reaſon of their *Taking*, were the very thing that ſhould have damn'd their *Plays*. When an opportunity offers on which we may have more *room*, we ſhall ſearch farther into theſe Errors in *Poetry*, and bring our Examples down lower. Of all our Tragick *Poets* none ever touch'd the Paſſion of *Pity* more than *Otway*, nor indeed ſo much. *Shakeſpear* mov'd Terror like a true Maſter of this Art: His *Hamlet* and *Mackbeth* will always ſtrike the Audience with that Paſſion; His *Othello* ſeems to be carry'd too near the Confines of Horror, *Fletcher* in Mr. *Dryden*'s Opinion mov'd Compaſſion better than *Shakeſpear*, who, he ſays, *did not fail ſo much in the Paſſions themſelves, as in the manner of expreſſing them: He diſtinguiſh'd not the blown Puffy Style from true Sublimity.* Let any one compare the worſt things in *Shakeſpear* with what we have repeated out of Mr. *Dryden*, or with *Maximin*'s Rant to the Gods,

Keep You your Rain and Sun ſhine in the Skies
And I'll keep back my Oil and Sacrifice,
But by the Gods, By Maximin *I meant.*

and much more in the ſame Strain, he will hardly find any thing in *Shakeſpear* ſo far diſtant from true Sublimity. What *Boſſu* ſays of *Seneca*'s Conduct, with Regard to the Paſſions, will ſerve for moſt of the Moderns. After he has Prais'd *Virgil* for his Conduct he goes on thus; "*Seneca*'s Conduct is quite oppoſite; If he has any thing to ſay which ought to expreſs a great Paſſion, and touch the Audience ſenſibly with it, he deprives both the Perſons of his *Drama*, and the Audience of all the Diſpoſitions they may have to move or be mov'd. If they are in Sorrow, Fear, or Expectation of ſome Terrible Accident, he begins with a Fine and Elegant Deſcription of the Place, which only ſhews a fruitful Fancy and the Pointed and Florid Wit of an Injudicious Poet". Thus in his *Troades*; "*Hecuba* and *Andromache* being diſpos'd to hear the violent and barbarous Death of their Son *Aſtyanax*, whom the *Greeks* had juſt flung from a Tower: They were alſo to be inform'd that among thoſe who ran from all Quarters to ſee ſo dreadful a Sight, there were ſome who were plac'd on Stones that had fall'n in Heaps from the Ruin of Buildings: That the Legs of others ſhook becauſe they were plac'd too high; *Alta rupes cujus è cacumine erecta ſummos turba libravit Pedes*, Such as ſpeak or hear ſuch Trifles are very little diſpos'd to weep when they have occaſion for't; and, like thoſe who are hir'd to mourn at Funerals, muſt be told when to begin and when to leave off". If Gentlemen will remember this when they hear or read moſt of our Plays where the Paſſions are pretended to be beſt touch'd, they will know what is true and what is falſe. Too much Buſineſs of which thoſe who belong to the *Drama*, particularly the *Players* and *Pit* are very fond, is contrary to the Paſſions which cannot be throughly rais'd where the Intrigue is too thick, as Mr. *Boſſu* has declar'd; "To manage the Paſſions well and move the Audience, they muſt be brought into the Poem pure and diſengag'd from any thing that may hinder their Effect; wherefore *Polymythy*, or too many Stories, Fables and Actions muſt be avoided; as alſo Adventures too intricate and difficult to be remember'd, or Intrigues that cannot be eaſily comprehended, which embroil the Mind, and require ſo much Attention that there cannot be enough left for the Paſſions". What will become of all that Buſineſs and Buſtle which our *Dramatick Poets*, in Complacency to the deprav'd Taſte of their Audience, are ſo fond of? they think it enough if the Scene is crowded, and they can make a *full Stage*. The Paſſions are touch'd rarely, and when the Audience is mov'd, 'tis generally with Rants and the Roaring of the Actor. A Player never flung himſelf on the Ground, but the Spectators believ'd 'twas the Strength of the Paſſion which occaſion'd it, whereas 'tis generally done to help out the want of it. When the Poet can't raiſe it ſo high as is neceſſary by the Sentiments, which is a little difficult, he has recourſe to Words, and there his Task is Eaſy. But ſays Mr. *Dryden*, [*Pref. to Troilus and Creſſida*,] "Wiſe Men wou'd

“ be glad to find a little Senſe couch'd under all “ theſe Pompous Words; for Bombaſt is commonly “ the Delight of that Audience which loves *Poetry*, “ but underſtands it not, and has commonly been “ the Practice of thoſe Writers, who not being “ able to infuſe a Natural Paſſion into the Mind, “ have made it their Buſineſs to ply the Ears, and “ to ſtun their Judges by the Noiſe.

Cleop. *And bent the Globe on whoſe each Side we*
(Trod,
Till it was dented Inwards, &c.

This ſeems to be of the ſame kind, tho' the Bombaſt is rather in the Thought than the Expreſſion. There's nothing ſo prejudicial to the Art of Moving the Paſſions as the intermingling Comical and Tragical Intrigues, what one bends the other unbends, and this is the Cauſe that the Soul cannot attend enough to either. Tragi-Comedy is a Monſter in the *Drama*, and tho' there are ſome fair ones, if any thing monſtrous may be call'd ſo, as the *Spaniſh Fryar*, in which Play there are ſome Maſter Strokes worthy the Pen of the Firſt Poet of his Times, and the *Laureat* of *Britain*, yet that and all of that kind is

A Woman's Head join'd to a Fiſhes Tail.

The Author of that *Tragi-Comedy*, we mean the *Spaniſh Fryar*, in his *Eſſay on Dramatick Poetry*, has this Paſſage, *There is no Theater in the World has any thing ſo abſurd as the Engliſh Tragi-Comedy.*

Atq; Urſum & Pugiles media inter Carmina poſcunt,

which is juſt, and 'twill hardly be Credible to the Reader, when he is told that in the very ſame Eſſay there's another Paſſage as contrary to it as *Artick* and *Antartick*. *I cannot but conclude to the Honour of our Nation, that we have Invented, Increas'd and Perfected a more Pleaſant Way of Writing for the Stage than was ever known to the Ancients or Moderns of any Nation*, which is *Tragi-Comedy*. What has been ſaid before by himſelf and others will be an Antidote to this Poyſon, and theſe Sentiments will be more largely handled in a Tract on Purpoſe.

Figures are a very great Help in Touching the Paſſions in Tragedy, as well as Heroick Poetry, and the *Pathetick* of the *Drama* is the *Marvellous* of *Epick Poeſy*, according to *Rapin*. *Dryden* ſays *Metaphors are neceſſary to raiſe Paſſion*, which is true, becauſe they bring Objects before the Eyes; and, as a great Maſter of *Rhetorick* tells us, *Pour donc allumer les Paſſions dans le Cœur de l' Homme il fant lui en preſenter les Objects & ceſt aquoi ſervent marveilleuſement les Figures*; therefore to kindle the Paſſions in the Heart of Man, the Objects muſt be repreſented to them, and to that End Figures are of wonderful Uſe. But as this *Eſſay* is by no means intended to give any Directions to Poets who are all Criticks by Profeſſion, and every one, to a Man, a compleat Maſter of his Art in his own Opinion, we ſhall not enter far into our Poetical Speculations, but keep as cloſe to the Practice as is neceſſary to let Gentlemen ſee when they are in the wrong and when they are in the right.

We do not forget that there remain Two Parts of *Epick Poetry* to be treated of, *Machines*, *Thoughts* and *Expreſſions*; of the latter of which we have occaſionally ſaid ſomething in the foregoing Pages; but both *Machines* and *Expreſſions* having ſome Relation, according to the Practice of the Moderns at leaſt, to *Tragedy*, we ſhall firſt ſpeak a little of the Second Part of *Dramatick Poetry*, which is *Comedy*.

What has been ſaid of *Tragedy*, with Reſpect to the Unities of Time, Place and Action, will ſerve for *Comedy*, ſince as we are told by Mr. *Rimer*, unleſs there be Unity of Place, of Time, and of the Action, in the Great Poems, there can be no Veriſimility. Now tho' Mr. *Dryden* is pleas'd to ſay, [*Pref. to Evenings Love*] *I thing Comedy is in its own Nature Inferiour to all ſorts of Dramatick Writing*; yet, as 'tis a Part of the *Drama*, 'tis juſtly reckon'd a Part of the Great Poeſy. Beſides, being the neareſt Imitation of the Natural Life, it ought to come neareſt to the Rules; which, whatever Myſterious Names are giv'n 'em, are nothing but Guides to conduct the Writer to the Trueſt Obſervation of Nature, and by that to form his Imitation. And tho' that Famous Poet calls it in the above cited Place, *the moſt Inferior Part of Dramatick Poetry*, he is not always of the ſame Opinion.

Wild Gallant, *Of all Dramatick Writing Comick Wit,*
As 'tis the beſt, *ſo 'tis moſt hard to hit.*

To this we muſt add, Comedy will always be reckon'd Part of the great Poetry on Account of its End, which is Inſtruction as well as Pleaſure; for tho' notwithſtanding the ſame Author, objecting againſt the Law of Comedy, which is to reward Vertue and Vice, anſwers, *He knows of no ſuch Laws to be conſtantly obſerv'd in Comedy neither by Ancient nor Modern Poets*, yet we muſt not truſt too much to this Aſſertion; for *Boileau*, whom in another Place he calls the beſt Critick among the *French*, writes,

Le Theatre perdit ſon antique fureur.
La Comedie apprit a rire ſans aigreur,
Sans fiel & ſans venin ſut inſtruire & reprendre,
Et plus Innocement dans les Vers de Menandre.

The Theater its Ancient Fury loſt,
And Comedy then laught at no Man's coſt,
Without or Gall or Venom it inform'd,
And in Menander's Verſe reprov'd and charm'd.

This is not only true by the Confeſſion of *Boileau* and *Rapin*, and indeed by all who are Criticks in the *Drama*, but Common Senſe will tell a Man, that ſince Men are ſooner laught than beat out of their Follies, *Comedy* muſt ſooner arrive at the Principal End of *Dramatick Poeſy* than *Tragedy*. The Neceſſity of the Unities being granted from ſo good Authority, whoever errs in Time, Place or Action; that is, whatever Action is Compound, whatever Time above what is neceſſary for the Repreſentation, whatever Scene is remov'd from one Street to another, or one Houſe to another, break the Rules; or to ſpeak with leſs Offence, are againſt Nature. By a ſimple Action is not to be underſtood the baniſhing *Epiſodes* or *Under-plots*, as our *Play-Writers* call 'em, provided they are ſo much a Part of the Main Deſign that it cannot be carry'd on without 'em. This will give the Poet opportunity enough to fill his Play with *Buſineſs*. And as to the Two other Unities, if he ſtretches a little, 'twill be forgiven him; eſpecially if it appears that the Action neceſſarily requir'd it, and the Tranſgreſſion is not too obvious. This Licenſe is only to be pretended to by Maſters; the Common Writers, who are not to be diſtinguiſh'd from the *Maſters* by their Succeſs, unleſs 'tis that by pleaſing the Multitude they *take* more, will be ſure to abuſe this Privilege, and err as often as they Write. The Manners muſt be as well obſerv'd here as in *Tragedy*; What ſays *Boileau* on this Subject?

> *Que la Nature donc ſoit votre Etude unique Auteurs*, &c.

> *Te Bards, Pretenders to the Comick Bays,*
> *Let Nature be your Guide in all your Plays.*
> *The Heart of Man, whatever Mind did reach,*
> *Let him its Errors tell and others teach.*
> *Whoe'er a Prodigal or Miſer knows,*
> *A Prodigal or Miſer may Expoſe,*
> *A Fop, a Coxcomb*, &c.
> *All Things our Humours muſt to Time ſubmit,*
> *Its Pleaſures has each Age, its Ways and Wit.*
> *When Toung*, &c.

That which diſtinguiſhes our *Comick* Poetry from all others, and gives it the Advantage over both Ancients and Moderns, is *Humour*; which, according to Mr. *Dryden's* Definition, *is the Ridiculous Extravagance of Converſation, wherein one Man differs from all others:* He tells us, *Of late Tears* Moliere, *the Tounger* Corneille *and* Quinault *have been imitating afar off the Quick Turns and Graces of the Engliſh Stage*; in which he was probably very much miſtaken, for none can well imitate thoſe they do not underſtand; and the *French* had, and have ſo mean an Opinion of our Poetry, that 'tis to be queſtion'd whether ever one Man in *France* Study'd our Language to inform himſelf how our Poets Write. 'Tis true, Mr. *Dryden* us'd to ſay *Rapin* learnt *Engliſh* on purpoſe to underſtand his Poems; but he muſt tell us ſo by Hearſay, for *Rapin* no where condeſcends ſo far as to confeſs he underſtood them or any other *Engliſh* Verſes. As a Proof of the *French* deſpiſing our Poetry, let the Reader know what happen'd, on the Death of Mr. *Dryden*, at *Paris*. An *Engliſh* Gentleman, who is very much eſteem'd for his Politeneſs and Learning, being then there, paid a Viſit to Mr. *Boileau*, who entertain'd him, as he do's all who come to ſee him, with the *French* Poetry, particularly his own; and ſaid little elſe, but that *he was very glad to hear we had paid due Honours to the Memory of a Great Poet in* England, *whoſe Name he pretended at leaſt not to know*. And as to the Diſpute between the *Engliſh* and *French* Poets, he was pleas'd to allow *The* Engliſh *had moſt Wit, but the* French *were the better Poets*, wherein he did too much Juſtice to his own Nation; For who is there in *Tragedy* to match our *Otway*? Our *Etheridge, Wicherley, Congreve, Vanbrugh* in *Comedy*? Our *Roſcommon, Waller* and *Denham*, in Gallant Poetry, and for a fine Turn of Verſe? Our *Cowley* for *Pindaricks*; and for all ſorts of Verſification, our Immortal *Dryden*, whoſe Name Mr. *Boileau* affected not to know, which is ſo ridiculous a Vanity, he would never have been guilty of it had not he been paſt his Climacterick. Is it likely ſuch a Man as Mr. *Boileau*, who frequented the *Engliſh* Ambaſſadors in the Duke of *Montague's* Time as much as any *Hôtel* in *Paris*; and who knew ſo many *Engliſh* Gentlemen, ſhould never be ſo curious as to inquire what Poets we had in *England*, and would not Mr. *Dryden* have been firſt nam'd? Or is it to be believ'd that ſo many *Engliſh* Gentlemen, proud of Mr. *Dryden's* Merit in Poetry, would have ſuffer'd him to be Ignorant of the Reputation in which he flouriſh'd Forty Years? But the *French* were ſo vain before they were lately mortify'd, that they would triumph over the Wit as well as Liberty of Nations? Monſ. *St. Evremont*, with all his Great Qualities, had his National Vanity, and that Contempt for our Tongue, that tho' he liv'd Forty Years among us, he never learnt enough of it to help him out in a Converſation of three or four Minutes. However, their ſetting a low Price on our Poetry has not put us out of Countenance, nor made us have a worſe Opinion of our ſelves or a better of them. 'Tis a bad Sign of the Poetical Genius of a Nation when they have never produc'd One Heroick Poem, and a Glorious Sign of Ours, that can ſhew a Genius greater than either *Homer* or *Virgil* in the greateſt Part of *Epick Poeſy*. My Lord *Roſcommon*, who knew the *French* better than they know themſelves, ſays of 'em

> *The Weighty Bullion of one Sterling Line,*
> *Drawn to* French *Wire, wou'd in whole Pages ſhine.*

Mr. *Dryden* is of the ſame Sentiment. *We are as well able to vanquiſh the* French *with our Pens as our Anceſtors have been with their Swords*; or rather, as we have ſince done with our Swords. Again, *In the Precepts which* Ben Johnſon *has laid down in his Diſcourſes, we have as many and Profitable Rules for Perfecting the Stage, as any the* French *can furniſh us with.* Again, *Be it ſpoke to the Honour of the* Engliſh, *Our Nation can never want in any Age ſuch as are able to diſpute the Empire of Wit with any People in the Univerſe; and our preſent Poets have far ſurpaſt all the Ancient and Modern Writers of other Countries.* There would be no End of it if we ſhould ſet down all the Authorities we might produce on this Article, if what the *Engliſh* have ſaid themſelves may paſs for Authorities, and that is not to be doubted: For why may not we ſpeak as well of our ſelves, as the *French* do of themſelves on all Occaſions?

This will not be thought a Digreſſion in an *Eſſay on Poetry*, eſpecially in one wherein no Exactneſs of Method is pretended to; but Things are ſaid as the Author refreſhes his Memory, and recovers loſt Ideas.

As to *Comedy*, *Ariſtotle* wrote a whole Book upon it, which is loſt; but Mr. *Dryden* thinks *Horace* had ſeen it and made Uſe of it in his Art of Poetry. *Boileau* has giv'n Rules for Writing it and *Rapin* ſpeaks of it alſo; but there's no more Myſtery in it than to obſerve the Characters, the Unities and Decorum of the Stage. Some have imagin'd that the Excellence of a *Comedy* conſiſts in the Wit, others will have it confin'd to the Intrigue and Turns of Incidents, others to the Humour; whereas 'tis indeed in the juſt Mixture of the whole.

He who has not Wit, will run into Farce, and generally *take* as well for a *Time*, as he who has. Who does not know, that the Authors of the Comedy of *The Birds*, and *The World in the Moon*, once took as furiouſly as the Authors of Sir *Fopling Flutter*, and *Venice Preſerv'd*? *The Trip*, *The Yeoman of* Kent, have had their *Days*; *Phædra*, and *Appius* and *Virginia*, have not yet had theirs. What can we ſay of *Taking*, but that he who values himſelf upon the Applauſe of the Many, is as great a Fool as any that applaud him, and knows as little of true Merit. *Beaumont* and *Fletcher* had Three Plays damn'd before they wrote *Philaſter*; *Ben. Johnſon* had the like Fortune. The *Plain-Dealer* had much ado to keep up its Head, when 'twas firſt repreſented. Who wou'd be proud of the Praiſes of that Audience which has condemn'd the beſt Play that ever was written? *Taking* therefore is no ſure Sign of Merit, tho' 'tis a good Encouragement to a Poet to endeavour to deſerve; and the Player and Bookſeller, let the Criticks ſay what they pleaſe, will always prefer a *Taking Farce* to a *Damn'd Comedy*. They judge of Things by what they bring in, and they are in the right of it; for thoſe who are to live by their Buſineſs, will ever be fonder of thoſe by whom they get, than of thoſe by whom they loſe. Complacency will not agree with Intereſt; but the Poet who thinks he has done well, becauſe he has *taken*, will probably, if he writes long enough, live 'till he has the Fate of ſome *Taking* Authors before him, to have his Plays refus'd even by the Players.

The Two remaining Parts of *Epick* Poetry, the Machines, Thoughts and Expreſſions having relation to *Dramatick* Poetry, at leaſt to Tragedy, ſhall now be handled with our uſual Brevity. As to Machines or Divinities introduc'd into Poetry, there are three ſorts of 'em, as divided by *Boſſu*; the one Theological, and invented to explain the Nature of God; the other Phyſical, to repreſent Natural Things; and the third Moral, under which the Vertues and Vices are figur'd. Of the Theological kind, are *Jupiter*, *Juno*, *Venus*, and *Deſtiny*, with which *Virgil* opens his Tenth Book. Of the ſecond kind are *Æolus*, *Eurus*, *Zephirus*, &c. Of the third, the *Furies*, &c. They muſt never be made uſe of but when the Action neceſſarily requires it.

> *Nec Deus intercit niſi dignus vindice nodus,*
> *Inciderit.*
>
> Hor. Art. Poet.

And that eſpecially in *Dramatick* Poetry. For 'tis the Opinion of ſome Criticks, that in *Epick* Poetry, Machines may be brought in, even when there's no neceſſity to heighten the *Marvellous* or Admiration, which is the Perfection of *Heroick* Poeſy. Our Religion does not admit of the frequent uſe of theſe Divinities, if of any at all, and our Audiences are ſeldom mov'd by them as the Ancients were. Indeed, in Tragedy they are never made uſe of by any Judicious Writer, unleſs it be in the *Prologue*, as *Piety*, in *Racine's Heſter*. But a new unnatural ſort of *Dramatick* Poeſy, call'd *Opera*, requires the uſe of 'em. *La Bruyere*, who is far from approving that trifling way of Writing, ſays Machine is one of the greateſt Beauties of the Opera; and where every Thing is out of Nature, ſupernatural Things are moſt natural. Our Machines are ſo wretchedly contriv'd, that, like a *Dutch* Angel, with two Scollop-ſhells inſtead of Wings, faſten'd to the Shoulders of a brawny Skipper, we ſee the poor Mortal under his God-like Appearance; and when our Goddeſſes deſcend in their Bathing-Tubs, like the Children in their Chairs and Chariots at the Machine in *Moorfeilds*, 'tis all Bungle and Blunder, we hear the Wheels grate, the Pullies go like thoſe of a Jack, the Ropes as viſible as are the Rope-dancers; and what Foreigners have the Dexterity to hide, we expoſe ſo, that the Admiration is loſt, and the Audience have no more Reſpect for *Venus* in her Chariot, than for Mrs. *Lindſey* in a Hackney-Coach, or other more Amorous Vehicle. Our Managers cannot be at the Charge of good Machines, and People to conduct them; they give Eight Hundred Guineas to a Foreign Singer at one Time, Twenty Guineas a Night to other Singers at another; all the Money that can be ſcrap'd together beſides is not enough to pay for the Decoration of the Knights and Baroneſſes that Perform, and the Salleries to the Muſick, Houſe-Rent, and Contribution is another ſevere Article; by all which Machines have been driven out of our Theatre, and unleſs we underſtood 'em better, 'tis no matter whether they are ever reſtor'd again. Opera is an *Italian* Invention, from whence it paſt into *France*, and has now croſt the Water to viſit our Inclement Region, an utter Enemy to fine Voices. The Unities in Opera's are never obſerv'd, nor one Rule of the *Drama*; 'tis enough if the Poet can join a few Harmonious Sentences together, and pick out ſome Muſical Words to keep the Singers Mouths open. The *Compoſer* will, if he has a Genius, find *Paſſion* for them. Muſick muſt be own'd to be very neceſſary in the *Drama* for the greater Pleaſure of the Entertainment, and ſometimes to aſſiſt in moving the *Paſſions*. The Ancient Chorus's were all ſung, but then the Poets were the Muſicians alſo, and ſet their own Words. In our Times, *Dramatick* Opera's may be very juſtifiable, and a Fable ſo form'd as to render Muſick abſolutely neceſſary; but when Words are tack'd to Muſick, when an *Engliſh* Woman ſings *Italian*, and an *Italian* anſwers her in *Engliſh*, when half the Buſineſs is done in *Engliſh*, half in *Italian*, and the whole a Mungrel Performance, when you have Words without Senſe, Muſick without Air, Singers without Voices, Show without Machines, and Poets and Audiences without Judgment, that muſt be a Pleaſure unworthy the Character of a Nation which perhaps is as Polite as the politeſt in the World; 'tis a Dream that amuſes us at preſent, we ſhall wake and laugh at our Folly.

The Thoughts and Expreſſions are the laſt Part of *Heroick* Poetry, we muſt treat of the Thoughts in diſcourſing of Logick, and therefore ſhall only in this Place ſay, the Sentiments muſt be always ſuitable to the Characters; and ſuch as in *Epick* Poetry are moſt proper to raiſe Admiration, and to move Terror and Pity in Tragedy; they muſt be always Juſt and Natural. *Point* is ſo brillant that 'tis often miſtaken for Wit; but 'tis a falſe Luſtre, and tho' Poets is very fond of it, it vaniſhes like Vapour, and ſtrikes only Women and Fools. We have elſewhere ſpoken of Deſcriptions, Compariſons, and Metaphors, &c. to which we refer the Reader, and conclude this Part of our Eſſay with ſome further Obſervations on Expreſſion.

Let the Criticks and Others deſpiſe *Diction* as much as they pleaſe, it will always, in our Opinion, be one of the moſt charming Parts of *Poeſy*, which, without Numbers, is the moſt contemptible of all Writing.

The *Romances*, ſo much in faſhion Forty Years ago, are good Poems in the Judgment of the *French*. *Novels* may with the ſame Reaſon pretend to that Title. *Proſe Cadence* as the *French* term it, is a certain Meaſure of *Periods* which pleaſes the Ear, but is not ſo muſical as the Numerous Cadence of *Verſe*. *Rhime* has been treated of already, and Numbers alſo, but we muſt add a word or two of the latter. Mr. *Dryden* tells us, *Variety of Cadence is the beſt Rule, the greateſt Help to the Actors, and Refreſhment to the Audience.* He further recommends *the Pindarick Numbers in Tragedy.* Wherein he wrote too much by *Humour*, and too little by *Judgment*. The *Pentameter*, or what we call the *Heroick* Verſe, is the moſt *Muſical* of any in our Tongue; and we ſhall ſee preſently how Letters will vary the Harmony, and adapt the ſound to the Senſe.

The *French* always make uſe of their *Alexandrin*, which is the ſame with our *Heroick*, as to the uſe of it, except in two or three Plays, where *Corneille* uſes the *Pindarick* Meaſure in two or three Scenes. Moſt of their Comedies are in *Alexandrin*, for 'twas late before they knew how to write a *Play* in *Proſe*. *Moliere* lov'd *Rhiming*, and his beſt *Comedies* are in *Rhime*. Scenes of Argumentation and Diſcourſe, are proper for Rhime, if Mr. *Dryden*'s Opinion be of weight in this Caſe, who, in his Epiſtle to the *Rival Ladies*, defends *Rhiming* Plays. But in other Places, he is ſo far from the *Pindarick* Meaſure, Rhimes, or any Conſtraint, *That he will not have his Senſe a Slave to Syllables.* Yet he ſays elſewhere, *I dare confidently affirm, that very few Tragedies in this Age ſhall be receiv'd without Heroick Verſe.* However, he did not continue long in theſe Opinions; for,

Grown weary of his long lov'd Miſtreſs, Rhime,

he is again for *Blank Verſe*, or *Proſe Cadence*, becauſe a Man is not ty'd up to Equality of Meaſure, which Variation is ſo common in this excellent Poet, that we ſhou'd never have done did we pretend to give all the Inſtances of it. Such was his ſetting up for the *Quatrain*, or Stanza's of four *Heroick* Verſes, and alternate Rhime, out of Complacency to Sir *Robert Howard*; *I have ever judg'd them more Noble, and of greater Dignity for the Sound and Number, than other Verſe in uſe among us; in which, I am ſure, I have your Approbation.* Yet he hardly ever wrote *Quatrains* afterwards. In the ſame Place he adds, *The Drama, tho' it excludes not the quickneſs of Wit and Repartees, yet it admits not a too curious Election of Words, too frequent Alluſions, or uſe of Tropes, or in fine, any thing that ſhews Remoteneſs of Thought, or Labour in the Writer.* *Blank Verſe* is certainly moſt proper for *Heroick* Poeſy and *Tragedy*, and *Proſe* for *Comedy*; a *Rhiming* Play is as unnatural as a *Singing* Play or Opera. I can as ſoon believe the Perſons ſing to each other as ſpeak in Rhime; and yet the Town ran mad after *Plays* that were *Rhim'd* Thirty Years ago. Mr. *Dryden* oblig'd 'em as much as any one, for Poets are

Fond of Applauſe, and ever fed with Praiſe.

They will do what they can to *Take*, and as the Humour of the Town is, ſo is their *Way* of *Writing*. In other Poems, the *Couplet Verſe* is the moſt eaſy; and 'tis not to be imagin'd what an Effect the Power of Numbers has on the Ear, and by that on the Mind. Letters ſometimes form a Sound that expreſs the Paſſion: *Virgil* ſucceeded in this better than any Poet who ever wrote; and of the Moderns, none came ſo near him as Mr. *Dryden*. The former, by his *Cadence* only, gave Idea's of the Things he wou'd have ſignify'd. Who does not conceive an Image of *Dido*'s Fury, when ſhe mounted the Funeral Pile, into which ſhe intended to fling her ſelf, when he reads theſe words,

Et altos conſcendit furibunda rogos?

The Precipitation and Elevation of the Cadence expreſs the Thing.

The ſweetneſs of the Cadence in the following Verſes, gives us a ſenſible Image of Sleep.

Tempus erat quo prima quies Mortalibus ægris
Incipit, & dono divum gratiſſima ſerpit.

We have a Deſcription of Night and Sleep in *Engliſh*, which Mr. *Rimer* prefers, not only to *Virgil's*, but to all other Deſcriptions on the ſame Subject in any Language, Ancient or Modern.

All things were huſh'd, as Nature's ſelf lay dead;
The Mountains ſeem to Nod their drowzy Head;
The little Birds their Dreams in Songs repeat,
And ſleeping Flow'rs beneath the Night-dew ſweat.
Ev'n Luſt and Envy ſleep.

What cou'd be more proper to move Pity in the Souls of the *Trojans*, than the languiſhing Numbers of theſe Verſes.

Heu! quæ nunc tellus, inquit, quæ me æquore poſſunt
Accipere; aut quid jam Miſero mihi denique reſtat.

Of the ſame Nature is the Cadence in the following Verſe, and expreſſes the melancholy Tone of a Perſon in Miſfortune.

Partem Opere in tanto, ſineret dolor, Icare, haberes.

La Cadence des paroles fait ſouvent plus que les Paroles memes un ton ferme imprime la Crainte un ton Langueſſant porte a la Compaſſion, &c. The Cadence of the Words do's often more than the Words themſelves. He who wou'd make his Numbers conformable to the Senſe muſt conſult the Ear, and learn by that what is the Sound of all Letters, according to a very conſiderable Author, from whom we have borrow'd a Part of this Eſſay. They muſt alſo know the different Tones of Vowels, Conſonants, Syllables, and every thing that has relation to Words. There are ſome Authors who have apply'd themſelves to ſtudy the various Uſe of them in this Caſe, and obſerve for Example, that the Conſonant *F* expreſſes the Wind *Cum Flamma furentibus Auſtris*; the Conſonant *S* a Stream of Water or

or Blood, & *plenos Sanguine rivos*; as alſo *Stormes.*

Luctantes ventos tempeſtateſq; ſonoras.

The Letter *L* agrees with ſoft Things.

Mollia lutteola pingit vaccinia caltha
—— eſt mollis flamma medullas.

Virgil makes uſe of ſeveral *M's* to figure a Noiſe and Confuſion.

——Magno cum murmure montis
Circum Clauſtra fremunt.

He was as careful to make the Feet agree with the Senſe as well as the Letters, and in this was happier than any other Poet.

————Illi æquore aperto
Ante notos, Zephyrumq; volant: gemit ultima pulſu
Thraca pedum.
Ferte citi Ferrum, date tela, ſcandite muros.

The *Dactyles* expreſs the Swiftneſs of the Action, and *Spondees* the Gravity.

———Magnum Jovis incrementum,
Tantæ molis erat Romanum condere Gentem.
Illi inter ſeſe magna vi brachia tollunt, &c.

The Greateſt Part of Poets among the Ancients, and almoſt all the Moderns, know nothing of this Art of making Feet, and even Letters conformable to the Senſe. They ſtudy'd only to arrive at a certain ſoftneſs of Verſe, which grows dull for want of Variety. The Joyful, the Afflicted, Maſters, Servants, all ſpeak in the ſame Tone; a Courtier has not more Harmony and Delicacy than a Peaſant. Theſe Poets did not perceive how *Virgil* made ſome Verſes harmonious by the rudeneſs of the Numbers of others, and ſtrengthen'd ſome by others ſoftneſs. Of the latter kind are thoſe Verſes, wherein he deſcribes the weak Blow old *Priam* gave *Neoptolemus*. The Verſe is languiſhing and weak, like the old King's Arm.

Sic fatus Senior, telumque imbelle ſine ictu
Conjecit.

Cicero and *Quinctilian* highly commend ſuch as make their Numbers agree with the Senſe. *Virgil* is inimitable in this Grace of Poetry. When he makes *Neptune* ſpeak in the Firſt Book of the *Æneis*, how Lofty and Majeſtick is the Cadence?

Tantane vos tenuit generis fiducia veſtri?
Jam cælum, terramque, meo ſine numine, venti,
Miſcere, & tantas audetis tollere moles?

How Pompous are the Verſes wherein he flatters the Emperor.

Naſcetur ex pulchra Trojanus Origine Cæſar,
Imperium Oceano, famam qui terminet aſtris.

Who can read his Deſcription of *Polyphemus*, without trembling at the Idea of that Giant?

Monſtrum horrendum, informe, ingens, cui lumen ademptum.

The Cadence of this Verſe, *Procumbit humi bos*, which falls all at once, imitates the Fall of that heavy Animal, as the following does the Heat of a mettleſome Horſe.

Quadrupedante putrem ſonitu quatit ungula campum.

Can Sorrow be better expreſs'd than in this broken Cadence?

O Pater, O hominum, divumque æterna poteſtas,
O lux Dardaniæ, ſpes o fidiſſima Teucrum.

The following Verſes are full of that Grief which one Friend expreſſes for the loſs of another.

————Te, amice, nequivi
Conſpicere, &c.
Implerunt rupes, flerunt Rhodopeiæ arces.

We might give many more Examples of this kind in *Virgil:* In the Moderns they are hard to be met with. Mr. *Dryden* ſucceeded in it beſt, and ſeem'd to form the ſoftneſs of his Verſes by affecting to let 'em roll off the Tongue with Words beginning with the ſame Letters, *The Mighty Monarch, The Sharpen'd Shears, The Beauteous Bride,* &c. And the ſame initial Letter repeated again in the Verb.

When Man on many multiply'd, &c.
Our Ships a Shelter on the Shores, &c.
The ſharpen'd Shears ſhall, &c.
For when a Father is too fondly kind.
Such Seed he ſows, &c.

Perhaps the *s* in *Engliſh* liſps too much, or rather whiſtles, and *ſh* is not without a ſhare of the ſame Fault. In other Caſes, this uſe of Words, whoſe initial Letter, or Syllables, are the ſame, when done without Affectation, has a good Effect, but when affected is ridiculous. A Poet of good Reputation in the Britiſh *Parnaſſus*, is eaſily to be known by his fondneſs of this Harmony, which is agreeable when 'tis not to be ſeen that the Poet ſought after it induſtriouſly, but deſpicable when us'd, as one who aſſumes that Name, did it,

Whoſe broad built Bulk, the boiſt'rous Billows bear.

Mr. *Waller* introduc'd this way, and Mr. *Dryden* profited himſelf of the Example.

He alſo ſhew'd us in many Places how the Numbers may be made agreeable to the Idea's, as in that admirable Poem of *Cimon* and *Iphigenia*, when the Nymph lay ſleeping on a River's Brink, and the Clown views her.

The fanning Wind upon her Boſom blows,
To meet the fanning Wind her Boſom roſe;
The fanning Wind and purling Stream continue her Repoſe.

We come now to the other Parts of *Poeſy*, and the Lyrick or Ode has been put next in order. Indeed the Ode is by ſome reckon'd part of *Epick*

Poetry, and ſo is *Paſtoral*, according to *Rimer* and *Rapin*; wherefore *Paſtoral* being the moſt Ancient of all *Poeſy*, we ſhall ſpeak of it firſt. *Paſtoral Poeſy*, ſays *Fontenelle*, *is apparently the moſt Ancient of all Poetry, becauſe a Shepherd's Life is the moſt Ancient of all Ways of living.* We ſhall not enter into his Speculations on this Subject, but agree with him in the main, that *Paſtoral* ſhould not be ſo Rude as the Country Convacation, nor ſo Polite as that of a Court. But, as *Boileau* ſays, appear like a Rural Nymph at a Sylvan Feaſt, fine with the Ornaments that ſhe took from the Fields.

Telle qu'une Bergere, au plus beau jòur de Fete,
De ſuperbes rubis ne Charge point ſatête.
Et ſans meler à l'or l'eclat des Diamans,
Cueuille en un Champ voiſin ſes plus beaux Ornemens.
Telle, &c.

Of the Ancients, *Theocritus* and *Virgil*; of the Moderns, *Taſſo* and *Spencer* ſucceeded beſt in this Way. We have hardly ſeen any Poem, later than *Spencer*, of this kind worth remembring. And were it allow'd us to have freedom of Speech on this occaſion, we might venture to ſay, that *Spencer*'s Shepherds are often too Ruſtick, and yet ſometimes too ſpeculative. Mr. *Dryden*, who did ſo well in every other Way, ſeem'd to have been no Maſter of the *Bucólick* manner. Shepherds ſhou'd never go out of their Woods; all the Similes in *Paſtoral* ſhou'd be taken from them; all the Sentiments be Tender and Natural, Soft and Eaſy, which ſhould alſo be the Character of the Stile and Numbers, unleſs where the Fable is ſo contriv'd, as to admit naturally of an old Swains talking of higher Things than Sheep and Herds, to teach or inform the younger. The *French* have had abundance of Writers endeavour to excel in the *Eclogue*, but all of 'em have miſcarry'd, except *Segrais*, who tranſlated *Virgil*; and even he, will hardly bear an Exception, ſo difficult is it for a Nation, who are diſtinguiſh'd by Vanity and Affectation, to keep to Nature in any Thing. *Blank Verſe* agrees very well with *Paſtoral*, and being a nearer reſemblance of the Natural way of Speech than *Rhime*, muſt be moſt agreeable to that *Poeſy*, which comes neareſt to Nature, as *Paſtoral* does; we mean that will leaſt admit of *Licence* in the *Imitation.*

The Shepherd Thyrſis *ſitting by a Stream,*
Which with ſoft Murmur glided thro' the Plain,
Call'd ſage Menalcas *from his Flocks which graz'd*
On the green Banks of the delicious Brook,
And ſpeaking thus, perſwaded him to ſing.

The *Ode* makes more Noiſe, her Tone is high, her Sentiments bordering on Enthuſiaſm, her Numbers various, as occaſion requires; Harmony and Dignity are Eſſential in every thing relating to the *Ode*. *Pindar* and *Horace* are Patterns not eaſy to be imitated. The *French* have produc'd ſeveral Poets fond of writing in the *Ode*; but they ſeem to know no diſtinction that it has from other Poems but the Stanza, and might more reaſonably have kept to the *Italian* modeſt Name of *Stanze*. *Cowley* fell into the *Pindarick* way in *England*, and ſucceeded in it; but Mr. *Dryden*, in his *Ode* upon *Cecilia*, has excell'd all the Writers in the *Ode* ſince *Horace's* Days. Perhaps there's not an *Ode* in *Pindar* himſelf that can be compar'd to it for the Variety of the Numbers, the Harmony of the Cadence, and the Conformity of both to the Sentiments, a very difficult Task on ſo nice a Subject as Muſick. We ſhall only inſtance in one Stanza, where the Hero, by the Power of Harmony, is wrought up to believe himſelf a God.

Timotheus *plac'd on high,*
Amidſt the tuneful Quire,
With flying Fingers touch'd the Lyre,
The trembling Notes aſcend the Sky,
And heavenly Joys inſpire.
The Song began from Jove,
Who left his bliſsful Seats above,
(Such is the Power of mighty Love.)
A Dragon's fiery Form bely'd the God,
Sublime on radiant Spires he rode,
When he to fair Olympia *preſt,*
And while he ſought her ſnowy Breaſt;
Then round her ſlender Waiſt he curl'd,
And ſtamp'd an Image of himſelf, a Sov'reign of the World.
The liſtning Croud admir'd the lofty Sound,
A preſent Deity they ſhout around,
A preſent Deity the vaulted Roofs rebound.
With raviſh'd Ears
The Monarch hears;
Aſſumes the God,
Affects to Nod,
And ſeems to ſhake the Spheres.

There are ſofter Numbers in the following Stanza's, but not ſo much Majeſty and Variety as in this. The *Ode* is not always confin'd to what is great and ſublime, it deſcends ſometimes to Gallantry and Pleaſure.

Elle peint les Feſtins, les Danſes, & les Ris.

It paints the Feaſts, the Dances, and the Sports.

Theſe are by many call'd *Anacreonticks*, and in our Tongue are generally confin'd to the Meaſure of ſeven Syllables, or eight at moſt. The ſeven Feet Meaſure is the ſofteſt.

Phillis, *why ſhould we delay*
Pleaſure ſhorter than a day? Waller.

A charming *Anacreontick* by the Author of

Anger in haſty Words or Blows,
It ſelf diſcharges on its Foes.

a famous Poem on Love in the eight Syllable Meaſure. The Sonnet, or Song, varies its Numbers or Feet at the pleaſure of the Author, but commonly 'tis a *Quartrain* of Alternate Rhimes; the firſt Verſe of eight Feet, the ſecond of ſix.

Her Eyes are like the Morning bright,
Her Cheeks like Roſes fair,
Her Breaſts like water'd Lillies white,
Like Silk her flowing Hair.

Elegy is a Poem invented to complain of Miſfortunes of all kinds, but eſpecially to mourn the Death of Friends, or the Cruelty of a Miſtreſs. The Paſſions of Grief and Deſpair ſhould predominate.

nate. The Numbers and Sentiments ſhould be ſoft and ſweet, the Meaſure, *Heroick Verſe* as moſt ſolemn. *Point* the diſtinguiſhing Character of *French* Wit, ſhould be baniſh'd as being contrary to *Paſſion.* *Ovid* and *Tibullus* are the Patterns of this kind of Writing. *Voiture* and *Sarraſin* in *France* wrote Elegies with Succeſs. In *England* we have none that deſerves naming, but ſome few Tranſlations, as this taken out of the Elegy of *Gallus.*

Henceforth farewell the Lovers ſoftning Joys
The Warbling Lute, ſoft Pipe and mellow Voice,
Farewell! Tho' Muſick be the Food of Love
No Tuneful Numbers can my Paſſion move.
The Sparkling Juices tho' by Beauty Crown'd
Are hurtful grown, and muſt no more go round,
Nor Artful Meaſure beat the burthen'd Ground;
The Savage Game no more Delight can yield,
Farewel the Manly Pleaſures of the Field.

By Elegy the moſt underſtand Verſes written on the Death of People only; but any Poem made to complain of any Misfortune or Trouble whatſoever is of this Kind, which is Beautiful and Perfect only when it touches the Heart.

Il faut que le Cœur ſeul parle dans l'Elegie. Boileau.

The *Rondeau* is a ſort of Poem of as mean a Character as our *Anagram*, 'tis of *French* Original. A very great Wit of *France* [*Benſerade*] having turn'd *Ovid's Metamorphoſes* into *Rondeaus.* Ballad by the Name ſhould be of the ſame Deſcent; as alſo the Madrigal, which we know only by the Name of *Song.* The Epigram is more valuable, becauſe its diſtinguiſhing Character is Wit, and the Chief Beauty of it *Point.* 'Tis a meer lucky Hit if it proves well, and *Rimer* ſays that's ſo rare, that 'tis ſufficient to have made one in a Man's Life. *Point* is hardly tolerable in any ſort of Poetry but this,

As Old as the World, yet an Infant is Love;
Tho' the leaſt of the Deities greater than Jove.
He fills with his Fire, the Earth, Seas and Skies;
Yet Cloe *contains the whole God in her Eyes.*

This hopping Meaſure is not ſo proper for *Epigram* as for

Satyr, which brings us to that Part of Poetry. By Satyr is not meant thoſe wretched Libels and Lampoons which ſome Infamous Scriblers diſperſe daily againſt the Reputation of Particular Perſons without Reaſon or Provocation; but that juſt Reſentment of Publick and General Follies and Crimes, which, according to Mr. *Rimer, may make Satyr of great Advantage to the State when taught to keep within Bounds.*

Fools and Knaves hate to ſee their Pictures; and tho' Knavery and Folly be drawn abſtractedly, yet each Fool and Knave takes a Cap to himſelf, which makes it dangerous to meddle with this Muſe.

A Man ought not to write *Satyr* but with his Sword in his Hand, and that's not often enough; for Aſſaſſinating has been heard of out of *Italy.* Truth ſtrikes too cloſe, and he who is a Friend to her muſt be an Enemy almoſt to every thing elſe. *Horace, Juvenal* and *Perſius* are the Satyriſts of the Ancients; *Boileau* the moſt Famous among the Moderns. The Lord *Rocheſter* had a fine Genius for Satyr, and had he Cultivated it, he wou'd have been too hard for *Boileau.* *Oldham* got a great Reputation by his *Satyrs*; but he did not come near *Dryden*, whoſe *Abſalom* and *Achitophel* is a Maſter piece. *Dryden* was as Good a *Satyriſt* as ever wrote, and laſh'd home when he took the Rod in his Hand, for which he was himſelf drubb'd, it being much eaſier for a Coxcomb to hire a Parcel of Fellows to beat a Man, than to vindicate himſelf againſt Juſt Satyr, which is only Juſt when 'tis General; or if Particular, ſo contriv'd as to be of General Uſe. It muſt be True or 'tis a Libel, and accountable to the Law: It ſhould be ſtrong to ſtrike powerfully, and the Stile and Manner be Manly and Smooth, as theſe following Verſes by Mr. *Dryden* againſt Popery.

Such Sav'ry Deities muſt needs be good
As ſerv'd at once for Worſhip and for Food.
They rak'd for Converts even the Court and Stews.
——————— *but who can know*
How far the Devil and Jebuſites can go.
If Written Words from Time are not ſecur'd
How can we think have Oral Sounds endur'd.
Abſ. *and* Achit.

Mr. *Dryden* againſt the Church of *England.*

A Lyon Old, Obſcene and Furious made
By Luſt Compreſt her Mother in a Shade,
To Foreign Lands no Sound of her is come
Humbly Content to be deſpis'd at home.
Hind *and* Panther.

We might carry on theſe Inſtances much farther, but we are not fond of ſhewing our Reading or Induſtry when there's no immediate Occaſion. No Gentleman can have a Judgment of a Thing any way ſo well as by Example, which was the Reaſon we have made ſo many Quotations. Beſides, we live in an Age which, perhaps like other Ages before, will not endure Opinion to paſs for Authority, unleſs it has the Sanction of ſome Illuſtrious Name. There's none of greater Luſtre than Mr. *Dryden's*, notwithſtanding the Inconſtancy both of his Judgment and Principles. He was the beſt Poet for Verſification in any Age ſince the *Auguſtan*, and his Faults were not ſo much Error in Knowledge as in Fancy and Humour.

We have another ſort of Verſe very proper for Satyr call'd *Burleſk*, a Word borrow'd of the *Italians.* *Butler* the Author of *Hudibras* brought it to Perfection: In his Mock Heroick Poem his Rhimes are ſo odd that they contribute to the Jeſt, and in that our Language is inimitable. 'Tis impoſſible to tranſlate

When Pulpit Drum Eccleſiaſtick
Was beat with Fiſt inſtead of a Stick.

A Man can't read that Couplet without Laughing at the Waggery of it if he Rhimes it; for when 'tis read *Inſtead of a Stick*, the Jeſt is loſt and the Verſe a miſerable one. There have been ſeveral Mock Heroick Poems, as the *Secchia Repita*, the *Lutrin*, &c. but the Meaſure was Heroick; whereas not only *Hudibras's* Fable, but his Rhimes, his Feet are Humorous and Comical. Of all his Imitators, My Lord *Dorſet* came neareſt to him in ſome ſhort Things of his Doing. Thouſands have endeavour'd to imitate him but cou'd never come up to him. If they cou'd make a Pitiful double Rhime or two jumble together at the End of Verſes they thought they had done well. Mr. *Cotton* of *Derbyſhire* attempted ſomething in this Kind and came off pretty well; but Nobody ever reach'd *Butler*, at leaſt in ſome Parts of his *Hudibras*, for 'tis far from being equal in e'ery *Canto*. One may ſay of him, what *Dryden* ſaid of *Milton*, That he's heavy for two or three hundred Lines together ſometimes; and if ever we ſhould ſee the Manuſcript Poem of his that is in the Hands of a Gentleman of the Inns of Court, we may probably be diſappointed in our Expectation of it. We have been told by Perſons who have ſeen it, that he wrote it in Diſguſt, and turn'd the *Satyr* on the Party who were his Heroes in *Hudibras*; for *Butler's* Fate was like that of his Brethren of Merit, to be applauded and yet neglected. *Dryden* ſays of him, by way of reflecting on the Church,

Unpity'd Hudibras, *Your Champion Friend,*
Has ſhewn how far your Charities extend.
Hind *and* Panther.

Several Men of Quality have written ſome little Papers of Verſes in this way with Succeſs, as the late Mr. *Walſh* and others, both dead and living; which Verſes are to be met with in the Miſcellany Collections. *Burleſk* is proper for Lampoon, if Lampoon may be at any time proper; but 'tis a Gift of Verſifying, which is harder to be acquir'd than the moſt Harmonious and Beautiful. The more the Feet hobble in moſt Places the more Perfect is the Meaſure. We can't ſay the Harmony, for whoever write Burleſk think that the leaſt Part of their Poetry.

Thus we have gone thro' all the ſeveral Kinds of *Poetry* in Uſe among us, except what ſome Old Faſhion'd Bards and ſome Boys at the College are fond of, *Acroſtick* and *Anagram*, which however are not much viler than the *French Bouts-rimer*, a Diverſion, that took up the Court Wits of *France* Fifty Years ago, ſo much that we have *Bouts-rimer* of *Voiture* and *Sarraſin*, tho' the latter wrote a Mock Heroick Poem againſt them, call'd *Dulot Vaineu*. The Way was to give Ten, Twelve or more Rhimes for Couplets, and the Poet was to fill them up, as ſuppoſe

Love *Fair* Cloe *you believe I* | *Love*
Move *And yet I can't your Pity* | *Move,*
Coy *Weary at laſt of being* | *Coy*
Joy *You'll covet when you're paſt the* | *Joy.*

But in this Trifling way of Verſifying the Myſtery was to make the Words have as little Agreement with one another as poſſible, as

Cold — Tho' Your Heart be ne'er ſo — Cold
Gold — He'll heat it 'till it melts with — Gold.

As much as we have trifled in *Engliſh* Poetry we have had nothing like this, for *Anagram* and *Acroſtick* were in Vogue abroad as well as here, and no where us'd but by mean Poets, and no where lik'd but by the Rabble.

We are very ſenſible that this Treatiſe might have been more *Regular* and *Perfect*. As to the *Regularity*, 'tis the Nature of an *Eſſay* not to require it; and as to *Perfection*, beſides Incapacity to reach it, Room was wanting, and we thought *Rules* might be better ſpar'd than *Examples*.

'Tis a hard Task to write on Poetry or in Poetry, it being a Science in which almoſt every Mortal living thinks himſelf a Judge, tho' he dares not paſs his Opinion on a Piece of Clock-work, or any much meaner Performance in Mechanicks. All Men pretend to Wit, and think they are Entitled to judge of what they poſſeſs. They taſte, 'tis true, only as directed by Party, Intereſt, Friendſhip or Malice, by which only they like or diſlike.

'Tis eaſy to find fault, but difficult to diſcover Beauties; he who can do it muſt have a Part of the Genius which produc'd them. By this means the World is crowded with Criticks, who can tell when they ſee a Blot; but when any thing is happily executed, they paſs it over thro' Envy, but oftner thro' Ignorance, for the Ignorant are, and ever were the Majority, and thoſe who know leaſt muſt ſevere, as Mr. *Dryden* aſſures us by Experience.

For he more fears like a preſuming Man
Their Votes who cannot judge, than theirs who can.

RHETORICK.

RHETORICK.

RHETORICK, as the Word ſhews, which is originally *Greek*, ſignifies *The Art of Speaking*. The Common Idea of Rhetorick is, that thoſe who underſtand it are capable of Perſwading, that is, to ſpeak ſo that they may engage ſuch as hear them to think as they do. For this reaſon there are ſome who define Rhetorick to *be the Art of well Speaking for Perſwaſion*. But the *Art of Speaking* ſeems to be ſufficient to define it, and the Addition of *for Perſwaſion* to be uſeleſs. We have treated of Words in our Diſcourſe of Grammar, and ſhall therefore ſay nothing of 'em here, tho' they are to be conſider'd as the Foundation of Rhetorick; which Art is divided into Five Parts, *Invention*, *Diſpoſition*, *Elocution*, *Memory*, and *Pronunciation*. That is, in order to perſwade, the Perſon who wou'd engage thoſe that are of contrary Sentiments to embrace his, muſt put his Thoughts in order; and after having made this Diſpoſition of what he invented in his Mind, make uſe of proper Words to communicate the Thoughts he has conceiv'd; he muſt retain in his Memory what he writes down, to pronounce it afterwards. When one defends a Truth, if it were not for Intereſt, Paſſion or Humour, there wou'd be no need of any thing but good Proofs, the Light of which diſperſes all the Obſcurity that hides it: But ſince Mankind generally are no great Lovers of Truth, at leaſt thoſe who are byaſs'd by Humour, Paſſion and Intereſt, if we wou'd perſwade them againſt any thing that ſhocks their Inclination, Reaſon only will not ſuffice, we muſt make uſe of Addreſs. In the firſt place we muſt ſtudy that Inclination and Humour to engage them to hearken to us; In the ſecond place, ſince every one judges according to his Paſſion, that a Friend is always in the right, and an Enemy in the wrong, we muſt raiſe thoſe Emotions in them that may incline them to our ſide. To which, the Maſters of this Art aſſign three Means in order to perſwade, Arguments or Proofs, Manners and Paſſions. They teach, that Proofs muſt be found out, that one muſt ſpeak conformably to the Inclination of thoſe we would gain over to us, that ſuch Paſſions ſhould be mov'd in them as are proper to incline them to that ſide whither we wou'd lead them, which brings us to

Invention, which is the firſt Part of Rhetorick. Clearneſs is the diſtinguiſhing Character of Truth; none can doubt of a Truth that's clear; no Body dares deny that the Whole is not greater than its Part, and that all the Parts are not equal to the Whole: Sometimes Men may turn away their Eyes not to ſee the clear Truths that ſtrike them, but when their Luſtre, in ſpite of all their Endeavours, reaches them, they muſt own it, and the Tongue cannot bely the Underſtanding. To convince thoſe that diſpute any Propoſition with us, becauſe it ſeems doubtful and obſcure, we muſt make uſe of ſeveral Propoſitions which admit of no difficulty, and then ſhew that the Propoſition in diſpute is the ſame with thoſe that are indiſputable. The Judges at *Rome* were doubtful, whether *Milo* had committed a Crime in killing *Clodius*, but did not doubt at all whether it was lawful to expel Violence with Violence. *Cicero* therefore, to prove the Innocence of the Perſon accus'd, did it only by theſe two Propoſitions, *One may kill him, who wou'd take away our Lives from us.* Milo *might kill* Clodius, *who wou'd have taken away his Life.* The one is clear, the other obſcure; one conteſted, the other receiv'd, and by conſequence the one being inconteſtable, the other ought to be the ſame. The Matter of the Art of Perſwaſion is not limitted; it appears in the Pulpit, at the Bar, in all Negotiations, in all Converſation; in a word, the End that we propoſe to our ſelves in the Commerce of Life, is to perſwade thoſe with whom we converſe, and bring 'em to our Sentiments. Wherefore, to be a Perfect Orator, and ſpeak to the purpoſe on all Subjects whatſoever, a Man muſt be Maſter of almoſt all ſorts of Knowledge, eſpecially every thing that relates to the Matter he has in hand. For the help of *Invention* in Oratory, the Orators have found out certain, ſhort and eaſy Methods to ſupply them with Arguments to diſcourſe properly on all Subjects, even ſuch as are entirely unknown to them. They diſtribute theſe Methods into certain Claſſes, which they call *Common Places*, and which the Logicians make a part of what they call *Topicks*. Common Places are general Advertiſements, which help all that conſult them, to remember all the Ways by which any Subject may be conſider'd. There may be a hundred ſeveral ways of conſidering a Thing. However, the Authors of the *Topicks* have been pleas'd to ſettle ſixteen *Common Places* only.

The firſt is the *Genus*, that is, one muſt conſider in any Subject what there is in it common with all other ſuch like Subjects; if we were to talk of a War againſt the *Turks*, we may conſider War in general, and draw Proofs from the generality.

The ſecond *Place* is *Difference*, one muſt examine what there is Particular in every Queſtion.

The third is *Definition*, that is, we ſhould conſider all the Nature of the Subject; for every Diſcourſe which expreſſes the Nature of a Thing, is the Definition of that Thing.

The fourth *Place* is the *Diviſion* or *Diſtribution* of the Parts contain'd in the Subject treated of.

The fifth is the *Etymology* of the Subject, ſhewing the Original and Signification of its Name.

The ſixth is *Conjugation*, which are Words that have Relation to the Name of the Subject, as that of Love has Relation to all theſe other Words, as to Love, Lovely, Loving, Loved, &c.

The ſeventh is *Similitude*, or the comparing two or more Things together.

The eighth, *Diſſimilitude*, or the diſagreeing of two or more Things in particular.

The ninth is *Contraries*, or Things which cannot both at the ſame time agree with one and the ſame Thing.

The tenth is *Oppoſites*, or Things which cannot agree alone.

The eleventh is *Compariſon*, or comparing one Thing with another. 'Tis of great importance to examine well all the Circumſtances of the Matter propos'd, what went before it, what are join'd to it, and what came after, diſtinguiſh'd in this Art by the Terms of *Antecedents*, *Adjuncts*, and *Conſequents*, which are the twelfth, thirteenth, and fourteenth Common Places. All the Circumſtances of an Action are generally compriz'd in this Verſe,

> *Quis*, *quid*, *ubi*, *quibus Auxiliis*, *cur*, *quomodo*,
> *quando.*

That is, we muſt examine who was the Author of the Action, what the Action was, where it was done, by what means, why, how, and when.

The fifteenth *Common Place* is the *Effect.*

The ſixteenth the *Cauſe.*

We muſt have regard to the Effects, of which the Thing treated of was the Cauſe, and to the Thing, of which it was its ſelf the Effect.

Theſe *Common Places* wou'd doubtleſs furniſh one with ample Matter for a Diſcourſe. The different Conſiderations of a Subject, will produce ſeveral Proofs; and this Method is enough to make the Invention of the moſt barren Underſtandings fruitful. By this we are taught, that if one was to ſpeak againſt a Parricide, we ſhould firſt enlarge on Parricide in general, and then report what it has in common with the Criminal. After this, the Circumſtances of the Parricide muſt be laid open, and its blackneſs fully repreſented, by Definitions, Deſcriptions, Diviſions; ſometimes the Etymology of the Name of the Thing ſpoken of, and the other Words that have relation to it, will give an occaſion of ſpeaking, and finding out good Proofs or Arguments. As in Theology, a Divine may make a large Diſcourſe of the Obligations that Chriſtians lye under to live religiouſly, by making them remember the Name they bear. Great Diſcourſes are lengthen'd out by Similitudes, Diſſimilitudes, Compariſons, which illuſtrate a Thing that's obſcure; in a word, the Circumſtantiating one Action with Antecedents, Adjuncts, and Conſequents, are ſometimes uſeful, and ſometimes alſo will rather tire than perſwade the Auditors.

As there are *Common Places*, ſo there are *Proper*, that is, ſuch as are proper only to certain Subjects. Before we Treat of the latter, we muſt obſerve there are two ſorts of Queſtions or Diſcourſes, a *Theſes* and *Hypotheſes*. A *Theſes* is a Queſtion which is not determin'd by any Circumſtance, either of Place, Time or Perſon, as if we ought to make War. An *Hypotheſis* is a Queſtion determin'd and circumſtantiated, as if we ſhould make War with the *Turks* this Year in *Hungary*. Theſe Queſtions are divided into three kinds, *Deliberative*, *Judiciary*, and *Demonſtrative*. For we deliberate whether we ought to do a Thing, or examine what Judgment ought to be made of it, or praiſe, or condemn it, each of theſe kinds has its *Proper Places*. There are, as has been ſaid, certain Advertiſements for each of 'em. As for the *Deliberative*, if one wou'd adviſe another to undertake a Thing, or give it over, he ſhould ſhew that it is uſeful or unuſeful, neceſſary or unneceſſary, poſſible or impoſſible; that the Event will be advantageous or prejudicial, that the Undertaking is juſt or unjuſt.

A Queſtion in the *Judiciary* kind, may be conſider'd in one of theſe three Conditions; either we do not know the Author of the Action treated of, and then becauſe we endeavour to diſcover that Author by Conjecture, that Condition is call'd the Condition or State of *Conjectures*: If the Author is known, we examine the Nature of the Action; as for Example, a Thief ſteals a Trunk out of a Temple, depoſited there by a private Perſon; we examine whether that Action ought to be call'd Sacrilege or a Theft, and ſeek for a Definition of the Crime: Thus this Condition is call'd the *State of Definition.* The third is call'd that of Quality, becauſe we examine the Quality of the Action, whether juſt or unjuſt.

As to the firſt Condition, we muſt conſider whether he, who we ſuſpect to have done the Action, cou'd do it, and whether we have any Token of it; then what his Diſpoſition may be, whether he had any Intereſt in doing it, his Power and Means to do it. One may find out whether he was really the Author of the Action propos'd, by the Circumſtances of it, as if he was found alone in the Place where it was done; if before, or after the doing it, he did or ſaid any thing that might give reaſonable cauſe of Suſpicion. As for the ſecond Condition, we muſt only conſider the Nature of the Action; and Reaſon, Laws, Cuſtoms, Agreements, Equity, &c. are to direct one in the *Third.*

In the *Demonſtrative* kind, to praiſe or condemn, we muſt report the Good or Evil of the Subject in hand. In Man there are three ſorts of things that may come under the Denomination of Good; the one relates to the Body, the other to the Mind, the other depends upon Fortune. This Treatiſe might be enlarg'd by entring into the Detail of theſe and other Matters relating to *Rhetorick*, but it will not anſwer the Intention of this Deſign; which, as has been, and will be often hinted, is only to give Gentlemen ſuch Idea's of the Sciences, that they may know them when they ſee them, and diſtinguiſh the one from the other.

We come now to the ſecond Part of Rhetorick, which is *Diſpoſition*, in order to perſwade, the Auditors muſt liſten favourably to what they ſhall hear, which is the firſt Thing to be done; the ſecond is to give them ſome Knowledge of the Affair that is treated of, that they may know what we are upon. We muſt not only bring Proofs of our own, but deſtroy thoſe of the Adverſary; and in a Diſcourſe of length, 'tis neceſſary to ſum up all in a few Words at the end. Thus, an Oration is divided into five Parts; the firſt is call'd an *Exordium*, or Entrance; the ſecond, the Narration or Propoſition; the third, the Confirmation, or Proofs, to confirm the Truth of what has been ſaid; the fourth, Refutation, or deſtroying the Evidence brought by the Enemy againſt the Truth defended; the fifth, the Concluſion, or Recapitulation.

The Orator ought to propoſe three Things to himſelf by the *Exordium*, to gain the Favour, Attention, and Docility of the Auditory. The way to gain their Favour, is to give them evident Signs, that we talk out of a pure Zeal for the *Truth*, and a Love for the Publick Good; we draw their Attention by putting what is moſt noble and ſhining in the Subject we ſpeak of in the *Exordium*. An Auditor becomes docile when he likes the Speaker, and is attentive. When 'tis ſaid that an Orator ſhou'd draw the Attention of the Auditory by placing the moſt noble and ſhining Parts of his Subject in the *Exordium*, it muſt be done with Modeſty, and without Affectation. And he muſt be ſure not to take a Tone which he cannot hold in, nor one that's above the Subject; the Conſequences of which will be pernicious to his Diſcourſe, and ridiculous to himſelf.

Quid dignum tanto feret hic promiſſor hiatu?
Parturiunt Montes. Naſcetur Ridiculus mus.

Orators ſometimes come to the *Propoſition* without any *Exordium*, and that is to be done only when the Juſtice of the Cauſe defended appears in what is propos'd. If a Queſtion only is to be handled, 'tis ſuſpicious to propoſe it in a few Words. If 'tis an Action, it ought to be related with all the Circumſtances that are true, for falſe and invented ones will injure the Truth of the Action. As to the *Confirmation* or Proofs; The Rules for managing of them, are as follow: Firſt, the Orator ought to conſider the Subject he is to ſpeak of, throughly examining every part of it, that he may the better find out which way he may ſhew the Truth, or diſcover the Falſhood with moſt effect. This Rule requires a great Extent of Underſtanding to put it in Practice.

The ſecond relates to the Clearneſs of the Principles, on which he founds his Argument.

The third to the Connexion between thoſe Principles, and the Conſequences drawn from them. In managing of Arguments, the Rhetoricians generally adviſe us to place the ſtrongeſt firſt, the weakeſt in the middle, and reſerve ſome of the ſtrongeſt for the end: The natural Order that ought to be obſerv'd in the Diſpoſition of Arguments, is to place them ſo that they may ſerve for ſteps, by which the Auditors may arrive at the Truth.

Refutation does not require any particular Rules, when a Man knows how to prove a Truth, he will eaſily diſcover Error, and refute it. As to what has been ſaid concerning Principles and their Connexion, with the Conſequences drawn from them, it ought to be remember'd in examining the Falſhood of the Adverſary's Principles.

The *Concluſion*, or Epilogue, ſhould conſiſt of a Recapitulation of the Subſtance of the Diſcourſe, that it may be kept freſh in the Minds of the Auditors, who will often be diſtracted in their Thoughts by the Number and Variety of the Things they hear. The manner of ſumming up the Subject-Matter of an Oration, in a few Words at the Cloſe, will be beſt learn'd by reading the Orators, eſpecially *Cicero*, who particularly excell'd in his Epilogues, where he collected together, with the greateſt Art and Addreſs, what had been ſcatter'd up and down in his Orations.

There remain only three Parts of this Art to be diſcours'd of, as *Elocution*, or the manner of expreſſing Things after their Invention and Diſpoſition, *Memory* and *Pronunciation*. 'Tis true, ſome Rhetoricians, but of the weaker ſort, divide the Art of Rhetorick into *Elocution* and *Pronunciation* only. To which they add *Invention* and *Diſpoſition*. They might have as well divided *Heroick* Poetry into *Diction* and *Numbers*: To which it was not thought improper, as it has been phras'd, with Reſpect to Rhetorick, to add *Fable* and *Action*. The Elliptical Fables, publiſh'd in *France*, gave riſe to this notable Diviſion, but *Elocution* has ſince been reduc'd to a lower degree, and has now the honour only to ſtand foremoſt in the laſt Claſs of the Parts of the Art of Rhetorick.

However, *Elocution* is that which, like the *Diction* of *Poetry*, ſooneſt affects the Auditor; and he who cannot judge of the Invention and Diſpoſition, will determine as to the goodneſs or badneſs of the Expreſſion: For Eloquence is a Gift, which tho' few enjoy, there are few who think they want it.

The Perfection of *Elocution*, conſiſts in apt Expreſſions, and a juſt and beautiful Order of placing of Words: To which may be added an harmonious Ear to form a Muſical Cadence, which has no little effect on the Operations of the Mind. It will not be expected that we ſhould here enter into a Diſſertation on the Organs of the Voice, and the Formation of Words, or the Abundance and Variety of Terms in all Languages, and eſpecially in our own, more fruitful in the ſublime Parts of Eloquence, than thoſe that boaſt moſt of their Fertility, by the Confeſſion of Monſieur *Coſte*, in the Preface to his Tranſlation of Mr. *Lock*'s Eſſay upon Humane Underſtanding into *French*. Neither will it be neceſſary to ſay more of Grammar than has been ſaid. But as to the ordering and placing of Words, *Pere Lamy* in his *Rhetorick*, ſays, *Pour l' ordre des Mots, & les Regles qu il faut garder dans l' arrangement du diſcours*, &c. As to the Order of Words, and the Rules that are to be obſerv'd in the ranging of a Diſcourſe, natural Light ſhews ſo lively what is to be done, that thoſe who will follow it cannot err. This natural Light however is Genius, a Gift of Heaven, with which but few are endow'd; for without it there will be Diſorder, Poverty, or Stiffneſs, and nothing of that Elegance which Charms the Ear, and perſwades the Mind. Having mention'd this moſt ſhining part of *Elocution*, let us report what the abovemention'd *Pere Lamy* ſays upon it. " The fineſt Expreſſions become mean, when they " are prophan'd by the uſe of the Populace, who " apply them to mean Things. Thoſe who write " Politely, carefully avoid any Terms defil'd by " the Vulgar; and this is in part the occaſion of " the continual Change in Language.

Ut Sylvæ foliis pronos mutantur in Annos,
Prima cadunt, ita verborum vetus interit ætas,
Et juvenum ritu florent modo nata, vigentque.

" Perſons of Quality and Men of Learning raiſe " themſelves above the Populace, and avoid ſpeaking like them, *&c.* But beſides, the care of " keeping to the Laws of Cuſtom which reigns in " Language; and to ſpeak pure, it muſt be confeſt, that that which raiſes thoſe we admire above " the common ſort, is a certain Art, or rather a " Happineſs they poſſeſs of finding rich and ingenious Phraſes to expreſs their Thoughts." This Art, or rather Happineſs, what we call Tallent, which was never perfectly acquir'd without a Gift of Nature. For he goes on, " With a little " Care and Study one may eſcape the Cenſure of

“ the Criticks, but cannot pleaſe but by a Happi-“ neſs, which is very rare.” What fault is there to be found in the following Words, *'Tis to* Cadmus *that* Greece *owes the Invention of Letters; 'Tis of him that ſhe learn'd the Art of Writing.* We cannot find any thing blame-worthy in this Expreſſion, but we are charm'd to hear the ſame Thing expreſs'd in another noble and ſenſible manner.

From him we that ingenuous Art deriv'd,
Of painting Words and ſpeaking to the Eyes;
By him to trace thoſe various Figures taught,
Which Colour to our Thoughts and Body give.

This Choice of Rich and happy Expreſſions is what we call *Elegance*; but beſides this, to render a Diſcourſe Elegant, 'tis neceſſary we ſhou'd ſhew that Eaſineſs which is to be ſeen in Beautiful Statues, and in *Latin* is term'd *Elegantia Signa*. This Eaſineſs conſiſts in making uſe of Natural Expreſſions to avoid ſuch as ſeem affected, and diſcover the Pains the Orator was at to find them.

Theſe ſhort Reflections on *Elegance* can never be thought a Digreſſion in an Eſſay upon *Rhetorick*.

Elocution is generally divided into Two Parts, *Trope* and *Figure*. When we make Uſe of a Word to ſignifie a Thing which is not proper to it, and which Uſe has apply'd to ſomething elſe, That Manner of Expreſſion is Figurative, and thoſe Words which are carry'd from a Thing which they ſignifie properly, to another which they ſignifie but indirectly are call'd

Tropes, as much as to ſay Terms that are Chang'd and their Uſe Inverted. The Word *Trope* being deriv'd from the *Greek* τρέπω *Verto*. *Tropes* ſignifie the Things to which they are apply'd only on Account of the Connexion and Relation which thoſe Things have to thoſe whoſe Proper Names they are. For which Reaſon we may reckon as many ſorts of *Tropes* as we can denote different Relations; but the Chief *Maſters* of the *Art* have been pleas'd to Eſtabliſh a very few only, as a

Metonymie, which is put firſt becauſe 'tis a Trope of the greateſt Extent, and contains ſeveral other ſorts in it. The Word ſignifies one Name for another; every time that we make Uſe of any Name but that which is proper, ſuch an Expreſſion is a Metonymie, as Cæſar *ravag'd the* Gauls, *Every body reads* Cicero, London *is alarm'd*. 'Tis plain that *Cæſar* properly ſhould have been *Cæſar's* Army, *Cicero*, *Cicero's* Works, *London*, the Citizens of *London*. We ſhall give a brief Account of 'em all.

A *Synecdoche* is the Name of the Whole for the Part, or of the Part for the Whole; as when we ſay, *the Plague is in* England, *tho' it be but in* London, or, *'tis in* London, *tho' it be in all* England. To this Figure belongs the Liberty that is taken to Name a certain Number for an uncertain, as, *ſuch a Houſe has a hundred fine ways to it*, becauſe it has ſeveral; or when any one is ninety nine Years old and above, we ſay he's a *hundred*.

An *Antonomaſia* is a Kind of a Metonymie, as is a Synecdoche, as when we apply the Proper Name of One Thing to ſeveral others; or on the contrary apply a Name Common to ſeveral, to a particular one. Thus a Voluptuous Man we call a *Sardanapalus*, and ſay of *Cicero*, The Orator ſays ſo; Now Orator is a General Name, for all of that Profeſſion apply'd to a particular Perſon, and *Sardanapalus* to any Voluptuous Man, becauſe the King of that Name was ſo.

A *Metaphor* is when we put a Foreign Name for a Proper Name, borrow'd from ſomething like that we ſpeak of, as, *Kings are term'd the Head of their Kingdoms*, becauſe the Head is the Chief of all the Members of the Body.

An *Allegory* is when in Speeking we ſeem to ſay ſomething very remote from what we intend, as the Etymology of the Word ſhews, and this Example taken from a Deſcription of the Effects of Grace.

'Tis Grace that bound by her Eternal Laws
Sows in our Minds the Seeds of Saving Faith,
That gives it Root, and by her kindly Flames
New Buds produces in our Souls—— *'Tis ſhe*
That watches from on high and feeds its Wants,
That ever guards and makes it ever grow.
She's careful that no Weeds nor Storms ſhould hurt
The Growing Sprouts, nor choak the Seed Divine.
No Wind of Complaiſance, &c.

Let not the Reader think this Example too ſerious for him; It lay in our Way, and we could not have found a better.

A *Litotes* or Dimunution, is a Trope by which we ſay leſs than we think, as, *I can never praiſe you enough, I ſhall never be able to make you amends.*

An *Hyperbole* is a Trope by which Things are repreſented either Greater or Leſs than they are, as, *He goes ſwifter than the Wind, he creeps ſlower than a Snail.*

An *Irony*, by which we ſpeak the quite contrary to what we think, as when we ſay of a Known Rogue. *He's very honeſt*; and of a Woman of a Lewd Character, *She's wondrous chaſte.* The Tone of the Voice in Pronouncing Ironies, is generally the Chief Sign of this Trope.

A *Catachreſis* is the Freeſt Trope of all, as when we take the Liberty to borrow a Name quite contrary to the Thing we wou'd ſignifie, as a *Silver Inkhorn* in our Language, and *un Cheval ferrè d' Argent*, an Horſe Iron'd, as the *French* call it, with Silver, inſtead of Shoo'd. Theſe are the Chief *Tropes*, and it remains only to ſpeak a Word or two of the Uſe of them. 'Tis particularly in *Tropes* that the Riches of a Language conſiſt. And as too much Riches often breed Diſorders in Governments, ſo too many Tropes will occaſion abundance of Faults in a Diſcourſe. They ſhould never be employ'd but to expreſs ſomething which could not be ſo well expreſt in the Common Terms; and when Neceſſity obliges the Uſe of them, they muſt be clear and proportionated to the Idea of which one would give an Image. When Tropes are far fetch'd they are obſcure. As if we ſhould ſay, *A Brothel is the Syrtes of Youth*, we cannot find out the Senſe of this Metaphor, till we call to Mind that the Syrtes are dangerous Sands on the Coaſt of *Africa*. Metaphors ſhould be taken from Things which are ſenſible, which the Eye often meets with, and of which the Mind will form an Image without ſearching after it. Tropes ſhould not be us'd too often, for the multiplying 'em is a great Occaſion of their Obſcurity. The Neceſſity of uſing Tropes has been hinted before. If I would give an Idea of a Rock of an extraordinary Height, the Terms Great, High, Elevated, which are given to Rocks of a Common Height, will not do; but if I ſay Rocks which *threaten the Skies*, the Idea of the Skies, which are above all the reſt of the Productions of Nature; and the Idea of Threatning, which agrees with a Man that is above others, form an Idea of the Extraordinary Height of the Rocks, which could not be expreſt any otherwiſe than by this Hyperbole, in which we ſay too much for fear of ſaying too little. Great Care muſt be taken to temper your Expreſſions of this kind, and that there be always a Proportion between the Natural Idea of the *Trope*, and that which you wou'd infuſe into thoſe that hear or read it; eſpecially that the Trope does not beget one quite contrary to what you intended; by which, inſtead of pleaſing you provoke Laughter; as when a Metaphor gives ſuch a ridiculous Idea as this, *Morte Catonis Reſpublica caſtrata eſt*, The Common Wealth is gelt by *Cato*'s Death.

There are a thouſand ways of tempering any bold Expreſſion you have occaſion to make uſe of by adding ſuch ſoftning Terms as theſe, *If I may ſo ſay, To ſpeak more boldly.* Thus you prevent the Reader, by ſhewing you are careful of your Reputation.

Tropes well us'd are a Lively Picture of the Things treated of. When we call a Great Captain *the Thunder of War*, the Image of Thunder is a Senſible Repreſentation of the Courage and Power with which this Captain over-runs whole Provinces, of the Rapidity of his Conqueſts, and the Noiſe of his Fame and Arms.

Beſides, theſe Quick Expreſſions, foreign to the Subject which Uſe and Art ſupply us with, to be the Signs not only of the Emotion of our Thoughts but of our Wills, the Paſſions have a Particular Character by which they Paint themſelves in Diſcourſe. As we read in a Man's Countenance what paſſes in his Breaſt, by the Fire in his Eyes, the Frown in his Forehead, the Alteration of his Colour from Pale to Red, ſhew the Extraordinary Emotions of his Soul, ſo the particular Turns of a Diſcourſe, the Manner of Expreſſing ones ſelf different from what we ſhould obſerve in a perfect Tranquility of Mind, are Signs of the Agitation the Soul is under at the time of Speaking. The Paſſions cauſe us to think of Things otherwiſe than we do when our Minds are Calm and in Repoſe. They magnifie Objects, fix the Soul to them, and occaſion its being entirely taken up with them; for they almoſt make as much Impreſſion on it then, as the Things themſelves. The Paſſions often produce quite contrary Effects; they carry the Soul away with them, and bear it in an Inſtant thro' different Changes; they force it on a ſudden to leave the Conſideration of one Object to purſue another which they preſent to it; they precipitate it, interrupt it: In a Word, the Paſſions operate on the Mind of Man as the Winds do on the Sea; ſometimes they throw the Waters on the Shoar, ſometimes force them back again into the Boſom of the Deep, ſometimes lift them up to the Clouds, and ſometimes drive them down to the Center.

Words always anſwer our Thoughts; the Diſcourſe of a Man that's mov'd is never equal; ſometimes 'tis diffus'd and draws an exact Image of the Things which form the Object of his Paſſion; and he ſays the ſame after a hundred ſeveral Ways. At other times his Diſcourſe is ſhort, his Expreſſions maim'd, a hundred things are ſaid at once, the Thread is broken with Interrogatives, Exclamations, and interrupted with frequent Digreſſions. Theſe Turns and this manner of Speaking are as eaſy to be diſtinguiſh'd from the Common, as the Looks of a Man in a Paſſion are from thoſe when he is out of it. We eaſily ſee by what *Dido* ſays to *Æneas* after he had declar'd the Reſolution the Gods had oblig'd him to take to leave *Carthage*; that ſhe was mov'd in an extraordinary manner.

Falſe as thou art, and more than falſe, foreſworn;
Not ſprung from Noble Blood, nor Goddeſs born,
But hewn from harden'd Entrails of a Rock
And rough Hyrcanian *Tygers gave thee Suck.*
Why ſhould I fear, what have I worſe to fear?
Did he once look or lend a liſt'ning Ear,
Sigh when I Sigh, or ſhed one kindly Tear?
All Symptoms of a Baſe Ungrateful Mind
So foul, that which is worſe, 'tis hard to find.
Of Man's Injuſtice, why ſhould I complain?
The Gods and Jove *himſelf behold in vain*
Triumphant Treaſon, yet no Thunder flies,
Nor Juno *views my Wrongs with Equal Eyes,*
Faithleſs is Earth, and Faithleſs are the Skies.
Juſtice is fled, and Truth is now no more,
I ſav'd the Shipwrack'd Exile on my Shoar,
With needful Food his Hungry Trojans *fed,*
I took the Traytor to my Throne and Bed,
Fool that I was— 'tis little to repeat
The Reſt, I ſtor'd and rigg'd his ruin'd Fleet.
I rave, I rave, a God's Commands he pleads,
And makes Heaven acceſſary to his Deeds,
Now Lycian *lots, and now the* Delian *God,*
Now Hermes *is employ'd from* Jove's *Abode*
To warn him hence; as if the Peaceful State
Of Heav'nly Powers were touch'd with humane Fate.
But go; thy Flight no longer I detain,
Go ſeek thy promis'd Kingdom thro' the Main.
Yet if the Heavens will hear my Pious Vow,
The Faithleſs Waves, not half ſo falſe as Thou,
Or ſecret Sands ſhall Sepulchre afford
To thy proud Veſſels, and their Perjur'd Lord;
Then ſhalt thou call on Injur'd Dido's *Name,*
Dido *ſhall come in a black Sulphry Flame*
When Death has once diſſolv'd her Mortal Frame;
Shall Smile to ſee the Traytor vainly weep,
Her Angry Ghoſt ariſing from the Deep
Shall haunt Thee waking and diſturb thy Sleep.
At leaſt my Shade thy Puniſhment ſhall know,
And Fame ſhall ſpread the pleaſing News below.
Dryd. *Virg.*

Theſe Turns, which are Characters drawn out in the Mind by the Paſſions, are the famous Figures ſo much talkt of by the Rhetoricians, which they define thus; *Figures are Manners of Expreſſion diſtinct from thoſe that are Natural and Common*, which Definition being very plain, we ſhall proceed to the Uſe of Figures.

There are Three Reaſons that make them neceſſary in Diſcourſe; as Firſt when we make a Perſon ſpeak who is mov'd by any Paſſion. To Paint that Paſſion livelily we ought to introduce all the Figures that are proper, and give the Diſcourſe that Turn which a Perſon in the ſame Paſſion wou'd give it. The Second Reaſon is ſtronger, and a greater Proof of the Neceſſity of uſing Figures. You cannot touch another if you do not ſeem to be touch'd your ſelf.

——Si vis me flere, dolendum eſt
Primum ipſe tibi—— ——

Weep firſt thy ſelf, if thou wou'dſt have me weep.

None can obſerve we are mov'd, unleſs our Words expreſs ſome Emotion of the Soul. The Third Reaſon is ſtill more Conſiderable. Animals know how to defend themſelves, and acquire or preſerve the Strength that is uſeful to them. Such as believe they are not meer Machines, ſhew ingeniouſly that their Bodies are ſo organiz'd as without the help of a Soul to direct them; they can defend themſelves and fight for their Preſervation. We our ſelves Experience that our Members without the Participation of the Mind, diſpoſe themſelves in the moſt proper manner to avoid Injuries. The Body aſſumes the Poſtures that are proper to attack and defend; the Hands and Feet expoſe themſelves for the Preſervation of the Head; the Feet ſtand firm to ſupport the Body, and enable it to reſiſt the Efforts of the Enemy; the Arm extends itſelf, and the Hand clinches to ſtrike with Force; the whole Body plies, bends, gathers up together to avoid Blows or prevent falling; all this is done almoſt naturally and without any Reflection.

It muſt not be imagin'd that Figures in Rhetorick are only certain Terms invented by the Rhetoricians for the Ornament of their Diſcourſe. God has not deny'd to the Soul what he has granted to the Body. If the latter knows how to repel Injuries, the former can defend itſelf as well, and Nature has not made it immoveable. When 'tis attack'd, all the Figures which it makes uſe of in Diſcourſe when it is mov'd, have the ſame Effect as the Poſtures of the Body: If theſe are proper to defend it in Corporeal Attacks, Figures in Diſcourſe are as proper for the Defence of the Mind. Words are the Spiritual Arms of the Soul with which it perſwades or diſſwades. 'Tis impoſſible to tell all the different Poſtures which the Paſſions make the Body aſſume, and to expreſs all the Figures which Paſſions employ in turning and winding a Diſcourſe. We ſhall therefore ſpeak only of the moſt remarkable, and ſuch as are commonly treated of by the *Maſters* of this *Art*. The different Turns of Diſcourſe occaſion'd by different Paſſions and different Ways of Expreſſion are the Reaſons why the *Maſters* of the Art have given them different Names. The firſt that lies in our way is

Exclamation, plac'd at the head of the others, becauſe the Paſſions begin by her to ſhew themſelves in Diſcourſe; every Wave that's rais'd in the Soul is follow'd by an Exclamation. Men in Paſſion when they ſpeak are always crying out *Alas! Ah! Oh Heaven! Oh Earth*, &c. Nothing is more natural. We ſee, that aſſoon as an Animal is wounded or hurt, it cryes out as if Nature made him demand Aſſiſtance. The next Figure is

Doubt. The Motions of the Paſſions are not leſs Changeable and Inconſtant than the Waves of the Sea, by which means ſuch as abandon themſelves to the Violence of their Paſſions are in a perpetual Diſquiet, ſometimes they will, ſometimes they will not. They undertake a Thing, and then give it over; they approve and diſapprove almoſt at one and the ſame Time. This Irreſolution is the Figure which is call'd Doubt, and there's a Fine Example of it in *Virgil*, when *Dido* ſhews herſelf irreſolute what to do upon *Æneas*'s abandoning her.

Then thus ſhe ſaid within her ſecret Mind,
What ſhall I do, what Succour ſhall I find?
Become a Suppliant to Hyarba's *Pride,*
And take my Turn to Court and be deny'd?
Shall I with this Ungrateful Trojan *go,*
Forſake an Empire and attend a Foe?
Himſelf I refug'd and his Train reliev'd
'Tis true? But am I ſure to be receiv'd?
Can Gratitude in Trojan *Souls have place,*
Laomedon *ſtill lives in all his Race?*
Then ſhall I ſeek alone the Churliſh Crew,
Or with my Fleet their flying Sails purſue?
What Force have I, but thoſe whom ſcarce before
I drew reluctant from their Native Shoar?
Will they again embark at my Deſire,
Once more ſuſtain the Seas, and quit their ſecond Tyre?
Rather with Steel thy Guilty Breaſt Invade,
And take the Fortune thou thy ſelf haſt made.

An *Epanorthoſis* is when a Man in a Paſſion is never ſatisfy'd with what he has ſaid and done. The Warmth of his Emotion wou'd puſh him ſtill farther. Thus the Words he has made uſe of not ſeeming ſtrong enough, he condemns his faint Expreſſions as too weak, and Corrects his Diſcourſe by adding others that are ſtronger.

No, Cruel, thou wer't never Goddeſs born
A Tygreſs nurſt thee at her bloody Paps,
And dreadful Caucaſus, *who in a rage*
Begot Thee, harden'd, like his Rocks, thy Heart.

This Figure is *Greek*, and ſignifies *Correction*.

An *Ellipſis* is when a Man is in ſo violent a Paſſion that he cannot ſpeak all he would ſay. The Tongue is too ſlow to keep Company with it; and indeed Paſſion is beſt expreſt by Broken and Interrupted Expreſſions. The Father in *Terence* being enrag'd againſt his Son, ſays only, *Omnium, Of all Mankind*——His Choler abounded ſo he cou'd not finiſh what he was going to ſay, *Hominum peſſimus, thou art the Worſt*, is underſtood. An *Eillpſis* is the ſame thing in our Language as an Omiſſion.

An *Apoſiopeſis* is a kind of *Ellipſis*; 'tis when a Man Changes from one Paſſion to another, or gets out of all Paſſion on a ſudden, or breaks off his Diſcourſe ſo, that ſuch as hear him have much ado to find out what he means. This Figure conſiſts commonly in Threats, as *If I ſhould*—— *I'll*—— *But*——&c.

Quos ego — ſed motos præſtat componere fluctus.

An *Hyperbaton* is nothing but a Tranſpoſition of Thoughts and Words from the Natural Order of Diſcourſe. 'Tis ſometimes treated of as a Figure in Grammar, but ought rather to be taken Notice of as one that bears the Character of a ſtrong and violent Paſſion. Let us ſee how *Longinus* talks on the like Occaſion; " In Effect conſider well all " ſuch as are mov'd by Anger, Fear, Spite, Jealouſy, or any other Paſſion whatſoever; for there's " ſo many we cannot determine their Number: " Their Minds are in continual Agitation; they " ſcarce form one Deſign before they conceive " another, and in the midſt of that propoſe new

“ ones to themſelves, which have no Connexion
“ nor Relation to it, after which they often re-
“ turn to their firſt Reſolution. Paſſion is in them
“ like a light inconſtant Wind that drives and
“ turns them inceſſantly from one Side to another.
“ Thus in this perpetual Flux and Reflux of oppo-
“ ſite Sentiments, they Change Thoughts and Lan-
“ guage, every Minute, and obſerve neither Order
“ nor Sequel in their Diſcourſe.

A *Paralipſis* is a Feint, as if one wou'd omit what is ſaid, and a Feint that is very natural. When a Man is mov'd, Reaſons crowd in upon the Mind; he is deſirous to make uſe of all of 'em, but is afraid of being tireſome; and beſides, the Activity of his Agitation hinders his ſtopping at all of 'em. Thus he produces 'em all at once, making as if he did not ſpeak of 'em at all, that is, not ſtop to enlarge on every one as much as he might have done: as for Inſtance, *I will not mention*, Gentlemen, *the wrong my Enemy did me, I willingly forget the Injuries I receiv'd from him, and ſhut my Eyes to all his Machinations againſt me.* There's a fine Example of this Figure in the Epiſtle to the *Hebrews*, where the Apoſtle numbers up all thoſe who had been eminent for their Faith under the Diſpenſation of the Law. *And what ſhall I ſay more? for the Time would fail me to tell of* Gideon, *and of* Barak, *and of* Sampſon, *and of* Jephtha, *and of* David *alſo, and* Samuel, *and the Prophets.*

Repetition is a very Common Figure in Diſcourſes where Paſſion predominates. There are two ſorts of Repetition, the one is of Words, the other of Things.

Fame ſhall her Juſtice o'er the World proclaim
And fill the liſt'ning Nation with Applauſe.
Her Juſtice ſhall to all Mankind be known,
And ev'ry Tongue her wondrous Goodneſs praiſe.

Here the Things are treated of in other Words; the Repetition of the latter is as thus,

In Crowning him they Crown'd the beſt of Kings.

This Figure is not only moſt Beautiful but moſt Uſeful in Poetry, where the Repetition of the ſame Words may be diſpos'd with ſo much Art, that by anſwering to one another they may make an agreeable Cadence to the Ear.

A *Pleonaſm* is when we ſay more than is neceſſary, as, *I heard it with my own Ears.* It comes from a *Greek* Word which ſignifies *ſuperabound.*

A *Synonomy* is when we expreſs the ſame Thing by ſeveral Words, that have the ſame Signification, which happens when the Mouth is not ſufficient for the Heart, and then we make uſe of all the Words we can think of to expreſs our Thoughts, as, *abiit, evaſit, erupit,* He's gone, He's flown, He's eſcap'd.

An *Hypotypoſis* is when the Objects of our Paſſions ſeem to be before our Eyes, and we hear and ſee them tho' abſent.

—— *Illum abſens abſentem auditq; videtq;*

This often comes into Dramatick Poetry, and expreſſes Paſſions very lively.

See there to Heaven on Angels Wings he flies,
And leaves new Tracts of glorious Light behind.

This Figure is call'd *Hypotypoſis*, becauſe it paints Things, and forms an Image which ſtands inſtead of thoſe Things, as the Greek Word ſignifies. 'Tis a ſort of Enthuſiaſm, which makes one fanſie we ſee Things abſent, and repreſents them ſo ſenſibly to the Eyes of ſuch as hear it that they think they ſee 'em alſo.

Deſcription is a Figure ſomething like it, but is not ſo lively; it ſpeaks of abſent Things as abſent, but in ſuch a manner, that it makes a very ſtrong Impreſſion, as in deſcribing a Storm.

The Sky was all in horrid Night involv'd,
Thro' which blue Lightning, ſhot its baleful Fires;
The Thunder roar'd, and rent the trembling Shoars.
The foaming Billows now to Heaven were toſt,
And on a ſudden to the Center, ſunk.
The frantick Winds from every Quarter rag'd;
The Clouds diſcharg'd another dreadful Sea;
The Ship no more repell'd the warring Waves;
The Sailors in Deſpair, their Labour ceaſt,
And let the Veſſel with the Tempeſt drive.

Diſtribution, another kind of *Hypotypoſis*, is when we enter into the Particulars of the Object of a Paſſion, as when St. *Paul* ſays, *I have been ſcourg'd with Rods thrice, I have been ſtoned once, I have ſuffer'd Shipwrack thrice,* &c.

An *Antitheſis* is alſo call'd *Oppoſition*; all Antitheſes, or Oppoſitions, Compariſons, and Similitudes, are Figures proper to repreſent Things clearly, being the Effects of that ſtrong Impreſſion made on our Minds by the Object of that Paſſion with which we are animated, and of which we are conſequently qualify'd to Talk exactly and clearly. 'Tis known by every Body, that oppoſite Things make each other the more Perceptible; as any thing white looks whiter, if plac'd by any thing that's black. As for Example of the *Antitheſis*, the following Verſe is ſufficient.

He gain'd by loſing, and by falling roſe.

A *Similitude* is ſo well known, that there's no need of giving either Definition or Example of it.

As a tall Oak, the Monarch of the Woods,
Defies the Winter-Winds and Autumn-Storms,
And keeps his Head aloft to mate the Clouds:
So when the Prince with adverſe Fortune ſtrove,
Great in Diſgrace, and Conſcious of his Worth,
He kept his Courage firm, and reach'd the Throne.

A *Compariſon* is different from a *Similitude*, only in that the former is more warm. There are Two things further to be obſerv'd, with Reference to Compariſons: The Firſt is, that there's no need of ſeeking for an exact Agreement between all the Parts of a Compariſon, and the Subject ſpoken of, ſeveral things are taken in only to render the Compariſon more lively, as in that which *Virgil* makes of a young *Ligurian* kill'd by *Camilla*, with a Dove in the Claws of a Kite. After having ſaid what was the principal thing on which the Compariſon was made, he adds, *Tum cruor, & vulſæ labuntur ab æthere plumæ.*

'Twas not neceſſary to ſay the Blood was ſeen to flow, and the Feathers to fall, that was not in the Compariſon, and ſerves only to make a ſenſible Image of a Dove torn in pieces by a Kite. Our Author makes the ſecond Obſervation in favour of this admirable Poet, to defend him againſt the Criticiſms of thoſe who condemn his Compariſon as too mean. But he ſhews his Art in his *Æneids*; in taking his Compariſons from ſimple Things, he wou'd eaſe the Mind of the Reader, which the Greatneſs and Dignity of the Subject had employ'd with too much Application. And to be ſatisfy'd that this was his Deſign, one need only read his *Georgicks*, where the Compariſons are on the contrary great and ſublime. We cannot ſuſpect that this Reflection will be thought an unneceſſary Digreſſion to any one. As for Inſtances of Compariſons there may be an infinite Number of all kinds given; but tho' 'tis probable we ſhall be thought to be put to it, when we have recourſe to the Old Teſtament for them; yet ſince we cannot meet with better for our Purpoſe, let us take 'em from that great Prophet *Iſaiah*, *The Ox knows his Owner, and the Aſs his Maſter's Crib, but Iſrael does not know, my People does not conſider.* Again, *Shall the Ax boaſt it ſelf againſt him that hews with it, or ſhall the Saw magnify himſelf againſt him that ſhakes it: As if the Rod ſhould ſhake it ſelf againſt them that lift it up, or as if the Staff ſhould lift up it ſelf as if it were no Wood.*

Suſpenſion. When we begin a Diſcourſe in ſuch a manner that the Auditor does not know what we wou'd ſay, and the Expectation of ſomething great renders him Attentive, this Figure is call'd *Suſpenſion*; as, *The Eye has not ſeen, the Ear hath not heard, neither hath it entered into the Heart of Man to conceive what God has prepared for them that love him.*

A *Proſopopœia* is when the Orator turns on a ſudden from his firſt manner of ſpeaking, and talks in the Perſon of another, as,

Bleſs me, he cry'd, what Horrors have I ſeen.

Quintilian ſays this Figure ought to be very artful, and touch very much, or elſe be very ſhocking. *Magna quædam vis Eloquentiæ deſideratur, falſa enim & incredibilia Natura neceſſe eſt, aut magis moveant quia ſupra vera ſunt, aut pro vanis accipiantur quia vera non ſunt.* He ſays further, this Figure ought to be ſoften'd, as *Cicero* has done it in this Example, *Etenim ſi mecum Patria, quæ mihi vita mea multo eſt charior, ſi cuncta Italia, ſi omnis Reſpublica ſic loquatur, M. Tulli, quid agis.* The Figure that in Latin is call'd *Sermocinatio*, or Dialogue, is a ſort of *Proſopopœia*. The Orator makes a feint of being ſilent, to let him ſpeak who is the Subject of his Diſcourſe.

Againſt the Foe, the mighty Hero rode,
With graceful Terror ſhone, and ſeem'd a God;
But ere he cut the Siſters fatal Thread,
He ſternly frown'd, and to the Tyrant ſaid,
But that I ſcorn to take thy hated Life,
What hinders me to end this fatal Strife?
Juſtice and Fate thy ſudden Death decree,
But tho' thou art to die, 'tis not by me.
Let ſome ignoble Hand, &c.

Sentences are only Reflections on a Thing that ſurprizes, and deſerves to be conſider'd. A Sentence is made in a few Words, which are full of Energy, and contain a great deal of Senſe, as this, *There's no ſort of Diſguiſe which can for any long Time hide Love where it is, nor Counterfeit it where it is not.* The Reflection which *Lucan* makes on the Error of the Ancient *Gauls*, who believ'd that Souls, when they went out of one Body, enter'd another, may ſerve for an Example of a kind of Sentence, which is more extenſive.

Officious Fraud, agreeable Deceit,
The Fear of Death, the worſt of Fears cou'd ne'er
Fright the fierce Nations of the Gauls, *who found*
Reſt in their ſweet Illuſions; and from thence,
That Flame of Zeal was kindled in their Souls,
To face a Terror which new Life beſtow'd;
To brave all Danger, and the Battle ſeek,
Amidſt a thouſand Deaths, in Death it ſelf,
To be regenerate and live again.

An *Epiphonema* is an Exclamation that contains ſome Sentence, or more than ordinary Senſe, which is plac'd at the end of a Diſcourſe. 'Tis like the laſt Blow, and gives the Auditors a cloſe and lively Reflection on the Subject in hand. This Hemiſtick of *Virgil* is an *Epiphonema.*

——*Tantæne animis cæleſtibus iræ?*

Such Wrath in Heavenly Minds.

Lucan, by a ſort of *Epiphonema*, finiſhes that Complaint which he makes for the Inhabitants of *Rimini*, againſt the Situation of the City, which was expos'd to the firſt Irruption of either Civil or Foreign Wars.

Rome *never heard the Thunder of a Storm,*
'Till Lightning firſt had darted on our Heads.

An *Interrogation* is a Figure that's to be met with almoſt every where. In a figurative Diſcourſe, Paſſion carries us continually towards thoſe we wou'd perſwade, and cauſes us to addreſs every thing we ſay to 'em by way of Queſtion. For which Reaſon, the Interrogation has a wonderful effect in making the Audience liſten to what is ſaid. Nothing in this kind can be more moving than what our Saviour ſpoke concerning his being the Meſſiah, a Matter which requir'd their ſtricteſt Attention. Thus, in letting 'em ſee that *John* Baptiſt was the Fore-runner of the promis'd Miſſion of himſelf, he ſhew'd them he was the ſame according to *John* Baptiſt's Teſtimony. *What went ye out into the Wilderneſs to ſee? A Reed ſhaken with the Wind? But what went ye out for to ſee? A Man cloathed in ſoft Rayment? Behold they that wear ſoft Cloathing are in Kings Houſes. But what went ye out for to ſee? A Prophet? Yea, I ſay unto you, a Prophet, and more than a Prophet; for this is he of whom 'tis written, Behold I ſend my Meſſenger before thy Face, who ſhall prepare thy way.*

An *Apoſtrophe* is when a Man being extraordinarily mov'd, turns to every ſide, addreſſes himſelf to Heaven, to Earth, to Rocks, to Foreſts, to inſenſible Things, as well as ſenſible. He makes no difference in ſuch an Emotion, he cries out for Help on all ſides. Thus *David*, when he heard of the death of *Saul* and *Jonathan*, makes Imprecations againſt the Mountains of *Gilboa*, *&c.* The Elegy he ſung on that Occaſion, for 'tis in the Poetical Strain, is an incomparable Example of this Figure. *Ye Mountains of Gilboa, let there be no Dew, let there be no Rain upon ye; nor Fields of Offerings, for there the Shield of the Mighty is vilely caſt away, the Shield of Saul, as tho' he had not been anointed with Oil,* &c.

A *Prolepſis* is that Figure which is made when we prevent what the Adverſary may object; and an *Upobola* is the manner of anſwering the Objections that are thus prevented. There's an Example of both theſe Figures, in the Epiſtle to the *Corinthians*, where St. *Paul* ſpeaks of the Reſurrection of the Dead. *But ſome Men will ſay how are the Dead rais'd up? And with what Body do they riſe? Thou Fool, that which thou ſoweſt is not quickened except it dies. And that which thou ſoweſt, thou ſoweſt not the Body that ſhall be, but the Seed only, as that of Wheat, or ſome other Grain.*

Communication is when we argue with the Auditors, and demand their Opinions. *What wou'd you have done, Gentlemen, on the like Occaſion? What Meaſures wou'd you have taken but thoſe which he whom I defend took?*

Confeſſion is a Figure by which we acknowledge our Faults, to engage him to whom we addreſs our ſelves to pardon 'em. 'Tis a very common one in the Pſalms. The following one is very fine. The Royal Pſalmiſt, ſpeaking to the Almighty, ſays, as thus Paraphras'd,

Regard not my Offences, Lord,
Which render me unworthy of thy Grace;
Thy Goodneſs boundleſs as thy Power regard.
The greater are my Sins,
The brighter will thy Mercy ſhine;
Not for my Penitence, Eternal God,
But for the Love of thy Immortal ſelf,
Let me its ſweet Effects enjoy.

Epitrope, or Conſent, is when we freely grant what we may deny, in order to obtain what we demand. This Figure is often Malicious, as in this Example, where *Boileau* anſwers ſuch as had reprov'd him for falling too ſeverely on the Verſes of a Man of Honour.

My Muſe, ſtill Charitable and Diſcreet,
Diſtinguiſhes the Marquis from the Wit;
He is Noble, Faithful, Juſt, and Generous, ſay,
His Candour and Civility diſplay:
Let him be Mild, Officious, and Sincere,
I willingly ſubſcribe to what I hear.
I'll take your Word, and whether right or wrong,
I'm ready, if you pleaſe, to hold my Tongue.
But when his Writings are for Patterns thrown,
When you wou'd ſeat him on the Muſes Throne,
My Choler riſes and I burn to write, &c.

This Figure is ſometimes made uſe of to move an Enemy, and ſhew him the Horror of his Cruelty. To which end you invite him to do all the Miſchief he can. 'Tis common alſo in the Complaints made to Friends, as *Ariſtæus*'s to his Mother *Cyrene* in *Virgil*,

Quin Age, & ipſa manu felices erue Sylvas,
Fer ſtabulis inimicum ignem, atque interfice meſſes,
Ure ſata, & validam in vites molire bipennem,
Tanta meæ ſi te ceperunt tædia laudis.

Periphraſis is a Turn taken to avoid certain Words that are ſhocking, and certain Things which might produce an ill effect. *Cicero* being oblig'd to confeſs that *Clodius* was kill'd by *Milo*, turns it off thus. *Milo's Servants,* ſays he, *being hinder'd from helping their Maſter, whom* Clodius *boaſted to have kill'd, and they believing it to be true, did, in his Abſence, without his Conſent and Knowledge, what every one here wou'd have expected from his Servants on the like Occaſion.* He avoids the odious Words of Killing or putting to Death.

Thus we have treated of moſt of the Figures which are mention'd by the moſt Modern Rhetoricians, for the Ancients had not ſo many, at leaſt not ſettled ones. *Hyperboles* and *Metaphors* of the greateſt Extent, are not ſpoken of in this Place, becauſe they were plac'd among the *Tropes*, tho' they are true Figures, and tho' the barrenneſs of Languages obliges us frequently to make uſe of *Tropick* Expreſſions, even when we are Calm and in Repoſe; yet the common uſe of 'em is in Paſſion, which generally makes Objects appear extraordinary, and conſequently ordinary Terms wou'd not repreſent them as great or as lively as we wou'd have 'em. 'Tis not pretended that all the Figures are here diſcours'd of; there wou'd be much more Room wanted than is allow'd to all this Undertaking, to ſhew all the Characters of the Paſſions in Rhetorick, which are as numerous as the viſible Signs of 'em in the Countenance. Threats, Complaints, Reproaches, Entreaties, have their Figures in every Tongue. There's no better Book to teach them than the Heart, and 'tis Madneſs to ſeek after that in other Mens Writings, which one carries always about one; particularly, if a Man ſhou'd deſire to know the Figures of Choler, let him mind what he ſays when he's acted by that Paſſion.

It muſt not be expected that the Figures ought to be all like the Examples here given, or that theſe Examples are Patterns after which Figures ſhould be form'd. The *Apoſtrophe*, *Interrogation*, *Antitheſis*, may be made an hundred ways. 'Tis not Art that rules there, nor Study that can find them out; but the natural Effects of the Paſſions, as has been already hinted.

An Orator, in managing a Diſcourſe, has not unaptly been compar'd to a Soldier; and the Compariſon holds well as to his Diſpoſition of himſelf, to attack or defend; but having not Room to Expatiate on Things in this Undertaking, we ſhall only obſerve, That the Mind being warm'd by the Paſſions, turns and winds to every ſide to find out Reaſons and Proofs in defence of the Truths it maintains. When a Man is eager to defend himſelf, and ſet a Value upon what he ſays, he repeats the ſame Things over and over, and ſpeaks 'em after different manners; he makes *Deſcriptions*, *Hypotypoſes*, *Compariſons*, and *Similitudes*; he prevents what the Adverſary has to object, and anſwers it. To ſhew his Conſtancy, he ſoon grants every thing that's demanded, and makes as if he wou'd not uſe all the Arguments the Juſtice of the Cauſe wou'd admit of. The Orator engages the Attention of his Auditory, when he finds it neceſſary, by *Apoſtrophes* and *Interrogations*; he awakens them by frequent and repeated *Exclamations*. When Truth is is oppos'd or obſcure, he brings Proof after Proof to explain it, or defend it; ſometimes he appears as if he was ſilenc'd and irreſolute; he advances firſt one Thing, and then another; when Proofs are wanting, he invocates all Nature by *Apoſtrophes*, he calls upon the Dead, and ſummons Heaven and Earth to his Aſſiſtance. There's nothing ſo proper to render a Truth clear, as Figures, eſpecially *Repetitions* and *Synonymies*, *Deſcriptions* and *Hypotypoſes*, &c. *Compariſons* and *Similitudes*, which are generally taken from Things that may be reach'd by the Senſes, make the Underſtanding of the moſt abſtracted Truth eaſy. Nothing is ſo high and ſo ſubtile, that may not be brought to the underſtanding of the loweſt Capacities, provided that among the Things which they either know or may know, the Orator dextrouſly finds out ſome that reſemble thoſe that he wou'd explain to him. There's a wonderful Inſtance of this Addreſs, in a Diſcourſe of Monſ. *Paſcal* to a young Lord, to let him into a true Knowledge of his Condition; to which purpoſe he propos'd this Parable, *A Man was thrown by a Tempeſt on an unknown Iſland, the Inhabitants of which were in great Concern for the loſs of their King, who had been ſome time miſſing; and this Man very much reſembling that Prince, both in Face and Shape, was taken for him, and receiv'd as their King by all the People. He at firſt cou'd not tell what he had beſt do, but at laſt he reſolv'd to yield to his good Fortune; he accepted of the Crown that was offer'd him, ſuffer'd them to treat him as King, and pay him Homage: But not being able to forget his natural Condition, he cou'd not help thinking, while they were paying it him, that he was not the King the People ſought after. Thus he had a double Thought in his Head, one by which he acted as a King, the other by which he acknowledg'd his true Eſtate, and that 'twas Chance only which had plac'd him on the Throne. He conceal'd this laſt Thought, and diſcover'd the other. By the firſt he carry'd himſelf towards the People, by the ſecond towards himſelf.* By this Image, Mr. *Paſcal* repreſented to the young Lord, that 'twas Chance only to which he was indebted for the Dignity of his Birth. That 'twas Imagination which apply'd an Idea of Greatneſs to the Quality of Duke, and that he was in reality no greater than others. By what has been ſaid, even in this narrow Compaſs, 'tis plain that the Paſſions cannot be mov'd without Figures. The uſe of which therefore muſt be very great, becauſe in this Art very few will be able to perſwade, who do not move. Figures are indeed, as has been hinted, the Characters of the Paſſions; and when thoſe Paſſions are irregular, Figures ſerve only to paint their Irregularity. They, for this Reaſon, may be put to an ill uſe, as well as to a good one; for being the Inſtruments with which the Soul is to be ſhaken, if theſe Inſtruments are handled by a Perſon acted by an unjuſt Paſſion, Figures in his Mouth are like a Sword in a Madman's Hand. The Orator is not allow'd to blacken thoſe he ſpeaks againſt by falſe Accuſations, nor is it lawful for him in ſuch a Caſe to make uſe of the ſame Figures as he wou'd do againſt a Criminal; Declaimers, who are generally moſt guilty of this Defect, never deceive twice. The Auditor hears their Exclamations without Concern, and it often happens to them, as it does to Perſons who counterfeit Sickneſs, they cry out but no Body minds 'em; inſomuch, that when they are really ſick, they are not believ'd.

Nec ſimul irriſus, triviis attollere curat,
Fracto crure planum; licet illi plurima manet
Lachryma, per ſanctum juratus dicat Oſirim
Credite; non Ludo: Crudeles tollite Claudum,
Quære peregrinum, vicina rauca reclamat.

This Fault is a ſign of Malice in ſome, and of Levity in others. 'Tis Malice, when the Orator takes Pleaſure in oppoſing the Truth, and does not deſire to convince the Auditory ſo much as to diſturb 'em with the Clouds of ſome unjuſt Paſſion, which deprives them of the ſight of it. True it is, our Declaimers, both at the Bar and in the Chair, ſuch we mean as are nothing elſe but Declaimers, for the Word ſhou'd never be taken in a good Senſe, are not guilty of this, ſo much out of Malice, as Vanity and Ignorance. They don't mind what Impreſſions their Figures may make; their deſign is not to perſwade, but only to ſhew their Eloquence. To this end they make uſe of all the ſtrong Figures in *Rhetorick*, a Vice to which ſome *Artificial* Poets are much given, enter into Enthuſiaſm, loſe the uſe of their Reaſon, and thus they ſee Things after a manner quite contrary to what they are.

Et ſolum geminum & duplices ſe oſtendere Thebas.

What is moſt Ridiculous in this corrupted Part of *Rhetorick*, is that theſe wretched Orators endeavour only to pleaſe without taking any Notice of their Adverſary, ſo as to ſet themſelves to overcome him by force of Words and Arguments. They may very well be compar'd to a Fool, who, when he's fighting, does not take any care to ſtrike his Enemy, or to prevent being ſtruck by him, provided he can attract the Eyes of the Spectators, and fight with a Grace, with a gallant and agreeable Air. *Pedius*, of whom *Perſius* ſpeaks in his Satyrs, was much ſuch a ſort of an Orator.

Fur es ait Pedio: Pedius quid? crimina raſis
Librat in Antithetis, doctas poſuiſſe Figuras
Laudatur.————

Bad Orators affect to meaſure their Words, and give 'em a Cadence to tickle the Ears. All their Expreſſions are proportionated; in a word, they figure their Diſcourſes, but with Figures which, in compariſon to ſuch as are ſtrong and perſwaſive, are like the Poſtures in a Dance, compar'd to thoſe in a Battle. The Art and Affectation, which appears in a painted Diſcourſe, are not the Character of a Soul truly touch'd with the Things it ſpeaks of, but of a Man without any Concern at all, who plays with what he's about. Theſe meaſur'd Figures, whoſe Cadence tickles the Ear, are call'd alſo *Theatrical Figures*; they are Arms for Sight and not for uſe. Figures proper to perſwade, muſt not be far fetch'd; the Warmth contracted in the Defence of Truth, produces them, places them in due Order, ſo that Eloquence is nothing almoſt but the Effect of Zeal.

'Tis not only in great Subjects that Figures are to be made uſe of. The Paſſions have ſeveral Degrees. All Anger is not equally great, neither have all Figures the ſame Force. For extraordinary Emotion, there are *Antitheſes*, and there are the ſame for ordinary. Converſation has its Figures as well as Harangues, as *Repetition*, *Deſcription*, *Simily*, &c. The Stile of thoſe Orators who make a bad uſe of Figures, is call'd *Cold*, becauſe let 'em be at never ſo much Pains to move the Auditory, they are heard with a certain Coldneſs and Indifference, ſo much the more ſenſible, by how much the leſs we are agitated by any of thoſe Emotions which they endeavour to excite. The invincible Diſpoſition we find our ſelves in to ſleep at ſome Sermons, and ſome Plays too, is an effect of this *Coldneſs* of Stile, of which we have too much Experience. When a Man weeps without a Cauſe, we laugh at his Tears. If he is angry without Occaſion, that Anger is look'd upon to be either Folly or Madneſs; but when both are well grounded, we enter into the ſame Paſſions.

Having ſaid thus much of Figures in Diſcourſe, let us add ſomething on *Figures* of *Words*, a Subject that has not been often handled in our Language, but being very well done by Father *Lamy* of the *Oratory*, we ſhall borrow from him, and that will occaſion our taking ſome of the Examples from the *French*.

Figures of Words are quite different from thoſe of Diſcourſe; for as the latter are produc'd chiefly by the Agitations of the Soul, the former are the effect of the Calmneſs and Study of the Mind. 'Tis granted that the Repetition of the ſame Word, the ſame Letter, and the ſame Sound, is generally diſagreeable, but it never ſhocks when that Repetition is made with Art. Indeed, the moſt diſagreeable Sounds pleaſe when they are heard by certain meaſur'd Intervals. The noiſe of a Hammer is apt to deafen us, however, when the Smiths play it on the Anvil with Proportion, they make a ſort of Conſort, which is not at all ſhocking to the Ear. The Repetition of one Letter, one Termination, one Word in meaſur'd Time, and by equal Intervals, muſt therefore be agreeable. This Repetition is made ſometimes in the beginning, ſometimes at the end, ſometimes in the middle of a Sentence, as will be ſeen in the following Inſtances, which are taken chiefly from Poetry, becauſe the Figures of Words are more adapted to Verſe than Proſe. Theſe Figures may be Infinite, becauſe the Repetition may be made with infinite Variety. The ſame Words may be repeated ſimply, without loſing its Signification, as *Good God, Good God, aſſiſt his Righteous Arms*; or in changing the Signification of the Word,

A Father's ſtill a Father, tho' enrag'd,
His Love, when he wou'd ſtrike reſtrains the Blow.

The word Father there is us'd the ſecond Time to ſhew the Tenderneſs which Fathers have for their Children. Another Example of this kind, much more Pathetick, is in *Les Entretiens Solilaires* of *Brebæuf*.

Inſtinct the vileſt Creatures better guides;
A Better uſe they make of good and ill;
They're never guilty of ſuch Crimes as Man,
And without any other help but That,
The Brute does nought unworthy of the Brute,
And Man whate'er's unworthy of himſelf.

The ſame Expreſſion is repeated at the beginning of each Member of a Sentence; as

There's nothing in the Mind of Man ſo baſe,
There's nothing that reſembles more the Fiend,
There's nothing which a Generous Soul abhorrs
So much as He who Sells his Country's Peace,
So much as he who riſes by its Fall.

The ſame Word is plac'd at the Beginning and End of a Sentence with good Effect; as

Revenge the Wrongs of Nations on the Gauls,
Religion, Liberty and Right, Revenge.

Sometimes the ſame Word ends one Member of a Sentence and begins another.

Let Glory rouſe ye, and Immortal Fame,
Immortal Fame the Heroe's ſure Reward.

This Repetition of the ſame Words is ſometimes in the middle of a Period.

The Prince, the Publick he betray'd for Gold,
But laid his wicked Plots too thin to hold,
In Favour falſe, and in Diſgrace the ſame,
From Guilt to Guilt he fell, from Shame to Shame.
One Faith renounc'd, another Faith he choſe,
And made his Foes his Friends, his Friends his Foes,
Inconſtant to himſelf and to the State,
A Proud Unſteady———

The ſame Word may be repeated in all Parts of a Sentence.

He ſooths, he threats, he flatters, he defies,
He gives, he takes, he grants and he denies.

There's a ſort of Repetition when the Word repeated is a little Chang'd, as

Nothing can pleaſe him, who's with nothing pleas'd.

To theſe and other ſuch Figures of Words the Rhetoricans aſcribe Particular Names, but there's no need for a Gentleman to charge his Memory with them.

Thus we have given a ſlight Idea of thoſe Things which wou'd take up whole Volumes to treat *a fond*, and go to the Bottom of 'em. It cannot ſure be improper to ſay ſomething of *Stile* in a Treatiſe of *Rhetorick*, which, tho' commonly taken for the Art of Speaking, yet includes alſo that of Writing. There's no occaſion of entring into an Enquiry after the Etymology of the Word *Stile*; What matters it to the Reader to know it was deriv'd from a Bodkin the Ancients us'd to write with, which ſerv'd for a Name to the Manner of the Writer's expreſſing himſelf. We ſhall alſo be excus'd if we do not, like ſome others on this Subject, examine how far the Qualities of Stile depend on thoſe of the Imagination, Memory and Underſtanding of ſuch as Write; nor how the Qualities of the Brain and Animal Spirits hinder or promote a Good Imagination, and ſome other ſuch nice Inquiries. 'Twill be ſufficient for 'em to obſerve

That Diſcourſe is the Character of the Soul: Our Words paint our Humours, and every one follows that Stile to which his Natural Diſpoſition leads him; this is the Cauſe of the Difference in Stile among ſuch as Write the ſame Language. The Stile of ſome Writers is diffus'd, and whatever Brevity they affect, half of what they ſay may very well be ſpar'd. May not ſome Orators at the Bar come under this Character, tho' perhaps that is not occaſion'd ſo much by a Natural Fluency or Redundancy, as an Affectation to amuſe ſuch as employ 'em, and a Cuſtom acquir'd by it. The Stiles of others are dry, poor, barren; Nothing can Cloath 'em, do what they will they'll be half naked; and there's a Stile alſo which is languiſhing, another that's rough, another ſoft: In ſhort, there's as much Difference in Stile as in Complexion. Every Climate has a particular manner of Expreſſion to itſelf, and that manner agrees very much with the Temper of the People. Every Age has alſo its manner, by which means good Criticks can tell the Time when any Author of Conſideration wrote; for there are ſome ſo wedded to what went before them, that 'twill not be eaſy to diſtinguiſh the contrary by the Stile. *Seneca* obſerves, that in every Age there appears an Author of ſo much Credit as to ſerve for a Pattern of Stile to all who write in it. Thus there may be ſeveral ways of Expreſſion and Terms introduc'd that are not warrantable, but being applauded, come into Uſe, and all the World affect to uſe 'em, by which means certain Faults in Stile have been authoriz'd during whole Ages. He gives an Example out of *Salluſt*; *They lov'd*, ſays he, *in his Time, Conciſe Expreſſions made obſcure by their Brevity.*

To come a little nearer to the Matter we are upon. To arrive at Soveraign Perfection in Eloquence, the Mind ought to be endow'd with Three Qualifications. The Firſt is Capacity, or an Extent of Underſtanding, which enables a Man to diſcover on any Subject whatſoever, all that may be ſaid of it with abundance. The Second conſiſts in a Certain Delicacy; a Certain Vivacity, which enters into Things, immediately goes to the Bottom and enlightens every Part of them. The Third Quality is a Right Judgment, to be a Rule to all the other Qualities, either of the Underſtanding or Imagination. Theſe Qualities of the Mind are not always found where there's a good Imagination, which occaſions a great deal of difference between Speaking and Writing. Thoſe who Write well when you give 'em time to think, often ſpeak ill if they are oblig'd to do it *Extempore*. There's no need of ſo fruitful, ſo warm and ſo ready an Imagination in Writing as in Speaking. When a Man has a Genius that is not entirely unhappy, if he thinks ſeriouſly of a Thing he will find out what ſhould and what can be ſaid upon it. Thoſe who have a Facility of Speaking *Extempore*, or off-hand as we call it in *England*, enjoy that Advantage by means of an abounding Imagination full of Fire, that extinguiſhes and dies in the Repoſe and Coldneſs with which a Piece is Compos'd in the Cloſet. The Qualities of the Mind are preferable to thoſe of the Body, and this Fiery Imagination deriving its Exiſtence from the Complexion of the Orator, the Cool and Calm Eloquence of the Cloſet is much more valuable; the Eloquence, which is the Effect of ſuch an Imagination as is before ſpoken of is like the Noiſe of a Cannon; 'Tis attended with a Flaſh and is gone, we hear of it no more. On the contrary a Writing Compos'd with Care preſerves its Beauty, and the more 'tis read is the more admir'd. *Tacitus* tells us of a certain Man nam'd *Hilerius*, who was Famous in his Life-time for his Oratory; but his Writings had not the ſame Succeſs as his Perſon, becauſe having more Fire in his Imagination than Judgment to govern it, his Talent was Speaking *Extempore*, and not Writing. *A Solid and Labour'd Piece*, ſays that Hiſtorian, *lives in the Eſteem of Mankind after the Author is dead.* The Sweetneſs and Brightneſs of *Hilerius*'s Eloquence were extinguiſh'd with him. *Quintus Halerius —— Eloquentiæ quoad vixit celebratæ, monumenta ingenij ejus haud perinde retinentur, ſcilicet impetu magis quàm curâ vigebat utq; meditatio aliorum & labor in poſterum valeſcit, ſic Hilerius canorum illud & profluens cum ipſo ſimul extinctum eſt.* How many *Hilerius's* are there now a-days who expect Immortality from a Talent which was ſo unfortunate to the *Roman!* In the Choice of *Stile* the Orator muſt be determin'd by the Matter he treats of; when that is great, the Stile ought to be animated, full of Emotion, enrich'd with Figures and all ſorts of Metaphors. If the Subject is not extraordinary, and may be handled without touching the Paſſions, the Stile ought to be Simple. The Art of Speaking being confin'd to no determin'd Number of Subjects, the Difference of Stiles are as various; but the Rhetoricians have reduc'd them to Three Kinds, the Sublime, the Middle, and the Low. To ſay a little of each: In the Sublime Stile nothing mean or low muſt be admitted. 'Tis not a thouſand things ſaid well will gain a Piece the Character of the Sublime, if there's any Allay among them of the Low Character; for this Reaſon *Longinus* condemns *Heſiod*, in his Poem Entitul'd *The Buckler*, for that after he had drawn a dreadful Picture of the Goddeſs of Darkneſs, he ſpoilt all he ſaid by adding *A Naſty Humour from her Noſtrils flow'd.* The Expreſſions muſt every where be noble, and anſwer the high Idea we would give of the Subject. Some Bold Writers, fond of the Sublime, mingle ſomething Great and Prodigious in every thing they Write, without conſidering whether there's any Foundation for't in Reaſon. This way of Writing or Speaking the *Greeks* call'd *Teratologia*, and we meet with an Inſtance of it in *Florus*'s Little Abridgment of the *Roman* Hiſtory. There was no need of ſaying any more than *Sextus Rufus* did, That the *Roman* Empire was extended as far as the Ocean, by the Conqueſts of *Decimus Brutus* in *Spain*; *Hiſpanias per Decimum Brutum obtinuimus & uſq; ut Gades & Oceanum pervenimus.* But tho' *Florus* had no room for Flights, yet, contrary to the Character of an Abridger, he takes Wing and ſays *Decimus Brutus aliquanto latius Gallæcos, atq; omnes Gallæciæ populos, formidatumque militibus flumen Oblivionis peragratoq; Victor Oceani littore non prius ſi qua convertit quam cadentem in maria ſolem, obrutumq; aquis ignem non ſine quodam Sacrilegii metu & horrore deprehendit.* He ſwells his Narration with Prodigies, and imagin'd that the *Romans* having carry'd their Arms to the Extremities of *Spain*, trembled with Fear when they ſaw the Ocean, and thought themſelves guilty of a Crime in looking with Preſumptuous Eyes on the Setting Sun when he ſeem'd to put out his Fires in the Waters of the Sea. This is what we call *Bombaſt*, but wou'd not be taken for ſuch by ſome Modern Hiſtorians, who are much more likely to miſtake it for the Sublime, and think it worthy their Imitation.

As to the Simple Character in Stile, 'tis a Maxim in good Senſe that Words muſt agree with Things; What is Great requires Words that give Great Idea's; what is mean and ordinary, muſt be expreſt Simply. In all Caſes the Writer or Speaker ſhould be a Perfect Maſter of the Tongue he Speaks or Writes in, but more eſpecially in the Simple Stile. There are Terms and Turns that are to be made uſe of only upon Great Subjects, but generally the Sublime Stile conſiſts in Metaphors and Figures, which are introduc'd with the utmoſt Liberty. On the contrary, when a Thing is to be ſaid Simply; that is, when 'tis to be ſpoken as we commonly ſpeak, we are confin'd to Common Uſage, which conſequently the Speaker or Writer ſhou'd underſtand to Perfection to Succeed in the Simple Stile. For this Reaſon the Letters *Cicero* wrote to his Friends are more valuable for Purity of Language than his Orations. 'Tis the ſame with *Virgil's Eclogues* which are in this Stile; which when 'tis call'd Simple muſt not be underſtood to be mean, for that is always bad and to be avoided. The Matter of this Stile admits of no Elevation, but that does not imply that the Diſcourſe by which it is expreſt ſhould be vile and contemptible. It does not require the Pomp and Ornaments of Eloquence, nor a Magnificent Dreſs, but it alſo rejects the Vulgar Ways of Expreſſion, and requires a Dreſs that is neat and decent.

Of the Middle Stile we ſhall not ſay much, becauſe the Name expreſſes that 'tis a Mediocrity between the *Sublime* and the *Simple*. *Virgil* has given us an Example of each of the three kinds of Stile, His *Æneids* are in the Sublime Character: He talks of nothing but Battels, Sieges, Wars, Princes, Heroes; every thing is magnificent. The Sentiments, the Words, the Grandeur of the Expreſſion anſwer to that of the Subject. There's nothing in that Poem which is common; no Terms are made uſe of which may be ſaid to be profan'd by the Uſe of the Vulgar. If he's oblig'd to name any thing ordinary, he does it by a Particular Turn, by ſome Trope; as, for *Panis* Bread, he puts *Ceres*, the Goddeſs of Corn among the Heathens. His *Eclogues* are in the Simple Character: Shepherds talk there, and entertain each other with their Flocks, their Fields, their Sports. The Manner is Simple, and agrees with that of the Words. The *Georgicks* are in the Middle Stile; the Matter does not come up to that of the *Æneids*. *Virgil* does not treat here of Famous Battels, and the Eſtabliſhment of the *Roman* Empire, which are the Subject of the *Æneids*. However, his *Georgicks* do not deſcend ſo low as to the Condition of Shepherds; for in theſe Four Books he dives into the hidden Cauſes of Nature, diſcovers the Myſteries of the *Roman* Religion, and mingles Philoſophy, Divinity and Hiſtory together, which oblig'd him to keep the middle Path, between the Majeſty of his *Æneids* and the Simplicity of his *Eclogues*. There are few Authors that hit this Mediocrity. The Polite underſtand it; but where, and who are the Polite? This Politeneſs is acquir'd in the Converſation of ſuch as have Natural Wit, and the reading of the beſt Authors; but never acquir'd by ſuch as have not a Portion alſo of the ſame Wit. There are not many Writers of this Character, tho' many aſſume it to themſelves, and have the good Fortune to ſee the World impos'd upon; for inſtead of it the greateſt Part of Readers miſtake the oppoſite Character, which is that of a Pedant, for it. He who reads *Homer* with Application will Learn the Natural Stile. *Cicero's* Letters, eſpecially thoſe to *Atticus*, *Horace's* Satyrs and Epiſtles, *Virgil*, *Salluſt* and *Cæſar* will uſe an Author to that way of Writing which is term'd Polite; in *Cæſar* particularly he will find a Perfect Model of the middle Stile.

There ſeems to be a General Miſtake in *Engliſh* Readers as to Stile; for they ſeldom enter into the different Manners, but Content themſelves with ſaying in generally, *Such an Author writes a very fine Stile*; as for Inſtance, Dr. *Tillotſon*, Dr. *Sprat*, Sir *William Temple*, Mr. *Dryden*, Sir *Roger l' Eſtrange*. 'Tis allow'd by every one that they were all Maſters of Stile, and yet perhaps there's as much difference between ſome of 'em as between a good Stile and a bad, tho' all may be perfect in their Kind. We do not in this place pretend to make Critical Remarks on Particular Stiles, but wou'd willingly let the *Engliſh* Reader ſo far into the Secret as that he may no more Confound the one with the other; it being uſual when Compariſons are too raſhly made between the Authors beforemention'd to decide arbitrarily, *this is beſt, or that is beſt*, when 'tis evident, that if thoſe Judges ſhou'd be ask'd who of 'em wrote in the Sublime, who in the Simple, and who in the Middle Stile, 'twould be a more puzzling Queſtion than at firſt Sight it appears to be; and if they cannot diſtinguiſh their Manners, they will never be able to diſtinguiſh their Merit. In order to this let us ſhew a little wherein this Difference of Stile conſiſts, and what are the Qualities of it; for in the ſame kind of Stile ſome are ſofter, ſome ſtronger, ſome florid, ſome ſevere. A Stile is ſaid to be ſoft when Things are ſaid with ſo much Clearneſs that the Mind is at no trouble to underſtand them. Nothing muſt be left to the Reader to gueſs; every thing difficult muſt be made eaſy, all Doubts prevented. In a Word, every thing muſt be ſaid within the neceſſary Compaſs; the Sweetneſs of Cadence and Numbers contributes wonderfully to the Softneſs of Stile, which admits of ſeveral Degrees; 'tis extraordinary when 'tis tender and delicate. *Herodotus* in the *Greek* and *Titus Livius* in the *Latin* Tongue, are taken for Patterns of this Soft Stile. The Second Quality of Stile is Strength, and 'tis entirely oppoſite to the Firſt: It ſtrikes the Mind and renders it extremely attentive. To give this Strength to Stile, we muſt make uſe of Conciſe Expreſſions, which ſignifie a great deal, and raiſe ſeveral Idea's. The *Greek* and *Latin* Authors are full of ſtrong Expreſſions; and of all the Modern Languages the *Engliſh* has the greateſt Share, at leaſt of thoſe Languages that are got out of the Number of the Barbarous. The *French* are not by their own Confeſſion happy in this Conciſe and ſtrong manner of Expreſſion; but they are ſo Civil to themſelves as to give Reaſons for it, which others wou'd give in other Language. They are, ſays *Pere Lamy*, ſpeaking of theſe Expreſſions, *plus rares dans le Francois qui aime que le Diſcours ſoit natural, libre & un peu diffuſ*, more rare in *French* which loves to have a Diſcourſe natnral free and a little diffus'd. Looſe and Wordy might have been ſaid, and in general not have done our Neighbours any Injuſtice. The Third Quality renders a Stile agreeable and florid, and depends in Part on the Firſt. Tropes and Figures are the Marks of a Florid Stile; and *Quintus Curtius* in his Hiſtory has given us an Example of it. The Laſt Quality is the Severe, which cuts off every thing that is not of abſolute Neceſſity: It grants nothing to Pleaſure, ſuffers no Ornament, baniſhes all Warmth and Emotion; and when 'tis carry'd too far, becomes dry. Every Stile muſt agree with the Subject it treats of. A Grave Majeſtick Subject will not admit of Flowers and Gaiety. When the Reader may be made to Laugh, the Severe Stile wou'd be impertinent; Strength of Expreſſion is uſeleſs, if the Mind is to be won by Softneſs; and the Latter wou'd be equally unſucceſsful when there's occaſion of ſtruggling with and conſtraining it.

Stiles may be diſtinguiſh'd again with Reſpect to Arts, as there are thoſe of the Orator, the Hiſtorian, the Dogmatical and Poetical Stiles; of which having ſeparately ſaid a few Words, we ſhall Conclude what we have to ſay of Stile.

The Orator's Stile, ſhou'd be rich and abundant; for it being to enlighten obſcure or doubtful Truths, 'tis neceſſary all the Clouds and all the Obſcurities that hide them ſhould be diſpers'd; this Abundance does not conſiſt in a multitude of Epithetes or Synonymous Words and Expreſſions. Let the Reader carefully remember this, and he will ſoon conceive an ill Opinion of ſome Celebrated Orators, who, if they were really ſo, wou'd only make uſe of ſuch Rich Expreſſions as wou'd make their Reaſons more Valuable. They endeavour to dazzle the Eyes and Underſtanding, and therefore fight always with ſhining Arms. Tropes are very ſerviceable to them on this Occaſion: But it muſt not be forgotten that they ſhou'd never dazzle with a Falſe Luſtre, nor impoſe Falſhood on the Auditory for Truth. The Eloquence of the Bar ſome Years ago conſiſted chiefly in Strong Lungs and a Talent of Rayling, which in our Time has been exploded, and a True and Judicious Way of Reaſoning introduc'd. *Formerly, thoſe Declaimers believ'd*, ſays a Modern Author, *they triumph'd over their Adverſary when they had rail'd at his Reaſons: They thought they had thrown him to the ground, when they had loaden him with Injuries, and ſpent all the Figures of their Art to make him appear ſuch as they wou'd have him.* This was chiefly in Criminal Caſes: In others their Raillery was rather loud than Biting, becauſe 'twas more to amuſe the Client than gain the Cauſe; but both the one and the other are baniſh'd our Courts now, and no ſuch Eloquence will ever paſs there again for Oratory. An Orator ſhould not be Cold or Indifferent in any Part of his Oration. None can argue well that is not concern'd for the Succeſs of his Argument. A Diſcourſe languiſhes when the Heart does not agree with the Sentiments. Figures animate and warm it. As to the Cadence and Number, it ought to be Periodical from time to time. The Roundneſs of Periods are a Charm to the Ear, and that affects the Mind; and when Periods are Pronounc'd with Majeſty, it adds weight to the Matter.

After Orations there's no Subject requires Eloquence more than Hiſtory. Thus *Cicero* ſays it belongs to the Orator to write Hiſtory, *Hiſtoria Opus eſt maxime Oratorium.* The Chief Qualities of the Hiſtorical Stile are Perſpicuity and Brevity. The Brevity contributes to the Perſpicuity. The Hiſtorian ſhould have a Curt Stile free from long Phraſes and Periods, which keep the Mind in Suſpence. It muſt not be interrupted with Extraordinary Figures, by thoſe great Emotions which raiſe Paſſion, it being his Duty to ſhew none. Not but that he's allow'd on ſome Occaſions to let his Eloquence ſhine, becauſe he's oblig'd ſometimes to report what was ſaid as well as what was done; and in ſuch Caſes where Speeches are neceſſary Figures will be alſo neceſſary to paint the Paſſions of thoſe that are repreſented Speaking 'em.

As to the *Dogmatical* Stile, there's no Occaſion of Figures to move the Auditor or Reader; for 'tis to be ſuppos'd they come with Minds prepar'd to Learn what is taught them. Nobody is concern'd for the Truth or Falſhood of a Geometrical Propoſition; whereas in Matters of Paſſion or Intereſt, of Life or Liberty, there's occaſion of every thing to perſwade the Opponents. Geometricians wou'd prove that Three Angles of a Triangle are equal to Two Right Angles; whether true or falſe, it does neither Good nor Harm to any body, and none oppoſe it; wherefore the Geometrical Stile ought to be Simple, Dry, and without any of the Emotions with which Paſſion inſpires the Orator. Beſides, the more a Truth is clear and evident, the more are Men apt to expreſs it after the ſame way in few Words. In *Phyſicks* and *Ethicks* the Stile ſhould not be ſo dry, the Matter is not ſo Crabbed; and as thoſe that handle it are not generally ſo out of Humour, as ſuch as make Inquiries in *Geometry* and *Algebra*, which are Sciences that have not the leaſt Complacency for the Negligence and Idleneſs of Superficial Minds ſo the Reader expects to find ſomething more Gay in *Ethicks* and *Phyſicks*, tho' they ought not to go ſo far out of the Severe Character. 'Twould be very Preſumptuous in a Layman to obſerve any thing on the *Theological* Stile; Who is there that profeſſes it but thinks himſelf a Maſter? Indeed ſo many are ſo, That when we ſay it ſhou'd be Clear and Solemn, Harmonious and Majeſtick, we need only refer the Reader to the Sermons that are Publiſh'd on extraordinary Occaſions, and alſo on others for Examples in this Kind.

We come now to the Poetical Stile, and are not ſo confin'd as in any of the other; for the Poets have all the Liberty given 'em they can deſire; They are not ſubject to the Laws of Common Uſe; They form to themſelves a new Language; They endeavour moſtly to Pleaſe and Surprize by Things extraordinary and marvellous; They cannot arrive at it, if they don't ſupport the Grandeur of Things by that of Words. Every thing they ſay being of this kind, the Expreſſion, which ought in all caſes to be equal to the Dignity of the Subject, muſt be uncommon and extraordinary. In the great Poetry, *Hyperboles* and *Metaphors* are abſolutely neceſſary; for Uſe does not ſupply Terms ſtrong enough. The Turn of the Diſcourſe ſhould for the ſame Reaſon be *Figurative*, for the Dignity of the Matter. In *Eclogues*, and other kinds of Verſe, where the Subject is low, the Stile muſt be ſimple and without Figures. 'Tis the Quality of the Things ſpoken of, which excuſes and authorizes the Poet's manner of ſpeaking; if the

Matter is Common, the Poet, no more than the Hiſtorian, ſhou'd not tranſgreſs the Laws of Cuſtom. Some Criticks will admit of no Poetry but what conſiſts of *Fable* and *Figure.* They will hardly excuſe a Satyr, or an Epiſtle in Verſe without a Deſign, as they call a Metaphorical Contrivance that has relation to the Subject. But theſe are Criticks, whoſe Heads are better turn'd for the Structure of Machines, we will not ſay they wou'd make better *Mechanicks* than *Poets*; but 'tis certain, their Invention is a great Impediment to their Wit. For all the Fire which ſhould ſhine in the Poem is waſted in the Deſign. This Error proceeds from a Miſtake in *Ariſtotle*, and his Commentators: For, becauſe in *Heroick* Poetry, in *Dramatick* Poetry, in the *Ode* and *Eclogue*, a Deſign or Fable is abſolutely neceſſary to expreſs the Paſſion and Action more lively, they imagine *Fable* is the Life of all Poetry in general, and that in all Subjects the *Expreſſion* muſt be *figurative.* But Criticks, eſpecially Modern Ones, are not exempted from the Misfortunes of Miſtaking. Poets, who, tho' they ſhould aim chiefly at Inſtruction, are fondeſt of pleaſing, generally make uſe of thoſe Expreſſions which give the Reader the leaſt trouble to underſtand; ſuch as form in the Imagination the moſt lively Picture of what they wou'd have him conceive. For which Reaſon, Metaphors which render all Things ſenſible, as we have ſeen, are ſo frequent in their Stile. This Deſire to ſtrike the Senſe, and to be underſtood with eaſe, was the Reaſon why the Ancient Poets ſo often made uſe of Fictions, and gave to every Thing a Soul and Body like ours. When a Poet is throughly warm'd, he never conſiders Things in their natural Condition.

'Tis not a Vapour then that Thunder forms,
But Jove *in Arms to fright the trembling World:*
The Tempeſt which ſo much the Sailors dread,
Is Neptune, *who enrag'd, has ſwol'n the Seas.*

Which manner of Expreſſion touches more than what is Common. When a Poet talking of War, ſays *Bellona, The Goddeſs of War, carries Terror thro' the whole Army, That* Mars *fires the Soldiers*, the Impreſſion it makes is quite different from the Common ways of Expreſſion, as, *All the Army was frighted, The Soldiers were eager to engage.* Each Vertue, each Paſſion, is a Divinity. In Poetry, *Minerva* is Prudence; *Fear, Rage*, and *Envy*, Furies. The Words, *Fear, Rage*, and *Envy*, conſider'd only with the Idea which Uſe has join'd to 'em, have no great effect. But we can't repreſent the Goddeſs of Rage with her Eyes full of Fury, her Hands ſtain'd with Blood, the Flames iſſuing out of her Mouth, with her Snakes and lighted Torches, without raiſing Terror. Proſe ſleeps; Poetry is, or ſhould be always awake. Poetical Narrations are interrupted by *Exclamations, Apoſtrophes, Digreſſions*, and a Thouſand other Figures, which engage the Attention. They always ſhew the moſt Charming ſide of the Things they repreſent. They take no Notice of any thing in Art but what is great and rare, and neglect what wou'd leſſen the Heat of Admiration. Thus, if we may ſo ſay, they go out of themſelves, and ſuffer themſelves to be carry'd away by the Fire of their Imagination. They become like a *Sibyl*, who being fill'd with an extraordinary Spirit, does not ſpeak the Language of Mortals.

——————*Sed pectus anhelat,*
Et rabie fera corde tument, majorque videri,
Nec mortale ſonans, afflata eſt Numine quando
Jam propriore Dei.——————

But this is not, as has been hinted, to be underſtood of any thing but the greater Poeſy.

We ſhall conclude this ſhort Eſſay upon Rhetorick with the Fourth and Fifth Parts of the Art of Rhetorick, which are all that remains to be ſpoken of, *viz.* Memory and Pronunciation. And firſt of

Memory, which is a Talent that depends on Nature and Exerciſe; it conſiſting only in the Facility with which the Marks of the Objects we have perceiv'd, are renew'd; Exerciſe helps one to a Memory, every thing plies that way to which 'tis often ply'd. We ſhou'd often repeat what we have learn'd, and endeavour daily to add ſomething new to it. We ſhou'd fill our Memory with proper Terms, and let the Relation of the Images and Names of Things be ſo ſtrict, that they ſhou'd both come together. A great Man has compar'd the Memory to Printing; if the Printer has nothing but *Gothick* Characters, he can Print nothing but in a *Gothick* Character, let the Work that's put to the Preſs be never ſo fine. Thus it may be ſaid of thoſe whoſe Memory is full of bad Words, having their Minds fill'd with *Gothick* Moulds, when their Thoughts are to be cloath'd with Expreſſions, they will always have a *Gothick* Air.

Both *Memory* and *Pronunciation* relate to the Art of ſpeaking chiefly, and but very little to that of writing.

Good Pronunciation muſt certainly be of great Advantage to an Orator; for it muſt be confeſt, that there's an Eloquence in the Eyes, and the Air of the Perſon will perſwade as much as his Reaſons. This is ſo true, that there was a very famous Orator, who for Twenty or Thirty Years went away with the Reputation of the moſt Eloquent Man in the Robe, tho' 'twas at laſt found out that his Eloquence conſiſted entirely in the Roundneſs of his Periods, and the Eloquence of his Air. When an Orator, with ſo fine a Mein begins to ſpeak, we join in with him immediately, *Des qu' un Orateur qui a cet air commence a Parler on luy donne les mains*, ſays a celebrated *French* Critick. In Matters of Divinity, ſome Sermons are well receiv'd, being well pronounc'd, which in the Mouths of ſome Preachers wou'd have been thought contemptible. Men are ſatisfy'd with the Appearances of Things; thoſe who talk with a loud and ſtrong Voice, and have an agreeable Air, are ſure of gaining Applauſe. There are few who give themſelves the trouble to make uſe of their Reaſon, Senſe is the Common way of trying all Things. 'Tis no matter what the Orator ſays, provided he ſays it handſomly, and we judge by the Eye and Ear: If he pleaſes the Eye, and tickles the Ear, he will always go off with the Character of an Eloquent Perſon. 'Tis ſo neceſſary to take Men by their weak ſide, that the moſt Eloquent ſhould not for this very Reaſon neglect the Art of Pronunciation. There are without doubt certain Defects in it, as indecent, ridiculous, affected, vulgar Poſtures, which are not to be endur'd, and Tones which ſhock the Ear and tire it. Theſe are the Vices of ſuch as find *Cant* much more eaſy to be learn'd than the Art of Reaſoning. 'Tis true, every Sentiment has a Tone of Voice, a Geſture, and a Mein proper to it. This Relation, as 'tis good or bad, makes good or bad Declaimers; if good, 'tis no little help towards the Auditors conceiving rightly what is ſaid, and the trouble the Orator is at to perfect himſelf in the Art of Pronunciation, will not be found to be vain and uſeleſs; but the Study of it is not to be done by Books, its Rules cannot be taught but by a living Maſter. Men being created to live together in a great Union, are ſo diſpos'd by Nature, that they ſoon imbibe the Sentiments of thoſe they live with, when they appear to be Natural. We are troubled when we ſee another troubled, and are joyful with thoſe that Rejoice. The natural Signs of Paſſion make an Impreſſion on ſuch as ſee 'em; and if they do not reſiſt that Impreſſion, they will follow its Dictates. Thus every one that ſpeaks naturally, will always move without intending it; and thoſe he ſpeaks to will think like him. Men hardly ever act by Reaſon, Senſe or Imagination always govern them; by which thoſe who know how to repreſent the outſide of their Thoughts, are ſure to impoſe them on the Auditory. Common Declaimers affect only a ſhining Pronuntiation, which indeed raiſes Admiration, and in that they ſucceed. For as naturally, we ſpeak with no extraordinary Geſtures, and in no elevated Tone, thoſe which are extraordinary, and with which we are ſurpriz'd, are when a Declaimer opens his Mouth wide, when his Geſtures are extravagant, then the People fanſie he ſays ſomething that's very great; they admire him, but their Admiration has no effect; they don't mind what he ſays, but his way of ſaying it.

LOGICK.

DIALECTICK or LOGICK.

LOGICK.

LOGICK is the Art of Guiding our Reaſon in the Knowledge of Things, as well for our own Inſtruction as the Inſtruction of others.

This Art conſiſts in the Reflections which Men have made on the Four Principal Operations of the Mind, as *Conceiving*, *Judging*, *Reaſoning* and *Diſpoſing*.

By *Conceiving* is to be underſtood the Simple View which we have of the Things that preſent themſelves to the Mind; as if we imagine the *Sun*, *a Globe*, *a Tree*, *a Square*, *a Thought*, *a Being*, without forming any Particular Judgment; and the Form by which theſe Things are repreſented to the Mind is call'd *Idea*.

By *Judging* is meant that Action of the Mind by which, joyning ſeveral Idea's together, it affirms from one what the other is; or from one denies what the other ſhould be; as when having an Idea of the Earth and an Idea of a Round, I affirm that the Earth is round, or deny that it ſhould be round.

By *Reaſoning* we underſtand that Action of the Mind by which it forms a Judgment of ſeveral others; as when we judge that True Vertue ought to have Relation to God, and that the Vertue of the Pagans was not True Vertue.

By *Diſpoſing* is to be underſtood that Action of the Mind, by which having ſeveral Idea's, ſeveral Judgments and ſeveral Reaſonings on the ſame Subject as a Humane Body; it diſpoſes of them in the moſt proper manner to ſhew what that Subject is: This is call'd *Method*.

As we can have no Knowledge of any thing that's without us, but by the Aſſiſtance of the *Idea's* that are within us the Reflexions that may be made on our *Idea's* are perhaps the moſt important Part of *Logick*, becauſe they are the Foundation of all the reſt. Theſe Reflections may be reduc'd to Five Heads, according to the Five Manners after which we ſhould conſider *Idea's*.

1. According to their Nature and Origin.
2. According to the Principal Difference of the Objects they repreſent.
3. According to their Simplicity or Compoſition.
4. According to their Extent or Reſtriction.
5. According to their Clearneſs and Obſcurity, or Diſtinction and Confuſion.

As to their Nature and Origin. The Word *Idea* is one of thoſe which are ſo clear of themſelves that they cannot be explain'd by others. When we talk of Idea's, we don't call thoſe Images that are Painted by the Fancy by that Name; but all that is within our Underſtanding, when we can truly ſay we *conceive* a Thing after whatever manner we *conceive* it.

There's nothing that we conceive more diſtinctly than Thought it ſelf, and no Propoſition that's more clear to us than this; *I think, therefore I am.* We can have no Certainty of this Propoſition, if we don't conceive diſtinctly *What it is to be*, and *What it is to think.* From this Propoſition a Logician takes occaſion to argue againſt thoſe who maintain that all Idea's are convey'd by the Senſes to the Mind. *There's no need,* ſays he, *of explaining theſe Terms, becauſe they are ſome of thoſe which are ſo well underſtood by all the World, that to go about to explain wou'd be to obſcure them. If therefore it cannot be deny'd but that we have within us the* Idea's *of* Being *and* Thought, *I demand by what Senſe they enter'd? Are they Luminous or Colour'd to make their way by the Sight? Are they of a ſharp or flat Tone to enter by the Ear? Of a fragrant or noiſome* Smell *to affect the Noſe? Of a Good or Bad* Taſte *to enter by that Senſe, Hot or Cold, Rough or Soft, to make their way by* Feeling? *If 'tis ſaid they were form'd of other Senſible Images, Pray let us know what thoſe Images are of which 'tis pretended the* Idea's *of* Being *and* Thought *were form'd? and how they were form'd by Compoſition, Ampliation, Diminution or Proportion. If nothing can be anſwer'd to all this but what is unreaſonable, then it muſt be confeſt that the* Idea's *of* Being *and* Thought *do not in any manner derive their Origin from the Senſes; but that our Mind has the Faculty of forming of it ſelf, tho' 'tis often mov'd to it by ſomething which ſtrikes the Senſe; as a Painter may be mov'd to draw a Picture by the Money that's promis'd him, yet it can't be ſaid that the Picture derives its Origin from the Money.* This is ſufficient to give the Reader an Idea of Idea's, and we do not pretend in this more than any other of theſe Eſſays to go farther. The next Article is that of Conſidering Idea's according to their Object. Every thing we conceive is repreſented to the Mind, either as a Thing, or as the Manner of a Thing, or as a Thing Modify'd. We call that a Thing which is conceiv'd as ſubſiſting by itſelf, and as the Subject of every thing that's conceiv'd of it; this is what is otherwiſe call'd *Subſtance.* We term that the Manner of Things, or Mode, or Attribute, or Quality, which being conceiv'd in a Thing, and not being able to ſubſiſt without it, determines it to be after a certain Manner, and cauſes it to be nam'd ſuch. We call a Thing Modify'd when the Subſtance is conſider'd as determin'd by a Certain Manner or Mode, which will be better comprehended by Examples: When I conſider a Body, the Idea I have of it repreſents a Thing or a Subſtance, becauſe I conſider it as a Thing that ſubſiſts by itſelf, and has no occaſion of any thing elſe to ſubſiſt it. But when I conſider that this Body is round, the Idea I have of Roundneſs repreſents to me only the Manner of Being, or a Mode, which, I conceive, cannot ſubſiſt naturally without the Body whoſe Roundneſs it is. In a Word, When I joyn the Mode with the Thing, I conſider a Round Body, which Idea repreſents to me a Thing Modify'd. The Names or Nouns made uſe of to expreſs Things are call'd Subſtantive or Abſolute, as *Earth, Sun, Spirit, God.* Thoſe alſo which ſignifie chiefly and directly Modes, becauſe they have in that ſome Relation to the Subſtantives, are alſo call'd Subſtantives and Abſolute, as *Hardneſs, Heat, Juſtice, Prudence.* The Names or Nouns which ſignifie the Things as Modify'd, denoting chiefly and directly the Thing more confuſedly, and indirectly the Mode, tho' more diſtinctly, are call'd Adjectives, as *Round, Hard, Juſt, Prudent.* In this Conſideration of Idea's, according to their Objects, 'twill be proper to place the Ten Categories of *Ariſtotle*, becauſe they are only ſeveral Claſſes to which this Philoſopher wou'd reduce all the Objects of our Thoughts, by comprehending all Subſtances under the Firſt, and all Accidents under the Nine others, as

I. *Subſtance*, which is either Spiritual or Corporeal.

II. *Quantity*, which is call'd Diſcrete, When the Parts are not bound together as Number, continu'd when they are bound; and then 'tis either ſucceſſive as Time and Motion, or permanent, which is what is otherwiſe call'd Space or Extent, in Length, Breadth and Depth; the Length alone making the Lines, the Length and Breadth the Surfaces, and all three together the Solids.

III. *Quality*, of which *Ariſtotle* makes four ſorts. The Firſt comprehends Habitude; that is, the Diſpoſition of Mind and Body acquir'd by repeated Acts, as the Fancy, Vertues, Vices, Addreſs in the Arts of Painting, Writing, Dancing. The Second, Natural Powers, ſuch as the Faculties of the Mind or Body, the Underſtanding, Will, Memory, the Five Senſes, the Power of going. The Third, Senſible Qualities, as Hardneſs, Softneſs, Weight, Cold, Heat, Colours, Sounds, Smells, Taſtes. The Fourth, Form and Figure, which is the Exterior Determination of Qualities, as Being, Round, Square, Spherical, Cubical.

IV. *Relation*, as that of Father, Maſter, Servant, King, Subject, every thing that denotes Compariſon, as Equal, Greater, Leſs.

V. *Acting*, either in itſelf, as Walking, Dancing, Knowing, Loving; or out of itſelf, as Beating, Calling, Breaking, Warming.

VI. *Suffering*; as, to be beaten, to be broken, to be warm'd.

VII. *Where*; that is, what anſwers to Queſtions which relate to Place, as to be at *Rome*, *Paris*, in a Cloſet, in a Chair.

VIII. *When*; that is, what anſwers to Queſtions relating to Time, as, When did he Love? A Hundred Years ago? When was that done? Yeſterday?

IX. *Situation*, as Sitting or Standing, Before, Behind, to the Right, to the Left.

X. *Having*; that is, to have ſomething on itſelf to ſerve for Cloathing, either Ornament or *Armour*, as, to be Cloath'd, to be Crown'd, to be Arm'd. Theſe are the Ten Categories of *Ariſtotle*, of which ſo much Myſtery is made, tho' in truth they are not very uſeful, and not only ſerve very little towards forming the Judgment, which is the End of true Logick, but often are very prejudicial to it on Two Accounts: The Firſt is, Theſe Catagories are lookt upon as Things founded on Reaſon and Truth, whereas they are Things that are altogether arbitrary, and have no Foundation but in the Imagination of a Man, who has no Authority to preſcribe Laws to others, as *Meſſieurs* of the *Port Royal* word themſelves; for they have as much Right as he to place the Objects of their Thoughts otherwiſe, according to their Manner of Philoſophizing: And indeed there are ſome who have compriz'd all that is to be conſider'd, according to a New Philoſophy, in every thing whatſoever in this Diſtich,

Mens, Menſura, Quies, Motus, Poſitura, Figura;
Sunt cum Materia cunctarum exordia rerum.

That is, theſe Men imagine that all Nature may be conſider'd in theſe Seven Things or Modes. 1. *Mens*, the Mind or Subſtance which Thinks. 2. *Materia*, the Body or Subſtance extended. 3. *Menſura*, the Greatneſs or Littleneſs of each Part of the Matter. 4. *Poſitura*, their Situation with reſpect to each other. 5. *Figura*, their Figure. 6. *Motus*, their Motion. 7. *Quies*, their Repoſe or leaſt Motion. The Second Reaſon which renders the Study of Categories dangerous is, that it uſes Men to be ſatisfy'd with Words, and fanſie they know all Things when they know only Arbitrary Names which form no clear and diſtinct Idea in the Mind: But 'tis very likely that the Young Gentlemen who have been three or four Years at the College will not allow of this Defeat of Words, which are the greateſt Merit of ſo many notable Exerciſes. We might here ſpeak of the Attributes of the *Lulliſts*, as *Goodneſs, Power*, &c. But 'tis ſuch a ridiculous thing to fancy as they do, that by applying ſome Metaphyſical Words to every thing propos'd, they may be able to give Reaſons for all, that 'tis not worth ſpeaking of. A Modern Author has ſaid with a great deal of Reaſon, *That the Rules of* Ariſtotle's *Logick ſerve only to prove to another what he knows already; but* Lully's *Art ſerves only to make a Man Diſcourſe without Judgment of a Thing he does not know.* Ignorance is better than this falſe Science, being much eaſier to be come at than what is true, and making as much Noiſe among the People, and perhaps a great deal more. The Number of its Students are very large, while that which is Sound find but few Votaries.

We are now to treat of Idea's conſider'd according to their Compoſition or Simplicity. The little Extent of our Mind is ſuch, that it can't perfectly comprehend Things that are Compounded, unleſs it conſiders them by Parts which is generally call'd *Abſtraction.* But as Things are differently Compounded, and there are ſome Parts that are really diſtinct, which are call'd *Integral Parts*, as the *Humane Body*, the *ſeveral Parts of a Number*; 'tis then very eaſy to conceive that our Mind may apply itſelf to conſider one Part without conſidering another, becauſe thoſe Parts are really diſtinct, which is not what is call'd *Abſtraction.* 'Tis ſo uſeful in thoſe Things to conſider rather the Parts ſeparately than the whole; that without it one cou'd have no diſtinct Knowledge of it; For Inſtance in a *Human Body*, How cou'd it be known but by dividing it into all its like and unlike Parts, and giving them all different Names? The Parts may be conſider'd alſo as a Mode, without having any Regard to it as a Subſtance, or two Modes which are joyn'd together in the ſame Subſtance by conſidering each of 'em apart. This the Geometricians do, who for the Object of their Science, have taken a Body extended in Length, Breadth and Depth; for in order to know it the better, they chiefly apply themſelves to conſider it according to one Dimenſion, which is Length, and this they call a Line. They then conſider it with two Dimenſions, Length and Breadth, and that they call Surface; and afterwards conſidering all three Dimenſions together, Length, Breadth and Depth, they term it a Solid or Body.

The more Things can be ſeparated into ſeveral Modes, the more the Mind will come to the Knowledge of them. Thus we ſee that in as much as it has not been diſtinguiſh'd in Motion, the Determination towards any Place, the Movement itſelf, and even ſeveral Parts of the ſame Determination, no clear Reaſon of Reflection and Refraction has been given, which is eaſily done by this Diſtinction, as may be ſeen in the Second Chapter of *Deſcartes*'s Dioptricks. There's another way of conceiving Things by Abſtraction, and that is when the ſame Thing having ſeveral *Attributes*, we think of one without thinking of other, tho' there is but one Diſtinction of Reaſon between them, which is done thus, If I reflect that I think, and conſequently that 'tis I that thinks, in the Idea I have of my ſelf that I think, I may apply my ſelf either to the Conſideration of a Thing that thinks without having any regard that it is me, tho' in me, me and that which thinks are the ſame Thing. Thus the Idea I conceive of a Perſon who thinks, may not only repreſent me, but all other Perſons that think. 'Tis plain, that by theſe ſort of Abſtractions, the Idea's of *Singulars* become Common, and the Common more Common; which brings us to conſider of

Idea's as to their Generality, Particularity, and Singularity: Tho' every Thing that exiſts is Singular, yet by means of Abſtraction we have all ſeveral Idea's, of which ſome repreſent but one thing, as the Idea which every one has of himſelf and others, may equally repreſent ſeveral things; as when we conceive a Triangle, without conſidering it otherwiſe than as a Figure of three Lines, and three Angles. The Idea it forms may ſerve one to conceive all other Triangles.

The Idea's which repreſent but one thing, are term'd *Univerſal*, *Common*, or *General*. The Names that denote the firſt are call'd Proper, as *Socrates*, *Rome*, *Bucephalus*; and thoſe which denote the latter Common, as *Man*, *City*, *Horſe*. And both Univerſal Idea's and Common Names may be call'd General Terms. There are two things in General Idea's, which 'tis of great Importance to diſtinguiſh well, *Comprehenſion* and *Extent*. By the Comprehenſion of an Idea, is to be underſtood the *Attributes* it contains in it ſelf, and which cannot be taken away without deſtroying it, as the Comprehenſion of the Idea of a Triangle includes Extenſion, Figure, three Lines, three Angles, &c. By the Extent of an Idea, is meant the Subject to which that Idea agrees, which is alſo call'd the Inferiors of a General Term; which, with Reſpect to them, is call'd Superior, as the Idea of a Triangle in General extends to all the divers kinds of Triangles.

We ſhall enter as little way as may be into theſe ſorts of Eſſays, aſſuring our ſelves that few Gentlemen will make 'em a part of their *Recreation*; and thoſe who would do more, will doubtleſs have recourſe to Treatiſes at large, ſuch as the *Port Royal*, *Le Clerc*'s, and other Logicks. But conſidering that Gentlemen ſhould be ſo far acquainted with the moſt abſtruſe Sciences, as not to be ſurpriz'd and confounded when they hear Men of Learning talking of them, or arguing upon them, we think we ſhould not anſwer the Deſign of this Undertaking, if we did not give 'em Light enough to prevent ſuch a Misfortune.

What has been already ſaid is, in a few Words, in order to explain the Five Univerſal Idea's taught in the *Schools*, where the Thread of Science is ſpun ſo fine, that 'tis often very apt to break. However, becauſe Scholaſtick Terms are affected on theſe Occaſions, 'tis not improper to go on with them, and let the Reader know that theſe five ſorts of Univerſal Idea's are *Genus*, *Species*, *Difference*, *Propriety*, and *Accidents*. When General Idea's repreſent to us their Objects as Things, and are denoted by Terms call'd *Subſtantive* or *Abſolute*, we give 'em the Names of *Genus* or *Species*.

Genus, is when the Idea is ſo Common, that it extends to other Idea's, which are alſo Univerſal, as the *Quadrilater* is *Genus*, with Reſpect to the *Parellelogram* and *Trapezia*; *Subſtance* is *Genus*, with Reſpect to *Subſtance* extended, which we call Body, and the *Subſtance* that Thinks, which we call Mind.

Species, is a Common Idea, under one more Common and more General, as the *Parallelogram* and *Trapezia* are *Species* of the *Quadrilater*, and *Body* and *Mind* are *Species* of *Subſtance*.

Difference, is when the Object of an Idea is an eſſential *Attribute*, which diſtinguiſhes one *Species* from another, as Extended, Weight, Heavy, Reaſonable.

Propriety, is when the Object is an *Attribute*, which in effect belongs to the Eſſence of the Thing, but is not firſt conſider'd in that Eſſence, but as dependant on the firſt Idea, as Diviſible, Immortal, &c.

Common Accidents, are when the Object is a true Mode, which may be ſeparated, at leaſt by the Mind, from the Thing of which 'tis ſaid to be an *Accident*, and yet the Idea of that Thing ſhall not be deſtroy'd, as Round, Hard, Juſt, Prudent.

We ſhall now ſay a word or two of Complex Terms, their Univerſality or Particularity. We ſometimes join to one Term ſeveral others, which compoſe in our Mind a Total Idea, from whence it often happens, that one may affirm or deny, what could not be deny'd or affirm'd of any one of thoſe Terms taken ſeparately. As for inſtance, *A Prudent Man, A Tranſparent Body*, Alexander *Son of* Philip, are Complex Terms. This Addition is ſometimes made by the *Pronoun Relative*, as if we ſhould ſay, *A Body that is Tranſparent*, Alexander *who is Son of* Philip. And if this Relative is not always expreſt, 'tis always in ſome manner underſtood.

There's nothing of more Importance than that all Idea's ſhould be clear and diſtinct, free from Obſcurity and Confuſion. Clearneſs may be diſtinguiſh'd in an Idea from Diſtinction, and Obſcurity from Confuſion. An Idea is clear, when it ſtrikes ſenſibly, tho' 'tis not diſtinct. As the Idea of Pain ſtrikes us livelily, and therefore may be call'd Clear; yet it may be very confus'd in repreſenting Pain to us, as in a wounded Hand, tho' 'tis only in our Mind. However, one may ſay, that all Idea's which are clear are diſtinct, and that their Obſcurity ariſes only from their Confuſion; as in Pain, the only Sentiment which ſtrikes us, is clear, and alſo diſtinct; but the Confuſion lies, in that we are at a loſs whether it is in the Hand or the Mind. Let the Clearneſs and Diſtinctneſs of Idea's be taken for one and the ſame thing, 'tis neceſſary to examine carefully why ſome are clear and others obſcure. But this is better to underſtand by Examples than any other way, and we ſhall therefore inſtance ſome that are clear and ſome that are obſcure. The Idea every Man has of himſelf, as a Thing that thinks, is very clear. We have alſo very clear Idea's of Subſtance, and what agrees with it; as Figure, Motion, Reſt. We have in the ſame manner clear Conceptions of Being, Exiſtence, Duration, Order, Number. Yet as clear as all theſe Idea's are, we often render them Obſcure, by endeavouring to make them more Clear. The Idea we have of God, in this Life, is clear in one ſenſe, tho' in another it may be very imperfect and obſcure: 'Tis clear, in that 'tis ſufficient to communicate to us, in the Knowledge of God, a great Number of Attributes, which can only be in God alone; but 'tis obſcure, if we compare it to that which the Happy in Heaven have of him; and 'tis imperfect, in as much as our finite Underſtandings cannot but very imperfectly have any Conception of Infinity. There's a great deal of difference between the Perfection and Clearneſs of an Idea; for 'tis perfect when it repreſents to us all that is in its Object; and clear, when it repreſents enough for us to have a clear and diſtinct Conception of it.

Confus'd and obſcure Idea's are ſuch as we conceive of ſenſible Qualities, as Colour, Sounds, Odors, Taſtes, Cold, Heat, Weight, *&c.* The Reaſon of their being confus'd, is what follows: As we were Children before we were Men, and exterior Things acting upon us, caus'd divers Sentiments in our Minds, by the Impreſſions they made on our Bodies; the Mind, which finds 'tis not by its own Will that theſe Sentiments are excited in us, but that they were occaſion'd by certain Bodies, as it is ſenſible of Heat by approaching Fire, is not ſatisfy'd with imagining that there's ſomething without it ſelf, which caus'd thoſe Sentiments in which it would not be deceiv'd. But it goes farther, believing that what was in thoſe Objects, was entirely like the Sentiments it had conceiv'd of 'em. From this Judgment it forms Idea's, by tranſporting theſe Sentiments of Heat, Colour, *&c.* into thoſe Things themſelves which are without its ſelf. Theſe are the obſcure and confus'd Idea's, which we have of ſenſible Qualities; the Mind adding that falſe Judgment to what Nature has help'd it to the Knowledge of. And as theſe Idea's are not Natural but Arbitrary, they are often very Fantaſtick; for Heat and Burning are but two Sentiments, the one weaker, the other ſtronger. We put Heat into the Fire, and ſay, *Fire has Heat*, but don't apply Burning to it in the ſame manner. For the Pain we feel by coming too near it, is not ſaid to be in it, like Heat; and would it not be thought very whimſical, if any one ſhould ſay, *Fire has Pain?* However, if Men have found out that the Pain is not in the Fire which burns the Hand, perhaps they are ſtill deceiv'd, in imagining that the Fire burns in the Hand; whereas, to take it right, 'tis only in the Mind, tho' occaſion'd by what paſſes in the Hand; becauſe Pain in the Body is only a Sentiment of Averſion, which the Mind conceives of ſome Motion contrary to the natural Conſtitution of the Body; which has been allow'd not only by ſome Ancient Philoſophers, as the *Cyrenaicks*, but alſo by St. *Auguſtine* in ſeveral places, particularly in the *City* of *God*, *Dolores qui dicuntur Carnis, animæ ſunt in Carne, & ex Carne.* The Pains we call Corporal are not in the Body, but in the Mind, which cauſes the Mind to feel Pain; but that Motion muſt communicate it ſelf to the Brains by means of little Threads encloſ'd in the Nerves, as in Pipes, which reach like little Strings from the Brains to the Hand, and other Parts of the Body. By which means, if theſe little Threads are ſtirr'd, that Part of the Brain from whence they proceed, is ſtirr'd alſo. We might follow Meſſieurs *de Port Royal* much farther in diſcourſing of this Example, but this is enough to prove that the Pain is not in the Hand, nor the Fire, but in the Mind. The Logicians generally take Pleaſure in enlarging on Idea's, and the more Uncertainty and Subtlety there are in Arguments, many are apt to be moſt delighted with them. Indeed, it gives a Character of depth of Science, of going to the bottom of Things, of Maſtery and Perfection; but we ſhall content our ſelves with the Notion of Idea's already given, in what has been ſaid in this Eſſay, and refer the Reader to Mr. *Lock*, if he is fond of being more learned in the Matter.

From theſe Idea's form'd in the Mind, ariſe *Propoſitions:* For after we have conceiv'd Things by them, we compare the Things together, and finding an Agreement between ſome of them, and a Diſagreement among others, we bind or unbind them, which is term'd *Affirmations* or *Negations*, and generally *Judging*. This *Judgment* is call'd alſo *Propoſition*; and 'tis eaſy to perceive it ought to have two Terms, one is call'd *Subject*, and the other which affirms or denies, *Attribute*. 'Tis not enough to have a right Conception of theſe two Terms; the Mind muſt alſo join or ſeparate them, which is done by the Verb *is* alone when we affirm, and with a Negative Particle when we deny. Thus, when I ſay, *God is Juſt*, God is the *Subject* of this *Propoſition*, *Juſt* the *Attribute*, and *is* the Affirmative which binds the two Idea's together, *God* and *Juſt*. When I ſay, *God is not Unjuſt*, *is* being join'd with the Particle *not*, is the Negative by which I look upon theſe two Idea's, as repugnant to each other. Every *Propoſition* is Affirmative or Negative, and is diſtinguiſh'd by the Verb which affirms or denies. When the *Subject* of a *Propoſition* is a Common Term taken in all its Extent, then the *Propoſition* is call'd Univerſal, whether Affirmative or Negative, as *Every impious Man is Mad*, or *No vicious Man is Happy*. When the Common Term is taken in part of its Extent only, 'tis call'd *Particular*, whether it affirms or denies; as *Whoever is Cruel is Baſe*, *Every poor Man is not Unhappy*. The *Propoſition* is call'd *Singular*, when the *Subject* is ſo; as, *Prince* Eugene *has taken* Liſle. All *Propoſitions* may be reduc'd to four ſorts, which for the help of the Memory are denoted by the four Vowels, *A*, E, I, O.

A is a Univerſal Affirmative, as *Every vicious Man is a Slave.*
E a Univerſal Negative, as *No vicious Man is Happy.*
I a Particular Affirmative, as *Whoever is Covetous is Poor.*
O a Particular Negative, as *Every poor Man is not Unhappy.*

That the Learner may remember them with the more eaſe, they are compriz'd in theſe two Verſes,

Aſſerit A, *Negat* E, *verum generaliter Ambo.*
Aſſerit I, *Negat* O, *ſed particulariter Ambo.*

The *Univerſality* or *Particularity* of *Propoſitions,* is call'd *Quantity*; the *Affirmation,* or *Negation, Quality.* Thus A and E agree in *Quantity,* and differ in *Quality,* and I and O the ſame; but A and I agree in *Quality* and differ in *Quantity,* and E and I the ſame.

Propoſitions are further divided, according to the Matter, into True and Falſe; and 'tis plain, there can be none but muſt be either True or Falſe, becauſe all *Propoſitions* denote the Judgment we make of Things; they are true when that Judgment is conformable to Truth, and Falſe when 'tis not conformable to Truth; and becauſe we often want Light to perceive what is True and what Falſe beſides, the *Propoſitions* which ſeem to be True to us, and thoſe which appear to be certainly Falſe, there are ſome which ſeem True, but the Truth of 'em not to be ſo Evident as to leave no Apprehenſion in us of their being Falſe. Theſe *Propoſitions* are call'd *Probable.*

We have ſaid already, that there are four ſorts of *Propoſitions,* A, E, I, O; and the Reader will now require to know wherein they agree or diſagree among themſelves; when ſeveral ſorts are propos'd in the ſame *Subject* and *Attribute,* which is what is call'd *Oppoſition,* of which there are three kinds; for if they are oppos'd in *Quantity* and *Quality* alone, as A and I and E and I, they are term'd *Contradictory,* as *Every Man is an Animal, Some Men are not Animals.* If they differ in *Quantity* only, and agree in *Quality,* as A and I and E and O, they are term'd *Subaltern,* as *Every Man is an Animal, Some Men are Animals.* If they differ in *Quality,* they are call'd *Contrary* or *Sub-contrary,* as *Every Man is an Animal, No Man is an Animal. Sub-contrary,* when they are particular, as *Some Men are Animals, Some Men are not Animals.* In examining theſe ſeveral Sorts of *Propoſitions,* 'tis eaſy to perceive,

1. That the *Contradictory* are either *True* or *Falſe* together, but if the one is *True* the other is *Falſe,* and if one *Falſe* the other *True*; for if it is *True* that *Every Man is an Animal,* it cannot be *True* that *Any Man is not an Animal*; and if on the contrary 'tis *True* that *Any Man is not an Animal,* it cannot be *True* that *Every Man is an Animal.*

2. *Contraries* cannot be *True* together, but they may be both *Falſe.* They cannot be *True,* becauſe then *Contradictories* would be *True*; for if it is *True* that *Every Man is an Animal,* 'tis *Falſe* that *Any Man is not an Animal*; which is the *Contradictory,* and conſequently more *Falſe,* than *No Man is an Animal,* which is the *Contrary*; but the *Falſity* of the one does not concern the *Truth* of the other: For it may be *Falſe,* that *All Men are Juſt,* and yet not be *True,* that *No Man is Juſt,* ſince there are juſt Men, tho' all Men are not juſt.

3. *Sub-contraries,* by a Rule quite *oppoſite* to that of the *Contraries,* may be *True* together; as theſe two, *Some Men are Juſt, Some Men are not Juſt,* becauſe Juſtice may agree to one Part of Mankind and not agree to another; and thus the *Affirmation* and *Negation* does not relate to the ſame *Subject,* for *ſome Men* in one of the *Propoſitions* are taken for one Part of Mankind, and in the other for another; but they cannot both be *Falſe,* becauſe otherwiſe the *Contradictories* would be both *Falſe.* For if 'tis *Falſe,* that *Some Men are Juſt,* it would be *True,* that *No Man is Juſt,* which is the *Contradictory.*

4. As to the *Subalterns,* they are not really an *Oppoſition,* ſince the *Particular* is a *Conſequence* of the *General*; for if *Every Man is an Animal, Any Man is an Animal*; if *No Man is an Ape, Any Man is not an Ape*; for which Reaſon, the *Truth* of *Univerſals* does concern that of *Particulars,* but the *Truth* of *Particulars* does not concern that of *Univerſals.*

Tho' every *Propoſition* muſt have at leaſt one *Subject* and one *Attribute,* it does not follow it muſt have no more than one of each. That which has but one, is call'd a *Simple Propoſition,* that which has more than one a *Compound*; as when I ſay, *Life and Death, Health and Sickneſs, Poverty and Riches, come from the Lord.* The *Attribute, Come from the Lord,* is not an *Affirmation* of a ſingle *Subject,* but of ſeveral, as *Life and Death, Health and Sickneſs,* &c. The *Simplicity* of a *Propoſition* is taken from the *Unity* of *Subject* and *Attribute.* There are ſeveral *Propoſitions* that have but one *Subject* and one *Attribute*; but the *Subject* or *Attribute* may be a Compound Term, which includes ſeveral other *Propoſitions* that may be call'd Incident, being but a part of the *Subject* or *Attribute,* and join'd by the *Pronoun Relative, Who* or *Which,* the Property of which is to join ſeveral *Propoſitions,* ſo that they may all Compoſe but one only. Compound *Propoſitions* may be of three ſorts,

1. When the Compoſition relates to the *Subject,* to the *Attribute,* or to both, as *Every Man who fears Nothing is a King, Rex eſt qui metuit nihil.*

Beatus ille qui procul negotiis
Ut priſca gens mortalium
Paterna rura bobus exercet ſuis
Solutus omni fœnore.

For the Verb *eſt* is underſtood in this laſt *Propoſition, beatus* is the *Attribute,* and all the reſt the *Subject.*

2. When the *Attribute* is a Compound Term, then the Compoſition relates to the *Attribute, Piety is a Good which renders Men happy in the greateſt Adverſity.*

Sum Pius Æneas famâ ſuper Æthere notus.

3. Sometimes the Compoſition falls on the *Subject* and *Attribute*, both the one and the other being a Compound Term, as in this Propoſition, *The Great, who oppreſs the Poor, ſhall be puniſh'd by God, who is the Protector of the Oppreſs'd.*

Ille ego qui quondam gracili modulatus avena
Carmen, & egreſſus ſylvis vicina coegi.
Ut quamvis avido parerent arva colono,
Gratum opus agricolis: At nunc horrentia Martis.
Arma virûmque cano, Trojæ quis primus ab oris,
Italiam fato profugus Lavinaque venit
Littora.

The three firſt Verſes, and half the fourth, compoſe the *Subject* of this *Propoſition.* The reſt, the *Attribute* and the *Affirmation*; is included in the Verb *Cano.*

If we aim'd in this Eſſay to explain this Art ſo thoroughly, as to leave nothing unſaid which the beſt *Logicians* have written upon it, we might enlarge *On the Falſity that may be found in Compound Terms, and Incident Propoſitions*; *On Compound Propoſitions, according to Affirmation and Negation*; and *Of a kind of Propoſition, call'd by the Philoſophers* Modal. We might treat *Of ſeveral ſorts of Compound Propoſitions, Of Propoſitions Compound in the Senſe,* and add ſome *Obſervations to ſhew which is the Subject and which the Attribute in ſome Propoſitions, expreſs'd after a manner that is not Common.* We might ſpeak of *Confus'd Subjects equivalent to two Subjects,* and obſerve *How Propoſitions may be further known to be Univerſal or Particular*; as alſo treat of *Propoſitions*; where the *Name of Things is given to Signs.* But this would ſwell the Treatiſe to a much more bulky Size than conſiſts with a Deſign that propoſes to give nothing more than the Skeleton of Things. We ſhall therefore proceed to Two ſorts of *Propoſitions* of great uſe in the Sciences, *Diviſion* and *Definition.* And firſt of *Diviſion,* which is the dividing one *Whole* into what it contains. But as there are two ſorts of *Wholes,* there are two ſorts of *Diviſions*; one compos'd of ſeveral Parts, really diſtinct, which in Latin is *Totum,* and the Parts of it are term'd Integral Parts. The *Diviſion* of this *Whole*, is properly call'd *Partition*; as when a Houſe is divided into its Apartments, a Village into its Precincts, a Kingdom into its Provinces, &c. The only Rule in this *Diviſion* is to take care to be exact in the Particulars, and leave nothing out. The other *Whole* is in Latin *Omne,* and its Parts term'd Subjective or Inferior, becauſe this *Whole* is a Common Term, and its Parts are compriz'd within its Extent, as the word *Animal* is a *Whole* of this Nature; the Inferiors of which, as Man or Beaſt, which are compriz'd within its Extent, are its Subjective Parts. This *Diviſion* is what is properly call'd *Diviſion,* and there are four ſorts of it.

1. When the *Genus* is divided by the *Species*; as *All Subſtance is Body or Soul, Every Animal is a Man or Beaſt.*

2. When the *Genus* is divided by its *Differences*, *Every Animal is Reaſonable, or depriv'd of Reaſon, All Numbers are Equal or Unequal, All Propoſitions True or Falſe, Every Line Right or Curv'd.*

3. When a Common *Subject* is divided by the Oppoſite *Accidents*, of which it is capable, or according to its ſeveral Inferiors, or into ſeveral Tomes, as *Every Star is Luminous by its ſelf, or only by Reflection, All Bodies are in Motion or Reſt, All* Britains *are Nobles or Commons, All Men are ſick or well, All People expreſs themſelves, either by Speech only, or by Writing and Speech.*

The Rules for *Diviſion* are, 1. That it be Entire, that is, that the Members of the *Diviſion* comprehend all the Extent of the Term divided, as Equal and Unequal comprehend all the Extent of the Term Number, there being none but what muſt be Equal or Unequal. The ſecond Rule which is a ſequel of the firſt, that the Members of the *Diviſion* be oppoſite, as *Equal* and *Unequal, Reaſonable and depriv'd of Reaſon.* The third Rule is a ſequel of the ſecond, and requires that no one of the Members be ſo ſhut up within the other, but that the other may be affirm'd, tho' it may be ſometimes included in it after another manner; for the Line is included in the Surface, as the Term of the Surface. And that does not hinder the Extents being divided into Line, Surface, and Solid, becauſe it cannot be ſaid that the Line is Surface, nor the Surface, Solid. We ought not to divide Opinions into True, Falſe, and Probable, but firſt into True and Falſe, and then divide the one and the other into Certain and Probable.

The next thing we are to treat of is *Definition,* of which there are two ſorts, the moſt exact retains the Name of *Definition*; the other, which is leſs exact, is call'd *Deſcription.* The moſt exact explains the Nature of Things by their eſſential *Attributes*; of which thoſe that are Common, are call'd *Genus*, thoſe that are Proper, *Difference.* Thus Man is defin'd as a reaſonable Animal, the Soul a Subſtance which thinks, the Body a Subſtance of Extent, God as a Perfect Being. Sometimes *Definitions* are made by the Integral Parts, as when we ſay, *Man is compos'd of Soul and Body.* The leſs exact *Definition,* which is call'd *Deſcription,* is that which gives ſome Knowledge of a Thing by Accidents proper to it. Thus Herbs, Fruits, Animals, are deſcrib'd by their Figure, Size, Colour, and other like Accidents. Of this Nature are the *Deſcriptions* of the Poets. There are three Things neceſſary to a good *Definition,* it ought to be Univerſal, Proper, and Clear. 1. A *Definition* may be ſaid to be Univerſal when it includes all the Things defin'd; for which Reaſon the Common *Definition* of *Time* is, that it is the Meaſure of *Motion,* becauſe we ſay a Thing has been ſo long in Reſt, as well as ſo long in Motion. 2. A *Definition* muſt be proper, that is, it muſt agree to nothing but the Thing defin'd; for which Reaſon the Common *Definition* of the Elements, *A Simple Corruptible Body,* does not ſeem to be Good. For the Celeſtial Bodies, according to the Philoſopher's own Confeſſion, are not leſs Simple than the Elements. And we have no Reaſon to believe that there are not the like Alterations in them, as in Terreſtrial Bodies; for not to ſpeak of Comets, which are known not to be form'd of Exhalations aſcending from the Earth, as *Ariſtotle* imagin'd. There have been Spots diſcover'd in the Sun, which are form'd and diſpers'd like our Clouds, though they are much greater Bodies. 3. A *Definition* muſt be ſo clear, that it muſt give us a clear and diſtinct Idea of the Thing defin'd, and as far as may be make us comprehend the Nature of it; ſo that it may help us to give the Reaſon of its Principal Properties. This is what ought to be chiefly conſider'd in Definitions, and ſay *Meſſieurs* of the *Port Royal* in their Logick, *yet this is what is wanting in a Great Part of* Ariſtotle's *Definitions.* The Authority of the *Port Royal* in this Matter will go as far as *Ariſtotle's*, eſpecially after the Reader has ſeen what theſe Gentlemen ſay of the Philoſopher on this Head. " For who is there, ſay they, who comprehends the Nature of Motion ever the better by his Definition of it; *Actus entis in Potentia quatenus in Potentia*, the Act of being in Power while it is in Power. Is not the Idea which Nature furniſhes us with a hundred times clearer than this? and how will it ever help to explain any of the Properties of Motion." When ſuch Great Men are at Variance in their Method of Explaining the Niceties of Art, the Learners muſt at once inform and pleaſe themſelves by reading what they ſay; wherefore we ſhall continue the Gentlemen of the *Port Royal's* Reflections on *Ariſtotle's* Definitions.

" The Four Celebrated Definitions of the Four Chief Qualities, as *Dryneſs*, *Moiſture*, *Heat* and *Cold*, are not better. *Dryneſs*, ſays he, is that which is eaſily contain'd in its own Bounds, and difficultly in thoſe of another Body, *quod ſuo termino facilè continetur, difficulter alieno.* *Moiſture* on the contrary is what is eaſily contain'd in the Bounds of another Body, but difficultly in its own, *quod ſuo termino difficulter continetur, facilè alieno.* Theſe Definitions agree better with Hard and Liquid Bodies than with Dry and Moiſt; for we ſay that ſuch an Air is dry, and another a moiſt Air, tho' it be eaſily contain'd within the Bounds of another Body, becauſe 'tis always Liquid. Further we can't ſee how *Ariſtotle* cou'd ſay that Fire, that is Flame, was dry, according to his Definition, ſince it eaſily accommodates itſelf to the Bounds of another Body, from whence *Virgil* calls it Liquid Flame, *Et liquidi ſimul Ignis.* 'Tis a vain Piece of Subtlety to alledge with *Campanella* that Fire being ſhut up *aut rumpit aut rumpitur*; for 'tis not on Account of its Dryneſs, becauſe its own Smoak ſtifles it if there's no Air. When there is any Paſſage for the latter to it, whereby it may drive out what it inceſſantly exhales, 'tis with Eaſe contain'd within the Bounds of another Body.

" As for *Heat*, he defines it to be that which gathers together like Bodies, and diſunites unlike, *quod congregat Homogenea & diſgregat Heterogenea*; and *Cold* that which gathers together unlike Bodies and diſ-unites like; which Definitions ſometimes agree with Heat and Cold, and ſometimes do not agree; and beſides, do's not at all help to the Knowledge of the true Cauſe which produces Heat and Cold. Thus the Chancellor *Bacon* had Reaſon to ſay theſe Definitions were like thoſe that were made of Man, by defining him to be an Animal that made Shooes and labour'd in the Vineyard: *Ariſtotle* defines Nature to be *Principium motus & quietis in eo in quo eſt*, the Principle of Motion and Reſt in that in which it is; which is founded only on an Imagination of his, That Natural Bodies differ'd from Artificial, inaſmuch as Natural have the Principle of Motion within 'em, and Artificial only without 'em; whereas 'tis evident and certain, that no Body can give Motion to itſelf, becauſe Matter being of itſelf indifferent to Motion or Reſt cannot be determin'd to one or t'other but by ſome Foreign Cauſe, which not being able to reach Infinity, it neceſſarily follows that God has impreſt Motion in Matter, and keeps it in it. The Famous Definition of the Soul appears ſtill to be more defective; *Actus primus corporis naturalis organici potentia vitam habentis*, the Firſt Act of the Natural Organical Body which has Life in Power. By which we can't tell what he would define; for if 'tis the Soul, as Common to Man and Beaſt, 'tis a Chimera, there being nothing Common between the Two Things. He has explain'd an obſcure Term by four or five more obſcure. To ſpeak only of the Word *Life*; the Idea we have of it is as Confus'd as that of the Soul, the true Term being equally ambiguous and equivocal." As to the Definition of the latter, with all due Submiſſion to the *Criticks* of the *Port Royal*, this Philoſopher might very well be a little obſcure in the Definition of a Soul, which none cou'd ever have a true Idea of but by the Help of the Knowledge of its Original. The True God and the Religion that teaches it, which Chriſtian Philoſophers having, may, doubtleſs, excel all that ſpeak of God or the Soul before the Sacred Revelation prevail'd. The Light of Nature will not go ſo far of itſelf, and the Brighteſt Idea's of the *Platoniſts*, relating to Immortal Beings are Confus'd, in Compariſon to the clear ones communicated to us by the Spirit of God.

What we have ſaid of Idea's already, and of Diviſion and Definition, prepares the way for that Part of Logick which is moſt treated of, and that is *Reaſoning*, the Neceſſity of which is founded only on the narrow Limits of Humane Underſtanding, which being to judge of the Truth or Falſhood of a Propoſition, which is there call'd *Queſtion*, cannot always do it by Conſideration of the Two Idea's that Compoſe it. That Idea which makes the Subject is call'd the *Little Term*, becauſe the Subject is commonly of leſs Extent than the Attribute, and the Idea of the Attribute is on the contrary call'd the *Great Term.* When the Conſideration of theſe Two Idea's only is not ſufficient to form a Judgment of Affirmation or Negation, there's occaſion of a Third, which is term'd the *Mean.*

This Term *Mean* muſt be compar'd as well with the Subject as with the Attribute, either ſeparately with each of theſe Terms, as in Simple *Syllogiſms*, or with both together, as in the Arguments that are call'd *Conjunctive.* In both, one way or t'other, Two Propoſitions are requiſite. We ſhall particularly ſpeak of the *Conjunctive* Arguments; for the Simple are clear, ſince the Mean being once compar'd with the Attribute of the Concluſion (which cannot be done but by affirming or denying) makes the Propoſition call'd *Major*, becauſe the Attribute of the Concluſion is call'd the *Great Term*; and being again compar'd with the Subject of the Concluſion it makes the *Minor*, becauſe the Subject of the Concluſion is call'd the *Little Term.* This Concluſion is the Propoſition to be prov'd, which before Proof is the *Queſtion.* The Two Chief Propoſitions are call'd *Premiſes*, for that they are plac'd at leaſt in the Mind before the Concluſion, which ought to be a neceſſary Conſequence if the Syllogiſm is good; that is, ſuppoſing the *Premiſes* to be true, the Concluſion muſt neceſſarily be ſo. 'Tis true, the two Premiſes are not always expreſs'd, becauſe oftentimes one is enough for the Conception of both; and when but Two Propoſitions are expreſs'd, this ſort of Reaſoning is call'd *Enthymeme*, which is a true Syllogiſm in the Mind, in as much as it ſupplies the Propoſition that is not expreſs'd. Tho' I have ſaid there are at leaſt Three Propoſitions in an Argument, there may be many more without rendring it defective, provided the Rules are always obſerv'd; for if after having conſulted a Third Idea, to find whether a Subject agrees to the Attribute, or does not agree to it; and having compar'd it with one of the Terms, I can't yet tell whether it agrees or diſagrees with the Second Term, I may chooſe a Fourth to inform my ſelf better, and a Fifth if that will not do, and ſo on 'till I have found one Term that will bind the Attribute of the Concluſion to the Subject. As for Example; Suppoſe I doubt whether *Miſers are miſerable*. I may firſt conſider that *Miſers* are full of Deſires and Paſſions; If that is not ſufficient for me to conclude from thence they are miſerable, I muſt examine what it is to be full of Deſires, and ſhall find in this Idea, that of wanting abundance of Things deſir'd, and the Miſery of being depriv'd of the Thing wiſh'd for; from whence I have ſufficient Ground to form this Argument, *Miſers are full of Deſires: Thoſe who are full of Deſires want abundance of the Things deſir'd, becauſe 'tis impoſſible for 'em to have their Deſires ſatisfy'd: Thoſe that want what they deſire are miſerable, therefore Miſers are miſerable.* The next thing to be treated of is *Syllogiſm*, ſo famous in Treatiſes of Logick, of which 'tis the Staff.

Syllogiſms, or Arguments of Three Propoſitions, are either Simple or Conjunctive. Simple are thoſe where the *Mean* is joyn'd but to one of the Terms of the Concluſion at once; Conjunctive are thoſe where it is joyn'd to both. Thus this Argument is Simple; *Every Good Prince is belov'd by his Subjects; Every Pious King is a Good Prince: Therefore every Pious King is belov'd by his Subjects*, becauſe the *Mean* is joyn'd ſeparately to *Pious Kings*, which is the Subject of the Concluſion, and with *belov'd by his Subjects*, which is the Attribute; but what follows is the Conjunctive for a Contrary Reaſon. *If an Elective State is ſubject to Diviſions 'twill not laſt long. An Elective State is ſubject to Diviſions, therefore an Elective State will not laſt long.* Here an *Elective State*, which is the Subject, and *laſt long*, which is the Attribute, are Part of the *Major*. Theſe two ſorts of Syllogiſms have their ſeparate Rules; and there are alſo two ſorts of Simple Syllogiſms, one wherein each Term is joyn'd wholly to the *Mean*; that is, to the Attribute wholly in the *Major*, and to the Subject wholly in the *Minor*: The other wherein the Concluſion is Complex'd, that is Compos'd of Complex Terms, we take but Part of Subject and Part of the Attribute to joyn with the *Mean* in one of the Propoſitions, and take all the reſt, which is but one ſingle Term to joyn with the *Mean* in another Propoſition.

The Law of God obliges to honour Soveraigns.
Queen ANNE is Soveraign;
Therefore the Law of God obliges to honour Queen ANNE.

The *Syllogiſms* which are call'd Conjunctive, do not all conſiſt of Propoſitions that are Conjunctive or Compounded, but are thoſe whoſe *Major* is ſo Compounded that it includes all the Concluſion. They may be reduc'd to Three Kinds, *Conjunctive, Disjunctive*, and *Copulative*.

Conditional Syllogiſms are ſuch whoſe *Major* is a Conditional Propoſition containing all the Concluſion, as

If there is a God he muſt be belov'd.
There is a God;
Therefore he muſt be belov'd.

The *Major* has Two Parts; the Firſt is call'd *Antecedent*, *If there is a God*; the Second *Conſequent*, *He muſt be belov'd.*

Disjunctive Syllogiſms are thoſe whoſe Firſt Propoſition is Disjunctive; that is, whoſe Parts are joyn'd by *Or*, as this of *Cicero*.

Thoſe who kill'd Cæſar *are Parricides, or Defenders of Liberty.*
Now they are not Parricides;
Therefore they are Defenders of Liberty.

Copulative Syllogiſms are thoſe in which a Negative Propoſition is taken, Part of which is afterwards laid down as Truth to take off the other Part, as

A Man cannot be at once a Servant of God, and a Worſhipper of Money.
Now a Miſer is a Worſhipper of Money;
Therefore he is not a Servant of God.

For this ſort of *Syllogiſm* does not neceſſarily conclude any thing, when one Part is taken away to have another put in its Place; as may be ſeen by this Argument taken from the ſame Propoſition.

A Man cannot be at once a Servant of God and a Worſhipper of Money.
Now the Prodigal is not a Worſhipper of Money;
Therefore he is a Servant of God.

Of *Syllogiſms* there can be none Perfect which have leſs than Three Propoſitions, unleſs the Concluſion is abſolute; for a Conditional Propoſition may include one of the Premiſes beſides the Concluſion, and even both of 'em. As for Example; Suppoſe I was to prove that the Moon is a Rugged Body, and not Smooth like a Looking-Glaſs, as *Ariſtotle* imagin'd, I cou'd not conclude it abſolutely under leſs than Three Propoſitions.

All Bodies which reflect Light from all Parts are Rugged.
Now the Moon reflects Light from all Parts;
Therefore the Moon is a Rugged Body.

But I ſhould have occaſion of Two Propoſitions only to conclude it Conditionally, as

All Bodies which reflect Light from all Parts are Rugged;
Therefore if the Moon reflects Light from all Parts, 'tis a Rugged Body.

Nay, this Argument may be brought within the Compaſs of one Propoſition.

If all Bodies which reflect Light from all Parts are Rugged, and the Moon reflects Light from all Parts, it muſt be allow'd that it is not a Smooth but a Rugged Body.

Or elſe one of the Propoſitions may be bound by the Cauſal Particle, *Becauſe* or *Since.*

If every true Friend ought to be ready to lay down his Life for his Friend,
There are no true Friends;
Since there are none who carry their Friendſhip ſo far.

This way of Arguing is very common and very fine, and ſhews that all Arguments are not bound to be made up of Three Propoſitions, divided and plac'd in the Order of the *Schools*; for 'tis certain that this Single Propoſition comprehends this Entire Syllogiſm.

Every true Friend ought to be ready to lay down his Life for his Friends:
Now there are none that are ready to lay down their Lives for their Friends;
Therefore there are no true Friends.

We muſt now ſay ſomething of *Enthymems* and *Enthymematick* Sentences. An *Enthymem* is a Perfect Syllogiſm in the Mind, but imperfect in the Expreſſion, becauſe one of the Propoſitions is ſuppreſt as too clear and too well known. This way of Argument is ſo common in Speaking or Writing, that 'tis rare to find all the Propoſitions expreſt, becauſe generally there's one clear enough to be underſtood. This Suppreſſion flatters the Vanity of thoſe to whom we ſpeak, inaſmuch as we leave ſomething to their Underſtanding, and by abridging the Diſcourſe 'tis render'd the more ſtrong and lively: As for Inſtance, if of this Verſe of *Ovid*, which contains a very Elegant *Enthymem*,

Servare potui, perdere an poſſim rogas,

Thee have I kept, Thee therefore I can loſe.

An Argument in Form had been made as; *He who can keep can loſe. Now I have been able to keep thee, therefore I can loſe thee.* All the Grace wou'd have been loſt; and the Reaſon is, That as one of the Principal Beauties of a Diſcourſe is to be full of Senſe, and give the Mind an Opportunity to form a Thought of more Extent than the Expreſſion; ſo 'tis on the contrary a great Defect to be void of Senſe, and include few Thoughts in the Expreſſion, which is almoſt *unavoidable in Philoſophical Syllogiſms*; yet theſe are in great Vogue with ſuch as having acquir'd a Habit of 'em in the Schools, cannot fall ſo eaſily into a reaſonable way of Arguing, as they can remember what they have Learnt. The Propoſition ſuppreſt by the *Enthymem* is ſometimes the *Major*, ſometimes the *Minor*, and ſometimes the Concluſion. It ſometimes happens that the Two Propoſitions of the *Enthymem* is concluded in one Propoſition only, which *Ariſtotle* calls an *Enthymematick* Sentence, and gives this Example,

Mortal, do not keep an Immortal Hatred.

The Argument Entire would be, *He that is mortal ought not to keep an immortal Hatred. Now you are mortal therefore*; and the Compleat *Enthymem* wou'd be, *You are mortal, let not your Hate therefore be immortal.*

Some *Syllogiſms* are compos'd of more than Three Propoſitions, and ſuch are generally call'd *Soriſtes*. They may be diſtinguiſh'd Three Ways, by *Gradation, Dilemma's* and *Epichereums*. Of *Gradation* ſomething has been ſaid, tho' under other Terms, when we firſt treated of *Syllogiſms*. *Dilemma's* will be ſpoken of in another Place; and in this we ſhall treat of *Epichereums*, which comprehend the Proof either of one of the Two Chief Propoſitions or both of them. As we are often oblig'd to ſuppreſs certain Propoſitions which are too clear in a Diſcourſe, ſo 'tis often alſo neceſſary to advance ſome that are doubtful, and to joyn Proof to 'em at the ſame time, to prevent the Impatience of thoſe to whom we ſpeak, who are ſhock'd ſometimes when we pretend to convince them by Reaſons which ſeem falſe or doubtful; for tho' we provide a Remedy in the Sequel, yet 'tis dangerous to give the leaſt diſguſt to the Mind, tho' but for a little time; wherefore 'tis neceſſary Proofs ſhould immediately follow doubtful Propoſitions, and not be ſeparated from them. This Separation will produce another great Inconveniency in obliging us to repeat the Propoſition to be prov'd. For which Reaſon, whereas the Method of the Schools is to propoſe the Argument Entire, and afterwards prove the difficult Propoſition, that which obtains in Common Diſcourſes is to joyn the Proofs that confirm it to ſuch Propoſitions as appear doubtful. This makes a ſort of Argument compos'd of ſeveral Propoſitions; for to the *Major* is joyn'd the Proofs of the *Major*, to the *Minor*, the Proofs of the *Minor*; after which comes the Concluſion. All *Cicero*'s Oration for *Milo* may be reduc'd to a Compound Argument, whoſe *Major* is, that 'tis permitted to kill him who lays Snares for our Lives. The Proofs of this *Major* are taken from the Law of Nature, the Rights of Mankind and Examples. The *Minor* is, Clodius *laid Snares for* Milo; and the Proofs of the *Minor* are Clodius's *Equipage and Train*, &c. The Concluſion is, *That 'twas therefore lawful for* Milo *to kill him*, which is ſufficient to give a Notion of the Nature of *Epichereums*; and the Uſe of 'em appears plainly in all Pleadings and Publick Orations, that are to have an immediate Effect on the Auditory; and to engage them, 'tis neceſſary to keep the Proofs as near any thing doubtful as is poſſible. The next Thing is the

Dilemma, which is a Compound Argument, wherein, after having divided a Whole into its Parts, we conclude affirmatively or negatively of the whole, what had been concluded of each Part; It muſt be, *What has been concluded of each Part*;

and not that only which might have been affirm'd, for nothing is properly call'd a *Dilemma*, but that wherein what has been ſaid of each Part is maintain'd by its Particular Reaſon: As for Example, being to prove that we cannot be happy in this World, this *Dilemma* may be made upon it.

We cannot live in this World without abandoning our ſelves to our Paſſions, or ſtruggling with them. If we abandon our ſelves to them, 'tis a miſerable Eſtate, becauſe ſhameful and unſatisfactory; If we ſtruggle with them that's alſo a miſerable Eſtate, becauſe nothing is more troubleſome than that inward War which we are continually oblig'd to have with our ſelves; therefore we cannot have any true Happineſs in this Life.

The following Obſervations may be made on theſe ſorts of Arguments.

The Firſt is, That we do not always expreſs all the Propoſitions that belong to them; as for Inſtance: There are abundance of Things to be underſtood in that Famous *Dilemma* by which an Ancient Philoſopher ſays, *That we ought not to meddle with Affairs of State.*

If we act well we ſhall give Offence to Man; if we act ill we ſhall oflend the Gods; therefore we ought not to meddle at all. And in this, by which another próv'd, *That we ought not to Marry.*

If we marries a handſome Woman, ſhe cauſes Jealouſy, if an Ugly Woman, Diſquiet; therefore we ought not to marry. For in both theſe *Dilemma's* the Propoſition that ſhould have contain'd the Partition is underſtood. And this is what is very common, becauſe it is eaſily underſtood, being ſufficiently denoted by the Particular Propoſitions wherein each Part is treated of.

Further, That the Concluſion may be contain'd in the *Premiſes*, ſomething general, which may agree to all, muſt be underſtood every where as well as in the Firſt; as,

If we act well we ſhall give Offence to Man, which is grievous; if we act ill we ſhall offend the Gods, which is alſo grievous; therefore 'tis grievous in any wiſe to meddle with State Affairs. This Advice is of great Importance towards judging rightly of the Force of a *Dilemma*; for that which makes this not concluſive is, That 'tis not grievous to offend Man when we can avoid offending God.

The Second Thing to be obſerv'd is, That a *Dilemma* may be vicious, and chiefly two ways. One is, when the *Disjunctive* on which it is founded is *defective*, as not comprehending all the Members of the whole which is divided. Thus the *Dilemma* againſt Marriage is not Concluſive, becauſe there may be Women not handſome enough to create Jealouſy, nor ugly enough to give Diſguſt. The other is, when the Particular Concluſions of each Part are not neceſſary. Thus 'tis not neceſſary that a handſome Woman ſhould cauſe Jealouſy, ſince ſhe may be ſo diſcreet and ſo vertuous, as not to give a Ground for Diſtruſtthat ſhe's Unfaithful. Neither is it neceſſary that an Ugly Woman ſhou'd give Diſguſt, becauſe ſhe may have ſo many good Qualities of Mind that ſhe may pleaſe her Husband.

The Third Thing to be obſerv'd is, That he who makes Uſe of a *Dilemma*, be very careful, leſt it might be turn'd againſt himſelf. Thus *Ariſtotle* witneſſes, That the Famous *Dilemma* about meddling with State Affairs was turn'd againſt the Philoſopher who made it, it being ſaid,

If we Govern according to the Corrupt Rules of Man,
we ſhall Content Man.
If we ſerve True Juſtice we ſhall Content the Gods;
Therefore we ought to meddle with them.

However, this Turn was not reaſonable; for 'tis not profitable to pleaſe Man by offending God.

We ſhall in the next place treat of the Method of finding out Arguments, and what the Rhetoricians and Logicians call *Loci Argumentorum* or *Places*, which are certain General Heads under which all the Proofs relating to the ſeveral Matters diſcours'd of may be plac'd; and that Part of Logick term'd *Invention*, is nothing elſe but what they teach by theſe Places.

Ramus on this Subject quarrels with *Ariſtotle* and the Philoſophers of the *Schools*, becauſe they treat of Places after having given Rules for Arguments, and pretends that Places, and every thing relating to Invention ought to be explain'd before the Rules are treated of; his Reaſon was, that the Matter ſhou'd be found out before we think of diſpoſing it. Now the Explanation of Places teaches how to find out Matter, wheteas Rules for Arguments ſhew only how to diſpoſe of it. " But, ſay the Gentlemen of the *Port Royal*, " this Reaſon is very weak; " for tho' 'tis neceſſary the Matter be found out " before we think of the Diſpoſition of it, 'tis " not how ever neceſſary to learn how to " find out Matter before we learn how to diſ- " poſe of it. For to diſpoſe of Matter, 'tis ſuffi- " cient to have Certain General Matters to ſerve " for Examples; now the Mind and Common Senſe " always furniſh enough without having any oc- " caſion to borrow from Art and Method. 'Tis " therefore true, that a Man may have Matter to " Explain the Rules of Arguments, but falſe that " 'tis neceſſary to find that Matter by the Method " of Places.

Much more might be ſaid for putting theſe Places in the Order the Reader will find them; but as long as he finds them he will be ſatisfy'd, eſpecially ſince there was no abſolute Neceſſity of their being made Introductory to the other Parts of Logick: So leaving *Ramus* to decide that Affair with *Ariſtotle* we proceed.

The Ancients made a great Myſtery of this Method of *Places*, and *Cicero* preferr'd it to all the *Dialetick* as taught by the *Stoicks*, becauſe they ſaid nothing of *them*. Let us leave off a Science that ſays nothing to us of the Art of finding out Arguments, and ſpeaks too much of that of judging, *Iſtam Artem totam relinquamus quæ in excogitandis Argumentis muta nimium eſt, in judicandis nimium loquax.* *Quintilian* and all the Rhetoricians, *Ariſtotle* and all the Philoſophers ſpeak of them; ſo that we ſhould be put to it to be of another Opinion, if General Experience was not quite contrary to it. We may call as many Perſons as have paſt thro' a Common Courſe of Study to witneſs this Truth. Is there one of them who having learnt this Method at the College, when afterwards he has been oblig'd to treat of any Subject that reflected on theſe Places, and ſought there for the Reaſons that were neceſſary. Let us hear what the *Port Royal* ſay of this Matter, becauſe we know 'twill ſhock the Logicians grown old in the ways of the Schools, and the Young Men, who are fonder of the Form than of the Power of Argument.

"Conſult, *ſay they*, as many Lawyers and Preachers as are in the World, as many Men as Speak and Write, and have always Matter left, and 'tis to be queſtion'd whether you'll find one that ever thought of making an Argument *à Cauſa, ab effectu, ab adjunctis*, to prove what he intended." Now this is at once to throw out of the School thoſe ſounding Terms which ſerve to amuſe the Ignorant, and divert others. What will become of *Cauſe Efficient, Procreant*, and *Conſervant, Final*? Of *Diſſentaneous, Diſparous, Privative, Comparate, Ratio*, &c. which make more Noiſe than good Senſe, and true Art. In a word, what will become of all the Exerciſes in Logick, that are to form ſo many future Orators for the Chair and the Bar? Let what ever will be their Fate, we'll go on with the *Port Royal's* Reflections, which 'tis probable will be of more uſe than their preſent Courſe in the *Dialectick*. "Thus, tho' *Quintilian* ſhew'd he had an Eſteem for this Art, he was oblig'd nevertheleſs to acknowledge that we ſhould not, when we handle any Matter, knock at the Door of all thoſe Places, to fetch from thence Arguments and Proofs. *Illud quoque ſtudioſi Eloquentiæ cogitant, non eſſe cum propoſita fuerit materia dicendi ſcrutanda ſingula & velut oſtiatim pulſanda, ut ſciant an id probandum quod intendimus, fortè reſpondeant.* 'Tis true, all the Arguments made on each Subject, may be brought under the Heads call'd Places; but 'tis not by this Method that they are found. Nature, the deliberate Conſideration of the Subject, the Knowledge of ſeveral Truths produces them, and Art afterwards accommodates them to certain *Genus's*. Again, we may form Rules by obſerving what Nature makes us do, but we never do thoſe Actions by the help of Rules. *Virgil*, in the Ninth Book of the *Æneis*, after having repreſented *Eurialus* ſurpriz'd, and ſurrounded by his Enemies, who were ready to revenge on him the Death of their Companions, whom *Niſus*, *Eurialus's* Friend, had ſlain, puts theſe Words, full of Emotion and Paſſion in the Mouth of *Niſſus*,

Me me adſum, qui feci, in me convertite ferrum
O Rutuli, mea fraus Omnis; Nihil iſte nec auſus,
Nec potuit. Cœlum hoc & ſidera conſcia teſtor
Tantum infelicem nimium dilexit amicum.

"This Argument is, ſays *Ramus*, *à Cauſa Efficiente*. But one may boldly ſwear that *Virgil* never thought of the *Place* call'd the Efficient Cauſe, when he made theſe Verſes; he never would have made them, if he had ſtop'd to look after ſuch a Thing as Place; for to produce ſuch Noble and Pathetick Lines, he muſt neceſſarily have not only forgotten thoſe Rules, if ever he knew them, but muſt in ſome meaſure have forgotten himſelf, to take on him the Paſſions he would repreſent.

"The Truth is, the little Uſe the World has made of this Method of Places, ſince it has been found out and taught in the Schools, is an evident Proof that 'tis indeed not uſeful. Let any one draw as much Fruit from it as 'tis capable of yielding, he will never arrive by it at any thing uſeful or valuable. All that can be pretended to by this Method, is to find out ſeveral General, Common, and Foreign Thoughts on each Subject, ſuch as the *Lulliſts* find by the help of their Tables. Now, of what uſe can ſuch an abundance be, than which nothing is more prejudicial to the Judgment? Nothing choaks good Seed ſo much as the abundance of Weeds. Nothing renders the Mind more barren of ſolid and juſt Thoughts, than this wretched Fertility of Common ones. The Mind accuſtom'd to this facility, eaſes it ſelf of the Trouble of looking after particular and proper Reaſons, which are only diſcover'd by ſerious Attention to the Subject.

"It ought to be conſider'd, that the abundance ſought after by the means of *Places*, is of very little Advantage; 'tis not what the greateſt part of Mankind wants. And thoſe who follow this Method, offend oftner thro' Exceſs than Deficiency; Diſcourſes made in this way are but two full of Matter. Thus, to form a ſolid and judicious Eloquence, 'twould be much more uſeful to teach Men to hold their Tongues than to ſpeak; that is, to ſuppreſs and cut off Low, Common, and Falſe Thoughts. And as the uſe of *Places* ſerves for little, but to find out ſuch Thoughts; if it muſt be allow'd, that 'tis convenient to know them, becauſe ſo many great Men have ſaid ſo, 'tis much more convenient to know how ridiculous it is to uſe 'em. To diſcourſe of every thing, as the *Lulliſts* do, by means of their General Attributes, which are a ſort of Places, and that this bad facility of diſcourſing upon every thing, and finding Reaſons every where, of which ſome Perſons are very Vain, is ſo poor a Character of Underſtanding, that 'tis below even Brutality." If theſe Gentlemen ſhould meet with many more Votaries than they have done already, the Ancient Logick will ſuffer as much as the Ancient Geometry did by the Diſcovery of the *Infinitely Littles*, which has in one Age gone farther than all the Art did before in Two Thouſand Five Hundred Years. Notwithſtanding what has been ſaid againſt the blind Uſage of *Places* inſtead of *Genius* and *Reaſon*, yet ſince a General Tincture of them may not be amiſs, in as much as it may help a Man when he does not think of 'em, to view Things on more ſides than one, we ſhall ſay ſomething of them.

Thoſe that have treated of Places have divided them after different manners, we ſhall follow that which was follow'd by the *Port Royal*.

Places of Grammar, are Etymology and Words deriv'd from the ſame Root, which in the Latin are call'd *Conjugates*. We argue by Etymology, when we ſay, for Example, *That ſeveral Perſons in the World never divert themſelves*, properly ſpeaking, becauſe to divert themſelves, is to diſapply themſelves from ſerious Occupations, and that they are never ſeriouſly occupy'd. Words deriv'd from the ſame Root, help alſo to find out Thoughts, as *Homo ſum, humani nil à me alienum puto. Mortali urgemur ab hoſte, Mortales. Quid tam dignum miſericordiâ quam Miſer? Quid tam indignum miſericordiâ quam ſuperbus Miſer?* Who is there more worthy of Mercy than a miſerable Man? Who more unworthy of it than a miſerable Man that's Proud?

Places of *Logick* are Univerſal Terms, *Genus, Species, Differences, Propriety, Accident, Definition, Diviſion*. To theſe Places are join'd certain Common Maxims, which 'tis convenient to know, not becauſe they are very uſeful, but becauſe they are common. The Ordinary Terms are,

1. What affirms or denies in the *Genus*, affirms and denies in the *Species*, *That which agrees with all Men, agrees with the Great; but they are not to pretend to Advantages that are above Men.*

2. By deſtroying the *Genus* you deſtroy the *Species*, *He who does not judge at all, does not judge ill, He who never ſpeaks at all, never ſpeaks ill.*

3. By deſtroying all the *Species* you deſtroy the *Genus*, *The Forms which are call'd Subſtantial (except the Reaſonable Soul) are neither Body nor Soul, therefore they are not Subſtances.*

4. If we can affirm or deny the total *Difference* of any Thing, we may affirm or deny the *Species*, *Extent does not agree to Thought, therefore it is not Matter.*

5. If we can affirm or deny the *Property* of any Thing, we may affirm or deny the *Species*, *It being impoſſible to figure to ones ſelf half of a Thought, nor a round or a ſquare Thought, 'tis impoſſible that it ſhould be a Body.*

6. We affirm or deny a Thing defin'd, when we affirm or deny the *Definition*, *There are few juſt Perſons, becauſe there are few who have a firm and conſtant Will to render to every one what is his due.*

Places of Metaphyſicks are certain General Terms, agreeing to all Beings; to which ſeveral Arguments are annex'd, as Cauſes, Effects, the Whole, Part, oppoſite Terms. What is moſt uſeful, is to underſtand ſome General Diviſions, and eſpecially of Cauſes. The Definitions which are given in the Schools to Cauſes in general, as *A Cauſe is that which produces an Effect, or that by which a Thing is,* are ſo little Clear, and 'tis ſo difficult to ſee how they agree to all kinds of Cauſes, that it would have been well if that Word had been left among thoſe which are not defin'd, the Idea we have of it being every whit as Clear as thoſe Definitions.

The Diviſion of Cauſes into four kinds, into Final, Efficient, Material, and Formal, is the moſt famous, and moſt neceſſary to be known.

A Final Cauſe is the end for which a Thing is. There are *Principal* Ends, which are thoſe that are principally regarded; and Acceſſory Ends, which are conſider'd only as over and above. What we pretend to do or obtain, is call'd *Finis cujus Gratia.* Thus Health is the end of Phyſick, becauſe it pretends to procure it. He for whom Labour is done, is call'd *Finis cui.* Man is the end of Phyſick, in this manner, becauſe 'tis for him that it deſigns the Cure. There's nothing more Common than to draw Arguments from the End, either to ſhew that a Thing is imperfect, as when a Diſcourſe is ill done, when 'tis not proper to perſwade, or to ſhew, 'tis likely a Man has done or will do ſuch an Action, becauſe 'tis conformable to the End he us'd to propoſe to himſelf. From whence came that famous Saying of a Roman Judge, that we muſt before every thing examine, *cui Bono*, what Intereſt had a Man in doing ſuch a thing, becauſe Men are generally acted by their Intereſt; or, on the contrary, to ſhew a Man ought not to be ſuſpected to be guilty of ſuch an Action, becauſe 'twould have been contrary to his End. There are ſeveral other Ways of Arguing from the End, which good Senſe will diſcover better than all Precepts; which Obſervation may ſerve for all other Places.

The *Efficient Cauſe* is that which produces another Cauſe. Arguments are drawn from it, by ſhewing that an *Effect* is not, becauſe there has not been ſufficient Cauſe, or that it will be by demonſtrating that all the *Cauſes* are. If theſe Cauſes are neceſſary, the Argument is neceſſary; if they are Free and Contingent, 'tis only probable. There are ſeveral *Species* of *Efficient Cauſes.* God creating *Adam*, was the total Cauſe, becauſe Nothing concurr'd with him in it; but the Father and Mother are each but partial Cauſes of their Child, becauſe both the one and the other was neceſſarily concern'd in the Generation of it. The Sun is a proper Cauſe of Light, but only the accidental Cauſe of the Death of a Man kill'd by its Heat, becauſe he was ill diſpos'd. The Father is a *Neighbouring* Cauſe of his Son, the Grand-father but a *Diſtant*, the Mother the *Productive*, the Nurſe the *Preſerving.* A Father is an *Univerſal* Cauſe, with reſpect to his Children, becauſe they are like him in Nature. God is but an *Equivocal* Cauſe, with reſpect to his Creatures. A Workman is the principal Cauſe of his Work, his Inſtruments are only the *Inſtrumental* Cauſe. The Air that enters an Organ, is an *Univerſal* Cauſe of the Harmony of the Organ. The particular Diſpoſition of each Pipe, and he who plays, are the *Particular* Cauſes which determine the *Univerſal.* The Sun is a *Natural* Cauſe, Man an *Intellectual* Cauſe, with reſpect to what he does with Judgment. The Fire which burns, Wood, is a *Neceſſary* Cauſe. A Man who walks, is a *Free* Cauſe. The Sun giving Light to a Chamber, is the *Proper* Cauſe of its Light; the Window is but a Condition, without which the Effect would not have been, *Conditio ſine qua non.* The Fire burning a Houſe, is the *Phyſical* Cauſe of its burning; the Man who ſet it on fire, the Moral. The *Exemplary* Cauſe is alſo reckon'd a Part of the *Efficient.* 'Tis the Model we propoſe to our ſelves in undertaking any Piece of Work, as the Deſign of a Building, by which the Architect builds; or generally whatever is the Cauſe of the Object of our Idea, or any other Image, as that of Queen ANNE, is the *Exemplary* Cauſe of her Picture.

The *Material Cauſe*, is that out of which Things are found, as Gold is the Matter of a golden Cup. That which agrees or diſagrees with the Matter, agrees or diſagrees with the Things made of it.

Form is that which renders a Thing what it is, and diſtinguiſhes it from others; by the Knowledge of which we muſt explain its Properties.

There are as many different *Effects* as there are *Cauſes*, theſe Words being reciprocal. The common way of drawing Arguments from them, is by ſhewing, if the Effect is, the Cauſe is; nothing can be without Cauſe. That a Cauſe is good or bad, is prov'd when the Effects are good or bad; which however is not always true in Cauſes by Accidents.

There are four ſorts of *Oppoſite* Terms; *Relative*, as Father, Maſter, Servant. *Contrary*, as Hot, Cold, Health, Sickneſs. *Privative*, as Life, Death, Knowledge, Ignorance, Sight, Blindneſs, Contradictory, which conſiſt in a Term, and the ſimple Negation of this Term *to ſee, not to ſee.* The difference between the two latter ſorts of Oppoſitions lies in that the Privative Terms include the Negation of a Form in a Subject capable of it, whereas Negatives do not denote that Capacity. Thus we do not ſay a Stone is blind or dead, becauſe 'tis not capable of Life or Sight. As theſe Terms are *Oppoſite*, we make uſe of one to deny the other. *Contradictory* Terms have this Particular in 'em, that by taking away one you eſtabliſh the other.

There are ſeveral kinds of Compariſons; for we compare things equal or unequal, like or unlike. We prove, that what agrees or does not agree with a thing equal or like, agrees or does not agree with another thing to which 'tis equal or like. In unequal things, we prove Negatively, that if what is more Probable is not, what is leaſt Probable is not with much greater Reaſon: Or Affirmatively, that if what is leaſt Probable is, what is more Probable is alſo. We generally make uſe of *Differences* or *Diſſimilitudes*, to ruin what others would confirm by *Similitudes*, as we ruin an Argument taken from a *Decree*, by proving 'twas given in another Caſe.

We hope the Reader, who is willing to have a View of Logick, will now be ſatisfy'd, ſince we have let him into the Secret of *Places*, and furniſh'd him with Names to puzzle others, and prevent being puzzled himſelf: For as to other Uſes, he will ſoon perceive, that as the Meſſieurs of the *Port Royal* declare in their Logick, few Men in Writing or Speaking tye themſelves to theſe Forms, but are furniſh'd with Arguments by their Genius and Capacity, which provide much better for them than theſe *Loci*. However, the Uſe of 'em is not unknown to 'em, Reaſon throws 'em upon it whether they will or not. Such as deſire a ſuperficial Knowledge of Terms, will find enough in the Article of the *Efficient Cauſe*; and if we had not rang'd that Liſt in due Order, it would have been a moſt inſufferable Diſappointment to the young Student, who takes theſe things to be the very Eſſence of fine Thinking; but that he may not be miſtaken, we'll cloſe our Diſcourſe of *Places* with a Word or two tranſlated from the Treatiſe written by the before-mention'd Gentlemen; "Thus have we given you a rude Sketch of Part of what has been ſaid of *Places*; there are other things much more uſeful than theſe, and worthier to be learn'd. Thoſe who would know more may read the Authors who have handled this Matter more amply: However, we ſhall not adviſe any Body to have recourſe to *Ariſtotle*'s Topicks, for they are a parcel of Books ſtrangely confus'd. But there's ſomething fine enough on this Subject in the Firſt Book of his Rhetorick, wherein he teaches us ſeveral Ways of proving a thing to be uſeful, agreeable, greater or leſs. Yet true it is, that we never arrive at the Knowledge of any thing ſolid by that way." The Authority of the *Port Royal* is ſufficient to juſtify our ſpeaking what a long Experience has taught us, That 'tis not all the Old Methods of the Schools which ever made a Man write or ſpeak well, who had not Capacity for it, and he who has will never make uſe of 'em. They are a great help to *Sophiſts* and *Pedants*, and whoever would arrive at any Maſtery in Pedantry or Sophiſtry, muſt be as well acquainted with 'em, as a Geometrician ſhould be with the Elements of *Euclid*. This naturally brings us to treat of *Sophiſts*, or falſe *Logicians*. Every one that underſtands the Rules of good Reaſoning will ſoon find out bad: Neverthelefs, ſince Examples to be avoided ſtrike more than thoſe to be imitated, 'twill not be uſeleſs to ſay ſomething of the principal Springs of bad Reaſoning, which is call'd *Sophiſtry*; the *Port Royal* reduces 'em to ſeven or eight. The firſt is, *To prove another Thing than that which is in Queſtion. Ariſtotle* calls this Sophiſm *Ignoratio Elenchi*, i. e. Ignorance of what ſhould be prov'd againſt an Adverſary. This is very common in the greateſt part of Diſputations. Men generally diſpute with Heat, but do not underſtand one another. Paſſion or Malice makes 'em impute that to an Adverſary which was far from his Thoughts, nay, tho' he diſowns and denies it. This *Ignoratio Elenchi*, is to be met with in almoſt all our Poetical Conteſts, and in too many of our Religious. There's hardly a Tract in *Politicks*, *Diſputative Theology*, or *Criticiſms*, but what is made up of this Sophiſm. And indeed, almoſt all manner of Modern Diſputations, which, whoever is the leaſt acquainted with 'em, eaſily comprehends. As he will do the ſecond Sophiſm, to *ſuppoſe that for Truth which is in Queſtion*, which *Ariſtotle* calls *Petition of the Principle*. This is not uncommon, as much as 'tis againſt Reaſon; and the great *Galileo* accuſes *Ariſtotle* himſelf of being guilty of it, when to prove that the Earth is in the Center of the World, he ſays,

The Nature of heavy Bodies is to tend to the Center of the World, and light Bodies to be at a diſtance from it:

Now Experience ſhews that heavy Bodies tend to the Center of the Earth, and light Bodies keep at a diſtance from it:

Therefore the Center of the Earth is the ſame as the Center of the World.

'Tis plain there's a *Petition* of *Principle* in the *Major* of this Argument; for tho' we perceive that heavy Bodies tend to the Center of the Earth, yet how did *Ariſtotle* come to know that they tended to the Center of the World, if he did not imagine that the Center of the Earth was the ſame as the Center of the World, which is the Concluſion he would prove by this Argument?

All Arguments, whereby Men pretend to prove an unknown Thing, by one that is as much or more unknown, or an uncertain one by one that's as much or more uncertain, are reckon'd Part of this *Sophiſm*.

The third is, *To take that for* Cauſe *which is not* Cauſe. This is very common, ſometimes out of Ignorance of the Cauſes of Things. Such was the Opinion of thoſe Philoſophers who taught, that Veſſels full of Water broke when frozen, becauſe the Water being bound up, left a *Vacuum*, which Nature cannot ſuffer; yet 'tis found out that they break on the contrary, becauſe the Water being frozen takes up more room than before, which is alſo the Cauſe that the Ice ſwims upon it. When Diſputants make uſe of Foreign Cauſes, or ſuch as prove nothing, for Proof of Things clear enough of themſelves, or falſe, or at leaſt doubtful; as when *Ariſtotle* would prove that the World is Perfect for this Reaſon, *The World is Perfect, becauſe it contains a Body; the Body is Perfect, becauſe it has three Dimenſions; three Dimenſions are Perfect, becauſe three are all* (quia tria ſunt Omnia) *and three are all, becauſe we do not make uſe of the word all, when there's but one or two things, but only when there are three.* By the ſame Reaſon, the leaſt Atom may be prov'd to be as Perfect as the World, becauſe it has three Dimenſions, as well as the World. We are very loath to mention the Miſtakes of great Men, knowing that tho' it became the *Port Royal,* it may not perhaps become us; for there's a ſort of Men in the World, who will never allow others to have a right to ſpeak Reaſon; Shall ſuch a one charge *Ariſtotle* with Error? Shall he pretend to deny Things that have been long thought ſo uſeful in the Learned World? 'Tis intolerable. And yet we ſhall at once offend another great Part of that Illuſtrious Body, who content themſelves with Words, and triumph with Sound; but becauſe we will let 'em ſee there's other Authority than our own Judgment, which was not form'd by reading the *Port Royal* Logick, but by Experience, and that Portion of Reaſon which fell to our Lot, we will oblige 'em with the Words of thoſe Gentlemen, as near as we can render them. Let it be remember'd, that when we ſpeak of the *Learned World,* we do not mean thoſe that are truly learned, for ſuch will not be concern'd in this Affair, but ſuch as pretend to Learning, and have really nothing but Pretence to ſupport 'em. Perhaps the Number may not be great, and therefore we'll venture to ſhew the World what true Logicians think of their Way of Arguing; "Another Cauſe, which makes them fall into this *Sophiſm,* is a fooliſh Piece of Vanity that renders them aſham'd to own their Ignorance. For that is the Occaſion that they had rather invent imaginary Cauſes of Things; the Reaſon of which if demanded of 'em, then they confeſs they do not know the Cauſe, and the way they take to avoid this Confeſſion is merry enough. *Every Gentleman will ſo often meet with ſuch notable Argumentations as theſe, eſpecially ſuch as are of ſhort ſtanding at the College, that 'tis very well worth his while to be a little Attentive here, for he'll collect abundance of Sophiſtry by this means, and get rid of abundance of Impertinence.* "When they ſee an Effect, the Cauſe of which is unknown to them, they fanſie they have diſcover'd it by joining to that Effect a general *Word,* or *Virtue,* or *Faculty,* which forms no other Idea in the Mind, but that that Effect has a Cauſe, which they knew before they had found out the Word. As for inſtance, there's Nobody but knows his Pulſe beats, that Iron is attracted by the Loadſtone, that Sena purges, that Poppy makes one ſleep: Thoſe who make no Profeſſion of Science, and are not aſham'd of Ignorance, confeſs freely they know thoſe Effects, but know nothing of the Cauſe; whereas the *Learned,* who would bluſh to ſay as much, get off after another manner, and pretend they have diſcover'd the true Cauſe of theſe Effects, which is, that in the Arteries there's a Pulſifick Virtue, in the Loadſtone a Magnetick Virtue, in Sena a Purgative Virtue, and in Poppy a Soporiferous Virtue. Thus you ſee how bravely they have accommodated Matters. There's never a Man in *China,* but might with as much eaſe have unfolded the Myſtery of the Clock, which rais'd ſuch Admiration among 'em. He needed only have ſaid, he knew perfectly well the Reaſon of that which others found ſo wonderful, and there was nothing in it, but that this Machine had an indicating Virtue which mark'd the Hours on the Plate, and a Sonorifick Virtue, which made it ſtrike and tell them. He would by this means have become as knowing in the Matter of Clocks, as the Philoſophers are in the knowledge of the beating of the Pulſe, the Properties of the Loadſtone, of Sena, &c. There are Words which make Men learned at a very ſmall Expence, as *Sympathy, Antipathy, Occult Qualities,* &c." 'Tis very plain by this, that theſe Gentlemen were not ſo eaſily to be impos'd on, as moſt Men are in the Affair of Thinking. For 'tis certain, that Appearances are not ſo much taken for Subſtances in any thing as in that.

The fourth *Sophiſm* is *Particularizing Things imperfectly.* There's no defect in Reaſoning, into which Men are more apt to fall than into this, and not to conſider enough how many ways a thing may be or may happen, whence they raſhly conclude, either that it is not, becauſe it is not after a certain manner, tho' it may be after another, or that it is after ſuch or ſuch a way, tho' it may be ſtill after another manner which they did not think of.

The fifth *Sophiſm* is *To judge of a Thing by ſomething which agrees with it only by Accident.* This is call'd in the Schools *Fallacia Accidentis,* and is when a Man draws an abſolute Concluſion, Simple, and without Reſtriction, from a thing that is true only by Accident, which is the Argument of thoſe who declaim againſt Eloquence, becauſe of the ill Effects it produces when 'tis abus'd. We will venture to give a falſe Example of this out of the *Port Royal,* becauſe tho' 'tis true with reſpect to the Papiſts, as thoſe Gentlemen were, yet 'tis Sophiſtry with reſpect to us, and that makes it pleaſant to have Sophiſm condemn'd by Sophiſtry. *'Tis by this,* ſay they, *the Hereticks of this Age have made ſo many abus'd Nations believe that Invocation of Saints, Veneration for Relicks, Prayers for the Dead, ought to be rejected as an Invention of Satan, becauſe Corruption and Superſtition have crept in among thoſe Holy Uſages warranted by all Antiquity, as if the bad uſe Men make of the beſt things could render them bad.* The Sophiſtry of this is obvious. The Reform'd, whom the Papiſts very wrongfully ſtile Hereticks, do not fall on the Catholicks for the Corruption of thoſe ſuperſtitious Cuſtoms in Religion authoriz'd by Antiquity, but for doing what is not warranted by Antiquity as the Hiſtory of the Apoſtolical and Primitive Ages of Chriſtianity plainly prove: However, in the Opinion of the Rigid Papiſts, this Example of the *Port Royal* is true, and not very unlike that of a late learned Writer againſt the Stage, who with great Applauſe fell upon the Immorality and Profaneneſs that had crept into it, and then made many *abus'd People,* as the *Port Royal* ſaid before on another occaſion, believe the Stage *ought to be* rejected as an Invention of Satan. This was a Proof of the fifth Sophiſm, *Fallacia Accidentis*; for he himſelf allow'd a Regulated Drama was not only uſeful but commendable.

The ſixth Sophiſm is *To paſs from a divided to a compound Senſe, or from a compound to a divided;* the one Sophiſm, is call'd *Fallacia Compoſitionis,* and the other *Fallacia Diviſionis.* The ſeventh, is to paſs from what is true in one Senſe to what is ſimply true, which is what is term'd in the Schools, *A dicto ſecundum quid ad dictum ſimpliciter.* Of this Nature is the ridiculous Argument of *Cotta* againſt the Exiſtence of God, mention'd in *Cicero's Natur. Deor.* *How,* ſays he, *can we conceive there's a God, not being able to attribute any Virtue to him? For ſhall we ſay he has Prudence; now Prudence conſiſting in the Choice of Good and Evil, what need can God* *have of Choice, not being capable of any Evil? Shall we ſay he has Knowledge and Reaſon? Reaſon and Knowledge help us to diſcover what is unknown to us by what is known; now nothing can be unknown to* God. *Neither can Juſtice be in Gad, for that only relates to Humane Society; nor Temperance, becauſe he has not Deſires to reſtrain; nor Streugth, becauſe he's not ſuſceptible of Pain or Labour, and is not expos'd to any Danger. How therefore can that be* God *which has neither Knowledge nor Vertue?* 'Tis difficult to imagine any thing more impertinent than this way of Arguing: 'Tis like the Thought of a Peaſant, who having never ſeen any thing but Thatch'd Houſes, and being told there are no Thatch'd Houſes in Cities, ſhould conclude there are no Houſes in Cities, and that thoſe who dwell there are wretched, being expos'd to the Injuries of the Weather. Thus *Cotta*, or rather *Cicero*, argues; *There cannot be a God with the ſame Vertues as Man has, therefore there cannot be a God.* And what is moſt wonderful is, he do's not conclude, there is no Vertue in God, but becauſe the Imperfection of Humane Vertue cannot be in God; ſo that he proves God knows nothing, becauſe nothing is hid from him; that is, He ſees nothing becauſe he ſees all Things; He can do nothing becauſe he can do all Things; He enjoys no good Thing becauſe he enjoys every good Thing. Is not ſuch an Argument as this enough to put a Mean Logician in Countenance; if ſuch a Sophiſm cou'd eſcape *Cicero*, well may we and others, who are by no means of his Size, deſpair of being perfectly free from Sophiſtry.

The Eighth is, *To abuſe with ambiguity of Words* what may be done after ſeveral Manners. This is a great Help to Young Sophiſts, and procures 'em an eaſy Victory in Diſputes where the Adverſary is rather to be Confounded than Convinc'd. Of this Kind are all Vicious Syllogiſms, whether they conſiſt of Four Terms, or the Middle is taken twice particularly; or in one Senſe in the Firſt Propoſition, and in another in the Second; or the Terms of the Concluſion are not taken in the ſame Senſe in the Premiſes as in the Concluſion. For by Ambiguity we don't mean that of meer Words only, which ſeldom or never deceives, but every thing that alters the Senſe of a Word, eſpecially when that Change is not eaſily to be perceiv'd, becauſe ſeveral things being ſignify'd by the ſame Sound they take 'em for the ſame Thing. When Words which ſignifie ſome Whole may be taken as collectively for all its Parts together, or ſeparately for each of its Parts; By this the following Sophiſm of the *Stoicks* is reſolv'd, which concludes that the World is an Animal endow'd with Reaſon, *becauſe that which hath the Uſe of Reaſon is better than that which hath not. Now there is nothing,* ſay they, *better than the World; therefore the World has the Uſe of Reaſon.* The *Minor* of this Argument is falſe, becauſe they attribute to the World what agrees only with God, who is the beſt and perfecteſt Being we can conceive: But confining our ſelves to the Creature, tho' it may be ſaid there's nothing better than the World, taking it collectively, for the Univerſality of all Created Beings, all that can be concluded at moſt is, that the World has the Uſe of Reaſon, according to ſome of its Parts, as *Angels*, *Men*; and not *that the whole together is an Animal that has the Uſe of Reaſon.*

The Ninth is, *To draw a General Concluſion from a defective Induction.* An Induction is, when by ſearching into ſeveral Particular Things, we acquire the Knowledge of one General Truth. Thus we have Experienc'd on ſeveral Seas, That the Water is Salt, and on ſeveral Rivers that the Water is Freſh: We conclude generally, that Sea-Water is Salt, and River-Water is Freſh. But ſuch ſort of Concluſions from Induction may very eaſily be falſe; for 'twas thought after repeated Experiments, that Water might be rais'd by an Air-Pump as high as one pleas'd, yet by later Experiments 'tis found out that it cannot be rais'd that way above thirty-two or thirty-three Foot.

We are now come to a Part of the Logick we Choſe for our Guide, which will, we hope, entertain the Reader as well as it entertain'd us, and then we ſhall be far from having any Reaſon to repent our Trouble. If he will read it with Attention, it will create many uſeful Idea's of our Modern Art of Thinking; and it may be, put him out of Love with ſome Authors, who have now the only Charm that can reach his Heart. The Vices committed in Arguing ariſe chiefly from Paſſion, Intereſt or Ignorance; and as the Two former are moſt Prejudicial to Truth, moſt will be ſaid upon thoſe Heads.

If we carefully examine what makes Men generally embrace one Opinion more than another, we ſhall find 'twas not the Penetration of Truth and Force of Reaſon, but ſome Engagement of Self-Love, Paſſion or Intereſt. If in our own Unhappy Diviſions we ſhould remember what is ſaid on this Subject by the Gentlemen ſo often cited in this Eſſay, we ſhall find this Truth Eternal and Univerſal. Self-Love, Intreſt or Paſſion are the Weights that turn the Balance, and decide moſt of our Doubts. We judge of Things, not as they are in themſelves, but with reſpect to their Relation to us; and Truth and Profit are to us the ſame thing. We have no need of any other Proofs than what we ſee every Day, That Things which are reckon'd every where elſe for doubtful, or even for falſe, are held for very certain, by all thoſe of ſome other Nation, Profeſſion or Party. *I am a Native of ſuch a Country, therefore I believe ſuch a Saint Preach'd the Goſpel there. I am of ſuch a Community, therefore I believe ſuch a Privilege really belongs to it. My Father was of ſuch a Religion, therefore am I.* Are theſe Arguments? Are theſe Reaſons? And yet if they are not, eſpecially the laſt, what would Millions have to ſay for their Creed? Again; *I love a Man, he is therefore one of the wiſeſt Men in the World? I hate him, he's a Raſcal*; and this often happens in one and the ſame Object: For the Paſſion cannot change oftner than the Manner of ſuch Mens Arguing, whoſe Reaſon is determin'd by it. Self-Love was a very notable way of deciding Things by a General Principle very advantageous to 'em; which is, *I underſtand Things; I know Truth when I ſee it,* and the like; as a late Critick in Defence of a Play. *I have not ſtudy'd the Art ſo long, but muſt be allow'd to know ſomething of the Matter*; which ſomething takes in the whole Compaſs of the Art, as modeſt as the Word is in Appearance. Others have a pleaſant way of rejecting Certain Opinions a little like the other; *If that was ſo, I ſhould know nothing of the Matter from whence they conclude much to their Advantage: Now I know very much of the*

the Matter, therefore it is not. Again, *Nothing is more common than to ſee Men mutually reproach each other, and for inſtance reciprocally call one another Opiniative, Paſſionate, Railers,* &c. *when they are of different Sentiments.* Let even our Britiſh Diſputation ſpeak in this Caſe; but of all Conteſts Pleadings are moſt diſtinguiſh'd in this Kind. However, we will not ſpeak our own Thoughts; let us keep here to the Text, and perhaps the Reader may find ſome Difference between our Pleaders and thoſe in France. “ There's hardly a Pleader but accuſes his Antagoniſt of ſpinning out a Suit, and to hide Truth by Artful Addreſs. Thus thoſe who are in the Right, and thoſe who are in the Wrong, ſpeak almoſt the ſame Language, make the ſame Complaints, and attribute the ſame Faults to one another, which is one of the moſt pernicious things in the Life of Man; for it confounds Truth and Error, Juſtice and Injuſtice, ſo that the Common People cannot diſcern the one from the other, by which means it happens that ſeveral are engag'd by Chance, and without Light to one Side and t'other; and others condemn both as equally in the Wrong.” To proceed; Self-Love has another Reaſon of the like Importance in the Art of Speaking; *'Tis a Notion of my own Invention, therefore true; 'Twas another ſaid it and not I, therefore 'tis falſe; I did not write ſuch a Book, therefore 'tis bad.* Under this Article will come almoſt all the Eulogies that are made upon ſome Men, and all the Cenſures that are paſt on others, Vanity and Malice are the Sources of both. Nor does it proceed ſeldom from a Spirit of Contradiction, which is indeed produc'd by Conceit and Ill Nature; and is the Cauſe that when Men hear or read any thing written or ſaid by another, they don't hearken to the Reaſons that might convince, but to ſuch as they think they can oppoſe. This Vice breeds moſt of the Criticks in our Times. Hiſtories, Sermons, Poems, are condemn'd or deſpis'd by it. This Vice alſo is the Principal Character of Pedantry; for a Pedant's Maſter-Piece is to hit a ſmall Blot, and be ſevere with the Author for't: He looks on a Beauty like a Blind Man on a Fine Picture; and if he's directed to it, maliciouſly turns his Eyes away as hating or fearing to ſee it: He hates to ſee what he can't imitate, and fears to be laſh'd by what he has juſtly provok'd, Reaſon being always at War with Folly and Affectation, of which Pedantry is the worſt ſort. Others do not oppoſe it out of Malice or Envy, but only out of a Diſputing Humour, which often debauches the Underſtanding. Others, eſpecially Courtiers, perceiving how ill this Humour looks, fly to a contrary one, and inſtead of Cenſuring approve every thing. What's that Man's Praiſe worth who praiſes every body? He certainly does it with as much ill Conſequence as if he Condemn'd every one to raiſe his own Character; for if he ſpeaks well of one who does not deſerve it, and at the ſame time of one that does, the World will have a Mean Opinion of his Judgment and Recommendation. Men engage themſelves often to defend Sentiments which are neither true, neither do they believe 'em to be ſo, and all Argument made on ſuch an Occaſion muſt be falſe; for where the Foundation is wrong all the Building muſt be the ſame. 'Tis a falſe and impious Opinion that Truth is ſo like Falſhood, and Vertue ſo like Vice, that 'tis impoſſible to diſcern them; but 'tis true, that in moſt Things there's a Mixture of Truth and Error, Vertue and Vice, Perfection and Imperfection, which Mixture is commonly the Riſe of all the falſe Judgments of Men. 'Tis thro' this Miſchief that the Good Qualities of Perſons we Eſteem make us approve of their Defects, and the Defects of thoſe we diſ-eſteem make us Condemn what is good in them. The Reaſon is, Men never judge by Particulars but according to the Impreſſion made on their Minds, and feel nothing but what ſtrikes them moſt. Thus when they perceive abundance of Truth in a Diſcourſe, they don't obſerve the Errors that are mixt with 'em; and on the contrary, If there are Truths mixt with abundance of Errors, they give their Attention to the Errors only. This proceeds from the General Tendency of Mankind rather to Condemn than to Commend; for we always find our Account more in the former than the latter. He who condemns aſſumes a Superiority over the Perſon Condemn'd, which Superiority flatters a Paſſion, inſomuch that we do not wonder the Number of falſe Criticks is ſo great. Men err by the *Exteriors* much more than by the *Interiors,* which will occaſion their judging wrong in all Caſes; for Good Senſe, Sound Judgment, Solid Learning, which may be term'd *Interiors,* never err; whereas Round Periods, Smooth Language, Choſen Words, and a Fine Manner of Expreſſion, which may be call'd *Exteriors,* are what pleaſe the Ear, charm the Senſe, and impoſe on the Underſtanding. Theſe Ornaments make us blind to the Faults that are mix'd in a Diſcourſe, and inſenſibly engage us to like it all. When we hear an Orator begin an *Antitheſis* of ſeveral Members, we ought to be on our Guard, for moſt certainly he intends to deceive us if he can. How many falſe Thoughts has the Fondneſs of ſome Writers for *Points* produc'd, eſpecially in Poetry. If there's a Point in a Poem, or a Poem full of Points, the latter ſhall be univerſally admir'd, and the former admir'd only for the Point that's in't. How many late Tragedies have ſucceeded for the Point, *Combien la rime a-t-elle engage de Gens a Mentir, How many Men,* ſays a Great *French* Critick, *have been tempted to lye by Rhime.* He proceeds; “ How many *Italian* Authors have writ fooliſhly out of an Affectation to uſe *Cicero's* Words, and write what they call pure Latinity? Who wou'd not laugh to hear Cardinal *Bembo* ſay of a Pope, he was Choſen by the Favour of the Immortal Gods, *Deorum Immortalium Beneficiis.* 'Tis the ſame with the Poets, who fanſie 'tis eſſential in Poetry to introduce Pagan Divinities; and a *German* Poet, juſt ſuch another as he was a Judicious Writer, having been reprov'd with Reaſon by *Picus de Mirandola,* for bringing into his Poem, wherein he deſcrib'd the Wars of Chriſtians againſt Chriſtians, all the Pagan Deities, and mingling *Apollo, Diana, Mercury,* with the *Pope, Electors* and *Emperors,* ſaid ingenuouſly in his Excuſe, he cou'd not have been a Poet without it, alledging to prove it, that *Heſiod's, Homer's* and *Virgil's* Verſes are full of the Names of the Fables of thoſe Gods, from whence he concludes 'twas lawful for him to do the ſame.” This Fault is ſo common in our *Engliſh* Poets, that *Oh Jove! Oh ye Immortal Gods,* &c. are the Chief Paſſion of their Poems on whatever

Subject they Writ, Jewiſh or Chriſtian, True, when they make uſe of the Name of *Phœbus* by way of Invocation, or as a Perſon for a Thing, by which they only mean the Spirit or Genius of Poetry, We queſtion whether there's ſo much Paganiſm in it as we condemn 'em for it. 'Tis common with moſt People in judging of Letters, or rather of Men of Learning, to cenſure them for what is falſe in an Opinion if they embrace what is true. Without this all our Party Men wou'd never be able to carry on their Political Controverſies: As for Inſtance, When a Man is Zealous in the Defence of our Eſtabliſh'd Church, and of thoſe Religious Ceremonies, Holy Rites and Sacred Ordinances which the Law has enjoyn'd, and Decency and good Order require, the Sectarian falls upon him for favouring Popery, becauſe Papiſts are fonder of Humane Inventions than the Laws of God in the Scripture. Again, If a Man warmly aſſerts the Divine Right of Monarchy, or the Royal Prerogative; tho' by Divine Right, he does not go ſo far as the Evil Inſtruments in King *James* the Second's Time carry'd it; yet his Adverſary immediately Charges him with Sedition and Faction, and brands him as an Enemy to the preſent Conſtitution, becauſe the Enemies of that Conſtitution among a Thouſand Errors maintain ſome true Principles. This Argument may be turn'd to the other Side, but 'tis ſo plain there needs no altering the Scene. The Reader will do it of himſelf, and obſerve that this is the General Reſource of all our Politick Diſputants.

This Part of our Eſſay might be Enlarg'd upon to a great Length, and be equally uſeful and diverting to the Writer and Reader; but the Compaſs we are circumſcrib'd to by the Narrowneſs of the Deſign and that occaſion'd by the Univerſality of it, which wou'd not allow of Expatiating much in Particulars, hinders us from proceeding further in it to ſhew other Cauſes of the falſe Reaſoning of Mankind who are byaſs'd by Paſſion and Intereſt. We muſt leave it however to others, and add a Word or two concerning *Method*.

By *Method* is generally underſtood the Art of diſpoſing a Series of ſeveral Thoughts, either to find out a Truth that is unknown to us, or to convince others of one we know.

There are two ſorts of Method, one to find out Truth, which is call'd *Analyſis*, the other to convince others of a Truth already found out, which is term'd *Syntheſis*. When Effects are prov'd by the Cauſes that is call'd Arguing *à Priori*: On the contrary, when Cauſes are prov'd by the Effects that's term'd Arguing *à Poſteriori*. We ſhall cloſe this Eſſay with a Diſcourſe upon *Analyſes*, which was taken from a Manuſcript of Monſ. *Deſcartes*.

All Queſtions which are reſolv'd by *Analyſis*, relate either to Words or Things. By Queſtions relating to Words, we underſtand not ſuch as inquire after Words only; but thoſe wherein by Words we inquire after Things, 'tis to unfold an *Ænigma*, or explain what an Author had ſaid in doubtful or obſcure Terms. Queſtions relating to Things may be reduc'd to Four Principal Kinds.

The Firſt, When we ſearch after Cauſes by the Effects: As for Inſtance; We know the ſeveral Effects of the Magnet, and ſearch after the Cauſe.

The Second, When we ſearch after the Cauſe by the Effects: As for Example, *It has been always known that Wind and Water have great Power in moving Bodies*; yet the Ancients did not enough examine what might be the Effects of thoſe Cauſes, nor apply them, as has been of late done by the Means of Mills.

The Third, When by the Parts we ſearch after the whole; as when having ſeveral Numbers given we ſearch after the Sum by adding them together.

The Fourth, When having the whole and ſome Part, we ſearch after another Part, as a Sum being given what is to be taken away, we ſearch after what remains.

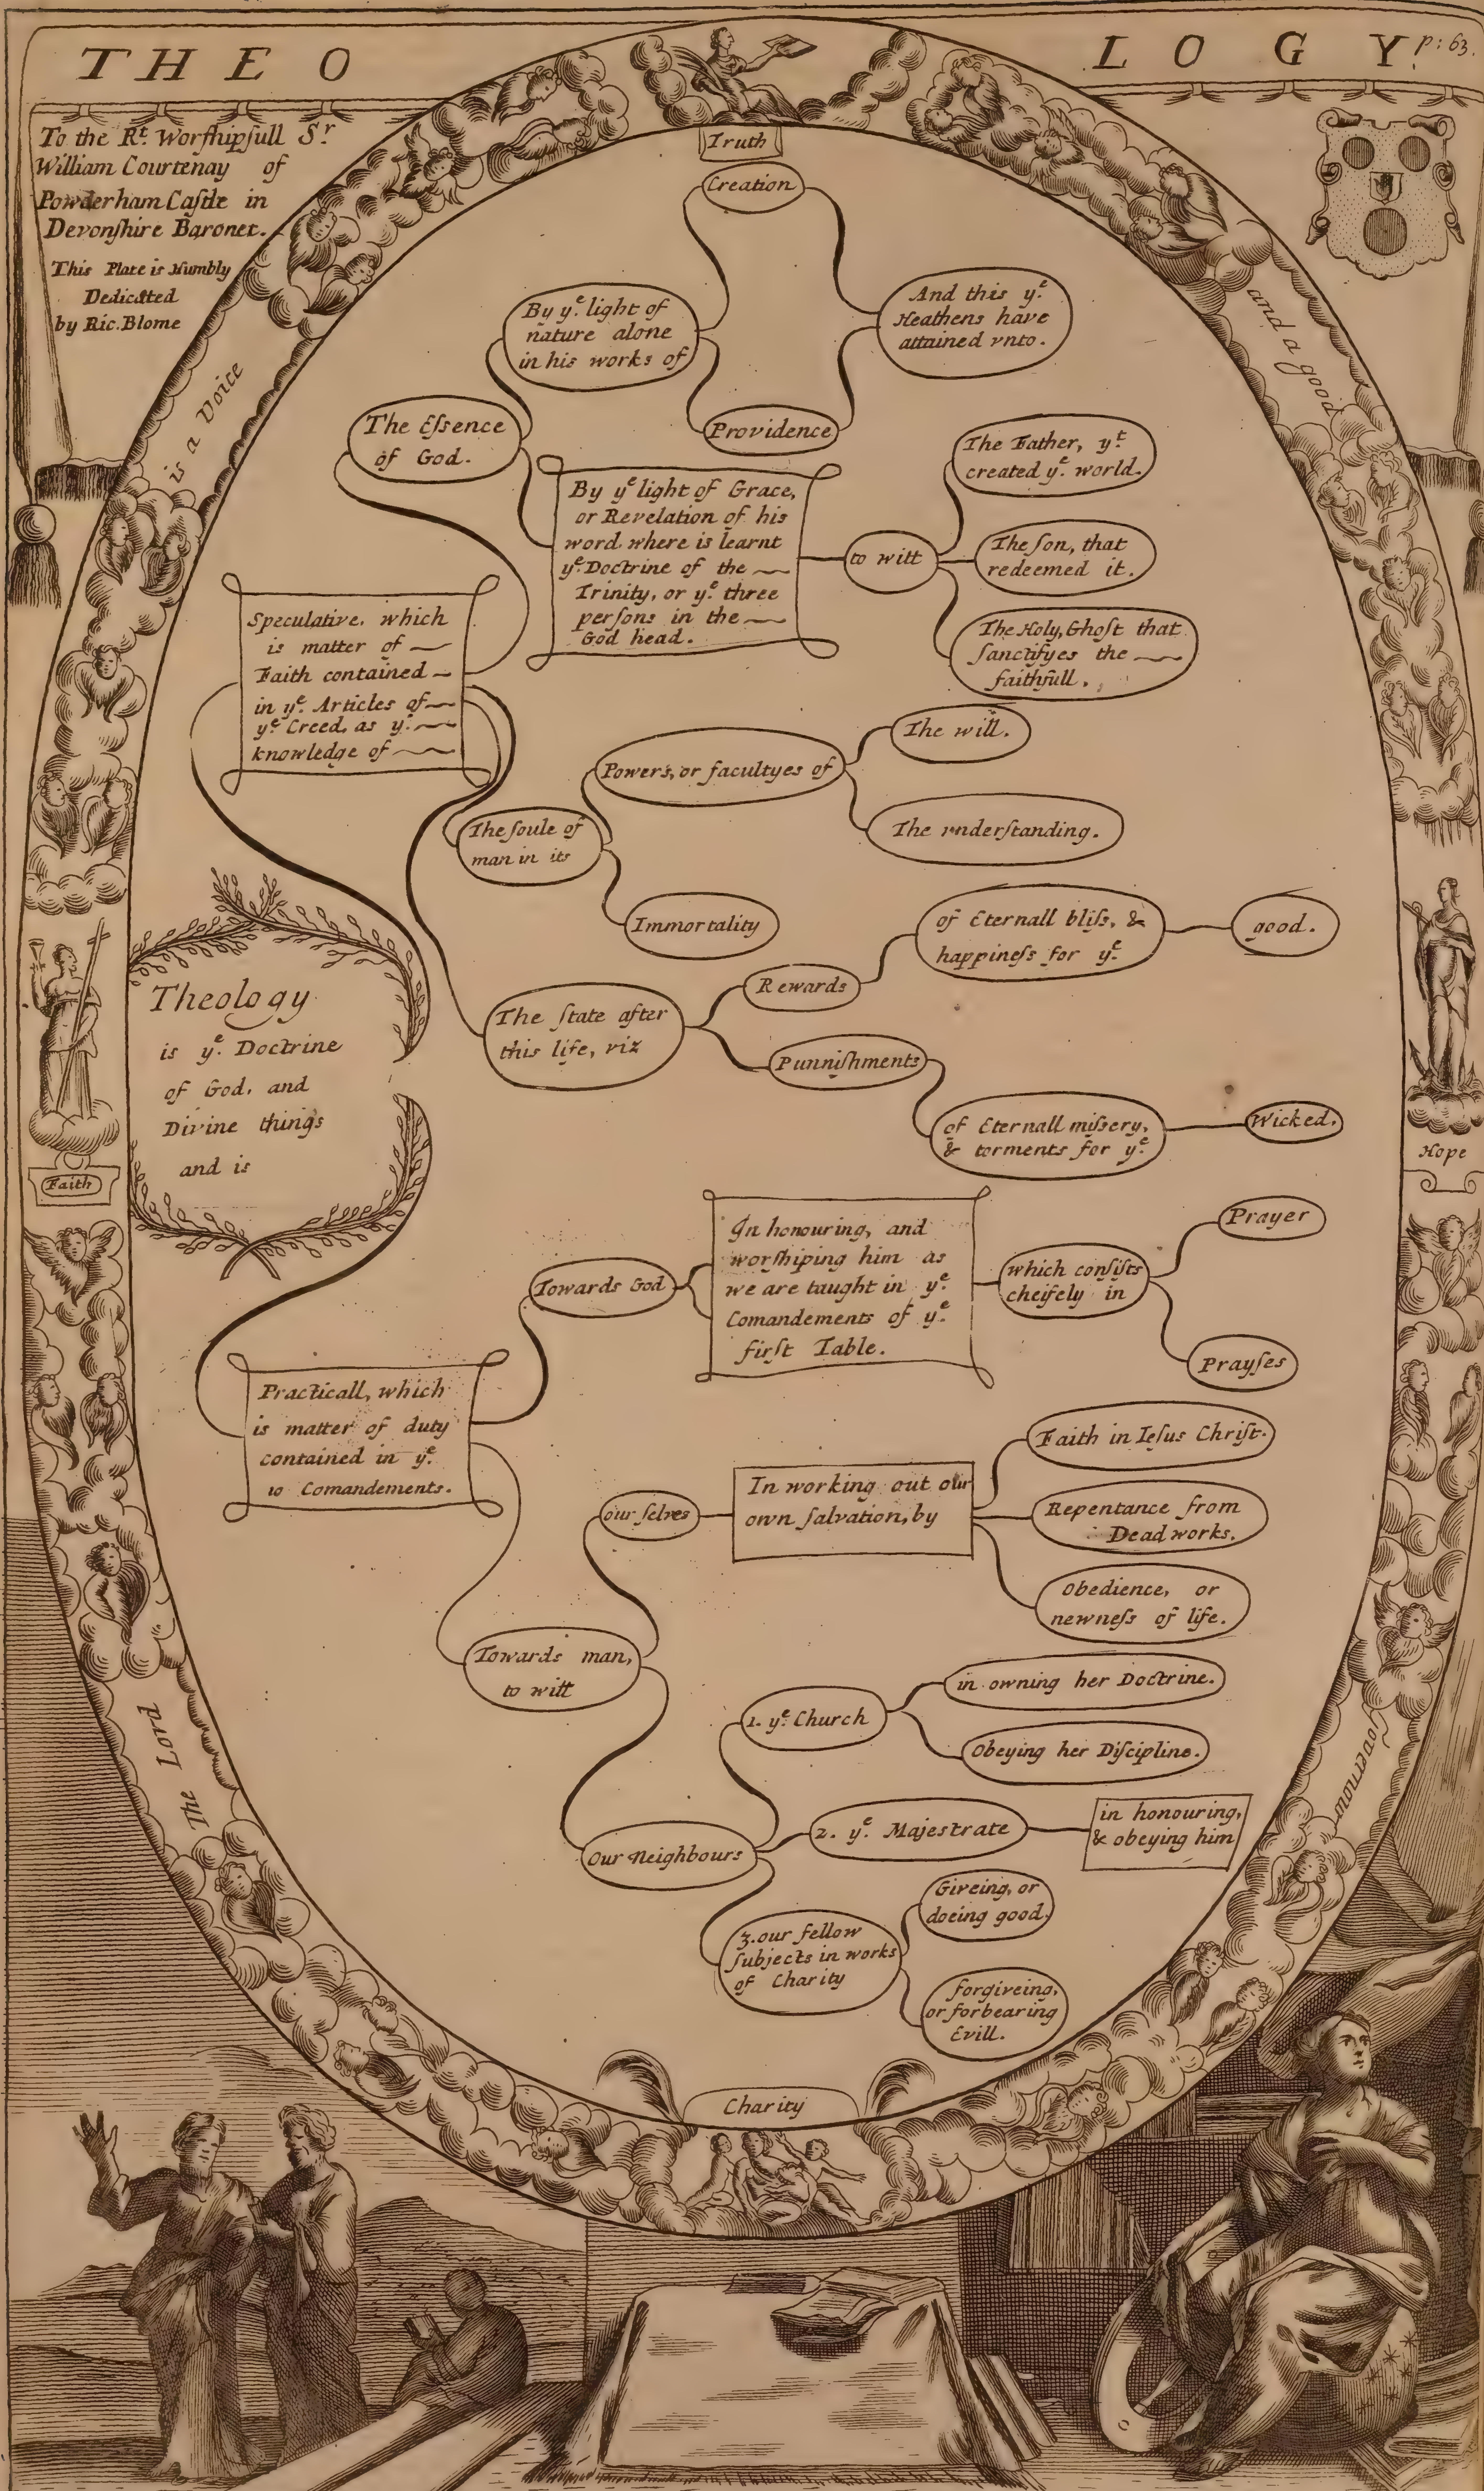
Of what Nature ſoever the Queſtion propos'd may be, the firſt thing to be done, in order to reſolve it, is, rightly and diſtinctly to conceive what is demanded of us; that is, what is the Preciſe Point of the Queſtion, for we ſhou'd avoid doing as a great many do, who thro' a Precipitation of Mind undertake to reſolve every thing propos'd to 'em before they have ſufficiently conſider'd the Signs and Tokens by which they may know what they ſearch after when they meet with it: As if a Servant, whoſe Maſter bad him ſeek for a Friend of his, ſhould run away to find him before his Maſter had particularly inform'd him who that Friend of his was. When a Man has well examin'd the Conditions of the Signs and Tokens beforemention'd, he muſt alſo examine well what he knows in the Queſtion, ſince 'tis by that he muſt arrive at the Knowledge of what he do's not know; for we muſt not imagine that we are to find out a New Kind of Being, when our Light cannot extend farther than to know in what manner the Thing we ſeek after participates of the Nature of Things known to us. If a Man born blind was to conceive a true Idea of Colours, wou'd all the Arguments and Proofs we cou'd think of give him ſuch a one as we conceive by our Senſes. 'Tis the Attention the Mind gives to what it knows in a Queſtion which helps it to reſolve it, and in which the *Analyſis* principally conſiſts, all the Art lying in extracting a great many Truths from that Attention, which may lead us to the Knowledge of what we ſeek after.

As, Suppoſe 'twas propos'd to reſolve, *If a Man's Soul is Immortal*; and in order to find out the Solution of the Queſtion, we ſhould conſider attentively the Nature of the Soul: We ſhould firſt obſerve 'tis the Property of the Soul to think that it may doubt of every thing; but that it thinks, for the very Doubt wou'd be a Thought; we afterwards ſhou'd examine what Thinking is, and finding nothing in the Idea of Thought like what is in the Idea of Subſtance, which we call Body; but that we may deny that to be in Thought which belongs to Body, as *Length*, *Breadth*, *Thickneſs*, *Diverſity of Parts*, *Figure*, and without deſtroying our Idea of Thought, we Conclude, That Thought is not a Mode of Subſtance of Extent, becauſe 'tis the Nature of Mode not to be conceiv'd in denying the Thing in it of which it was the Mode. When we further infer that Thought, not being a Mode of Subſtance of Extent, it muſt be the Attribute of ſome other Subſtance; and that Subſtance which Thinks, and Subſtance of Extent muſt be Two Things really diſtinct; from whence it follows that the Diſtraction of the one ought not to imply the Deſtruction of the other, ſince even the Subſtance of Extent is not, properly ſpeaking, deſtroy'd, but all that happens in what we call De-

Deſtruction, is nothing but a Change or Diſſolution of ſome Parts of the Matter which always remains in Nature; as when we break the Wheels of a Clock there's no Subſtance deſtroy'd, tho' we ſay the Clock is deſtroy'd; which ſhews, that the Soul not being diviſible, and compos'd of any Parts, cannot periſh, and by Conſequence is Immortal: This is what is call'd *Analyſis* in Logick; *Analyſis* in Geometry is the Solution of a Problem, of which we are to treat elſewhere.

Thus far we have gone in Copying after ſeveral Famous Authors, whoſe Labours ſuffer a little by our being oblig'd to keep within narrow Limits. Things might have been made ſomewhat more clear, more and larger Examples might have been given, more Parts of the Art treated of, and a better Connexion of the whole obſerv'd. But then it wou'd have taken up as much Room as we cou'd allow for a Third Part of this Undertaking, which was not feaſible nor neceſſary; for tho' the Art of Thinking is of the laſt Importance in Humane Life, yet we fear there are few who will give themſelves the Trouble to think by Art. Men are apt to fanſie their Fund of Reaſon ſufficient without making any Improvement; and thoſe that wou'd have recourſe to Science want great Names to give their Art *Authority*. For Indeed the Authority of *Names* is *Sovereign* in the Buſineſs of *Letters*. As to ſuch as deſire to inform themſelves of Things they did not know before, and yet not to go to the Bottom of 'em, this Deſign is Good and Commendable: As for ſuch as would be thoroughly Maſters of a Science, let 'em conſider that there is not one treated of in all this Volume but wou'd take up a Life for a Man to render himſelf Perfect in it, and they will then be ſatisfy'd with what is done here.

DIVINITY.



THEO LOGY
To the Rᵗ. Worſhipfull Sʳ. William Courtenay of Powderham Caſtle in Devonſhire Baronet.
This Plate is Humbly Dedicated by Ric. Blome
The Lord is a Voice and a good Governour

DIVINITY.

DIVINITY is the Knowledge of God, and his Worſhip. The immediate Object of it is *Religion*.

Religion is a general Habit of Reverence towards the Divine Nature, whereby we are enabled and inclin'd to worſhip and ſerve God after ſuch a manner as we conceive moſt agreeable to his Will, ſo as to procure his Favours and Bleſſing.

Religion is either
- *Natural*, or
- *Reveal'd*.

Natural Religion is that which Men might know and ſhould be oblig'd unto, by the mere Principles of Reaſon, improv'd by Conſideration and Experience, without the help of *Revelation*.

Reveal'd Religion is that which God by the Manifeſtation of his Will has oblig'd us to perform, upon the Conſideration of Temporal or Future Rewards or Puniſhments. The Parts of it either *Faith* or *Practice*.

Faith
- *Humane*, or
- *Divine*.

Humane Faith is an Aſſent unto any thing credible merely upon the Teſtimony of Man.

Divine Faith an Aſſent to ſomething as credible upon the Teſtimony of God. Upon which account, the *Faith* of a *Chriſtian* is an Aſſent unto Truths credible upon the Teſtimony of God, deliver'd unto us in the Writings of the *Apoſtles* and *Prophets*.

Chriſtian Faith may be reduc'd to this one *Article* of believing in God, in the *Unity* of whoſe *Eſſence*, is a *Trinity* of *Perſons*. God may be conſider'd in his *Eſſence* or *Attributes*.

God conſider'd in his *Eſſence* is that Supream and independent being, which owes its original to no other Cauſe, and is himſelf the Cauſe of all other things.

The *Attributes* of God are,
- *Incommunicable*,
  - *Simplicity*,
  - *Unity*,
  - *Immutability*,
  - *Infiniteneſs*.
- *Communicable*, belonging to the Divine,
  - *Faculties* of *Acting*,
    - *Power*,
    - *Dominion*.
  - *Will*,
    - *Goodneſs*,
    - *Juſtice*,
    - *Faithfulneſs*.
  - *Underſtanding*,
    - *Knowledge*,
    - *Wiſdom*,
    - *Providence*.

Simplicity of God is his Freedom from all kind of Compoſition or Mixture, either of Principle or Parts.

Unity, by which he is one and no more.

Immutability is a Freedom from all kind of Change or Inconſtancy, both as to his Nature and Purpoſes.

Infiniteneſs, by which is meant his not being bound by Place or Space, or by Duration; but is without Limits or Bounds, without Beginning or End.

By the *Power* of God is meant, an Ability of doing all ſuch things, the doing of which may argue Perfection, and which do not imply a Contradiction, either in the things themſelves, or to the Nature and Perfection of the Doer.

Dominion is a Relative Power, reſpecting that Juriſdiction which he has over reaſonable Creatures; his Right to Govern them in this World, to Command, and Prohibit what he pleaſes, to Reward and Puniſh as ſhall ſeem good unto him.

Goodneſs is a Propenſion and Diſpoſition in the Divine Nature, to communicate Being and Happineſs to his Creatures.

Juſtice, by which is meant, not only the Rectitude of his Nature in general, but more eſpecially his dealing with his Creatures according to the deſert of their Deeds.

Faithfulneſs ſignifies an exact Correſpondence and Conformity between his Word and his Mind, and conſequently between his Word and the Truth and Reality of Things; eſpecially in reſpect of any Promiſes he has made, in which there is an Obligation of Juſtice ſuperadded to his Word.

Knowledge of God is that Perfection or Faculty whereby he underſtands and conſiders things abſolutely as they are in their own Natures, Powers, Properties, Differences, together with all the Circumſtances belonging to them.

Wiſdom of God conſiders the Relations of things one to another, under the Notion of Means and Ends, and of their fitneſs and unfitneſs for the various Purpoſes to which they are deſign'd.

God's *Providence*, { *Particular*,
Univerſal.

Particular Providence is, whereby he ſuperintends and takes care of every individual thing in the World; continuing them in their Beings, diſpoſing of their Operations and Effects in ſuch a wiſe Order, as may be moſt ſuitable to thoſe Ends and Purpoſes for which they are deſign'd.

Univerſal Providence is that whereby he takes care of all things in general, but eſpecially of Mankind; the moſt viſible Act of which is ſeen in redeeming him from that State of Miſery and Servitude, which *Adam* by the Fall had brought upon himſelf and his Poſterity.

The Perſon employ'd in this great Affair, is the ſecond Perſon of the ever bleſſed *Trinity*, who is to be conſider'd in his *Names* and *Offices*.

Names, { *Jeſus*,
Chriſt.

Jeſus ſignifies a Saviour; and this Title was given by God to our *Lord* to ſhew, that he was to be the Saviour of the World, and that no other beſides him was or can be ſo.

Chriſt in *Greek* is the ſame with *Meſſias* in *Hebrew*, or *Syriack*; and is as much as to ſay the *Anointed*; which Title was beſtow'd upon our Saviour to ſhew, that as by the Ceremony of *Anointing* heretofore, God conſecrated thoſe whom he call'd to ſome certain Offices; ſo was this *Jeſus* to be ſeparated, tho' not by a viſible *Unction*, yet by the inviſible Power and Grace of the Holy Spirit, for all thoſe Offices, to which Men were *Anointed*, by God's Command under the *Law*.

Thoſe *Offices* were { *King*,
Prieſt,
Prophet.

His *Regal* or *Kingly Office*, *Chriſt* exercis'd here while we was upon Earth, by giving Laws unto his *Church*, for the Regulation of the Lives and Actions of thoſe who ſhould become Members of it. Theſe Laws he eſtabliſh'd with the Royal Sanction of Rewards and Puniſhments. He ſettled a Miniſtry for the Conduct of his Church under him. He Rules in the Hearts of the Faithful by his Spirit. He has already begun to ſubdue our Enemies, Sin, the Devil, and Death; and he will hereafter utterly deſtroy them. He now ſits in full Power at the Right-hand of God, interceeding for us: And at the End of the World he will deſcend from thence with Glory to judge all Mankind, and put in Execution his Promiſes and Threatnings; by infinitely rewarding thoſe who ſhall be found to have obſerv'd his Laws, and exceedingly puniſhing them who ſhall have broken them.

Chriſt's Prieſtly Office was not according to that of *Aaron*, and the *legal* Inſtitution; but of another and more ancient kind, after the Order of *Melchiſedeck*. This Office he perform'd by offering himſelf on the Croſs for us; by which Oblation he made a full, perfect, and ſufficient Sacrifice, Satisfaction, and Atonement for the Sins of the whole World. Having done this, he aſcended into Heaven, there to appear in the Preſence of God, to mediate and intercede for us. And he bleſs'd us, not only by delivering us hereby from the Puniſhment of our Sins, but by ſanctifying our Souls; and ſo freeing us, in a great Meaſure, even from the preſent Power and Dominion of them.

The *Prophetick Office of Chriſt*, was fulfill'd in foretelling things to come; in declaring God's Will to the World; and leaving us an exact, plain, and perfect Rule of Life and Manners.

This *Rule* are the Canonical Books of the *Old and New Teſtament*, which were wrote by Men divinely inſpir'd, *Prophets*, *Apoſtles*, and *Evangeliſts*, and have been receiv'd into the *Canon* by the Holy *Catholick Church*.

The *Scriptures*, as they refer to the ordering and management of our Lives, are that Scheme of *Chriſtian Morality*, which every one that liſts himſelf into the Service of *Chriſt* is oblig'd by his *baptiſmal* Vow to keep and perform.

Theſe may be conſider'd either as *Precepts*, or the *Motives* to the *Obedience* of them.

Precepts of { *Life*,
Ceremony.

The *Precepts* or Commands of the Goſpel which refer to Life or Manners, may be conſider'd as they lay Duties upon us with reſpect to

God,
Our Neighbour,
Our Selves.

The Duties which relate to God may be found out the moſt eaſily, by conſidering what Influence his *Attributes* ought to have upon us.

His *Incommunicable Attributes* lead us to the Duty of *Adoration* or *Worſhip*.

Which is the higheſt Eſteem and Admiration of him in our Minds, whereby we continually bow down our Souls before him, in the acknowledgment of his Excellencies, depending upon him, invoking him in our Neceſſities, and confeſſing him to be the Author of all the Mercies we enjoy, together with ſuch external Services, as may be fit to teſtify to others that inward Veneration which we have for him, whether by the humble Geſtures of Proſtration, or bowing our ſelves before him, lifting up Hands and Eyes unto him; being always ready to ſpeak good of his Name, and make his Praiſe glorious.

Communicable Attributes, which relate to the Divine *Power* of *Acting*, ſtir up in us *Reverence* and *Obedience*.

Reverence is an humble, awful, and ingenuous Regard towards the Divine Nature, proceeding from a due Eſteem and Love of him, whereby we are rendred unwilling to do any thing which may argue Contempt of him, or which may provoke and offend him.

Obedience may be deſcrib'd to conſiſt in ſuch a ſubmiſſive Frame of Spirit, whereby a Man does always reſign and devote himſelf to the diſpoſal of his Maker, being ready in every Condition, to do or ſuffer that which he apprehends to be moſt reaſonable and acceptable, and whereby he may beſt expreſs his Love and Subjection. By which deſcription it appears, that *Obedience* is of two kinds,

Active,
Paſſive.

Active, which conſiſts in a Readineſs of Mind to do what God ſhall enjoyn.

Paſſive, in an Acquieſcence of Mind under what he ſhall inflict.

Attributes of the *Divine Will* diſpoſe us to *Love,* which is an eſteeming of him, and a ſeeking after him as our only Happineſs; So that there are two Ingredients of this Vertue, *Love,*

Eſtimation,
Choice.

An *Eſtimation* of the Judgment; a due Valuation of thoſe Excellencies which are in the Divine Nature, whereby we look upon God as the Supream Being *in genere boni*; from whom all created Goodneſs is deriv'd, and by Conformity to whom it is to be meaſur'd.

Our *Choice* of him, as being the only proper Object of our Happineſs, preferring him before any thing elſe that may come in Competition with him.

Attributes of the *Divine Underſtanding* lead us to *Affiance* or *Confidence.*

By *Affiance,* means an Acquieſcence of the Mind, whereby it is ſupported againſt all unneceſſary Doubts and Fears, upon account of the Divine All-ſufficiency in general, with more ſpecial reſpect as to his Knowledge, and Wiſdom, and Providence, by which he takes notice of our Conditions, and is able to order all things for the beſt, and does not permit any thing to befal us without his Knowledge of it, and being concern'd for it.

The *Precepts* which regulate our Duty towards our *Neighbour* may be ſum'd up in theſe two,

Juſtice,
Charity.

Juſtice is a Propenſion and Cuſtom of giving every Man his due. It is either

Negative,
Poſitive.

Negative is the not injuring or wronging any one.

Poſitive, to do right to all, to yield them whatever appertains or belongs to them.

Charity is the Love of our Brethren, or a kind of brotherly Affection one towards another. The Rule and Standard by which we are to examine and regulate this Habit, is that Love we bear our ſelves, or that which *Chriſt* bore us; that is, that it be unfeign'd, conſtant, and out of no other deſign but their Happineſs.

The *Precepts* belonging to our *Selves,* are either of

Temperance,
Humility,
Contentedneſs,
Repentance.

Temperance is that Abſtinence from ſenſual Pleaſures, which renders the Body tame and governable, ſerviceable to the Soul, and chearful in the Exerciſe of Religion; which frees the Mind of Man from its Captivity to Senſe, and eſtabliſhes its Dominion over the brutiſh Part; ſo that the Man lives the Life of Faith, and not of Senſe, and is from henceforth diſengag'd from the World, and the Allurements of it.

Humility is a mean Opinion, or rather the true Knowledge of our Selves, a ſober Contemplation of our Infirmities, and a real Perſwaſion of our Imperfection.

Contentedneſs is that firm Reliance upon the Providence of God, which works an Acquieſcence in every Man's Mind, and makes him ſatisfy'd and content with that State and Condition God has plac'd him in.

Repentance is ſuch a Converſion of a Sinner to God, whereby he is not only heartily ſorry for the Evil he has done, and reſolv'd to forſake it, but actually begins to renounce it, and to fulfil his Duty according to his Ability, with a ſtedfaſt purpoſe to continue God's faithful Servant unto his Life's end. The chief Ingredients of it are

Sorrow,
Confeſſion,
Prayer.

Sorrow, which leads to a true Repentance, is that godly *Sorrow* which proceeds from a Senſe of our Duty, and of the Obligation we lie under to the Performance of it. When we are ſorry for our Sins, upon the account of our having thereby offended God; broken the Covenant of the Goſpel; and griev'd the Holy Spirit which was given to us; and are therefore reſolv'd immediately to forſake our Sins, and never return any more to them.

The Deſign of *Confeſſing* our *Sins,* is not that God has any need of being inform'd by us of what we have done amiſs; but to the end we may thereby both raiſe in our ſelves a great Shame and Sorrow for our Evil Deeds; and give the greater Glory to God, by ſuch a ſolemn humbling of our ſelves in Confeſſion before him.

Prayer is a Religious Calling upon God, founded upon the Belief both of his infinite Knowledge, Power, and Preſence; and of his gracious Goodneſs and Mercy towards us in *Jeſus Chriſt*; and being publickly perform'd, is one of the higheſt Acts of outward Honour, that we are capable of giving to him. It is neceſſarily eſtabliſh'd upon theſe two Principles; 1. A due Senſe of our own Weakneſs and Wants; and, 2. A firm belief, that God is both able and willing to relieve us.

The *Ceremonial Precepts* are the *Sacraments.* A *Sacrament* is an outward and viſible Sign of an inward and ſpiritual Grace given unto us, ordain'd by *Chriſt* himſelf, as a means by which we receive the ſame, and a Pledge to aſſure us of it.

Sacraments two, { *Baptiſm,*
Lord's Supper.

Baptiſm is the *Sacrament* of our new and ſpiritual *Birth,* the Seal of our *Adoption,* and the ſolemn Means of our Admiſſion into the Communion of the Chriſtian Church. By the outward waſhing whereof, our inward waſhing from our Sins, by the Blood and Spirit of Chriſt, is both clearly exhibited, and certainly ſeal'd to us. The manner of performing is by dipping in, pouring on of, or ſprinkling with Water, in the *Name of the Father, and of the Son, and of the Holy Ghoſt.*

The Lord's Supper is the ſecond *Sacrament* of the *New Teſtament,* and is ſo call'd becauſe it was both inſtituted by our Lord at Supper, and was deſign'd to ſucceed into the Place of the *Paſchal* Supper among the *Jews.* It was ordain'd for the continual Remembrance of the Sacrifice of the Death of *Chriſt,* and of the Benefits which we receive by it. In which *Supper,* by the Elements of *Bread* and *Wine,* which the Lord has commanded to be receiv'd, the Body and Blood of *Chriſt* are verily and indeed taken and receiv'd by the Faithful.

The Motives to the Obedience of theſe Precepts or Laws, are the *Promiſes* and *Threatnings* of the Goſpel.

The *Promiſes* are the
- *Sending of the Holy Ghoſt,*
- *Pardon of Sins,*
- *Reſurrection of the Body,*
- *Reward of Eternal Life.*

The *Holy Ghoſt* is the third *Perſon* of the ever bleſſed *Trinity;* and partakes as ſuch, of the ſame Divine Nature, with the *Father* and the *Son.* It is he that ſanctifies all the Elect People of God. He regenerates us at our *Baptiſm,* unites us unto *Chriſt,* co-operates with us in all our Religious Undertakings, diſpoſes our Wills, ſettles us in the Faith of Chriſt, helps our Prayers, fortifies us againſt Temptations; and carries us thro' all the Dangers, that either our own Weakneſs, or the Cunning and Malice of the Devil may raiſe againſt us: to draw us away from, or hinder us in our Duty. And in ſuch caſes as he ſees needful, ſeals our Souls with that inward Senſe, and Aſſurance of God's Favour, which makes us fully ſatisfy'd of our future and everlaſting Salvation.

Pardon of Sins is that Act of Divine Mercy, whereby he waſhes away the Stains of them by his ſanctifying Grace; and remits the Puniſhment of them, for the ſake, and thro' the Merits and Mediation of *Jeſus Chriſt* our Saviour. Upon which *Promiſe* the Covenant of the Goſpel is founded; wherefore, if we believe that Chriſt dy'd for our Sins, we muſt alſo believe, that God for *Chriſt's* ſake will forgive all thoſe who truly repent of their Sins.

The Reſurrection of the Body, naturally ſuppoſes that we ſhall receive our own Bodies; and the End of it confirms it to us: Our Bodies being therefore rais'd, and reſtor'd to us, that we may be rewarded or puniſh'd, in the ſame State both of Soul and Body, in which we had done things worthy either of Reward or Puniſhment. Thoſe that ſhall be found alive at the laſt Day upon the Earth, ſhall not die, nor, by Conſequence, riſe from the Dead; but they ſhall be chang'd, and by the mighty Power of God, be put into the ſame State with thoſe, who being dead, were rais'd from the Dead, and ſo be brought with them before the Judgment-Seat of *Chriſt.*

The Reward of Eternal Life is generally comprehended in that one word *Heaven,* which may either be conſider'd as a

State,
Place.

State. In this ſenſe it is the ſame with Holineſs, conſiſting in ſuch God-like Diſpoſitions, as may make us Partakers of the Divine Nature.

In the Notion of a *Place,* it denotes that other World, where we hope to enjoy the beatifical Viſion, in the bleſſed Society of the Saints and Angels.

Threatning's comprehended under that general Notion *Hell,* which is a State of inexpreſſible Miſery, where the Wicked ſhall be tormented, without Intermiſſion, and without End.

METAPHYSICK.

M*ETAPHYSICK* is the Knowledge of *Being* in general, barely conſider'd as ſuch.

The *Object* of *Metaphyſick*, or that about which it is converſant, is *Being* in General. For the Underſtanding not being confin'd or determin'd to one Thing, as the Senſes are to their proper Objects; has a diffuſive Power to comprehend whatſoever is intelligible. To avoid Confuſion, which would inevitably flow from the great Variety of Things which fall within the Compaſs of the Underſtanding, it is found neceſſary to reduce the *Species* of *Beings* to one *Genus*, in order to make them the Object of any *Art* or *Science*; ſo all the Conceptions in *Natural Philoſophy* are reduc'd to that one of a Natural Body; all the Obſervations concerning *Proportion*, *Figures*, and *Quantity* to *Mathematick*; and all the *Idea's* concerning the various *Modes* of *Being*, *Subſiſting*, and *Inhering*, are reduc'd to one *Object*, which is call'd *Being*.

Being is ſeveral ways divided.

1. *Being* taken in its utmoſt Latitude is either *Complex* or *Incomplex*. *Complex*, which in its Notion involves many *Idea's*; *Incomplex* which only takes in one.

2. *Being* is either *Poſitive* or *Negative*. *Poſitive* is that which has a real *Exiſtence* in the Courſe of Nature. *Negative* deſtroys this *Exiſtence*. If it deſtroys it *abſolutely* then it is a perfect Negative *Being*; but if it only prevents its Being in a *Subject* which was capable to receive it, then it is ſtil'd a *Privative Being*. For *Privation* may be properly defin'd, to be the Want or Abſence of ſome Natural Perfection, from a Subject capable to receive it, in which Subject it either was before, or at leaſt ought to have been: Beſides, as this *Privation* is either greater or leſs, ſo it is either call'd *Total* or *Partial*. *Total* is the worſt, for it deprives the Subject of its Natural Perfection, both as to the Exerciſe of any Preſent Action, and the Power of regaining it for the future; as when the Eye is perfectly put out. *Partial* is only in ſome particular reſpect, and relates principally to its preſent Actions, or ſome degree of them; as when one ſhuts his Eyes, or is purblind.

3. *Being* is either *Rational* or *Real*. *Rational Being*, which is the mere Product of Reaſon, has no *Exiſtence* but in the Mind in *Idea*, and when none thinks upon it, it ceaſes to be. A *Real Being*, which is not produc'd by the Strength of Imagination or Fancy, has a *Real Exiſtence* in the Courſe of Nature, antecedent to any Thought or Conception of the Mind.

4. *Being* is either *Actual* or *Potential*. *Actual* is that which actually Exiſts in the Order of Nature, whether it depend upon any *Cauſe* in order to produce it, as an Infant; or whether it be antecedent to all Cauſe, as God. *Potential Being* is that which can be produc'd by the Power of ſome Agent. Theſe are the Principal *Nominal* Diſtinctions of *Being*, and from theſe we may collect that that *Being* which is the *Object* of *Metaphyſick*, is an *Incomplex*, *Poſitive*, *Real*, and *Actual Being*.

Metaphyſick is divided into Two Parts, *General* and *Particular*.

The *General* Part of *Metaphyſick* gives an Account of *Being* in its moſt abſtracted Nature; under which Notion it may be thus defin'd; *Being is that which in itſelf has a real and poſitive Eſſence.*

Being may be conſider'd either with reſpect to thoſe Words which are *Synonymous or Equivalent to it*; or in reference to its *Affections or Modes.*

Words *Synonymous* to *Being*, are Terms which *Simply* have the ſame Signification, or elſe at the ſame time do imply a reſpect to ſome other Thing. Upon this Ground they are divided into Two *Claſſes*; ſome in every reſpect implying the ſame with *Being*, others either from the *Philoſophical* or *Grammatical* Uſe of the Words imply a Relation to ſome other *Being*.

In the Firſt *Claſs* are rankt *Eſſence*, *Thing*, *Something*.

Eſſence is the ſame with *Being*; tho' ſome wou'd make a Diſtinction to lie betwixt them in this, that *Being* has the ſame reſpect to *Eſſence*, that the *Concrete* has to its *Abſtract*. But *Eſſence* in *Metaphyſick* is taken in its moſt abſtracted Nature, and ſo it muſt of Neceſſity be the ſame with *Being*.

Thing is the ſame with *Being*; for there is nothing in the Notion of *Being* but what *Thing* implies in its *Idea*, and on the contrary.

Something as well as *Thing* and *Eſſence* is equivalent to *Being*. And this may be further prov'd from theſe following *Axioms*. For, *If it be impoſſible for the ſame Thing to have Eſſence, and not to have Eſſence at the ſame time; to be a Thing and not to be a Thing; to be ſomething and not to be ſomething*; are Maxims Equivalent to this firſt Principle of Knowledge, *That it is impoſſible for a Thing to be, and not to be at the ſame time*; then *Eſſence*, *Thing*, and *Something* are Words *Synonymous* to *Being*.

Synonymous Words of the Second *Claſs* are, *Exiſtence*, *Quiddity*, *Nature*, *Form*. Theſe are the ſame with *Being*, yet imply ſome reſpect in the *Philoſophical* Way of uſing them, which Reſpect is form'd by the Operation of the Mind upon hearing theſe Words.

Exiſtence, beſides the Signification of *Being*, implies a Reference to its *Cauſe*, whether it *poſitively* had its Original from ſome Cauſe, as an Houſe; or *negatively* was antecedent to all *Cauſe*, as God.

Quiddity is the ſame with *Being*, but inferrs a Relation to our Underſtanding; for the very asking what a Thing is, implies that it is the Object of Knowledge; upon which Account that which *really*

Exiſts in the Courſe of Nature, is accidentally made the *Object* of Knowledge.

Nature is the ſame with *Being*, but includes a Reſpect to its *Operations and Properties.*

Form is of the ſame Signification; for every *Being* as by its *Eſſence*, ſo by its *Form* is what it is. Yet this Term involves this Reſpect, that it is more generally by *Philoſophers* apply'd to *particular and determinate Beings.*

The *Modes* or *Affections* of *Being*, are Three General *Idea's* or Conceptions of *Being* which naturally flow from it, and are reciprocated with it, yet repreſent it in different States and Conditions.

- *Affections*
  - *United*
    - *Primary*
      - *Unity,*
      - *Truth,*
      - *Goodneſs.*
    - *Secundary*
      - *Duration,*
      - *Ubiety.*
  - *Diſunited*
    - *Primary*
      - *Immediate*
        - *Neceſſity and Contingency,*
        - *Power and Act,*
        - *Corruptibility and Incorruptibility,*
        - *Dependent and Independent,*
        - *Created and Increated,*
        - *Finite and Infinite,*
        - *Cauſe, and the Thing Cauſ'd.*
      - *Mediate*
        - *Simplicity and Compoſition,*
        - *The Whole and Part,*
        - *Identity and Diverſity,*
        - *Communicability and Incommunicability,*
        - *Natural and Artificial,*
        - *Complete and Incomplete,*
        - *Permanent and Succeſſive,*
        - *Definite and Indefinite.*
    - *Secundary*
      - *Subject and Adjunct,*
      - *Abſolute and Relative,*
      - *Sign, and the Thing ſignify'd,*
      - *Meaſure, and the Thing meaſur'd.*

The *United Affections* of *Being* are ſuch as *ſingly* and *ſolitarily* are predicated of *Being*, and without any Conjunction are convertible with it; as every *Being* is good, and all good is a *Being.*

The *Diſunited Affections* of *Being* are predicated of it with a Disjunction, and by taking in both Parts of the Sentence are convertible with it. As, *Being* is either neceſſary or contingent, and whatever is neceſſary or contingent is a *Being.*

The *Primary United Affections of Being* are *Unity, Truth* and *Goodneſs.*

Unity is either *Real* or *Rational. Real* is, which without any Operation of the Mind is really in every particular *Being. Rational Unity* is that common Nature which is diffus'd in all the Particulars of any Kind, yet by the Operation of the Underſtanding is made *one.*

Unity is the *Indiviſion* of any *Being*; i. e. the Diviſion of its Eſſence implying ſuch a Contradiction, that without we can divide a Thing from it ſelf it is impoſſible to divide it.

Union is the Concourſe of many *Beings*, in order to the making of one *Individual.*

Union is either *Verbal, Real, Eſſential, Perſonal*, or *Accidental.*

Verbal Union conſiſts in the bare Agreement of Words.

Real in the Concourſe of many diſtinct *Beings*, in order to the forming of one *Individual.*

That is an *Eſſential Union* when many *Incomplete Beings*, adapted to one another, do concurr to make one *Eſſential Individual:* So Matter and Form are *Eſſentially* united in the Compoſition of a Body. And this *Union* is not only viſible in *Eſſential* Compoſitions, but in *Integral*, becauſe even in ſuch a Compoſition there is one *Eſſence*; ſo the Elements in all mixt Bodies are united by an *Eſſential Union.*

Perſonal Union is by which Two Natures are ſo united as to make one *Perſon.* The only Inſtance that can be given of this is, in the *Union* of the Divine and Humane Nature in the *Perſon* of our Saviour.

Accidental Union is by which many Cauſes accidentally concurr to make one Thing by *Accident.*

The *Second of the United Primary Affections of Being* is *Truth.*

Truth is either *Metaphyſical, Logical*, or *Moral.*

Metaphyſical Truth is the Conformity of the Thing with the Divine Underſtanding.

Logical is the Conformity of the Idea with the Thing itſelf.

Moral is the Conformity of our Words, Geſtures, and Actions with our Hearts.

Logical Truth is particularly ſeen in True Propoſitions, ſuch as agree with their Rule, which is the Things themſelves of which they treat. That is a *Moral Truth* when a Man's Heart and Mouth go together, when he ſpeaks what he thinks, and is in Reality what he wou'd ſeem to inſinuate himſelf to be by his Shew and Appearance. It is not abſolutely requir'd to this *Truth*, that Things ſhould exactly agree with the Relation of them, upon Condition that he that tells 'em knows nothing to the contrary: So that one need not doubt to affirm that a Man at once, in the ſame Thing, may ſpeak *Truth* and tell a *Lye.*

Another Diviſion of *Truth* is into *Truth*, in *Being, Signifying*, and *Knowing.*

In *Being* is the Agreeableneſs of the Eſſence of any Thing to the Underſtanding of God.

In *Signifying*, when there is an Exact Correſpondence betwixt the Sign and the Thing ſignified.

In *Knowing*, when the Underſtanding by its Idea's repreſents the Thing which is to be underſtood exactly as it is.

The Third of the *United Primary Affections* is *Goodneſs*.

Goodneſs is the Agreeableneſs of any Thing. Some place the Eſſence of *Goodneſs* in the Agreeableneſs of the Eſſence and the Will: But ſuch a Conformity do's not lead us to the Nature of Goodneſs as it is *abſtractedly and abſolutely* conſider'd, but only *relatively*; i. e. as it is a Good of this or that ſort. Others place the *Eſſence* of Goodneſs in Deſire, which Opinion agrees very much with the former. But Deſire is a Conſequent of Goodneſs; for a Thing is therefore deſir'd becauſe it is good; and not that it is good becauſe deſir'd. For under the Appearance of *Good*, *Evil* is very often deſir'd. Others again place the Eſſence of *Goodneſs* in *Perfection*; but Perfection do's not give us an adequate Notion of *Goodneſs*.

Goodneſs is either ſuch as is abſolutely ſo in itſelf, or with *Reference* to ſomething elſe. That *Goodneſs* which is abſolutely ſo itſelf is call'd *Perfection*.

Perfection is either *Eſſential* or *Accidental*.

Eſſential Perfection, is when a Thing has no Eſſential Defect in its Nature.

Accidental Perfection, when a Thing is inveſted with all thoſe Accidents which uſually accompany its *Species*.

Again, *Perfection* is either *Abſolute* or *Comparative*.

Abſolutely every Being is perfect, which wants nothing to the compleating of its Eſſence.

Comparatively, one Being is more perfect than another; as God is more perfect than his Creatures, a Man than a Plant.

That *Goodneſs* which is *Relative*, and bears a Reference to ſomething elſe, is ether *Real* or *Apparent*.

Real Goodneſs is ſuch as is intrinſically ſo in its Nature, as Vertue.

Apparent is made ſo by the falſe Reaſonings of Men: Thus many look upon Idleneſs to be *Good*.

Again, *Goodneſs* is either *Metaphyſical*, *Phyſical*, or *Moral*.

Metaphyſical is the Agreeableneſs of any Thing with the Divine Will.

Phyſical is the Agreeableneſs of any Particular to the whole *Species*.

Moral is the Agreeableneſs of our Actions with the Law of Nature, and is the ſame that is meant by *Moral Vertue*.

The *Secundary United Affections* are *Duration*, *Ubiety*.

Duration is either *Imaginary* or *Real*.

Imaginary, which is only fram'd by the working of Fancy, there being no ſuch Thing in Nature: So the *Papiſts* imagine ſome to continue a long time, others a ſhort one in *Purgatory*.

Real is either *Extrinſical* or *Intrinſical*.

Extrinſical is the comparing *Duration* with ſomething elſe, making that Thing to be the Meaſure of it; ſo in *Natural Philoſophy*, Time, by the Heavenly Bodies is divided into Years, Months, and Days. This is improperly call'd *Duration*.

Ubiety is the Preſence of any Thing in its *Ubi*, or *Place*.

Ubiety is either *Infinite* or *Finite*.

Infinite Ubiety is the indeterminate Preſence of a Thing in every Place; it is call'd in one Word *Ubiquity*. This is the Property of God.

Finite Ubiety is the determinate Preſence of a being in a Place. It is *Definitive* or *Circumſcriptive*.

Definitive Ubiety is, when a Thing without any Circumſcription is ſo in a Place as to be no where elſe. After this manner Spirits, Material Forms and Accidents are in a Place. It is call'd *Definitive*, becauſe we can Define it to be here and not there.

Circumſcriptive Ubiety is that by which a Thing is exactly Circumſcrib'd in its *Ubi*, and this is properly call'd Place; this is the Condition of all Bodies.

The *Diſunited Primary Immediate Affections* of Beings are; *Neceſſity and Contingency*, *Power and Act*, *Corruptibility and Incorruptibility*, *Dependent and Independent*, *Created and Increated*, *Finite and Infinite*, *Cauſe and the Thing Cauſed*.

Neceſſity is that by which a Being is put into ſuch a Condition that it cannot be in any other.

Neceſſity is either *Abſolute* or *Hypothetical*.

Abſolute Neceſſity is when it is contrary to the very Nature of the Things, and its Principles to be otherwiſe. This is either *ſimply abſolute* or *reſpectively ſo*.

Simple Abſolute Neceſſity is, which upon no Terms will let a Thing be in another Condition than what it is in. This is never met with but in an Independent Being, *i. e.* God.

Reſpective Abſolute Neceſſity is when, according to the Order of the Creation, and the Settled Courſe of Second Cauſes, a Thing will continue as it is.

Power is by which a Being is able to effect or do ſomething. It is either *Active* or *Paſſive*. *Active* by which it is able to do ſomething. *Paſſive* by which it is made capable to ſuffer.

Act is that, by which a *Being* is in real Action: So Walking is an *Act*, not as it is in any ones Power, but as it is really perform'd.

Corruptibility is a Power not to be. *Corruptibility* proceeds either from *without* or from *within*. *Corruptibility* from *within* is when a Thing contains the Principles of its own Deſtruction. From *without* when a Thing may be deſtroy'd by an External Principle.

Incorruptibility is an Inhability not to be.

Dependent is a previous Want, whereby one Thing depends upon another as its Cauſe.

Independent is whereby one Thing do's not depend upon another as its Cauſe.

Creation is the Production of a Thing out of nothing, or out of indiſpos'd or unqualified Matter, by the Influence of an Almighty Power.

Created is that which by *Creation* has its Dependance upon another, as all Finite Beings.

Increated, which do's not depend upon another by Creation; as God.

Finite, which has Terms or Bounds of its *Eſſence*.

Infinite is either ſo *in itſelf* or with *Reſpect to us*. That which is infinite in itſelf is what properly belongs to *Metaphyſick*; not that which is only ſo with reference to us, as the Stars, and Sand, becauſe their Number cannot exactly be diſcover'd by any Man.

Infinite is that which implies a Contradiction to have Terms or Bounds to its *Eſſence*; ſuch God is only.

A *Cauſe* is an Active Principle influencing the Thing Cauſed. A *Cauſe* is either *Internal*, which partakes of the Eſſence of the Thing Cauſed, *viz.* *Matter* and *Form*. Or *External*, which has an outward Influence, *viz.* *Efficient* and *Final*.

Matter is an *Internal Cauſe* out of which a Thing is made.

Form is an *Internal Cauſe* by which a Material Being is conſtituted what it is.

Efficient is an *External Cauſe* from which any Thing by a real Action derives its Being or Eſſence.

The *End* is an *External Cauſe* upon whoſe Account the *Efficient* acts.

The *Thing Cauſed* is that which derives its Being or Eſſence from its Cauſes.

So far we have conſider'd the *Primary*, *Immediate*, *Disjoyn'd*, or diſunited Affections of Being. We come now to conſider thoſe which flow from *Being* thro' the Mediation of *the united Affections*.

From *Unity* flows *Simplicity and Compoſition*; The *Whole and Part*; The *Same and Different*; *Communicability and Incommunicability*.

Simplicity is an indiviſible Unity. It is either *Abſolute* or *Limited*. *Abſolute Simplicity* is when a thing is independently indiviſible. This is the Property of God.

Limited Simplicity, when a thing is really indiviſible, but yet that depends upon ſome external Being.

Compoſition is a diviſible Unity.

The *Whole* is that which is made up of parts united in due Order and Diſpoſition. The *Whole* is either *Eſſential* or *Integral*.

Eſſential, which conſiſts of ſuch parts as compleat the Eſſence of that Being; ſo Man is made up of Soul and Body.

Integral, which has the ſame Nature with its parts; as every drop of Water is call'd Water.

Part is that which conſtitutes the *Whole*.

Identity is the agreement of two or more things in a another.

Communicability is when one Being can partake of another.

Incommunicability, when one Being cannot partake of another.

From *Truth* follows *Natural* and *Artificial*.

Natural is that, of whoſe Truth the Underſtanding of God is the immediate Rule.

Artificial, the immediate Rule of whoſe Truth is the Underſtanding of the Artificer.

From *Goodneſs* flows *Compleat and Incompleat*.

Compleat is that whoſe Eſſence is bounded in its ſelf, and is not deſign'd to perfect any thing elſe.

Incompleat, whoſe Eſſence is not bounded in its ſelf, but is ordain'd of it ſelf to the Completion and Perfection of another Being.

From *Duration*, proceeds *Permanent* and *Succeſſive*.

Permanent, the parts of whoſe Eſſence are not in a perpetual Flux.

Succeſſive, the parts of whoſe Eſſence are in a continual Flux.

From *Ubiety* flows *Definite* and *Indefinite*.

Definite, which has a finite *Ubiety*, or Place.

Indefinite, which has an infinite *Ubiety*, or Place. Such a Being God is, whoſe Eſſence is boundleſs.

The *Secundary diſunited Affections*, are *Subject* and *Adjunct*; *Abſolute* and *Relative*; *Sign, and the Thing ſignify'd*; *Meaſure, and the Thing meaſur'd*.

Subject is a Being, which has another thing joyn'd to it, which other thing does not enter into its Eſſence.

The *Adjunct* is that which is joyn'd to another thing, ſo as not to conſtitute part of its Being.

A Being is then *Abſolute*, when it has no reſpect to any thing elſe.

Relative, when it has a reſpect to ſomething elſe.

A *Sign* is that which repreſents any thing to the Faculties of Knowledge; under which Faculties, are comprehended Senſe, as well as Underſtanding. The thing *ſignify'd* is whoſe *Idea* by its *Sign* is repreſented to the Faculties of Knowledge.

Meaſure is that by which the Quantity of any thing is found out.

The thing *meaſur'd*, is whoſe Quantity is determin'd by another.

Thus we have run thro' all the *Affections* of *Being*, which is the general part of *Metaphyſick*. We proceed now to the *Particular Part*, which is concerning the Diviſion of *Being*.

Being is divided into *Subſtance* and *Accident*.

Subſtance is a *Being* ſubſiſting by its ſelf. *Subſtance* is either *Compleat* or *Incompleat*.

Compleat Subſtance, whoſe Eſſence is bounded in it ſelf, and is not ordain'd to the intrinſical Perfection of any thing elſe. As God, an Angel, a Man, &c.

Incompleat Subſtance is which is ordain'd to the Perfection of another thing, and is a part of ſome Compound. As the Soul, a Hand, a Vein, &c.

Subſtance is divided into *Material* and *Immaterial*. A Body is a Subſtance made up of Matter and Form, and is the Object of a particular Science, *viz.* *Natural Philoſophy*, by which it is divided into *Simple* and *Mix'd*, *Animate* and *Inanimate*, &c. Spirit is a *Subſtance* void of Matter and Form, and is the Object of *Pneumaticks*.

Accident is a Being inhering in a Subſtance. *Accident* is either *Entitive* or *Modificative*. *Entitive* is either *Primary* or *Secundary*. *Primary* is *abſolute*, as *Quantity* and *Quality*; or *reſpective*, as *Relation*. *Secundary Action*, Paſſion. *Modificative Accidents* are, *Quando*, *Ubi*, *Situs*, *Habitus*.

Quantity is either *Continu'd* or *Divided*. Continued *Quantity*, which properly belongs to this place, is whoſe parts are joyn'd together by a common Term.

Divided Quantity is whoſe parts are not link'd together by a common Term, but are divided. *Divided Quantity* is Number, which may be defin'd, a multitude compos'd of Units.

Quantity is an Accident by which a material Subſtance is extended.

The Species of continu'd *Quantity* are a *Line*, a *Superficies*, and a *Body*; for *Quantity* is extended either into bare *Longitude*, and then it is call'd a *Line*, not a material one, but ſuch an one as the Mind can frame by Idea; or elſe it is extended into *Longitude* and *Latitude*, and that is call'd a *Superficies*; or elſe into *Longitude*, *Latitude*, and *Profundity*, and that makes a Mathematical Body, which is not to be underſtood as if it were a corporeal *Subſtance*.

Quality is an *Accident* which influences its Subject after the manner of an eſſential Form. There are four *Species*, or kinds of it. *Habit and (Diſpoſition;) Natural Power (and Weakneſs;) Paſſion; Figure or Form.*

Habit is a *Quality* ſuperadded to a Natural Power, which makes it very readily and eaſily perform its Operations. *Diſpoſition* is an imperfect *Habit*, or a *Habit* juſt begun.

Natural Power is a *Quality* rooted in our very Natures, which renders a Subject fit to do or ſuffer any thing. *Weakneſs* is a Diminutive Power.

Paſſion is a *Quantity* which affects the Senſes and the ſenſitive Appetite, but is quickly over.

Figure or *Form* is the outward Determination and Diſpoſition of *Quantity*, as Roundneſs.

Relation is an Accident by which one thing is referr'd to another.

Action is an *Accident* by which a thing is ſaid to act. It is either *Immanent* or *Tranſient*. *Immanent*, which does not go from the Agent to another Subject; as *Underſtanding*, *Thinking*, *Meditating*.

Tranſient which goes from one Subject to another, as *Beating*.

Paſſion is the receiving of *Action*. *Paſſion* is either *Perfective*, by which the Subject receives ſome Additional Perfection, as, *to be inform'd:* Or *Corruptive*, by which the Patient is either wholly, or in part corrupted, as, *to be wounded.*

Quando is the Duration of a Being in Time.

Ubi is the Preſence of a Being in a Place.

Situs is the Reſpect of the Parts of the Body to a Place.

Habitus is the Application of a Body to that which is near to it.

PHILOSOPHY.

BEFORE we enter upon *Ethicks* and *Natural Philoſophy*, which are Branches of *General Philoſophy*, it will not be improper to ſay a Word or two of *Philoſophy* in *General*; in which we ſhall obſerve our accuſtom'd Brevity.

'Tis certain, that in Ancient Times, the Name of a *Philoſopher*, or a *Lover* of *Wiſdom*, tho' a very modeſt one, was preferr'd to the moſt illuſtrious Characters of Honour. Princes apply'd to Philoſophers for Advice, and eſteem'd it a Glory to have been their Diſciples. 'Twas *Philoſophy* which taught *Pythagoras* that Integrity and Sincerity of Life and Manners which drew after him ſo numerous a Train of Followers; 'Twas by Philoſophy that *Empedocles* refus'd a Crown, and preferr'd Privacy and Peace to Pomp and Greatneſs; 'Twas by Philoſophy that *Democritus* renounc'd the Pleaſures of the Body to enjoy thoſe of the Mind; That *Socrates* was enabled to lay down his Life without either Arrogance or Weakneſs; That *Cato* was inſpir'd with ſuch an utter Contempt of Life, after the Ruin of the Roman Republick; And in ſhort, That all the great and glorious Things were done in the Pagan World by thoſe who were term'd Philoſophers.

The *Egyptians* were the firſt who ſtudy'd Philoſophy, to which they gave ſuch an Air of Myſtery, that the People reverenc'd it as they did Religion. Their Prieſts, by veiling their Obſervations under Figures and Hieroglyphicks, deſign'd to ſurpaſs the Capacity of the Vulgar, and diſtinguiſh themſelves from the Multitude. They had no way of Teaching but by Tradition, and were not very communicative to Strangers; ſo that whatever is pretended to be ſaid of their Philoſophy, is on ſlender Authority.

The *Greeks* were the firſt who left any ſuch Pieces of Philoſophy behind 'em, as to give Poſterity a clear Knowledge of their Principles and Inquiries. There were more Diſcoveries made in Phyſicks from the Time of *Thales* to that of *Plato*, than in many Ages that follow'd. But it muſt be by the force of long and ſevere Study that Men attain'd to apprehend in ſome degree the moſt conſiderable Motion of the Heavenly Bodies, to diſtinguiſh their Periods and Revolutions, and to form the firſt Draught of an Univerſal Syſtem, to diſcern the Obliquity of the Zodiack, and lay open the Secrets of Natural Things. Among thoſe who engag'd in this Attempt, *Thales*, *Anaximander*, *Anaxagoras*, *Heraclitus*, *Hippocrates*, *Democritus*, *Empedocles*, *Archelaus*, ſignaliz'd themſelves in an eſpecial manner. And while Learning and Application made Philoſophers in *Greece*, Nature produc'd others in *Scythia*, ſays *Juſtin*, *Prorſus ut Admirabile videatur, hoc illis dare Naturam, quod Græci longa ſapientia præceptis que Philoſophorum conſequi nequibant.* *Thales* and *Pythagoras* are look'd upon as the Two great Founders of Philoſophy among the Ancients, *Thales* in *Greece*, and *Pythagoras* in *Italy*. *Pere Rapin* tells us, That in the School of *Pythagoras* we find ſomewhat more regular and ſolid than in that of *Thales*. His common Method of Teaching was by Geometry and Numbers. By the former, he explain'd material and ſenſible Things; by the latter, intellectual Things; in which he alſo made uſe of Muſick. This Science of Numbers has been a Secret ever ſince. His Morality is loſe and diſorder'd. His Phyſicks much the ſame with thoſe of the Platoniſts. His Doctrines of two Principles, the one Good, the other Evil, on which the *Manichæan* Hereſy was grounded, ſhews that this Philoſopher was not always Infallible. For there can be but one firſt Cauſe of all real and ſubſtantial Effects. What *Pythagoras* ſays in *Plutarch*, That the chief Benefit he deriv'd from Philoſophy, was to be incapable of Wonder and Surprize, as being inſtructed in the Cauſe and Reaſon of every Appearance, has more Vanity than Solidity in it. *Socrates* and *Plato* are indebted to him for moſt of their fine Notions. The former was the firſt that began to reduce the confus'd Idea's of his Predeceſſors into ſome Method and Order; 'Twas *Socrates* who firſt trac'd out the Plan of Logick and Morality, and ſupply'd Principles to Phyſicks. Yet his Conceptions, according to a great Critick, are rather Principles than Deciſions, and his Philoſophy ſeems much more proper to pull down than to build. But then the ſame great Author gives us ſuch a Character of him, as makes one ready, with the Oracle, to pronounce him the Wiſe *Socrates*. *He had*, ſays he, *beſides all that Agreeableneſs of Wit which ariſes from a Faculty of Genius and Felicity of Parts, all the Depth and all the Solidity imaginable; and yet this Height of Underſtanding, and this Abundance of Light, was attended with true Simplicity, and perfect Meekneſs; he preſerv'd an Air of Pleaſantry in Treating of the graveſt Subjects*, &c. But 'tis not for us here to enlarge on the Character of any one Philoſopher, even not of *Socrates*, upon whom great Pens have laid out all their Eloquence. Monſ. *Charpantier*, Secretary to Cardinal *Richlieu*, wrote his Life in a pretty large Volume, and with ſo much ſucceſs, nothing can be added to it. And ſuch as read that Author, will be as well acquainted with *Socrates*, as if they had been bred in his School. *Plato's* is a more ſhining Genius. *Rapin* ſays of him, *He is the fineſt Speaker of all Antiquity, and therefore is more deſirous to be heard than ſollicitous to be believ'd; he is always florid, but not always ſound. There's ſo natural a Grace in all he ſays that we can conceive nothing more Charming.* As to his Capacity, what *Quintilian* ſays of it is ſufficient to give an Idea of its Extent. *Quæ ars digna Literis Platoni defuit? What Art is there worth knowing, which* Plato *did not know?* Tho' he had an admirable Genius for the Sciences, he rais'd the Credit of his Philoſophy more by the Vertues of his Life, than by his Speculations of Doctrine. For twas he who firſt taught that true Philoſophy conſiſted more in Fidelity and Conſtancy, in Juſtice and Sincerity,

Philosophy is either Naturall, or Morall.
Naturall Philosophy, or Phisicks is the knowledg of nature, and is divided into
Generall wch treats of
Comon Principles of Body
Matter
Forme
Privation
Comon Affections of Body
Internall
Motion
Finiteneſs, or termination of quantity
Externall
Place
Time
Particular wch treats of ſeverall kinds of Bodys, as
1 ye World as it makes one Sphere
2 of ye Elements as they are the cause of Naturall changes in
Action & Paſsion
Generation
Alteration
Mixion
3. of Bodyes imperfectly mixt, or Meteors
Pure as
Torches, hanging fires, Fiery Darts, Dancing Goats, flying Sparkles, falling Stares, Burning Lances, fiery Dragons, Ignis fatui, or goeing fires
Mixt as
Comets, Thunder. Lightning, Clouds. Showrs, Snow. haile, Dew, Miſt. Ice, Fountains, Rivers, Seas, Winds. Earthquaks.
4 of Bodyes perfectly mixt
Inanimate
Stones, Mineralls, Baſtard-Mineralls,
Animate
Plants, Animalls.
5 of ye parts of mans Body
6. of ye soul
Vegetitive, Senſitive, Rationall.
Morall Philosophy is the Doctrine of Virtue, in order to attaine ye greateſt happineſs, & hath theſe three Parts
Ethicks, treats of mans Duty, as a private Perſon & hath three parts
ye first treats
De fine: of the End & deſign of all Actions, which by Philosophers is said to be ſomething yt is good
De Bono, of Good as it is ye last end of all humane Actions
of Felicity or Beatitude
Objective
Formall
The Second treats of Principles of humane Actions
Internall
Naturall
Acquired
Externall
ye principle that moves alwayes effectually, that is God.
other Externall Principles, as Angells and men.
The third treats of
Actions
Generally
Particularly
Paſsions
Generally
Particularly
Virtues
Generally
Perticularly as
Prudence, Iuſtice, Fortitude, Temperance
Vices
Oeconomick is that part of morall Philosophy ye contains a mans duty towards a family, either as a
father
husband
maſter
Politicks, is that part of Morall Philosophy wch contains ye duty to the Publick whether the Government be by
one which is called Monarchy,
or a few, which is called oligarchy, or Ariſtocracy,
or many wch is called Democracy
Right
Truth
Equity
Loyalty
Concord
Peace

and the Love of our Duty, than in a great Knowledge and Capacity. He was *Socrates*'s Diſciple, and *Ariſtotle* his, whom having mention'd, let us content our ſelves, as to his Character, to repeat *Rapin*'s Expreſſion of him; *He is a Genius ſo much above the Standard, as not eaſily to be comprehended; He's an Eagle mounted out of Sight*, &c. He was the firſt that gather'd the various Parts of Philoſophy, in order to caſt them into a regular Syſtem. Indeed, ſays that Critick, *It may be ſaid of him there's ſcarce any thing Juſt and Rational that has been advanc'd in Philoſophy, but what ſhews ſome Trace, or bears ſome Impreſſion of* Ariſtotle's *Spirit.* We are of late us'd to hear other things ſaid of *Ariſtotle*, and Modern Philoſophy has gone a great way to explode the Ancient in many Branches of it. This is allow'd by all who have made any Progreſs in the Study of Philoſophy in latter Times; for in former, that of the Ancients, and particularly *Ariſtotle*'s, was made Sacred in the Schools. But conſidering the Reputation it is in at preſent, who can help wondering to hear *Pere Rapin* affirm, *'Tis in vain therefore that a whole Volly of little Wits have let fly againſt the Reputation of this great Man*, &c. *Cauſabon* upon *Laertius* tells us, *That none but Sophiſts and Pedants, that is, none but ſuperficial Pretenders have ſpoken ill of* Ariſtotle: *He cites an Ancient Philoſopher for this Remark, and if we conſider who theſe Criticks are, from whom* Ariſtotle *has ſuffer'd moſt in the preſent Age, we ſhall find their Character coming much within the ſame Deſcription.* If we had Room in this ſhort Eſſay, how many Names might we inſtance among *Pere Rapin's Superficial Pretenders*, which are now reckon'd among the moſt Celebrated in *Europe*? But we ſhall content our ſelves with Mr. *Boileau's*, he being his Country-Man, and in Poſſeſſion of a Reputation at leaſt equal to his own. The Univerſity of *Paris* finding this Ancient Philoſopher, who had ſo long reign'd in their own as well as all other Academies, was almoſt entirely laid aſide, and that they could not reinſtate him by the force of their Arguments, reſolv'd ſome Years ago to call in the Authority and Aſſiſtance of the Parliament to oblige the Academicks to read *Ariſtotle*. This was a very merry Deſign, and *Boileau* treated it accordingly in the ridiculous *Decree out of the High Court of* Parnaſſus, which he wrote in favour of *Ariſtotle*'s Philoſophy, as he pretended; but the Turn is ſuch, that 'tis very plain, *Ariſtotle* could not be reſtor'd, unleſs Reaſon, who had taken his Place, was turn'd out of the Univerſity: And it ſeems the Gentlemen of the Academy were generally fonder of *Ariſtotle* than of Reaſon, in which they are not without Companions. We might have mention'd the Authority of the *Port Royal* againſt *Rapin* in this Caſe, but refer the Reader to the Eſſay on Logick. May we not ſay, That *Ariſtotle*, by reducing Philoſophy into Syſtem, and his vaſt Diſcoveries, was the moſt ſerviceable of all the Ancients to Philoſophy in general, without affirming he is preferable to all the Moderns, and indeed, to Experience and Reaſon. May we not admire without adoring him; nor think him Excellent, without making him Infallible. Thoſe who are far gone in theſe Matters, will aſſure us, that if we truſt to his Philoſophy, we ſhall in many Parts of it find our ſelves miſtaken. True it is, that he brought Philoſophy to the greateſt height it ever was in among the Ancients: And 'tis no wonder, that in Matters depending on Experiments, we who have the Advantage of Two Thouſand Years Experience more, may pretend to know a little more than the Ancients, without being guilty of Vanity or Preſumption. 'Tis true, after *Ariſtotle*'s Time, Philoſophy degenerated from its noble Birth; that Purity which is maintain'd in its firſt Originals, was ſoon corrupted by the Multitude of Sects that ſprung up under its Protection. For, according to the learned Jeſuit beforemention'd, *Zeno*'s School was fill'd with falſe Vertues, *Epicurus*'s with real Vices. Philoſophy became Impious under *Diagoras*, Impudent under *Diogenes*, Selfiſh under *Demochares*, Railing under *Lycon*, Voluptuous under *Metrodorus*, Fantaſtical under *Crates*, Drolling under *Menippus*, Libertine under *Pyrrho*, Litigious under *Cleanthes*, Turbulent under *Arceſilaus*, and Unconſtant under *Lachydes*. In fine, it was abandon'd to all the Extravagancies that can enter into the Mind of Man. The old *Platonick* School was by the Sentiments of the New, debas'd into the Tribe of *Scepticks* and *Pyrrhonians* that profeſs'd to doubt of every Thing. And after *Theophraſtus*'s Death, the Order of *Peripateticks* cool'd very much in their Application to Natural Things, as preferring the Purſuits of Eloquence.

Philoſophy declining thus in *Greece*, it declin'd conſequently in all other Parts of the World, *Greece* being the only Seat of Philoſophy. After *Alexander*'s Death, the Kings of *Egypt* and *Pergamus* rival'd each other a while in their Encouragement of Learning; but one of the *Ptolemy*'s baniſhing the Profeſſors of Philoſophy from *Alexandria*, they return'd to *Greece*; and about the Time that the Romans grew powerful there, there was a lucid, but ſhort Interval of Learning at *Athens*, where flouriſh'd *Panætius*, Inſtructor to *Lælius* and *Scipio*, *Polybius*, *Carneades*, *Clitomachus*, *Apollonius*, *Milo*, Maſter to *Cæſar* and *Tully*.

Athens was then the Academy for all the Roman Youth of Quality; and 'tis plain, that 'twas by this means the Latins began to ſignalize themſelves in Philoſophy. *Lucretius* was the firſt of this Nation, who explain'd Philoſophy in Writing, as he himſelf informs us,

> *Denique Natura hæc rerum ratioque reperta*
> *Nuper & hanc primus*, &c.

Terentius Varro was a great Philoſopher; *Quintilian* mentions another *Varro Atacinus*, who wrote in Philoſophy; and what are many Parts of *Virgil* but of the ſame kind? However, it muſt be own'd that of all the Romans *Cicero* diſcover'd the moſt generous Paſſion for Philoſophy; he compos'd numerous Treatiſes in Proſecution of it, and explain'd the Doctrine of *Plato* and his Succeſſors, in his Books of Academical Queſtions. *Plutarch* is of Opinion that he valu'd himſelf more on the Glory of being a Philoſopher, than on that of being an Orator. *Brutus* compos'd alſo ſome Philoſophical Pieces. The Romans follow'd the *Greek* Syſtems, and we hear of none founded at *Rome*, 'till towards the latter end of the Reign of *Auguſtus*, when *Potamon* of *Alexandria* eſtabliſh'd a new Sect at *Rome*. He choſe out the more rational Parts of all the other Syſtems, and re-united them in his own, whence his Followers took the Name of *Eclecticks*. The Chief of whom were in the Number of the Primitive Chriſtians; for 'tis very plain by what is left us of Antiquity, that many Principles of *Socrates*, *Plato*, &c. are founded on ſuch good Morality, that Chriſtian Ethicks are not at all diſhonour'd by being united with them. Who can expect we ſhou'd have much to ſay of Philoſophy or Philoſophers, in the Times of Imperial Tyranny at *Rome*, when the *Tiberius's*, the *Caligula's*, and the *Nero's* were Maſters, and enſlav"d, as far as in them lay, the Minds as well as the Perſons of their Subjects. There's no need of any Philoſophy, but Stoiciſm, under a Tyrannical Government; Liberty alone is a Friend to that Generous Spirit which produces Wonders in the Rational World. Why have we in *England* had more Philoſophers, conſidering the Extent of our Country, than any other Part of *Europe*, but becauſe we live under a Government regulated by Excellent Laws, and have not had the Minds of our Men of Learning checkt by the Tempers of our Princes? If it be objected, How comes it that *France* has produc'd the *Gaſſendus's*, the *Deſcartes's*, &c. May it not be anſwer'd, 'tis perhaps becauſe the *French* have of all Mankind the moſt Complacency for Tyranny, and are by Nature beſt qualify'd to accommodate themſelves to Slavery. *Longinus*, in his Treatiſe of the Sublime, has handled this Argument; and tho' living under a Foreign Power, he gives a great way into the contrary Opinion, yet 'tis viſible he agreed in the main with the Philoſopher, who aſſerted to him, that the Decay of Humane Wit proceeded from the Loſs of Liberty. *Caligula*, *Nero*, and *Domitian* baniſh'd all Profeſſors from *Rome*; and *Nero* ſent for *Arabian* Magicians to refine upon his Maſter *Seneca*'s Philoſophy. *Seneca* was himſelf leſs a Philoſopher than a Courtier. *Quintilian* tells us his Morals were ſevere, but his Principle not ſo exact. Thoſe who profeſt Learning muſt now alſo profeſs Flattery, or leave both Schools and Country; and thus it will always be where Princes are afraid of Reaſon. Aſſoon as *Rome* was again happy in a Good Prince Philoſophy return'd, and ſeveral Emperors ſucceſſively made it a Part of their Glory to be themſelves Philoſophers. Nay *Commodus*, tho' one of the moſt Cruel Tyrants that ever liv'd, had the Vanity of aſſuming the Title of a Philoſopher, tho' he had no more Reaſon to do it than to take on him that of a God. *Pliny* went farther than any Man before him in Inquiries into Nature. *Dionyſius Chryſoſtome* wrote about the ſame Time on Moral and Natural Philoſophy: But *Plutarch*, one of the Wiſeſt and moſt Senſible Philoſophers that ever wrote, having been *Præceptor* to Two Emperors, *Trajan* and *Adrian*, reviv'd the Philoſophical Spirit ſo much by that means, that in few Years we find *Antoninus Philoſophus* on the Imperial Throne now flouriſh'd, *Epictetus*, *Arrian* his Diſciple, *Galen* the Famous Phyſician, *Diogenes Laertius*, *Herodes Atticus*, *Pauſanias*, *Aulus Gellius*, *Ptolemy* the Aſtronomer, *Maximus* of *Tyre*; and about the ſame time, *Taurus* of *Berytus*, *Athenæus*, *Alexander*, *Aphrodiſæus*, *Plotinus*, *Apuleius* and *Porphury*, by whom for a long Time Philoſophy was kept in Faſhion; and it being the Mode, *Lucian*, who found it in a State of Corruption, in Compariſon to what it was in its Primitive Purity, fell grievouſly upon the Profeſſors; many of whom had groſly abus'd their Profeſſion.

As the Light of the Goſpel prevail'd the Chriſtian Philoſophy ſhone with a Superior Brightneſs, and with Rays ſtronger than thoſe of the Sun. Heathen Wiſdom ſoon appear'd dark and obſcure. But however, many of the Fathers thought fit to Study it to overcome the Pagans with their own Weapons: But St. *Paul* admoniſh'd the *Coloſſians to beware leſt any Man ſpoil 'em thro' Philoſophy and vain Deceit*. *Juſtin Martyr*, *Clemens Alexandrinus*, *Tertullian* and *Euſebius*, employ'd all the Force of their Eloquence to expoſe the Fooliſhneſs of Heathen Wiſdom. By Humane Wiſdom they certainly meant only what endeavour'd to impoſe Falſhood for Truth, and not that Science which is ſerviceable to Truth and an Enemy to Falſhood; for many of 'em were Eminent Philoſophers, as *Ariſtides* a Philoſopher of *Alexandria*, *Juſtin Martyr* himſelf, *Tatian*, *Athenagoras*, *Bardeſanes*, *Athenogenes*, *Apollinaris* Biſhop of *Hierapolis*, *Melito* Biſhop of *Sardis*, *St. Irenæus* and *Tertullian* alſo, who, to uſe *Pere Rapin*'s Expreſſion, was oblig'd to Study Philoſophy in defending the Cauſe of Religion, which paſt with the Heathens of thoſe Times for a new Philoſophical Sect. To theſe may be added, *Pantænus*, Maſter of the Catechetick School at *Alexandria*, *Clemens* his Scholar, *Origen*, who ran thro' all the various Schemes the better to confute his Adverſary *Celſus*, *Lactantius*, *Arnobius*, *Gregory Thaumaturgus*, *Ammonius*, whom the Pagans admir'd. He was the Firſt who taught *Ariſtotle*'s Philoſophy in the Chriſtian Schools. *St. Baſil* is ſaid to have been the Ableſt Logician of his Time; St. *Chryſoſtom* was no leſs Eminent for his Philoſophy than for his Eloquence; St. *Auſtin*, who, beſides his Three Books againſt the *Platoniſts*, Compos'd a Syſtem of Logick ſtill extant. How many others might be nam'd, but we need only imagine that when by the Favour of the Chriſtian Emperors the Schools came under the Direction of Chriſtian Maſters, there were no Profeſſors who neglected any Part of Learning which was neceſſary to form Good and Uſeful Scholars, and then certainly Philoſophy was not omitted, at leaſt as much of it as help'd to extend the Knowledge and refine the Manners of Mankind, without oppoſing the Truths of Chriſtianity which it now ſerves to defend.

We have omitted making mention of the Magicians who made a mighty Buſtle in the Firſt Centuries of our *Æra*, and aſſum'd the Names of Philoſophers. 'Twas by *Nero*'s Encouragement that they firſt pretended to make a Figure in the Learned World; and the Pagans obſerving that the Chriſtians got ground chiefly by the Miracles wrought by Chriſt and his Apoſtles, the Truth of which were not to be Conteſted againſt the Teſtimonies of ſo many hundred thouſand Eyes that had ſeen 'em, ſet up theſe Magicians to work pretended Miracles by the Power of Magick. How far the Omnipotent may ſuffer 'em to be deluded by the Great Deluder and his Emiſſaries, we will not pretend to determine; but 'tis very probable ſome of our moſt Dextrous Operators in the *German* Art, ſome of our Modern Profeſſors of *Hocus Pocus* might have paſt for as Good Magicians, had they had the ſame Encouragement, the ſame Opportunities, and met with the ſame Diſpoſition in People to believe 'em.

The Chief of theſe Magick Philoſophers was *Apollonius Tyanæus*, whoſe Life and Impoſtures were blaſphemouſly oppos'd to our Saviour's Life and Miracles by *Hierocles* and *Philoſtratus*. And *Eunapius* wrote the Lives of the *Sophiſts*, who were moſt of them Magicians, to vie with the Lives of the Primitive Chriſtians. We are very unfit to ſay any thing of the Power of Magick Philoſophy, having no manner of Notion of the Magicians Science. If they deal with the Devil they may do much; if they don't, their Art is of the ſame Importance with the Cabaliſtical Doctrine, which, as *Delrio* informs us, took its Riſe from it.

The *Barbarians* over-running both Eaſtern and Weſtern Empire, Philoſophy and all Learning had the ſame Fate with the Government, and were overwhelm'd with Barbariſm. The Moſt Victorious of all theſe Barbarous Nations were the *Saracens*, who over-ran almoſt all the Eaſtern, and a good Part of the Weſtern Empire, by which means what little Learning they had among them, they in a great meaſure impos'd on thoſe they Conquer'd, and made a Revolution in the Republick by Letters. Father *Rapin* tells us, " Their Genius " was ſubtile, deep, and muſing; and by fixing too " cloſe on the Text and Letter of *Ariſtotle*, they got " an abſtracted way of Reaſoning ſomewhat different " from the Solidity of the *Greeks* and *Romans*." It had an Appearance of great Sagacity, but was falſe and full of wild Conceits, as may be ſeen in the Works of theſe *Arabian* Philoſophers, *Avicenna*, *Alkindus*, *Algazel*, *Averroes*, *Alpharabius*, *Albehaſen*, &c. *Ludovicus Vives* cenſures *Avicenna*'s Metaphyſicks and *Averroe*'s Philoſophy as the Dreams of a roving Imagination, and a-kin to the *Alcoran*. However, 'tis by Certain that they had ſo many Opportunities by their Victories and Plenty to follow and enlarge their Studies, that eſpecially in the Mathematicks, they were for ſome Ages the moſt diſtinguiſh'd Scholars in the World. *Averroes* follow'd Ariſtotle, and Study'd him ſo much, that he deſerves a Name amongſt his Commentators. He founded a new Sect of Philoſophy under his own Name. *Avicenna* follow'd *Plato*, and there was a Contention between theſe Two *Saracens* about thoſe Two Philoſophers whoſe Followers they had declar'd themſelves.

The *School-men*, the laſt Sect of Philoſophers, as *Rapin* terms them, came after the *Arabians*, and framing their Genius on *Arabian* Comments, it thence became ſo knotty and ſo ſubtile. *Thomas Aquinas* is lookt upon as the Founder of this Sect. We do not know whether Gentlemen will be veryfond of knowing who were the Chiefs of this Scholaſtick Philoſophy; for, as to the Philoſophy itſelf, moſt certainly they, nor no reaſonable Men will concern themſelves about it, and few wou'd have been troubled had it dy'd in thoſe Countries where Superſtition and Sophiſtry were bury'd; when True Religion and Learning reviv'd with the Reformation, School-Divinity ſerv'd rather to perplex than explain Things; and truly the Darkneſs of Popery was ſuch at that Time, that the leaſt Ray of Light was enough to have attracted the Eyes of the Chriſtian World, had they not been blinded by the Subtleties of the Schools. But becauſe we have given an Account of Philoſophy from the Firſt Sects to the Laſt, let us ſay ſomething alſo of the School-men who come under the Claſs of Philoſophers. They tell us that *Lanfranc*, whom the *Norman* made Arch-Biſhop of *Canterbury*, *Abelardus*, *Peter Lombard*, &c. fram'd the rude Draught of this Sect from St. *John Damaſcen*, which Notable Monk was the Firſt who introduc'd Tranſubſtantiation in the Form as 'tis now Eſtabliſh'd in the Church of *Rome*; ſo that we ſee what a Fine New Philoſophy we are like to have, ſince 'tis probable 'twas only accommodated to that and other extravagant Principles in Popery. *Thomas* of *Aquin* perfected this Noble Method, and reduc'd the Scholaſtick Way into Form. It has been divided like the *Platonick* Sect into Three Periods; the Old, the Middle, the New. The *Engliſh* had a great Hand in this Revolution in Learning. *Alexander Hales*, whom *Rapin* calls *Alexander* of *Ales*, and that Error is continu'd in ſome Tranſlations, was an *Engliſh* Man, and the moſt conſiderable in the Firſt Period of School-men. The Second Period was begun by *Albertus Magnus*, and now was the *Ariſtotelian* Doctrine carry'd to its Height of Glory by *Thomas Aquinas*; and *John Duns*, Sirnam'd *Scotus*, our Country-man, who, ſays *Rapin*, ſeem to have been the Two Greateſt Genius's for Philoſophy in our latter Ages. *Durandus* began the Third Scholaſtick Age; the Firſt of which laſted about Two Hundred Years, the Second One Hundred, and the Laſt about the ſame Time. During theſe Ages there aroſe a Famous Diſpute between the *Normaliſts* and *Realiſts*. *Ocham*, the Chief of the *Normal* Way, taught, *that Univerſal Natures were but Names and Notions*; and *Scotus* the Leader of the *Realiſts* maintain'd, that *Univerſal Natures were Things truly Exiſtent*. The Merrieſt Part of this Hiſtory is, That in *Germany* the Diſputants fell from Words to Blows, and knock'd one another on the Head in oppoſing and defending thoſe *Univerſal Natures*, of which doubtleſs the Reader has a very Clear Idæa by the very naming the Terms. We ſhall Conclude what we have to ſay of theſe Worthy Gentlemen, with what *Pere Rapin* himſelf, who has a great *Tendre* for 'em ſometimes, ſays of their Philoſophick Diſputes; *Hence proceeded that dead Weight of Summs and Courſes which ſtifled all the Remains of Good Letters in the World.*

While the School-men were Eſtabliſhing their *Sentences* and *Summs*, there appear'd Three other Philoſophers who deſerted the Scholaſtick Rules, and ſet up a quite oppoſite Method; as *Rapin* and *Lully*, *Cardan* and *Paracelſus*. *Lully* by his Commerce with the *Arabians* acquir'd a great Knowledge in Natural Philoſophy, Aſtronomy and Medicine. Out of theſe Three Sciences he Compos'd a Fourth, that of Chymiſtry, of which he deſir'd to paſs for the Reſtorer in *Italy* and *Spain*. *Cardan* brought the *Dark* and Cabaliſtical Learning upon the Stage; and *Paracelſus* had more the Air of an Operator than Philoſopher: He was for framing a New Philoſophy, New Phyſick, and a New Religion: He affected to be Myſterious, and even Unintelligible, a Happy Diſpoſition in one who is to teach. The Cabaliſtical Occult Philoſophy obtain'd very much in the Thirteenth Century; *Cornelius Agrippa*, *Arnaud de Villeneuve*, and *Petrus de Opono* were the Chief of it; the Magick, of which *Pere Rapin* is ſo much afraid, will not appear ſo terrible to ſuch as are not fully confirm'd in the Belief of Modern Witchcraft, and 'tis likely they were greater Cheats than Conjurers.

Thus we have rather gone thro' Philoſophy than the Account of its Tenets; and as we took the Form and Part of the Matter from *Pere Rapin*, ſo we doubt not but his Authority will very much contribute to the Credit Gentlemen will give this Eſſay. We might have follow'd the ſame Method, with reſpect to Logick, as he has done, but the *Port Royal's* being the more perfect Treatiſe on that Science, we preferr'd it to *Rapin's*, which is ſhort and Hiſtorical, and will rather amuſe than inform. As for Philoſophy in general, ſuch an Hiſtorical Account was not improper, becauſe we ſhall in the Branches, treat of Philoſophy in particular.

Philoſophy did not continue in this State of Chimera and Confuſion long after the Reformation in Religion, for when that great Truth hath broken its way, People were animated by it in the ſearch after all other Truths, and the Liberty of Learning made it ſpread and flouriſh. The Roman Catholicks found it neceſſary to put themſelves forwards as well as the Reform'd, who got Ground of 'em by their Science, as well as by the Truth of what they maintain'd; and had the Papiſts abandon'd the Field of Learning to the Proteſtants, they muſt ere now have abandon'd their Religion too, which they have hardly been able to defend with all the Art and Induſtry humane Wit and Application could maſter, againſt even ſome of the weakeſt Attacks of the Reform'd. This Emulation produc'd abundance of great Men in all Sciences, and eſpecially in Philoſophy. *Pere Rapin* gives us a ſhort Character of the Philoſophical Genius of the ſeveral Nations of *Europe*. "The *Spaniards*, ſays he, grew ſubtle in their Reaſoning, great Formaliſts and Metaphyſicians, as having an Head turn'd for ſevere Reflection and grave Diſputes." Whether this great Critick has not rather painted the Character of the People in *Spain*, than their Philoſophers, or conſider'd them more as *Spaniards* than Men of Learning, let thoſe determine who underſtand the *Spaniſh* Philoſophy, which has not made a mighty Noiſe in the World. As to the *Italians*, he tells us, "They aſſum'd a more agreeable Character of Wit, and were choice and curious in fine Idea's. The Works of *Nipilus* gave them a Value for *Ariſtotle's* Philoſophy, as thoſe of Cardinal *Beſſarion*, and *Maralius Ficinus* inſpir'd them with a Paſſion for the Doctrine of *Plato*, to which they were more inclin'd than their Neighbours, by the Beauty of their Genius, which is publick and lively, and impatient of hard Labour." Now we come to his Character of the *French* in Philoſophy; and tho' he is doubtleſs one of the greateſt Criticks that Nation ever produc'd, yet he is ſtill a *Frenchman*, Self-love and Vanity are a little apparent. "The *French*, as they found themſelves capable of all Sciences, ſo they ventur'd upon all." But now he remembers himſelf, as a Man of Learning, and will not ſacrifice his Judgment to flatter his Country-men; for to this he only adds, "By their Ingenuous and Inquiſitive Temper, they ſucceſsfully copy'd whatever was Excellent in other Nations." 'Twas the ſame excellent Judgment that forc'd him to do juſtice to the *Engliſh*, of whom he ſays, "The *Engliſh*, by that Depth of Genius which is Natural to them, undertook the more abſtruſe Inquiries into the Cauſes of Things; and by an invincible Application to Labour, excell'd the reſt of *Europe* in their Improvements of Natural Knowledge, as appears from the Works they have publiſh'd on this Subject." None can ſuſpect that this learned Jeſuit ſaid what he did not think; for never did *Frenchmen* love the *Engliſh* ſo well, as to Compliment 'em on their Underſtanding, but when they were forc'd to do it by the Brightneſs and Sublimity of their Genius. In his Character of the *Germans*, he trifles ſomewhat more than he has hitherto done. "The *Germans*, by the Neceſſity which their Climate lays upon 'em of coming near the Fire, and by the convenience of their Stoves, apply'd themſelves to Chymiſtry, together with other People of the North. Of Modern Philoſophers, thoſe who have made the greateſt Noiſe, are *Galilæo* an *Italian*, *Bacon*, *Hobbs*, and *Boyl*, *Engliſhmen*; *Gaſſendus* and *Deſcartes*, *Frenchmen*; and *Van Helmont* a *Flemming*; to whom may be added Sir *Iſaac Newton* an *Engliſhman*, and Monſ. *Leibnitz* a *German*, who in their ſeveral Studies have gone a greater Length than any that went before 'em, Ancients or Moderns. What Father *Rapin* ſays of the Philoſophers before-mention'd, will certainly be agreeable to an *Engliſh* Reader, becauſe there's ſo much ſaid of *Engliſhmen*, who, however they differ now and then among themſelves, are paſſionate Lovers of their Country-men in general. We ſhall make uſe of the Criticks own Words, as near as they can be render'd.

"*Galilæo* ſeems to have had the fineſt Genius, and ought, in my Opinion, to be look'd upon as the Father of Modern Philoſophy. His Method holds a near Reſemblance with that of the *Platoniſts*, &c.

"*Bacon's* Genius is Extenſive and Vaſt; the largeneſs of his Capacity hinders him from being ſtrictly Accurate, and he cannot ſtay to go to the bottom of Things. The greateſt part of his Maxims are rather Heads of Meditations, and noble Structures of Thought, than Rules of Practice, more like ſudden Sparks of Fire than like a continu'd and natural Light.

"*Hobbs* is Obſcure and Unpleaſant; ſingular in his Notions; learn'd, but not ſolid; inconſtant in his Sect and Party; ſometimes an *Epicurean*, ſometimes a *Peripatetick*.

"*Boyl* is Exact in his Obſervations; no Perſon in *Europe* has enrich'd Philoſophy with ſo many Experiments, which yet are not always infallible, becauſe the Principles on which they proceed have no abſolute Certainty; after all, he muſt be own'd to be a noble Philoſopher, and a great Maſter of Nature." What he ſays of Mr. *Boyl*, is enough to make ſome late Pretenders to Philoſophy in *England* bluſh with Ingratitude, by endeavouring to leſſen the Reputation of a Gentleman, to whom Foreigners acknowledge themſelves to be very much indebted. And how will ſome Perſons, who without having gone ſo far in Philoſophy, as to be able to tell us what Sciences it includes, decide arbitrarily as to the Merit of this noble Philoſopher. To continue *Rapin's* Characters.

“ *Gaſſendus*, who acts only as a Reſtorer of the Philoſophy of *Democritus* and *Epicurus*, advances little himſelf, and has ſcarce any thing of his own but his Beauty of Stile, *&c.*

“ *Deſcartes* is one of the moſt extraordinary Wits that has appear'd in theſe latter Ages, of a fertile Invention and profound Meditation; The Thread of his Doctrine is finely drawn out; The Method, according to his Principles, exactly contriv'd; And his Syſtem, tho' partly Ancient and partly Modern, very well put together. Indeed, he inclines too much to *Scepticiſm*, and is a very ill Pattern for thoſe who are naturally of an incredulous Temper; but ſtill he is more of an Original in his Way.

“ *Van Helmont*, by the Skill in Natural Cauſes, which he had obtain'd after his peculiar manner, perform'd ſo prodigious Cures, that he was ſuſpected of doing things beyond the Powers of Nature, and put into the Inquiſition.

Thus we have given a ſhort Account of Philoſophers and Philoſophy, from the Ancients down to our own Times: What remains, is to obſerve ſome of the Uſes and Inconveniences attending Philoſophy in general, and therein we ſhall be directed by the Jeſuit, who has hitherto been our Guide. He begins this Part of his Treatiſe with a Compariſon between the Ancient and Modern Philoſophy; and 'tis his Opinion, That the Ancient is grounded more upon Authority, the Modern upon Experience. The Ancient is Simple and Natural; the Modern, Artificial and Refin'd; the former has more Gravity and Modeſty, the latter a more Aſſuming and Magiſterial Air. Much more he ſays of the Compariſon; but the Cloſe of it all is, That the Ancients deſerve the Prize, in as much as their good Senſe alone ſeems preferrable to all the Art and all the Refinement of the Moderns; wherein the greateſt part of the Moderns will diſſent from our Critick, for he having yielded up Experience to Modern Philoſophy, 'tis very much to be queſtion'd whether in the Compariſon, the word Experiment is not worth more than theſe, Authority, Simplicity, Gravity, Modeſty, and even Natural, if Experience in Philoſophy is not the beſt Sign of Nature. He indeed adviſes all to be very careful not to favour the one or the other, more by Paſſion than Judgment; and cautions young Students to be modeſt in their Opinions of the Ancients, for which he gives ſeveral good Reaſons. *Pythagoras*, 'till the Fiftieth Year of his Age, was a Scholar under the greateſt Maſters of the World. *Euſebius* teſtifies, that *Democritus* ſpent no leſs than Fourſcore Years in hard Study. *Parmenides* ſhut himſelf up Eighteen Years in a Cave, to finiſh his Logical Speculations. *Plato* gave Forty Years Attendance to the Lectures of *Socrates*, *Archytas*, and *Eurytas*; and *Ariſtotle* labour'd more than Twenty Years under *Plato:* Whereas, ſays my Author, *We, after ſome Two Years ſlight Practice under indifferent Maſters, dare enter the Liſt againſt thoſe Heroes.* The young Gentlemen at the College will do very well to conſider of theſe things before they declare War with Antiquity. But becauſe the Ancients were excellent in abundance of things, muſt they therefore be perfect in all? Muſt we do like *George Trapæzund*, accommodate *Ariſtotle*'s Doctrine to the Holy Scriptures? Or, like *Maralius Ficinus*, affirm, That *Plato* acknowledg'd the Myſtery of the Holy Trinity? Which, had there been any thing in it, he muſt do by a Prophetical Genius, he writing Three or Four Hundred Years before our Saviour's Birth, and the Second and Third Perſon were preach'd. The Paſſion of *Hermolaus Barbarus*, Patriarch of *Aquileia*, for *Ariſtotle*, is much more Notorious. For if we truſt this learned Jeſuit, he conſulted the Devil, a very odd Commentator upon *Ariſtotle*, about the meaning of the word Ἐντελέχεια. This Story paſſes on the Believers of the Legend; and if we do not believe it, 'tis not becauſe we think the Patriarch made a Conſcience of it; but much doubting whether the Devil would take the Character of a Critick on him in Complacency to that Prelate. There's another Failing, in making a Judgment of Philoſophers and Philoſophy, by partially engaging to one Man's Sect or Principles, and condemning all others; whereas, in the Purſuit of Wiſdom, every thing True in all is alike valuable; yet ſo great has been the Obſtinacy of ſome Men on this Occaſion, that *Pythagoras*'s Followers choſe rather to be burnt, than abjure their Maſter's Doctrine. *Hegeſius*'s Diſciples, by too ſtrict an Adherence to the Rigour of his Precepts, ſtarv'd themſelves to Death.

Now ſince there is not the leaſt Certainty in the Maxims of the greateſt Philoſophers, and 'tis hard to ſeparate Truth from Appearance, 'twould be prudent to ſtick to none ſo implicitely, as never to examine them, or embrace Things for Infallible Truths, which are liable to Exception or Doubt. *Deſcartes* built a new Syſtem of Phyſick upon Principles not altogether new; he himſelf look'd upon this Syſtem as no better than a Fiction or Romance, which was the Name he gave his Philoſophy among his intimate Friends: And ſhall that be Sacred to me, which was a Jeſt to the Author. In Philoſophy, we ought to proportion our Aſſent to the different Degrees of Certitude in the Subject of Debate, ſo as never to entertain Truth as Probability, nor Probability as Truth. Another Weakneſs in Philoſophical Studies, is the being fond of Novelties. Men are very much in danger of loſing themſelves, when they are inclin'd to Travel in by Paths. 'Tis very difficult to preſerve the Character of a wiſe Man, and yet to recede from common Opinions. How Capricious would it ſeem in a Poet never to introduce the Stars or Conſtellations, without talking like *Deſcartes*, of their *Vortices* and ſubtle Matter? And yet this is the Spirit which reigns among the Pretenders to Philoſophy in our days, they attempt to ſignalize themſelves by thinking out of the way, and relinquiſh common Senſe only becauſe 'tis Common. If they happen to imagine ſomething new, they are tranſported in advancing what was never before aſſerted. *Tully* compares *Arceſilaus*, who over-turn'd the old Philoſophy to eſtabliſh the new, to *Gracchus*, and the other ſeditious Diſturbers of the Civil Government. But with all due Submiſſion to *Tully*, and Monſieur *Rapin*, who tells it us, if *Arceſilaus*'s new Philoſophy was true, he was no more to blame than

Gracchus, whoſe Sedition is by ſome look'd upon as the laſt Struggle of the People of *Rome* to preſerve their Conſtitution. If 'tis the good Fortune of a great Genius to hit upon ſomething Juſt as well as True, his Diſcovery is glorious to him, as it is uſeful to Mankind. Should any one charge Sir *Iſaac Newton* and Monſieur *Leibnitz* with ſeeking after Novelties, becauſe by their Search after Perfection, in the Science of Geometry, they found out the *Infinitely Littles*, which has given ſuch a Defeat to the Ancient Geometry? Or is *Copernicus*'s deſire of going out of the way blameworthy, for reviving, as *Pere Rapin* terms it, the Syſtem of the Earth's Motion? Certainly, ſuch Diſcoveries as theſe are not meant, when he cautions us not to ſeek after Novelties. But an Inconſtancy of Study, to which young and light Heads are moſt apt, and a Turbulency in the Minds of others, who like nothing but what derives in ſome meaſure its Being from themſelves, and are fond of advancing and eſtabliſhing new Notions upon this Head. This learned Jeſuit aſſerts a Thing which ſmells rankly of the Slavery of *French* Principles. *This ſhews how neceſſary it is that the Civil Law ſhould interpoſe their Authority in regulating Mens Sentiments, and the Government be enabled to reduce the Exorbitance of Imagination.* To ſet Limits to Peoples Thoughts, and Confine their Fancy, which we believe is not in the Power of that Monarch, who has bid as fair for an Empire over the Mind, as any Prince ever did ſince *Diocleſian*'s Days.

Our Critick proceeding in his Treatiſe, gives his Reaſons why ſome Philoſophers, eſtabliſh'd their Opinions and Maxims ſo ſovereignly, that others ſubmitted readily to 'em. He imputes it to a Superior and Commanding Genius in the one, and a Dependant and Precarious Genius in the other. Myſtery, he ſays, and with a great deal of Judgment, has been ſerviceable to ſome in promoting their Syſtems, they being reverenc'd for that Obſcurity which is eſteem'd as Depth, and ſometimes as Divine. *Paracelſus*, and according to him *Deſcartes*, ow'd their Reputations to the like Meaſures.

Men of too quick and ſubtle Spirits are not fitteſt to commence Philoſophers; it is better to ſettle the Imagination, and as it were condenſate it with ſomething groſs and filling, than let it evaporate in nice Speculations. The plain *Good Senſe* of *Socrates* triumph'd over all the *Art* of the *Sophiſts*. *Philoſophy* never becomes abſtracted 'till it ceaſes to be ſolid. Men retire to *ſhew* when they have nothing *real* to advance. 'Twas by this the Stoicks made a Notional King of their wiſe Man, inveſted him with empty Titles of Majeſty, and enrich'd him with Treaſures that conſiſted only in Magnificence of Speech, as *Tully* pleaſantly expoſes them.

Miſtaken Philoſophy has ſpoil'd many a good Head, and Wiſdom miſunderſtood has been fertile in the Production of Fools. *Empedocles* ran Mad with Study, and threw himſelf into *Ætna*, in Purſuit of an Apotheſis, as *Horace* ſays. *Cornelius Agrippa* owns that he was infected with ſuch a ſort of Frenzy. *Peter de Opono* went ſo far into the Depths of *Aſtrology*, that he was put into the Inquiſition for a *Conjurer*, which perhaps was more a ſign of the Inquiſitor's Ignorance than of his Learning. 'Twould be endleſs, if we ſhould go about to mention all the Extravagancies which miſtaken *Philoſophy* has made Men guilty of.

He ought to be look'd upon as a good Proficient in *Philoſophy*, who has diſcover'd how full of Doubt thoſe things are of which he is beſt appriz'd, and who is contented to be ignorant of that which he is not in a Capacity of knowing. But as 'tis a Folly to doubt of Nothing, or to doubt of all Things; ſo to approve of all Things, or to approve of Nothing, cannot be a greater Argument of Wiſdom. The Preſumptious and Obſtinate ſubſcribe to no Aſſertion, becauſe they will not diſparage themſelves by yielding. The Light and Inconſtant ſubſcribe indifferently to any, becauſe they will not be at the Trouble of Inquiring. 'Tis an Argument of Weakneſs, to hang upon other Mens Lips, and to be a Slave to their Opinions. But it ſeems a more dangerous Eſtate to hover in Habitual *Scepticiſm*, and by a Pride of Spirit reſiſt that Natural Bent and Inclination which Man has to be convinc'd by Truth, and concluded by Reaſon. Let us be as diligent in examining what is Doubtful, as in embracing what is Certain. If we examine the Motives by which the greateſt part of *Philoſophers* are determin'd to their peculiar *Sect*, we ſhall find that *Philoſophy* has the leaſt Share in them. 'Tis often by Prevention, of Age, or Accident, without Deliberation or Choice, and ſometimes without Thought, that they embrace one Opinion rather than another.

Pere Rapin declares for *Diſputations* in Schools, to *awaken the Powers of younger Minds, and exerciſe their growing Wit*, &c. whereas Experience ſhews us that it tends rather to inſtil into thoſe *younger Minds* a Spirit of Contradiction and Sophiſtry. He ſays himſelf, the Ground of moſt Diſputes is that the Parties don't underſtand one another. *Thales* declar'd againſt a *Vacuum* which *Democritus* admitted without Scruple. Let both explain themſelves on the Point, and both will be agreed. *Epicurus* rely'd on the Teſtimony of Senſe in all things. *Empedocles* would truſt it in nothing. The Diſpute would drop, if they could once come to a Reſolution about the Nature of that Error of Senſe which ſometimes defeats its Teſtimony. If we could explain to *Deſcartes* the true Nature of Senſation, he would make no difficulty of allowing an Horſe to be an Animal. Now as to ſuch notable Diſputes as the laſt, what would be the uſe of it? How would that awaken the Powers of younger Minds, and exerciſe their growing Wit, to diſpute againſt the Certainty of Senſe, as that a Horſe is an Animal, or that a Dancing-Maſter moves in a Jig. Yet there are abundance of young Students who had rather triumph by proving there's no Motion in the one, and that the other is no Animal, than by convincing another of an Error in Opinion, or a Miſtake in Judgment. *Peter Ramus* and *Gaſſendus* were for baniſhing this Diſputative Genius; and whatever this learned Jeſuit ſays for reviving or confirming it, will have little weight againſt Experience, which ſhews how apt it is to Corrupt, rather than Improve younger Minds, by making 'em

Affected, Opinionative, Superficial, and Obſtinate. This Argument might have been continu'd to a great length, and this Eſſay will to ſome appear too curt, as to others it may ſeem even too long. But we all along deſire the great Maſters of Science, who are poſſeſs'd of all the Treaſures of Knowledge by Inheritance, from Father to Son, in the Academick World, not to think we are ſo daring as to write for the Gentlemen at the College, who are to Teach others, and cannot themſelves be Taught. They certainly will find many things deficient, and perhaps Philoſophy, Metaphyſicks, Ethicks, &c. are not a part of their *Recreations*, whatever it may be of their Buſineſs. We write to thoſe Country Gentlemen and others, who having forgot the Things which they learn'd there, or never been hitherto at the Trouble to learn 'em, come now with a willing Diſpoſition to know as much of the Sciences as is neceſſary to diſtinguiſh them from ſuch as are entirely Ignorant of them; who, if they read with Candour, and if they approve of what they read, will think themſelves oblig'd to this Deſign, and having a Stock of Good Nature, Generoſity, and Humanity, if they do not approve of it, will at leaſt commend the good Intention of the Undertaking.

MORAL

Moral Philoſophy.

BEFORE we attempt to Treat of this Science in Form, we ſhall obſerve to whom the Preſent Age is indebted for the *Ethicks* of the preceding, and look a little into the Hiſtory of *Morality*.

Democritus was the Firſt Philoſopher who began with wonder to reflect how Man being ignorant of himſelf, ſhou'd yet engage his Curioſity in Studying the Heavenly Bodies; this latter was the whole Buſineſs of Philoſophers 'till *Socrates*'s Time: He was the Firſt who apply'd himſelf to the forming of Manners. *Pythagoras* indeed ſhew'd him the way, but the Specimen he made was very imperfect; and he deduc'd the Rules of Morality from the Obſervations of Nature, which Part of Knowledge he acquir'd by his Converſe with the *Ægyptian* Prieſts. The great Aim of his Moral Doctrine was to purge the Mind from the Impurities of the Body, and from the Clouds of the Imagination, which he term'd the *Meditation of Death*. It ſeems to have had more Purity and Piety than the other Syſtems, but leſs Exactneſs. His Maxims were but a bare Explication of Divine Worſhip, of Natural Honeſty, of Modeſty, Integrity, Publick Spiritedneſs, and other Common Offices of Life. The *Golden Verſes* which go under his Name, are aſcrib'd to his Diſciples, who were as remarkable in the Practice as the Theory of *Ethicks*, inſomuch that at *Rome*, in the Time of the Firſt Conſuls, to be a Wiſe Man and a *Pythagorean*, were eſteem'd Equivalent Terms.

Socrates to this Morality added Settled Principles, and reduc'd it into Method. Much has been ſaid of his *Dæmon*, which *Apuleius* calls the *God of Socrates*. Some think it was a Peculiar Spirit; Some will have it to be an Evil one, as *Tertullian* and *Lactantius*: Some an Inſtinct of Conſcience, as *Maximus* of *Tyre*: Some a Lucky Planet, as *Pomponatius*. His Diſciple *Plato* wou'd perſwade us 'twas an Inviſible Angel or Genius that was his Conſtant Guide and Director; and conſidering what Reverence this Man was in by Antiquity, 'tis probable the Evidence of *Plato* was very prevalent in Mens Opinions: But *Pere Rapin*'s Thoughts of it are moſt reaſonable, and what others often have thought on the like occaſion, tho' he was before 'em in expreſſing it. "It ſeems probable that *Socrates*'s Genius, "which conducted him in all his Actions, was "really no more than his Habitual Prudence, which "he had gain'd by his Experience of Things, and "his Reflections upon their Events, in which he "was ſeldom miſtaken." He ſuffer'd Death upon the moſt unjuſt Charge of Impiety; for that which made him ſuſpected of Irreligion was, his Deſign of ſtill reforming and purging *Pythagoras*'s Philoſophy: His Doctrine was one continu'd Leſſon of Vertue: His Morals gain'd Admittance by a ſeeming Eaſineſs and Agreeableneſs: He Eſtabliſh'd it as a Rule of Diſcourſe to treat of the moſt Serious Subjects, without an Air of too much Seriouſneſs, knowing that to pleaſe was the ſureſt Method to perſwade.

Plato ſtill improv'd upon the Draught of Morality which *Socrates* had left him; for by mixing his Idea's on the Univerſal Principle of Philoſophy thro' the whole Deſign, he carry'd each Vertue to its laſt Height and Accompliſhment. In his *Phædon* he explains the Nature of Moral Philoſophy, the great End of which is to clear the Underſtanding from the Falſhood and Obſcurity of Imagination by the help of Philoſophical Reflexion.

The Morality of this Philoſopher abounds with Good Leſſons, tending either to the Authorizing of Vertue or diſcountenance of Vice; and this Morality is diffus'd thro' his Writings. *Diogenes*, who was his Co-temporary, commenc'd a ſevere Pique againſt him, whoſe Eaſineſs and Gentility he deſign'd to expoſe by an Affectation of Rigour. The Edge of his Philoſophy was always turn'd againſt Vertue and Greatneſs: His Morals were built upon no other Foundation than a Vain Haughtineſs and Moroſeneſs of Temper; ſo that 'twas an eaſie Task for *Plato* by the Solidity of his Doctrine and the Strictneſs of his Vertue, to deſtroy the falſe Morals of the *Cynicks*. 'Twas he who firſt Rectify'd the Doctrine of the Immortality of the Soul, which, ſays *Rapin*, Socrates *learnt from* Pythagoras, Pythagoras *from the* Ægyptians, *and the* Ægyptians *from the* Hebrews, *by the Travels and Converſe of* Abraham. If this is any more than gueſs'd at, 'tis much for the Advantage of *Plato*'s Doctrine that it had ſo Divine an Original; for the *Hebrews* had it from God. We wiſh well to all the Parts of Hiſtory, favourable to that which we believe to be the Inſpiration of the moſt Holy, becauſe every Thing helps to confirm what wou'd want no ſuch mean Proofs, if the Wickedneſs and Infidelity of Mankind were not ſuch, that they are almoſt always ready to believe any thing ſooner than what is of the laſt Importance to believe. But whether the *Jews* had ſo much Credit in the World as to ſpread their Doctrine; or whether the Light of Natural Reaſon, where it ſhone ſo brightly as in *Pythagoras*, *Socrates*, and *Plato*, would not carry a Philoſophical Genius ſo far of itſelf, is what may be doubted at leaſt. We have not room here to enlarge our Reflections, however ſatisfactory it might be to our ſelves and others.

Ariſtotle form'd *Plato*'s Doctrine into a more Regular Body, not only by diſtinguiſhing the Characters of Publick and Private Vertue, the Prudence of a Civil Governour, and that of a Maſter of a Family, but by Eſtabliſhing the Two Things which make the very Life and Soul of Morality, a Laſt End or Happineſs of the means of attaining it. But nothing has ſo much advanc'd the Glory of *Ariſtotle*'s Morals as the General Polity of the World, there being ſcarce any well Regulated Government but what is founded upon this Bottom. But after all, this Moral Doctrine, as well as that of *Socrates* and *Plato*, is only capable of making a Philoſopher, and has not Strength enough to make an Honeſt Man without the Sublime Philoſophy of Chriſtianity, Morality had a fine Notion ſufficient to teach a Man to know his Duty, but not to engage him to love and embrace it. 'Tis worth obſerving what the Learned Jeſuit, to whom we ſtand ſo much indebted for what has Relation to Philoſophy, ſays upon this, *He that owes all his Vertue to his Philoſophy is Vertuous only by Force.*

The Great Principle of Morality advanc'd by *Zeno* Chief of the *Stoicks*, was to live conformably to Nature founded upon a Pretended Maxim of *Plato's* School, *That we ought to look for the Soveraign Good in Nature only, Nulla in re, niſi in Naturâ quærendum ſummum bonum.* But as this Maxim too much favour'd Senſuality, and fell in with the impudent Doctrines of *Antiſthenes* and the *Cynicks*; it ſcandaliz'd many Philoſophers, and gave them a Prejudice againſt *Zeno*; and therefore, that he might repair his Credit with the Publick, he gave a more Honeſt Turn to his Opinion in explaining this Conformity to Nature by an Agreeableneſs to Right Reaſon. But his Diſciples differently interpreted this Explication, and their Principles were generally exploded. Nothing was thought more ridiculous than their Parity of Sins, and nothing more falſe than that Tranquility grounded on an Indifference to External Good and Evil. The *Stoick*, as drawn at full Length by *Seneca* and *Epictetus*, is but an Imaginary Wiſe Man, and ſuch as the World never ſaw; and *Plutarch* proves *Zeno's* Morals to have been more Romantick than others, as being Compos'd of Specious Maxims and aſſuming Expreſſions, as *Quintilian* Phraſes it, *Stoici rebus acuti, Oratione Magnifici*; but the Vertue they profeſs is a meer Shadow, and every thing is vain in a *Stoick*, to his very Modeſty, according to a Modern Author, who adds further,

There is nothing that has a fairer Shew of Honeſty than the Moral Doctrine of *Epicurus:* It propoſes no other End but the pureſt Pleaſures of the Mind, and profeſſes only to lead Men into a State of Perfect Liberty, by curing their Weakneſſes and reſtraining their Paſſions, and veſting them with the true Character of Wiſdom: He took a Large Round the better to come at his Point, and ſalve falſe Appearances. *Gaſſendus* has made an ample Apology for the Opinion of this Philoſopher, and pretends that the Pleaſure in which he fix'd the Soveraign Good was nothing elſe but the Higheſt Tranquility of Mind, in Conjunction with the moſt perfect Health of Body; but *Tully*, *Horace*, and *Plutarch*, as well as almoſt all the Fathers of the Church, give us a very Indifferent Repreſentation. Indeed the Nature of his Pleaſure, in which the Chief Happineſs is ſuppos'd to be Seated, is a Grand Problem in *Epicurus's* Morals. Sometimes he ſpeaks like a Philoſopher, and very gravely declaims againſt the Pleaſures of Senſe. At other Times his Rigours are all ſoften'd, and he appears a very diſcreet Advocate for Debauchery. In Publick his Diſcourſes ſtill ran upon the Pleaſures of the Mind, but he knew how to change his Language among his Confidents, at eaſier Hours; and thus, ſays my Author, *We have the whole Myſtery of this Celebrated Doctrine.* We may allow that *Epicurus* had great Vertues; and that his Followers were Rational, Faithful, Commodious, and Friendly: As alſo that he himſelf was particularly Sober, yet this Sobriety was at the Bottom, according to the ſame Author, nothing but a Regimen of Health, in which the Weakneſs of his Conſtitution oblig'd him to be ſo exact, that the beſt Hours of his Life were ſpent in attending his Digeſtion. 'Tis ſaid he confin'd his Notions to that Pleaſure which Reaſon and Vertue will allow in the moſt abſtracted Spirits, yet no Man who has any Spark of Common Honeſty can bear its Inſolence in preſuming to oppoſe Religion.

Zeno's and *Epicurus's* Morals had made ſo much Noiſe, that from their Time *Ethicks* began to be more Cultivated than any other Part of Philoſophy, and Happineſs was banded about according to the Opinions, and ſometimes the Complexions and Conſtitutions of Philoſophers. *Herillus* plac'd it in Science, and *Caliphon* and *Dinomachus* in Honeſt and Lawful Pleaſure. And that *Happineſs conſiſts in Pleaſure*, is what we have ſo often heard of from a Modern Author, that we can with good Reaſon confirm *Dinomachus* and *Caliphon* have had their Diſciples ſince the Reformation. *Theophraſtus* was for mixing the Ingredient of Fortune with that of Vertue, in order to make the Compoſition of Felicity, in which he will certainly be follow'd by the Court Philoſophers. Others added other Ingredients, as Health, a very neceſſary one; for a *Stoick* wou'd have had a hard Matter to have pronounc'd himſelf happy in a good Fit of the Stone. Others put Beauty and Indolence, but theſe ſeem to have accommodated their *Ethicks* to the Beaux and Belles of their Age and ours; for 'tis not abſolutely neceſſary that a Man ſhou'd be handſome, ſtupid, or lazy, to be happy. Some were for Fame and Honour: To theſe we have nothing to ſay while 'tis ſo much for the Publick Intereſt that Men ſhou'd place Happineſs in a Reputation acquir'd by Great and Glorious Actions, as far at leaſt as Chriſtians are allow'd to place any Part of their Felicity on this Side Heaven. The *Summum Bonum* was very many Ages, the Subject of Philoſophical Controverſies. *Varro* reckons up no leſs than Two Hundred Eighty Eight different Opinions, after which the Reader will excuſe us from mentioning any more of 'em; for the Number might as well have been as unconfin'd as the Fancies of Mankind, or indeed as their Faces, as to imagine there were near Three Hundred Chiefeſt Goods.

After *Zeno* and *Epicurus*, we have no Remains of any new Draught of Morality. The Characters of *Theophraſtus* are very good Leſſons of Manners, and what will be an Eternal Mortification to the Enemies of the *Drama*, if they have any Value for Father *Rapin's* Authority, *Menander's*, *Plautus's* and *Terence's* Comedies are, as he ſays, *alſo very good Leſſons of Morality, tho' without any Principles.* He goes on with a Character of ſome Heathen Syſtems. *Tully's* Offices are founded on the ſevereſt Vertue. *Seneca's* Morals are not ſo pure and exact; *Plutarch* is more real and more in earneſt; *Pliny* has ſome bright and forcible Stroaks of Morality. *Epictetus* is the moſt Rational of all the *Stoicks*; but the Chriſtian Revelation open'd a way for ſuch Refin'd *Ethicks*, that all the Pagan Morality appear'd at once to be dark and trivial, and nothing elſe to be pure and perfect. The Brightneſs of it amaz'd even the Heathen, and the Lives of the Primitive Chriſtians were ſo ſeverely ſober, that they were conſtant Leſſons to the Pagans, and prevail'd in their Converſion equally with the Divine Truths they profeſt. This put the Heathens upon reducing their Morals to a Purer Standard, and they at laſt became ſo ſevere, to vie with the Chriſtians, that under *Antoninus* moſt of the Philoſophers joyn'd themſelves to the *Stoicks:* But all their Morality appear'd to be ſo weak, that they ſoon fell into Contempt with all ſuch as were ſeriouſly diſpos'd to the Study of Vertue and a Good Life. For beſides that, the Indifference to Pleaſure and Pain, Glory and Infamy, Wealth and Poverty, which *Zeno* pretended to teach, was never really found but under the Diſcipline of Faith. Beſides that, the Concernment and Felicity under Sufferings, which the Heathen Sages ſo much boaſted, was never made good but by Chriſtian Examples; the Sum of Philoſophical Vertue prov'd, upon a ſtrict Inquiry, to be nothing elſe but an Art of concealing Men's Vice and of flattering their Pride, becauſe the utmoſt it cou'd perform was to fill the Mind with falſe Idea's of Conſtancy and Reſolution, while the Chriſtians brought them acquainted with their real Infirmities, and taught them to reſtrain thoſe Irregular Deſires which the former Inſtitutions allow'd them to enjoy. It was the Doctrine of theſe Lights that Eſtabliſh'd the New Goſpel-Morals; and the Fathers who have been the moſt Eminent Expoſitors of this Divine Morality are, St. *Baſil*, St. *Chryſoſtom*, St. *Jerom*, St. *Ambroſe*, St. *Auſtin*. Thus far have we gone with *Pere Rapin*, but cannot name the reſt, St. *Gregory*, St. *Bernard*, and *Thomas Aquinas*, without complaining that he mix'd his Pretended *Romiſh* Fathers with the Pure Primitive Aſſertors of Chriſtian *Ethicks*. Of the Moderns, beſides *Thomas Aquinas* and St. *Bernard*, who are Moderns to the Fathers he names, *Javellus*, who next to *Aquinas* wrote the beſt on this Part of Philoſophy, and reckons *Petrarch* the *Italian* Poet among the Moral Writers. The Honour he does to our Country-man, the Lord *Verulam*, is no more than Juſtice. *There is a Nobler Spirit in* Bacon's *Moral Eſſays than in any other of his Works; every Thing there is finely thought*, &c. *Cardan*, according to him, was never more at a Loſs than about the Manners. *Deſcartes* has only touch'd upon a Moral Principle or Two; but *Puffendorf* has gone farther than any who went before him in all Parts of *Ethicks*, and from him we ſhall therefore take the greateſt Part of what follows in this Eſſay.

E*thicks* is that Art which teaches us to ſeek out thoſe Rules and Meaſures of Humane Actions that lead to True Morality and Happineſs, and which acquaints us with the Means to practiſe them.

Such is the Definition generally given of Moral Philoſophy, by ſuch as do not go ſo far in their Inquiries into it as *Puffendorf* has done, who, in treating of Morality begins with Moral Entities, "which he defines to be Certain Modes ſuperadded to Natural Things and Motions by Underſtanding Beings, chiefly for the guiding and tempering the Freedom of Voluntary Actions, and for the procuring of a Decent Regularity in the Method of Life." They are call'd Modes becauſe *Ens* or *Being* in General is conceiv'd to be more conveniently divided at large into Subſtance and Mode, than into Subſtance and Accident. The Original of Moral Entities is juſtly to be referr'd to God, who wou'd not that Men ſhou'd paſs their Life like Beaſts without Culture and without Rule, but that they and their Actions ſhould be moderated by Settled Maxims and Principles, which are not to be effected without the Application of Terms and Notions. As the Original Way of producing Natural Entities is by Creation, ſo the manner of framing Moral Entities cannot be better expreſt than by the Term of Impoſition. Since Moral Entities were Inſtituted for the Regulation of Mens Lives, 'tis neceſſary that thoſe who are to obſerve this Rule ſhou'd bear ſome ſettled Relation to one another, ſhould govern their Actions by a fix'd Method, and act with determinate Reſpect and Titles about ſuch Goods and Poſſeſſions as the Occaſions of Life require. We may hence conceive 'em to be principally inherent in Men, and in the Actions of Men, and in ſome wiſe in Things which Nature, either by her own Strength, or with the Aſſiſtance of Human Induſtry, may produce.

As the Natural Subſtances ſuppoſe ſome kind of Space in which they fix their Exiſtence, ſo Moral Perſons are ſaid to be in ſome State, which in like manner contains them. The State of Man is either Natural or Adventitious. The Natural State of Man, conſider'd with Relation to other Men, is that which affects us upon the bare Account of our Univerſal Kindred. The Adventitious State is that which obliges Men by the Authority of ſome Humane Conſtitution. Tho' every State ſuppoſes, in the Perſon whom it affects, a Reſpect and Diſpoſition towards others, inaſmuch as 'tis attended with ſome Right or Obligation, neither of which we can conceive without an Object to employ their Force upon; yet ſome kinds of States do more expreſly include and denote a Relation towards other Men, while they ſignifie the manner by which the mutual Buſineſs of Men is done. Of this ſort the moſt material are Peace and War. Peace is that State by which Men live quietly together without the Diſturbance of Violence or Injuries, and voluntarily diſcharge their mutual Duties, as matters of neceſſary Obligation. War is a State of Men mutually engag'd in offering and repelling Injuries, or endeavouring forcibly to recover their Dues.

Moral Entities fram'd with Analogy to Subſtances are call'd *Moral Perſons*, and admit of too many Diſtinctions to be mention'd in this ſhort Treatiſe. Titles are reckon'd among Moral Attributes, and are apply'd for the Diſtinction of Perſons in Civil Life, with reference to their State and Eſteem. Power is that by which a Man is enabled to do Things lawfully, and with a Moral Effect. Right is that Moral Quality by which we juſtly obtain either the Government of Perſons, or the Poſſeſſion of Things; or by the Force of which we may claim ſomewhat as due to us. An Obligation is that by which a Man is bound under a Moral Neceſſity to perform or admit, or undergo any thing.

It is very plain that all theſe Things ſhou'd be expatiated on that ſeveral Things ſhou'd intervene to make way for them, that their Brevity will render 'em a little too obſcure; but it will be alſo, we hope, as plain that we take notice of ſuch Parts only of Moral Entities as are moſt noted, and ofteneſt met with in Reading and Commerce, and have kept to the Definitions at large, farther than which we had no Room to go.

There has been ſomething ſtarted by *Ariſtotle* and others, which makes it doubtful whether Moral Philoſophy is a Science capable of that Certainty as the Mathematicks, and others which, after having explain'd the Nature of Demonſtration in General, he gives in the Affirmative, and his Reaſons will weigh with all that are capable of Conviction by Reaſon; and 'twas neceſſary he ſhou'd do ſo before, he was at ſo much Trouble upon this Knowledge in his Voluminous Tract, wherein he next treats of the Underſtanding, that Power of the Humane Soul which it bears as a Light for its Guidance and Direction, and in which; as it is concern'd about Voluntary Actions, we conceive Two Faculties; one is, that by which the Object is ſhewn to the Will with a General and Confus'd Notice, whether it be Agreeable or Diſagreeable, Good or Evil: The other is that by which the Reaſons of Good and Evil, which in ſeveral Objects offer themſelves numerouſly on both Sides, are weigh'd and compar'd, and Judgment is given when, and in what manner we are to act. The *Will* in the Soul of Man is the Internal Guide of his Actions, that the Objects being propos'd and known this Power might by an Intrinſick Principle, and without any Phyſical Neceſſity move itſelf towards them, and might chooſe that which ſeem'd moſt Agreeable and Convenient, and reject that which appear'd Unſuitable and Incommodious. There are Two Faculties of the Will, by one of which it is ſaid to act Spontaneouſly, and by the other Freely. *Volition* is that Act of the Will by which it is ſimply carry'd towards ſome End, without regard had whether the End be preſent or abſent. Intention is the Deſire efficacious towards the obtaining an End. Fruition is the Reſt or Delight of the Will in the End obtain'd: To which is oppos'd Repentance or an Averſion. Conſent is our Simple Approbation of Means as we judge 'em proper for our Work; and thoſe Means, when they are plac'd within our Reach and Power, employ the Two remaining Acts of the Will, *Eliciti* and *Imperati*. The *Eliciti* are Acts immediately produc'd by the Will, and terminated by the ſame Power. The *Imperiati* are Acts enjoyn'd, perform'd by other Humane Faculties, on the Motion and Appointment of the Will.

Liberty is a Faculty of the Will by which all Requiſites of Action being given, it may out of many propos'd Objects chuſe one or more and reject the reſt: Or if any one Object be propos'd, may admit that or not admit it, may do it or not do it. But the Chief Affection of the Will, and what ſeems immediately to flow from its Nature is an *Intrinſical Difference*, upon the Account of which it is not reſtrain'd to any certain, fix'd, and unalterable way of Acting, and which cannot be entirely extirpated by the Force of any External Means. For the Right Underſtanding of this Indifference of the Will, ſomething ought to be premis'd of the Nature of Good in General. The Nature of Good ſeems to conſiſt in that Aptitude, by which one Thing is diſpos'd to benefit, preſerve or compleat another. Now 'tis apparent that the Nature of the Will is to be always deſirous of Good in General, and always averſe to Evil in General; and therefore in this General Inclination of the Will there can be no Indifference admitted, as if it cou'd ſometimes deſire good and ſometimes evil: But they are the particular Goods and Evils which give Room for the Indifference of the Wills of particular Men, who at different Times and upon different Occaſions, are various in their Purſuits. However, it do's not fall out that the Mind maintains a kind of *Æquilibrium*, and applies itſelf to Acting or not Acting, without any Conſiderable Advantage on one Side more than on the other. Various are the Cauſes of its Tendency to one Thing more than another, as *Genius, Diſpoſition, Force, Repetition, and Cuſtom of Actions*, the *Paſſions* and *Vices*, eſpecially *Drunkenneſs*, particularly nam'd by *Puffendorf*, the more remarkable for that his Ethicks were written in the North; and that there are other Vices which have as much Power over the Will; upon which he talks with great Reaſon and Clearneſs, which cou'd not be convey'd entirely to the Reader in ſo contracted a Piece as this.

After he has treated of the Underſtanding and Will he comes to Moral Actions, which are the Voluntary Deeds of Men conſider'd in Common Life, as they include the Imputation of their Conſequences and Effects. The Formality of a Moral Action conſiſts in the *Imputativeneſs* of it, by which the Effect of a Voluntary Action may be imputed to the Agent, or eſteem'd as ſomething properly belonging to him, whether he himſelf Phyſically produc'd that Effect, or whether he caus'd it to be produc'd by others. This Imputativeneſs bears the Nature of a Poſitive Form from which, as from Spring and Root, all the Affections, Properties and Conſequences of ſuch an Action reſult. Now that a Moral Action ſhould be imputed to any Man, there can be no other Cauſe but that the Man had Power and Ability to do it and not to do it; and 'tis a Prime Maxim in Morals, That a Man is accountable for thoſe Actions, the Performance or Forbearance of which were both in his Power: But thoſe Things cannot be imputed to a Man which proceed from a Phyſical Neceſſity, or from any Cauſes plac'd beyond the Direction of Men. Neither can it be imputed to Man that Natural Cauſes produce this and no other Effect; but when this Active Force is drawn out or confounded by Man, the Effects of Natural Cauſes furniſh large Matter for Imputation. How large might this Part of Moral Philoſophy, Imputation, be, if we had room to particularize what may, and what may not be imputed to Man? Bnt it will not be expected from us in this Eſſay; and the greater Number of thoſe Imputative Things or Non-Imputative, are to be reduc'd under the before mention'd Obſervations, and brought to this Conſideration, Whether ſuch Things were or were not in his Power, or were or were not dependent or independent of him.

We come now to one of the moſt Important Branches, the Rule of Moral Actions; and this Rule or Law muſt be accurately diſtinguiſh'd from ſome other Things which ſeem to bear ſome Relation to it, and theſe are *Counſel*, *Covenant*, and *Right*. Now Law differs from Counſel in this, that by the latter a Man endeavours, with Reaſons taken from the Nature of the Thing to induce another Perſon to ſome Performance or Omiſſion, over which Perſon at leaſt, as to the preſent Buſineſs, he has no proper Power, ſo as that he can lay no direct Obligation on him, but muſt leave it to his Pleaſure and Choice, whether he will follow the Counſel or not. The Ancients are condemn'd by *Puffendorf*, for applying to Laws the Name of *Common Agreements.* For beſides that, neither the Divine Poſitive Laws, nor the Laws of Nature had their Riſe from the Agreement of Men, and therefore that Title can only be attributed to Civil Laws; even theſe are not properly Covenants and Agreements, tho' there was **Indeed ſome Intervention of Compact at the Original of Civil Law**, to uſe *Puffendorfs's* own Words, as they are faithfully tranſlated. A Compact is a Promiſe, but a Law a Command; a ſhort, but plain Mark of the difference between Laws and Covenants. As for the Term of Right, as it imports a Power of Acting, granted or left free by Laws, we muſt take care not to let it paſs for the ſame thing as the Law it ſelf. Right denotes a Liberty, but Law includes ſome Bond and Engagement, by which our Natural Liberty is reſtrain'd. A Law may conveniently enough be defin'd to be *A Decree by which a Sovereign obliges a Subject to conform his Actions to what he Preſcribes.* Law may be beſt divided with reference to its Original, into Divine and Humane; the former having God, the latter Man for its Author. But 'tis alſo divided into Natural and Poſitive; Poſitive Law is that which flows from the ſole Pleaſure of the Law giver; the Natural Law is that which is exactly fitted to ſuit with the Rational and Social Nature of Man, ſo that Humane Kind cannot maintain an honeſt and peaceful Fellowſhip without it. As to the various Obligations of Men to ſubmit to theſe Laws, how uſeful ſoever it would be to touch upon them all, we cannot do it unleſs we would ſwell this Eſſay to a Bulk, which would not ſuit with that of the others, ſo we are oblig'd to paſs them over, and proceed to conſider

The Qualities of Moral Actions; according to which, Actions are ſaid to be *Neceſſary*, when, by Virtue of the Law or the Command of a Superior, the Perſon to whom the Law or the Command is given, is bound abſolutely to perform them. Oppos'd to theſe are *Forbidden* Actions, expreſly prohibited by the Laws or Orders of the Superior. And lawful or allow'd Actions, neither commanded nor forbidden by the Laws, but left to every Man's Pleaſure. Actions morally good, are ſuch as are agreeable to the Law, and morally evil, as are diſgreeable. This *Goodneſs* and this *Evil* of Actions as they conſiſt formally in ſuch an Agreeableneſs or Diſagreeableneſs to the Law, as we have been ſpeaking of, ſo they depend entirely on him, as their Efficient Cauſe, who performs an Action, which the Law either Commands or Forbids. The Juſtice of Actions differs from their Goodneſs chiefly in this, that Goodneſs barely denotes Conformity to the Law, but Juſtice further includes a Reſpect to thoſe Perſons towards whom the Action is perform'd. Next comes the Quantity of Moral Actions, or to conſider on what account they fall under different Rates and Meaſures; and then the Imputation of Moral Actions, or to ſee how and by what means they may be actually imputed, ſo as to produce ſome Moral Effect in the Agent, or ſome other Man; and herein might be conſider'd Imputation of Favour and Debt; what Merit is, and how the Effects of Moral Actions are revers'd or diſanull'd, but for the Reaſons ſo often hinted, we muſt deny our ſelves and the Reader that Satiſfaction. True it is, without going farther into Ethicks, the Gentleman who looks into this Book, will know but little of the Matter *here*, but we will endeavour that what he does know, ſhall be faithful and clear, and give ſuch an inſight into it, that it may ſerve for more than Recreation, if he is diſpos'd to make more of it, otherwiſe he will ſoon be turning to other Parts more conformable to the Gaiety and Eaſe of a Gentleman's Life.

Mr. *Puffendorf* is at a great deal of Pains to prove that 'tis not in the Nature of Man to live without Law. Abſolute Liberty would be ſo far from being uſeful, that it would be deſtructive to Humane Nature, and therefore the binding and reſtraining it with good Laws is highly conducive to the Good and Safety of Mankind. An Univerſal Liberty, void of all Hindrance and all Defect, is applicable to God only. The Liberty of Brutes, which ſeem to be more abſolute than that of Man, is treated of by this great Author; and the Superiority of Man's State, even by the Reſtraint of Laws, aſſerted and prov'd, which leads him to

The Natural State of Man. And by the Natural State of Man he does not mean that Condition which is ultimately deſign'd him by Nature as the moſt perfect and the moſt agreeable, but ſuch a State as we may conceive Man to be plac'd in by his bare Nativity, abſtracting from all the Rules and Inſtitutions, whether of Humane Invention, or of the Suggeſtion and Revelation of Heaven. As to the Miſeries and Inconveniencies of ſuch a State, they are too many to find a Place in our Brevity; and what kind of Rights attend Men in a State of Nature, we may eaſily gather, as well from that Inclination common to all living Things, by which they cannot but embrace and practice with the greateſt Readineſs and Vigour all poſſible ways of preſerving their Body and their Life, and of overcoming all ſuch Things as ſeem to drive at their Deſtruction, as from this other Conſideration, that Perſons living in ſuch a State, are not ſubject to any Sovereignty or Command. For from the former Reflection it follows, that Men plac'd after this manner in a Natural State, may uſe and enjoy the common Goods and Bleſſings, and may act and purſue whatever makes for their own Preſervation, while they do not injure the Rights of the reſt. We are ready to own, that all Mankind did never exiſt together in a meer Natural State. *Eve*, 'tis plain, was ſubject to *Adam*, and their Children to Paternal Authority; which Subjection deſcended to ſucceeding Generations. A State of Nature did never exiſt, unleſs qualify'd, and as it were in part, as when ſome Party of Men joyn'd with ſome more in a Civil Body, or in ſome Confederacy like that, but ſtill retain'd a Natural Liberty againſt all others. Mr. *Hobbs*, who makes this Natural State to be a State of War, is fully anſwer'd by this learned Author, who proves that Right Reaſon ought not to be baniſh'd from the Conſideration of a State of Nature, and ſhews that the Manners and Rights of barbarous Countries do not conſtitute a State of Nature. That Natural Peace requires not the Intervention of Covenants, but he is oblig'd to confeſs that ſuch a Natural Peace is too full of Suſpicion and Uncertainty.

Of the Law of Nature in general, ſomething more muſt be ſaid, it being a very important Obligation on Mankind, which few, very few know much of. This Law, is that moſt General and Univerſal Rule of Humane Actions, to which every Man is oblig'd to Conform, as he is a Reaſonable Creature. It binds the whole Body of Humane Race, and is not ſubject to change, which is the diſadvantage of Poſitive Laws. The Ancients pretended that Beaſts had this Law in common with Men, which Notion is now diſcarded, becauſe 'tis impoſſible to conceive how a Creature ſhould be capable of Law, and at the ſame time incapable of Reaſon. Thoſe Authors who ſearch for the Law of Nature in God himſelf, are divided into two Parties; for ſome placing the Spring of it as it were in the Divine Will, conclude thence, that in as much as that Will is in the higheſt manner free, the Law of Nature may therefore be chang'd by God. Others affirm this Natural Law to be founded after ſuch a manner in the Eſſential Juſtice of God, as to expreſs a kind of Image of his Attributes; and hence ſay they, proceeds the Immutability of the Law of Nature. That God will alter this Law is not to be imagin'd, for many Reaſons too long to be inſerted here. Neither does Mr. *Puffendorf* allow of the ſecond Opinion. And from this Conſideration among others, that we ought not to admit any Law common both to God and Man. Thoſe who found the Law of Nature on the Conſent of Mankind in general, produce Arguments which are very ſlippery and uncertain. He ſhews how near it is to Impoſſibility, that ſuch a Conſent ſhould ever be procur'd, and the Inſtances of the vaſt difference between the Laws and Cuſtoms of Nations, are not one of his leaſt weighty Reaſons. That being lawful in one, which was highly criminal in another Religion. In one Pious, which in another was Impious, from whence ſome conclude there's no Natural Law, which is anſwer'd with the ſame Succeſs as other Objections meet with from this Philoſopher. *Actions*, ſays he, *perform'd in Conformity to the Law of Nature, have a double Excellency, not being only honeſt that is conducive to the increaſe of the Honour and good Credit of Men, but alſo uſeful or profitable, promoting their Intereſt and Advantage, and contributing largely to their Happineſs.* 'Tis by moſt agreed, that the Law of Nature is to be drawn from Man's Reaſon, flowing from the true Current of that Faculty when unperverted, on which account the Holy Scriptures declare it to be written in the Hearts of Men. But that the general Principles of the Law of Nature are *Innate*, neither this Author nor the Right Reverend Father in God Doctor *Cumberland* think neceſſary, and their Arguments are unanſwerable. The former tells us there ſeems no way ſo directly leading to the Diſcovery of the Law of Nature, as the accurate Contemplation of our Natural Condition and Propenſity. But there is a neceſſity of ſuppoſing, what no Man in his Senſes will deny, that there is a God, and that his Wiſe Providence Overſees and Governs the whole World, and in a particular manner the Lives and Affairs of Mankind. For the Philoſopher declares that the Obligation of Natural Law proceeds from God himſelf, who, by Virtue of his Sovereignty, has bound Man to the Obſervation of it; for the Supream Being having ſo form'd and diſpos'd the Nature of Things and Mankind, as to make a ſociable Life, neceſſary to our Subſiſtence and Preſervation; and having on this account endu'd us with a Mind capable of Entertaining ſuch Notions as conduce to this End, and having inſinuated theſe Notions into our Underſtandings by the Movement of Natural Things, deriv'd from him the firſt Mover; and alſo moſt clearly repreſented to us their neceſſary Connexion and their Truth, hence it follows, that 'tis the Will of God, Man ſhould frame his Life according to that Diſpoſition and Method which he ſeems peculiarly to have aſſign'd him, above the Life of Brutes. And ſince this cannot otherwiſe be compaſs'd than by the Obſervance of the Natural Law, it muſt be ſuppos'd God has laid an Obligation on Man to obey this Law. The wiſeſt of the old Heathens acknowledg'd the Authority of the Law of Nature, and deriv'd it rightly from God. *Plutarch* ſays, *To follow God and obey Reaſon is the ſame thing*; and *Tully* is large on this Argument in his Books *de Republicâ*. As to the matter of the Law of Nature, that in obeying Reaſon we promote as much as in us lies the Safety, Preſervation, and Happineſs of our ſelves and Fellow-Creatures, to enter into the Particulars of ſo Copious a Subject, would be too tedious in ſo Conciſe an Eſſay.

The Law of Nations is the next thing to be treated of, and if we are a little longer on this Head than the others 'twill be excus'd, becauſe we ſeem to be great Strangers to this Rule in Ethicks. When the Czar's Ambaſſador was lately Arreſted, contrary to this ſacred Law, who was there that did not in the praiſe of our Common Law ſeem to vindicate an Affront offer'd to the moſt ſacred of Laws, without which the Band of Society would be broken, and Ruin and Slaughter over-run the World? We have ſeen how the Law of Nature ought to be rever'd; and ſince moſt Philoſophers make no difference between that Law and the Law of Nations, all that has been ſaid for the Sanction of the one ſerves for the other. *Puffendorf* agrees in a great meaſure with *Hobbs* in this. Under the Title of the Law of Nations are many Things rank'd, we ſhall only hint the moſt material. As ſeveral Cuſtoms mutually obſerv'd by Tacite Conſent among moſt People pretending to be out of a State of Barbariſm, eſpecially in the Affairs of War; but in this *Puffendorf* diſtinguiſhes the Law of Nature from the Law of Nations, for by the Law of Nature, whoever wages a juſt War may ſlight theſe Formalities at pleaſure, unleſs he thinks it more for his Intereſt to obſerve them, as a means to render the Enemy leſs ſevere towards himſelf and his Men. Now, as to Ambaſſadors, take *Puffendorf*'s own Words, "The Perſons of Ambaſſadors are Sacred and Inviolable, even among Enemies, by the meer Law of Nature, provided they do not come purely as Spies, nor enter on any Hoſtile Deſign againſt the Perſon to whom they are ſent. Though in the ordinary Courſe of Buſineſs and Treaties, they preferr their Maſter's Intereſt to all others. For in as much as ſuch Perſons are neceſſary for the procuring, the preſerving, or ſtrengthening of Peace by Leagues and Covenants; and ſince the Law of Nature enjoyns us to embrace Peace by all honeſt Ways, it muſt

“ at the ſame time be ſuppos'd to have provided for the Security of thoſe Men, without whoſe Intervention this good End cannot be obtain'd. To this Right of Perſonal Safety is joyn'd another of being exempted from the Juriſdiction of the Sovereign to whom they are ſent.” This is enough to prove that all ſuch as ſhall at any time inſult an Ambaſſador's Perſon are to be look'd upon as Violaters of the Law of Nations, and conſequently of Nature; which Law being written in our Hearts by God himſelf, is infinitely more Sacred than all Laws, Ordinances, and eſpecially *Cuſtoms*. For narrow muſt be the Spirit of that Nation, that would have their particular and fallible Uſages preferr'd to this general, eternal, and infallible Rule.

We ſhould now diſcourſe of the Duties and Performances of Man towards himſelf, as well in regard to the Improvement of the Mind, as to the Care of his Body and Life. And herein we find the Culture of the Mind is in the firſt place aſſerted and prov'd to be a neceſſary Duty; that it ought firſt to be inſtructed in Religion, and all contrary Opinions extirpated, which is the principal Care; and then the main Concern is for a Man accurately to examine his own Nature, and to ſtudy to know himſelf. From this Knowledge it follows, that a Man muſt apprehend his Subjection to Almighty God, and the Obligation that lies upon him, according to the meaſure of the Gift he has receiv'd, both to Celebrate the Divine Majeſty, and ſhew himſelf a ſociable Creature in his Tranſactions with his Fellows. A Man by ſtudying his own Strength, will ſoon diſcover 'tis of a finite Nature, and look higher for Support and Aſſiſtance. He will learn alſo not to attempt things that are not within his finite Capacity, and know how to govern himſelf in the Purſuit of the beſt worldly Enjoyments, which we might have call'd moral Enjoyments, and have kept more to our Title, eſpecially if he conſiders what our Author recommends to him, on ſeveral of them, as,

Firſt, Concerning Fame, which is ſo far to be purſu'd, as it redounds from worthy Actions, agreeable to Reaſon, and promoting the Good of Humane Society, and as it opens a wider Field for ſuch generous Undertakings. *Eſteem*, which ſimply ſo call'd, is the bare good Opinion of good Men, which flows from the Obſervance of the Law of Nature, and our Duty; and we ought, as far as in us lies, to endeavour to procure and preſerve it, becauſe the want of it may lay open an occaſion to a thouſand Miſchiefs and Inconveniences. *Riches* are alſo an Object of our Induſtry, and we may take hold of all Opportunities conſiſtent with our Strength and Honeſty to acquire them: But the Mind ought to be put into ſo even a Temper as not to loſe it ſelf, if it ſhould happen to loſe them. *Expences* are to be manag'd with ſuch Moderation, that we may moſt willingly undertake thoſe our Duty requires of us, but not waſte our Fortune at a venture, without Neceſſity and Reaſon. Pain is what Reaſon permits us and adviſes us to avoid, to the utmoſt of our Power, and all unneceſſary Trouble and Diſquiet; That we ſhould not only endeavour to keep our ſelves free from Grief and Care, but likewiſe entertain our ſelves with ſuch Objects as are agreeable and delightful to them, which is term'd *Pleaſure*. 'Tis very rational for us to allow our ſelves the moderate Taſte of lawful Pleaſures, without ſuffering them to over-whelm us. But this is to be fix'd as an inviolable Rule, that no Pleaſure muſt be purchas'd at ſo dear a Rate, as the Neglect or Tranſgreſſion of our Duty. The *Paſſions* muſt be kept under the Government of Reaſon; for the greateſt part of 'em do not only impair the Health of the Body, and the Vigour of the Soul, but caſts ſuch a Cloud over the Underſtanding, as to wreſt it violently from the ways of Reaſon and Duty. It cannot be thought tedious to give the Characters of them in a few words from the before-mention'd Philoſopher. *Joy* is of all Paſſions moſt agreeable to Nature, but care muſt be taken that it does not break out on improper Occaſions, as on other Mens misfortunes. *Sorrow* is a Canker that waſtes the Body and Mind, and not to be encourag'd, unleſs for the Misfortunes and Deaths of others, as or the great Work of Repentance. *Love* is a friendly Motion to Mankind, but muſt not be thrown away on an ill Object, nor procure baſe and unworthy Fuel to its Flames, nor hinder the Exerciſe of other Duties, nor degenerate into Diſquiet and Diſeaſe. *Hatred* is pernicious, as well to the Perſon who employs it, as to him againſt whom it is employ'd. If ſome Perſons deſerve our Averſion, 'tis folly to create Uneaſineſs to our ſelves on their Account. *Envy* is a deform'd Monſter, ſometimes producing ill Effects in others, but always in the envious Perſon. *Hope*, tho' a more eaſy and mild Paſſion than others, muſt not aim at Things vain and uncertain, or beyond its ſtrength and reach. *Fear*, as it is a dangerous Enemy to Humane Minds, ſo it is a Motion uſeleſs and unſerviceable. *Anger* is a moſt deſtructive, as well as a moſt violent Paſſion; and nearly related to it is the *Deſire* of *Revenge*, which when it exceeds a moderate Defence of our ſelves and our Dependants and Concerns, and a juſt Aſſertion of our Rights againſt the Invaders of them, turns to Vice, and is, with Anger, to be carefully avoided.

Having gone thus far towards the Culture of the Mind, we come now to Learning, the Benefits of which we would hope are not to be Taught now in one of the moſt learned Countries of the World. The Philoſopher takes it almoſt for univerſally granted, that Learning is one of the chiefeſt Improvements of the Mind, and proceeds to divide it into three kinds, as uſeful Learning, ſuch as Morality, Phyſicks and Mathematicks. Elegant and Curious, as Hiſtory, Criticiſm, Poetry, and Oratory. And vain and inſignificant Learning, among which *Puffendorf* places the School-Learning, which *Rapin* has been at the Pains to commend; and 'tis not a little Satisfaction to us, to find that ſo great a Philoſopher ſhould confirm what has been ſaid of it in the preceding Chapter, with reference to the Service the School-men did Popery. For ſpeaking of 'em, he ſays, *'Tis the manifeſt Intereſt of the Papal Monarchy to keep Mens Heads on Trifles, for fear they ſhould make ſome very dangerous Diſcoveries.*

The Care of the Body is as well a Duty as that of the Mind; and under this Care comes the Conſideration of our Health and Strength, which we ought to preſerve to the utmoſt, by avoiding Gluttony, Drunkenneſs, and the immoderate Uſe of

Women, &c. In this Treatiſe of Ethicks we might with the Original diſcourſe of the Uſe of Life, and examine whether we lie under any Obligation to preſerve our Lives; how far Life may be ſpent for the Advantage of others; and how far expos'd to reſcue others from Danger; but we are too much confin'd in Room, and on thoſe Heads muſt refer the Inquiſitive to the Original itſelf. As to Self-Murther, he denies that Man has Abſolute Power over his own Life. But what ſignifies Reaſons and Arguments to prove what is ſo very plain. Can any one think that a Self-Murtherer deliberates with himſelf as to the Legality or Illegality of the Crimes he is about to Commit? Is a Man in ſuch a Diſpoſition capable of Arguments and Reaſon? Will they weigh with him in his Frenzy? and out of it ſure there's no Reaſonable Creature can imagine 'tis Lawful for a Man to terminate a Being given him by God for the Diſcharge of ſo many Excellent Duties. Tho' he has largely treated of Self-Defence, which one wou'd think is ſo well and is really ſo ill underſtood, yet we muſt for our uſual Reaſon content our ſelves with ſome Hints only.

Self-Defence may be undertaken two ways, either without hurting him who deſigns the Miſchief againſt us, or elſe by hurting and deſtroying him; but whether the latter be an obligatory and neceſſary Duty is not eaſy to be determin'd, and *Puffendorf* ſeems to be more againſt it than for it. And in Caſes of Injury a Wiſe Man ought to try all Expedients before he proceeds to Arms: For inaſmuch as all Combat and forcible Contention is of uncertain Iſſue, it wou'd be adviſeable firſt to make Experiment of ſafer Remedies. If I can cut off an Invader's Acceſs to me, I'm a Fool to meet him. If I could defend my ſelf with a Wall, 'twould be abſurd to expoſe my Breaſt. Thoſe who live under the ſame Government ought to be ſo moderate in the Uſe of *Violent Self-Defence*, as never to have recourſe to it but when Time and Place will not admit 'em to apply to the *Magiſtrate*. A Perſon aſſaulting another by Miſtake, without any Evil Deſign againſt the Man he aſſaults, the Perſon aſſaulted may kill him; for tho' there was an Error in the Perſon there was no Error in the Deſign: And the Common Determination, That the killing a Man in our own Defence is then only innocent, *when we cannot poſſibly eſcape the danger by other means*, is not to be interpreted in too ſtrict a Senſe, it admitting of a reaſonable Latitude on Account of that Perturbation of Mind which ariſes from ſo Surprizing and Imminent a Miſchief. We have, eſpecially ſince the Swarming of the Soldiery, introduc'd ſuch fine Notions of Honour, with reſpect to Duels, that it will not be improper to obſerve under what Acceptation they ſtand in Morality, which is certainly as Good a Judge of Reaſon and Honour, as Vanity, Inſolence, and Debauchery.

In might be obſerv'd on this Head, ſays our Author, *That the Plea of Self-Defence ſhall not Excuſe or Indemnifie him, who being challeng'd to meet in the way of Duel, do's by ſo appearing, put himſelf into ſuch a Condition that he muſt either kill or be kill'd; for in the Eſtimation of ſuch a Fact, the Danger will not be conſider'd ſince the Laws forbad him to meet it; and therefore he will not only be guilty of Homicide, but will ſtand obnoxious to thoſe other Penalties which are particularly ordain'd againſt the Cuſtom of Duelling.* And ſpeaking of Affronts, *as a Box of the Ear*, he adds; *Nor is the Vulgar Notion of any Weight which fancies the Courage of Men, and eſpecially of Soldiers, to be endamag'd in its Character by the receiving theſe kinds of Affronts: And that therefore Credit muſt be vindicated by Sword or Duel: for that Man ſhews ſufficient Teſtimonies of his Courage, who bravely maintains and diſcharges the Office aſſign'd him by the State. And there are more noble and more ſhining Occaſions of Exerciſing Valour, than contrary to the Laws of Reaſon and our Country, to purſue an immoderate Paſſion, or to engage in the Hazard of an unneceſſary and unprofitable Combat.* Againſt all this Reaſon and Morality, nothing is ever urg'd by Bravo's, for what other Name do they deſerve, but *Honour*. Now the Honour of a Man who values not the Purity of Body or Mind, of a Man who is every Day diſhonouring Common Honeſty and Vertue; the Honour of ſuch a one is a Dream, a Vapour which aſcends into his Head with the Fumes of the Bottle, and is no more worth defending than the Strumpet for whom this Duel is often occaſion'd. Thoſe who are not quite ſo rampant in their Morals, and yet give into this Weakneſs, muſt be well ſtockt with Vanity, but much more with Ignorance. As to the Defence of Chaſtity, of Perſon and Goods againſt Night-Thieves, and the like, 'tis very plain how a Philoſopher will determine the Matter as to its Guilt or Innocence, ſo we ſhall ſay no more on this Article but go on.

The Right and Favour of Neceſſity are of much larger Extent than ſome may at firſt imagine, and our Learned Author has gone thro' them, but we are forbid to follow him by our General Conſtraint, or elſe we might with him have obſerv'd of how many Kinds Neceſſity is, on what Principle the Right and Favour of Neceſſity are grounded, what Degree of Power and Right is hence convey'd to us either over our ſelves or over others *directly*, what is *indirectly* indulg'd by the ſame Principle, what Power we obtain from hence over the Things or Goods of others, what Freedom we may be allow'd to uſe with the Goods of others for the Preſervation of our own; all which are at large handled in this Treatiſe of the Law of Nature and Nations, to which we muſt again referr the Reader.

We come now to the Natural Precepts which contain the Duties we are to practiſe towards other Men, having already taken Notice of thoſe a Man is enjoyn'd to exerciſe towards himſelf; and the Firſt Precept is, *That no Man hurt another, and that in Caſe of any Damage done by him he fail not to make Reparation.* The Word *Damage*, which ſeems properly to refer only to Goods and Poſſeſſions, is here us'd in an extended Senſe, ſo as to make it take in all manner of Harm that may be offer'd to a Man's Body, his Chaſtity, or his Good Name. In Stating who are the Eſteem'd Authors of Damage, we muſt have recourſe to *Imputative* Actions, of which we have taken ſome Notice, but were forc'd to abridge our ſelves in that Place as well as others, and cannot here enter far into them. A Perſon may damnifie his Neighbour, not only immediately by himſelf but likewiſe by the Miniſtry of others. And farther, a Damage immediately done by one Man may be Chargeable upon another, (who is conſequently oblig'd to make Reparation) inaſmuch as he contributed ſomewhat to the Action either by doing what he ought not, not by omitting what he ought to have done; where therefore many Perſons have concurr'd to one Act of Damage, this Order ſhall be obſerv'd in making Reparation. Thoſe ſhall be in the firſt place Chargeable, who ſet forwards the Miſchief either by their Commands or by ſome other Powerful Means, amounting almoſt to a neceſſary Influence; and the immediate Actor of the Crime, or he who was thus forc'd to Lend his Hands for its Performance, ſhall in theſe Caſes be eſteem'd only as the Inſtrument. We muſt break off here too, tho' 'tis very neceſſary, in order to aſcertain the Meaſures of Guilt as to Damage, to proceed in it farther. Whenever we hurt or endamage another, we do it either out of full Purpoſe, or a Fault of Negligence, or by Chance. The Firſt is certainly bound to make Reparation to the full Value of the Wrong. The Second too is deem'd Reſponſible, but the Third not. Thieves muſt reſtore, notwithſtanding Puniſhment; and other Criminals and Damnifyers might be nam'd, if we did not conſider this Eſſay is not deſign'd for Lawyers and Civilians, but for Gentlemen.

The next Thing our Author advances is, That all Men by Nature are to be accounted equal. Some reſtrain this Equality to a Parity of Strength, as Mr. *Hobbs*, which is anſwer'd in the Treatiſe that has been our Guide hitherto, and will be to the End of this Eſſay. The Equality of Right is what he means by it; and the Principle from which that Equality ſprings is this, That the Obligation to a Social Life equally binds all Men, inaſmuch as it is the Inſeparable Companion of Humane Nature, conſider'd ſimply as ſuch. We might add further; Our Bodies are all Compos'd of the ſame Matter: We owe our Exiſtence to the ſame Method of Propagation; Our Growth and Nouriſhment are perform'd alike: Our Death and the Corruption of our Bodies are the ſame, which indeed reduces all Men to a Great Parity, from whence flow ſeveral Precepts: we ſhall only name the Chief. From hence it is manifeſt, That he who wou'd uſe the Aſſiſtance of others, ought as freely to be at their Service when they want his Help on the like Occaſions; for he muſt certainly eſteem others unequal to himſelf, who conſtantly demands their Aid, and as conſtantly denies his own. This Equality teaches a Man how to carry himſelf in caſe he be appointed Arbitrator of any Right betwixt others, to treat them as Equals, and give no Favour or Indulgence to one above the reſt, except ſuch as he can Claim by Virtue of ſome Peculiar Right. This Rule is tranſgreſs'd by Pride, when a Man, for no Reaſon, or without ſufficient Reaſon, preferrs himſelf to others; as alſo to ſhew his Contempt of others by outward and open Signs.

Beſides the ſeveral Things that are forbidden by the Rules of Morality, there are ſeveral enjoyn'd; Every Man is oblig'd to promote the Good of another, either indefinitely and abſolutely, or definitely and relatively; we ſhall only relate what *Puffendorf* terms the Vulgar Degrees of Humanity, the Omiſſion of which implies a moſt Baſe and Abject Mind. As in what relates to Paſſage thro' others Grounds, either to Perſons or Goods; Whether an Impoſt or Duty may be laid on Paſſage what concerns Acceſs to a Foreign Shoar, the Admiſſion of Strangers, the Granting them a Seat and Habitation, the Allowing a Mart, whether we are oblig'd to Buy of others, what relates to Marriage with Strangers; whether what is Granted in Common to all may be particularly with-held from one. Theſe he has ſeverally enlarg'd on; but, as 'tis further from the Degrees of Humanity, which Gentlemen will find often Occaſion to exerciſe, than what follows, ſo we ſhall ſay no more of them, that we may have the more room to enlarge a little on *Beneficence*, *Gratitude* and *Ingratitude*. *Beneficence* is the higheſt and moſt illuſtrious Strain of Humanity, when a Man out of pure Inclination ariſing either from a Native Generoſity of Soul, or from Pity and Compaſſion to a Perſon in Diſtreſs, is at ſome Pains or Charge in beſtowing freely upon another what may relieve his Neceſſity, or promote his Advantage. The Vertue anſwering to Beneficence in the Giver, is *Gratitude* in the Receiver, by which he demonſtrates that the Kindneſs was acceptable to him, and upon this Score entertains a hearty Reſpect for the Author of it, ſeeking all Occaſions of making a Requital. *Ingratitude*, tho' it does not imply a real Injury, yet generally paſſes for a Vice more foul than Injuſtice; for 'tis lookt upon as an Argument of a moſt Abject and Degenerate Soul for a Man to declare himſelf unworthy of the fair Opinion which another entertain'd of his Honeſty, to be Proof againſt Benefits, and conſequently paſt all Senſe of Humanity.

We are in the next Place to treat of the Duties of keeping Faith, and the Diviſion of Obligations. Many are the Reaſons why in order that the True Fruits of a Social Nature, and that the mutual Offices of Mankind, may be Practis'd with the more Frequency and more Regularity, it was neceſſary for Men to Bargain and Agree among themſelves, that they wou'd perform to each other ſuch and ſuch Services as they cou'd not be abſolutely ſecure of by the Law of Humanity. And when Men once have engag'd themſelves by Pacts, their Nature obliges 'em as Sociable Creatures, moſt religiouſly to obſerve and perform them: But, inaſmuch as Pacts and Covenants, thoſe eſpecially which are expreſs'd, do impoſe an Obligation on us which Nature did not before enjoyn, at leaſt not in ſo preciſe and determinate a manner, there are ſeveral ſorts of thoſe Obligations upon us to perform them, as *Connate* Obligations, which are ſuch as all Men fall under, by Virtue of their being Creatures endu'd with Reaſon, or ſuch as neceſſarily attend and accompany the *Rational Nature*, conſider'd in that Simple and General Notion. Adventitious Obligations are ſuch as fall upon Men by the Intervention of Humane Deeds, not without the Conſent of the Parties, either expreſs, or at leaſt Preſumptive. The moſt Eminent is that which lies in all Men, with reſpect to God's Commandments and Laws. Whoever breaks this Obligation ſtands guilty of the moſt Heinous Charge of Atheiſm. Obligations may be again divided into Natural and Civil. By Natural Obligations are meant ſuch as bind only by Virtue of the Law of Nature; and by Civil Obligation ſuch as is ſupported and aſſiſted by Civil Laws and by Civil Power,

Power. They may again be divided into Temporary and Perpetual. The Perpetual is that which cannot be taken off as long as the Perſon exiſts in whom it adheres. Such are our Obligations towards God and towards our Neighbour. Temporary are ſuch as may ceaſe while the Perſons in whom they inhere do exiſt. Much more might be added on this as well as on other Articles. As to Adventitious Obligations, Promiſes and Pacts in General are the moſt Eminent. A Perfect Promiſe is when a Man not only determines his Will to the Performance of ſuch or ſuch a Thing for another hereafter; but alſo ſhews that he gives the other a Full Right of Challenging or requiring it from him. Bare Aſſertions are not to be an Obligation; neither do Expreſſions in the future transfer a Right.

Conſent is always neceſſary in making Pacts and Promiſes, and muſt be ſignify'd either expreſly or tacitly, by ſuch as have the Uſe of Reaſon, which is ſuſpended by the higher Degrees of Drunkenneſs. Minority and Force invalidate Promiſes, and ſeveral other Cauſes mention'd at large by our Author.

Obligations lie only to Things Poſſible; wherefore Promiſes about Impoſſible Things are null, when the Thing, at the Time of making the Pact, appear'd Poſſible, and afterwards becomes Impoſſible, if it happen'd by Chance the Pact is diſannull'd. To make a Pact truly obligatory, 'tis requiſite we have a Moral Power of performing the Thing agreed upon; and if the Thing be unlawful, and we conſequently want this Power, we cannot tie our ſelves by any ſuch Engagement.

We come now to the Conditions of Promiſes. A Condition is an Appendage added to ſuch Acts as are Productive of Rights and Obligations, by Virtue of which their whole Force and Efficacy are made to depend on ſome Particular Event, proceeding either from Fortune or Humane Pleaſure; ſo that to the True Nature of a Condition, theſe Two Things are requiſite: Firſt, That it have the Power of deferring and ſuſpending the Force of the Obligation; and Secondly, That the Event expreſt in it do not yet appear, at leaſt that it be at preſent uncertain as to our Underſtanding.

If we follow'd our Original Step by Step, we ſhould now treat of Agents concern'd in Contracting Obligations for other Men: But we muſt come off of that by the ſame Excuſe that we have come off of other Things. The greateſt Part of what remains in this Excellent Moral Tract relates to the Civil Law in a particular manner; and tho' it has alſo relation to Ethicks, yet we think we ſhall be excus'd for not entring upon Oaths, the Power of Mankind over Things, of the Origin of Dominion or Property, of the Object of Property, of Occupancy, of Acceſſions or Additional Improvements, of the Right over other Mens Poſſeſſions, of Transferring, of Property in General, of Wills and Teſtaments, of Succeſſion to Perſons who die Inteſtate, of Preſcription, of the Obligations which flow immediately from Property, of Price, of Contracts in General that preſuppoſe the Price of Things, concerning the Equality that ought to be obſerv'd in Chargeable Contracts, of Gainful, Contracts in Particular, of Chargeable Contracts in Particular; and of Bartering, Buying and Selling, of Renting and Hiring, of the Loan of a Conſumeable Commodity, of Partnerſhip, of Contracts that depend upon Chance, of Acceſſory Pacts, by what means Obligations founded upon Compact may be diſſolv'd, of Interpretation, of the way of deciding Controverſies in the Liberty of Nature. Let it not be wonder'd at how we came to ſay ſo little on ſo Copious a Subject, but rather, how we ſaid ſo much in ſo little Room. Whoever has the Curioſity or Occaſion to inquire into any of the Heads which we have omitted, *Puffendorf* will give him Perfect Satisfaction. There remain Two Branches of Moral Philoſophy to be handled, *viz.* Oeconomicks and Politicks, which we ſhall undertake to treat of from the ſame Author without leaving him once, but where we give the Reader notice of it.

Oeconomicks is not touch'd upon by him particularly: They teach a Man to Rule and Govern his Family, as a Husband, a Father, a Maſter; and every one of theſe have their particular Duties or Obligations, as Conjugal, Paternal, and Magiſterial. The Obligations of a Wife, Children and Servants are alſo Parallel to theſe, and are comprehended in Love and Obedience. As the Maſter of the Family's Duty is in Love and Care of providing for them, according to their ſeveral Capacities or Qualifications: For the Duty of the Maſter of the Family is one Thing towards his Wife, another towards his Children, and ſtill different from them both towards his Servants. The ſeveral Duties of the Wife, Children and Servants are diſtinct and ſeveral in regard of their Relation to him. The Firſt State Mr. *Puffendorf* treats of is that of

Matrimony, which being the Source of Private Families, does conſequently ſupply Matter for the Compoſing of all Sovereignties and States. In this, after having aſſerted the Neceſſity of Marriage, and prov'd the Inconveniences attending Licentious Amours to the Propagation of Mankind, and Civil Peace and Right, he ſhews the Authority of the Husband over the Wife, and then proceeds to

Paternal Power. And here the Author granting but in Part that the Act of Generation gave the Father this Right over the Child, adds, this Power ariſes from that Duty which Nature (in enjoyning Man to be a Sociable Creature) lays on him to take care of his Offspring, ſhe having at the ſame time, to ſtir up his Diligence, wiſely implanted in him a moſt Tender Affection towards theſe Little Pictures of Himſelf. The Sovereignty of the Parent is alſo built on the preſum'd Conſent of the Child, and conſequently on a Tacit Pact. The Power which a Father enjoys on the bare Score of his being a Father, inaſmuch as it accrues to him as a neceſſary means of diſcharging his Obligations towards his Iſſue which Nature lays upon him, muſt conſequently be ſo great, as ſufficiently to Anſwer and Effect that Deſign; to Educate, Nouriſh, Protect, Inform and Govern them. To Abdicate or Diſinherit a Son is the Severeſt Penalty that a Father, by Virtue of his being a Father, can inflict.

The next Power is the *Deſpotical*, or the Authority of the Maſter over his Servant; the Authority of which is thus trac'd out. In the Early Ages of the World, when Men began to quit their Primitive Plainneſs and Simplicity, to Cultivate the method of Living, and enlarge their Fortunes and

Poſſeſſions; 'tis very likely the Wiſer and Richer Sort invited thoſe of leſs Parts and leſs Wealth to aſſiſt them in their Buſineſs for Hire. Afterwards, when both Parties form'd their Benefit in this way of Proceeding, the meaner Tribe were by Degrees to joyn themſelves Perpetual Members to the Families of the Greater, under theſe Conditions, that the latter ſhou'd engage to ſupply Food and all Conveniencies of Living; and the former ſhou'd bind themſelves to undertake all Proper Labours and Employments, as their Patrons ſhould direct; ſo that the firſt Riſe of Servitude is owing to the voluntary Conſent of the poor and more helpleſs Perſons, and is founded on that Common Form of Contract, *Do, ut facias*; I promiſe to give you conſtant Suſtenance upon Condition you aſſiſt me with your conſtant Work. Thus every Maſter may enjoyn his Servants what Task he pleaſes in proportion to their Strength and Skill, may Correct their Sluggiſhneſs, but his higheſt Puniſhment is to Expel them. The Author treats of Slaves alſo, and traces them originally from War. Thus we ſee he takes Care not to break in any where on the Opinion he would advance, that Subjection was at firſt *Voluntary*. He cloſes what he has to ſay on that Part, which may be call'd Oeconomicks, with his Diſcourſe on Servitude, and all that he ſays of them is to make way for his

Politicks, on which he enlarges, and begins with the Cauſes and Motives inducing Men to eſtabliſh Civil Societies. Here again he remembers Paternal Power, and ſuppoſes all Government to be originally in the Fathers of Families, who conſented to reſign up their Government, and form a Common-wealth, to guard themſelves againſt thoſe Injuries which one Man was in danger of ſuſtaining from another. The bare Reverence of the Law of Nature was not ſufficient to ſecure the Peace of Mankind, nor the ſole Force of Arbitrators or Covenants. The difference of Mens Opinions was even greatly prejudicial to the Peace of the World, and theſe Cauſes made them ſtand in need of a much more ſevere Reſtraint, which was that of Publick Government. Men are only a ſufficient Defence againſt the Wickedneſs of Men, and it being to this end neceſſary that many ſhould joyn together, and agree in their Reſolutions, mutual Preſervation produc'd the firſt League, and prevail'd with the Fathers of Families to reſign their Authority, and to enter into Compacts or Covenants, for the Structure of the firſt State.

The Nature and the Number of thoſe Covenants by the Mediation of which a Civil State is to be compacted, may be diſcover'd by the following Method of Enquiry. Let us conceive in our Mind a multitude of Men, all Natural, Free, and naturally Equal, going about voluntarily to erect themſelves into a Common-wealth; here it will be neceſſary firſt of all that they Covenant with each in particular, to joyn in one laſting Society, and to Correct the Meaſures of their Welfare and Safety by the Publick Vote. Now what *Puffendorf* ſays afterwards is very remarkable, *Tho' in a Compact of this Nature, 'tis the moſt uſual way for particular Perſons to reſerve to themſelves the Liberty of departing if they ſhall ſee fit.* Farther, when this Covenant is to be tranſacted, 'tis requiſite that all of 'em give their Conſent; Then 'tis requiſite that a Decree be made, ſpecifying what Form of Government ſhall be ſettled among them; There will then be occaſion for a new Covenant, when the Perſon or Perſons on whom the Sovereignty is conferr'd, ſhall be actually Conſtituted; by which the Rulers on one hand engage themſelves to take Care of the Common Peace and Security, and the Subjects on the other to yield them faithful Obedience. This Method of producing a Civil State, by the means of two Covenants and one Decree, is moſt natural, and what agrees in general to every kind of Government. Yet a *Monarchy* may ſometimes happen to be Conſtituted by one Covenant alone; as, Suppoſe many Perſons, without any Antecedent Agreement, ſhould each Man for himſelf, ſubject himſelf to a ſingle Maſter. Every State had certainly once a Beginning, before the fixing of which the Perſons of whom it was to conſiſt, could not be united to each other by the ſame Ties as they are after the State is actually ſet up, nor could they yet be ſubject to thoſe to whom afterwards they owe Subjection. And here we cannot underſtand how either this Union or this Subjection could be made without the Covenants before-mention'd. 'Tis neceſſary that the ſaid Covenants muſt tacitly at leaſt have paſs'd in the Inſtitution of Commonwealths. Nor is there any thing to hinder, but that the Original of ſome things, not committed to the Monuments of Time and Hiſtory, may be trac'd out by the Diſquiſitions of Reaſon. What Mr. *Hobbs* has ſaid concerning the Original Compact, is fully confuted by this Author; but we muſt forbear enlarging upon it. The State thus form'd in exerciſing its Will, makes uſe either of a ſingle Perſon, or a Council. Where the Sovereignty is lodg'd in one Man, there the State is ſuppos'd to chuſe and deſire whatever that one Man, who is preſum'd to be Maſter of perfect Reaſon, ſhall judge convenient in every Buſineſs or Affair, which regards the end of Civil Government. Where the Supream Authority is conferr'd on a Council, according to the regular Courſe, the Votes of the Majority in Aſſemblies have the Force and Virtue of a general Decree; and 'tis ſo plain, that Aſſemblies muſt neceſſarily be determin'd by a Majority, that there's no occaſion of giving Reaſons for it. The Civil State being thus fram'd and ſettled, the Perſon or Perſons on whom the Supream Authority is conferr'd, whether one Man or a Council, either particular or general, obtains the Name of a *Monarch*, a *Senate*, or a *People*.

The next Thing to be treated of is *Civil Sovereignty* or *Majeſty*; and in order to find out how it is produc'd, we muſt ſuppoſe firſt that Civil Authority, for the obtaining its juſt Effect, requires as well natural Strength, by means of which the Subject, if he preſumes to decline Obedience, may be terrify'd into his Duty thro' the Fear of Puniſhment; as alſo a Title, by Virtue of which, as by juſt Right, the Performance or Omiſſion of any Action may be impos'd on others; to which *Title* there anſwers in the Subject an Obligation to comply with what is thus enjoyn'd. Now both theſe Requiſites do immediately flow from thoſe Parts by which the State is united and ſubſiſts. For tho' no Perſon can transfer his Strength to another by any real and natural Conveyance, yet he is ſuppos'd to be Maſter of other Mens Strength, according to whoſe Pleaſure they are bound to exert and apply it, not having any Power to reſiſt or to refuſe his Command. By which it appears, that he who holds the Sovereign Rule, is poſſeſs'd of ſufficient Force to compel any Perſon to the diſcharge of the ſeveral Injunctions which he lays upon them. So alſo the ſame Covenant affords a full and eaſy Title, by which the aforeſaid Sovereignty appears to be eſtabliſh'd not upon Violence, but in a lawful manner, upon the voluntary Conſent and Subjection of the Reſpective Members. And he who affirms Sovereignty to reſult immediately from Compact, does not in the leaſt detract from the Sacred Character of Civil Government, or maintain that Princes bear Rule by Humane Rights only, not by Divine. Governours are call'd God's Vicegerents, which, according to our Author, may very fairly and conveniently be explain'd in this Senſe, That whereas the Peace and good Order of Mankind was not ſufficiently procur'd by a bare Reverence towards the Law of Nature, and towards the Author of it, that End is now happily produc'd by the Virtue and Efficacy of Civil Dominion. What *Puffendorf* ſays in Anſwer to thoſe who aſſert that Sovereignty is conferr'd on Princes immediately by God himſelf, will probably be ſatiſfactory to an *Engliſh* Reader. *'Tis manifeſt it tends to the breaking aſunder all thoſe Compacts and Fundamental Laws which paſs between Princes and Subjects, with regard to the Publick Adminiſtration. We cannot admit that they ſhould aſcribe Majeſty to Kings alone, and utterly deny it to Free States and Democracies. The Definition of Majeſty, the chief Power every where over the State, poor and dry as it is, agrees as well to the Senate, or to a popular Aſſembly.* It cannot be expected from us that we ſhould ſtrengthen every Aſſertion as he does, by Reaſon and Examples, but let the Reader once for all be inform'd, that he never lays down any thing without giving Reaſons, and very often Inſtances, in both of which he is always Inconteſtable.

The Parts of Sovereignty, and their Natural Connection, are now to be diſcours'd of; for tho' the Supream Authority in its own Nature be but one individual Thing, yet becauſe it Exiſts it ſelf in different Acts, 'tis generally conceiv'd as conſiſting of many Parts. 'Tis term'd the *Legiſlative Power*, as it is buſy'd in preſcribing general Rules of Action; The *Judiciary Power*, as it determines the Controverſies of the Subjects by the Standard of theſe Rules. 'Tis the Power of Peace and War, as it either Arms the Subjects againſt Foreigners, or Commands them to lay down their Hoſtility. 'Tis call'd the *Right or Power of appointing Magiſtrates*, as it takes in the Aſſiſtance of Miniſters in the diſcharge of Publick Buſineſs; and ſo with regard to its other Offices and Functions, as the Right of levying Taxes, and of examining Doctrines, as far as it tends to the Publick Peace and Safety, is lodg'd by our Author in the Supream Authority. Theſe Parts of the Sovereign Power are naturally ſo united, and, as it were, interwoven with one another, that ſhould we ſuppoſe ſome of them to inhere in one Perſon, ſome in others, the regular Frame of the State muſt abſolutely be deſtroy'd; for if we appropriate the Legiſlative Power to one, and to another the Judiciary, each Primarily and Independant, it will of neceſſity follow that either the former is Null and Void, or that the latter only miniſters to the former; 'twill hold as ſtrong in all the Branches of the Sovereignty; and this is very ingeniouſly and learnedly handled by our Philoſopher.

We go now to the Forms of Common-Wealths, which are Three only, ariſing from the proper or particular Subject in which the Supream Power reſides, which is either a ſingle Perſon or a Council, Select or General; for the Sovereignty is committed either to one Man, or a Council of ſeveral Men; and this Council is made up either of all the Members, or of the ſmaller indeed, but the better or ſelect Part. One Species or Form therefore is when the Sovereignty is lodg'd in a Council conſiſting of all the Members, and where every Member has the Privilege of a Vote, and this is call'd a *Democracy*. Another is when the Sovereignty reſides in a Council compos'd of ſelect Members, term'd an *Ariſtocracy*. A third, when the Sovereignty is in the Hands of one Man, call'd a *Monarchy*. *In the firſt, the Sovereign,* ſays *Puffendorf, is ſtyl'd a* People; *in the ſecond,* Senators; *in the third, a* Monarch. *Democracy* has ſomething peculiar in it from other Forms of Government, as indeed each Form has from the other. When a Number of free Perſons aſſemble together in order to enter upon a Covenant about uniting themſelves in a Civil Body, this Preparative Aſſembly has already ſome Appearance of a *Democracy*; properly in this reſpect, that every Man has the Privilege freely to deliver his Opinion concerning the Common Affairs; yet he who diſſents from the Vote of the Majority, ſhall not be oblig'd by what they determine, 'till by means of a ſecond Covenant, a Popular form ſhall be eſtabliſh'd, and the Rights of ſettling Matters, relating to the general Safety, is conferr'd for ever on a general Aſſembly. An *Ariſtocracy* is thus conſtituted, when the Aſſembly who by means of their firſt Covenant united themſelves into the Rudiments of a State, as we may term it, do by common Decree entruſt the Supream Adminiſtration in the Hands of a Council, conſiſting of ſome ſelect Members. *Monarchy* is ſettled when the Sovereign Authority is conferr'd upon one Man. *And,* our Author proceeds, *this is done by means of a Covenant intervening, as we have already ſufficiently demonſtrated againſt Mr.* Hobbs. A *Monarchy* differs from the two former Species of Government in this reſpect, that under them, before any Matter can be debated or determin'd, 'tis neceſſary that certain Times and Places be aſſign'd for this purpoſe; whereas, in a *Monarchy* (at leaſt if ſuch as we term Abſolute) Deliberations may be held, and Reſolutions taken at all Places and Times. A *Monarch* is always furniſh'd with an immediate Power of exerciſing his Sovereign Command. In Bodies Politick, there may be Vices of Men and Vices of State. The Vices of Men, in a *Monarchy,* are when the Sovereign is deſtitute of the Arts of Government, and very little or not at all affected with any Care or Concern for the Common Intereſt, which he proſtitutes to the Ambition or Avarice of bad Miniſters; when he renders himſelf Cruel by Paſſion or Cruelty; when he expoſes the Common-wealth to unneceſſary Hazard; when he waſtes the Publick Revenues or hoards 'em up; when he is notoriouſly abuſive and unjuſt. The

Vices of Men in an *Ariſtocracy* are, when by Corruption and Baſe Acts, Perſons of no Honeſty and no Ability find an Eaſy Admiſſion into the Senate; when Merit is Excluded; when Parties and Factions are Predominant, and Senators are enrich'd at the Expence of the Publick. In a *Democracy* the Vices of Men are theſe; when ſuch as really want Judgment turbulently and importunately maintain their own Opinion; when Extraordinary Vertue, yet not dangerous, is oppreſs'd; when Laws, thro' Levity and Inconſtancy are raſhly made and repealed; when Sordid and Worthleſs Perſons are Entruſted with the Adminiſtration. Thus we ſee there's no Form of Government but what is attended with the General Imperfection of Humane Nature; and this ſhould be a Leſſon to us who live under a Conſtitution that comes neareſt to Perfection, to beware how we endeavour to ſtretch it on either Side beyond its Legal Bounds in hopes of getting nearer it by Change. The *Vices* of a *State* are, when the Laws are not accommodated to the Nature of the People or the Place; when ſo fram'd as to breed Diſtractions, *&c.* As for the Moderns, ſome of them have Invented many Kinds of *Mixt States.* In ſome the Parts of the Sovereign reſide ſeparately and independently in Different, Perſons or Bodies of the ſame Common-Wealth, ſo that each Perſon or Body hold their reſpective Part. In ſome the Sovereign Authority inheres indiviſibly in many together, yet ſo as that neither the moſt Conſiderable Majority without ſome Diſſenting Members, nor indeed all the reſt, when any one of the Members ſtand out, can exerciſe any Part of the Supreme Power: But theſe and other Mixtures may perhaps, where any Regularity is obſerv'd, be reduc'd under one of the Three Capital Forms; where entirely Irregular, we leave 'em to their own Anarchy and Confuſion.

Let us ſay a Word or Two of the Properties belonging to Sovereignty. The Sovereign muſt be acknowledg'd to be Unaccountable, not Obnoxious to Humane Judgment or Puniſhment; for both theſe ſuppoſe a Superior, but a Superior to the Supream in the ſame Order of Men, and the ſame Notion of Government is a Contradiction. I may give Account Two Ways to a Superior, who may reverſe all my Acts, to an Equal whoſe bare Approbation I am willing to obtain. In the former manner Supream Rulers are not Accountable to any Earthly Power; but in the latter way, Princes who are tender of Reputation, commonly endeavour to lay open their Actions and Counſels to the View of the whole World, which being done only to ſecure the Credit of their Reign, cannot imply the leaſt Shadow of Subjection. Tho' Sovereigns are far from Humane Puniſhment *Divine Juſtice*, ſays *Puffendorf, finds many ways of ſhewing itſelf on thoſe High and Potent Princes who violate the Laws of Nature in Contempt of all Earthly Tribunals.* Notwithſtanding his Original Compacts, we find our Philoſopher no ſuch Stanch Republican as ſome may imagine him. He further proves, That he who is Inveſted with the Sovereign Power is above Humane Laws: That a King may be Superior to a whole People, and refutes all the Arguments to the contrary. But then he diſtinguiſhes between Abſolute and Limited Monarchies, and ſeems to attribute all thoſe Boundleſs Prerogatives to the former. He thus defines Abſolute Government: As we cannot conceive in Single Perſons a Higher and more Abſolute Liberty than that they ſhall determine and diſpoſe of their Goods and Actions, not by the Will of another, but by their own Judgment and Pleaſure; yet ſtill with a full Obedience to the Law of Nature: And as this Liberty naturally belongs to all Perſons who are not Subject to the Command of others, ſo where many Men cleave together in one Eſtabliſh'd State, there too as in a Common Subject, muſt neceſſarily reſide the ſame Liberty, or the Power of Chooſing by their own Judgment, all Means and Methods tending to the Preſervation of the whole Society. And this Liberty is attended with an Abſolute Command, or a Right of preſcribing thoſe Means to the Particular Members, and of compelling them to a Due Obedience and Conformity: Therefore, in every State properly ſo call'd, there muſt always be ſuch an Abſolute Authority at leaſt in Habit and Power, if not always in Exerciſe and Act. And that this Abſolute Soveraignty implies nothing that can be term'd Unjuſt or Intolerable, we may eaſily apprehend from the End of Civil Eſtabliſhments. Limited Monarchies need no Explication, the Terms ſufficiently expreſs the Thing. How Monarchial Sovereignty may be acquir'd ſhould come next under our Conſideration, as alſo the way of Acquiring Soveraignty in *Democratical* and *Ariſtocratical* States; but we muſt on this Head referr the Reader entirely to the Original, where he will find how far Government may be Seiz'd on by Juſt Force, and how far Unjuſt; how a Perſon may be releas'd from the Government of another; how many kinds of Election there are; what an *Interregnum* is, and *Inter-reges* are, the Caſe of Poſthumous Iſſue in the Hereditary Line of Succeſſion in a Patrimonial Kingdom, of the ſame in Kingdoms Eſtabliſh'd by the free Act of the People; and this either Simply Hereditary, or Lineal, or Tranſverſe. He aſſerts and demonſtrates that the Supream Power is to be held Sacred in Civil States; ſhews the Duty of Sovereigns; Treats of the Power to direct the Actions of the Subject; of the Power of the Sovereign over the Lives of the Subject for the Defence of the Common-Wealth; over the Lives and Fortunes of the Subject in Criminal Caſes; of the Power of the Sovereign in determining the Value of the Subjects; of the Power of the Sovereign both over the Publick Patrimony, and the Eſtates of Private Subjects; of the Right of War; of Compacts that relate to War; of Compacts that reſtore Peace; of Leagues; of Promiſcuous Compacts of Sovereign Princes; of the Ways by which a Man may ceaſe to be a Subject; of the Changes and Diſſolution of the Common-Wealth. But we cou'd not enter into any of theſe Articles, having already too far tranſgreſs'd our Bounds; we ſhall only obſerve ſomething as to the Changes and Diſſolution of the Common-Wealth, and therein paſs over many Cauſes which he aſſigns, to come to the Laſt. I ſhall make uſe of his own Words; "The Laſt Change by which a Common-Wealth ceaſes to be, happens when the People themſelves are diſſolv'd or deſtroy'd. 'Tis a common

“ Saying, *That Kings are Mortal but Common-Wealths Eternal*; by which it is not meant that 'tis impoſſible that a People ſhou'd ever be ſcatter'd or utterly extinguiſh'd by any Violence or Fatal Period; but that they do not ſuffer any ſuch Decays of Nature, as Particular Men do after certain Courſe of Years; for tho' Individuals change, yet there continues a conſtant Succeſſion of Freſh Supplies, either by a Reſort from the Neighbouring States, or by the Natural Iſſues of Procreation at home; By a continual Courſe of which Succeſſions the People always appear the ſame, and poſſeſs the ſame Rights and Privileges, though the Particular Subjects are frequently chang'd: As *Virgil* ſays of his Bees.

Ergo ipſas quamvis anguſtus terminus ævi
Excipiat, (neque enim plus ſeptima ducitur Æſtas)
At Genus Immortale manet, multoſq; per Annos
Stat Fortuna Domûs, & avi numerantur avorum.

Which Mr. *Addiſon* has thus elegantly render'd.

Tho' Seven ſhort Springs conclude their Vital Date,
Yet by Re-peopling their Decaying State,
Their Ancients Stocks eternally remain,
And in an Endleſs State their Childrens Children Reign.

Natural Philoſophy.

THIS Science call'd alſo *Phyſicks*, is ſo well known in our Times, by the Advantage of many Excellent Treatiſes upon it; and ſo much Improv'd by Modern Diſcoveries and Experiments, that what the Ancients have written upon it, ſhews rather how well they could gueſs than what they knew; and is a plain Evidence of the Weakneſs and Preſumption of Humane Reaſon, for with how much Aſſurance did they aſſert Things for Principles, which we now find to be equally Falſe and Ridiculous, not by the Help of our Reaſon only, but that of Experience, the only ſure Guide. *Rapin* ſays, *All the Power of Ancient Philoſophy was not able to ſettle one Principle of Nature. Thales* maintain'd that Water was the great Source of all Things; *Heraclitus* declar'd for Fire; *Anaximenes* for Air; *Pythagoras* for Numbers; *Democritus* for Atoms; *Muſæus* for Unity; *Parmenides* for Infinity. And under this profound Darkneſs of Natural Things, and this wide Diſtance of Conjectures about them, it was impoſſible to be ſure in the leaſt Particular. *Protagoras* affirm'd, That every Thing was really True that appear'd to be ſo. *Ariſtippus* allow'd nothing to be True but what Men are throughly convinc'd of by the inward Perſwaſion of the Mind. *Chryſippus* declares that the Senſes are always in the wrong. *Lucretius*, that they are always in the right. Quite contrary. Yet both maintain'd with all the Strength and Pomp of Argument. From whence we are taught, that in all Phyſical Diſputes, which are not grounded on *Experiments* or *Mechanicks*, let the Learning of the Diſputants be never ſo Abſtruſe and Extenſive, we of Common Capacity, and as the Scholars term us, *Meer Mortals*, muſt not however be led away by them, or think they are by ſo much the more in the right, by how much the leſs we underſtand them. We ſhould admit of no Syſtem, but upon thoſe Conditions, upon which *Ptolemy* publiſh'd his, that is, only as an Hypotheſis, and without obtruding Authority inſtead of Reaſon and Demonſtration. *Ariſtotle*, of all the Ancients, is he who went fartheſt without the Help of Modern Experiments; and it muſt be granted, that as he has given us a Rehearſal of all that had been propos'd in Phyſicks before his Time, in order to refute it, ſo there has been ſcarce any thing rationally advanc'd in this Science, which did not paſs thro' his Invention, and derive its Principles from his Store. Thus, ſays *Pere Rapin*, in his Phyſicks, and ſhews us what is to be ſaid for, and what againſt *Ariſtotle*'s Natural Philoſophy. Now this Philoſopher being certainly the greateſt of all the Ancients, it will be acceptable to any curious Gentleman, to ſee what Judgment is made of him by Judges.

This then is what our learned Jeſuit ſpeaks in his Favour, at leaſt the Subſtance of it; for we have not Room to give the Whole, which would be more Improving and Entertaining. *Ariſtotle* begins with a kind of Hiſtory of the Opinions of all the Philoſophers before him. His Phyſicks are an Abridgment of thoſe of *Pythagoras, Ocellus, Lucarius, Timæus, Leucippus, Parmenides, Hippocrates, Meliſſus, Democritus*, and the reſt of the elder Sages. He refutes the Notions of *Parmenides* and *Meliſſus*, who held but one Principle, Infinite and Immoveable; and having evinc'd the Abſurdity of *Democritus, Empedocles*, and *Anaxagoras, &c.* he ſubſtitutes his own three Principles, Matter, Form, and Privation, as thoſe by which we may beſt comprehend the Change that is made in all Natural Productions; in which we may always ſuppoſe ſomewhat that receives, and ſomewhat that is receiv'd, or ſome Common Subject of the Form excluded, and the Form admitted in its place. And this is ſo true and certain, that we can form no Idea of a Natural Generation without it. *Plato*, who allow'd of two of *Ariſtotle*'s Principles, Matter and Form, did not diſtinguiſh *Privation* from Matter. And therefore *Ariſtotle*, the Author of the Diſtinction, boaſts of it as his own peculiar Work. What he calls Form, is no more than the Cauſe and Original of the ſeveral Diſpoſitions, Qualities and Operations in every Compound Being, or that which conſtitutes a Thing in its eſſential Perfections. In the firſt Book of his Phyſicks, he refutes the Opinions of the other Philoſophers, and eſtabliſhes his own in their room. In the ſecond Book he diſcourſes of Nature, and ſtates the true meaning and import of that Term. In the Third, Fourth, and Fifth, he treats of the Diviſion of Cauſes, of Motion and Place, and the Affection of Natural Bodies. In the Sixth, he explains the Nature of Quantity. In the Seventh Book he ſettles the Doctrine of a firſt Mover. And in the Eighth he diſcourſes of Time, the Natural Rule of Meaſure and Motion. He deſcribes the Heavenly Bodies, their Matters or Subſtance, their Qualities, Motion, Situation, and Figure, and all that relates to the Syſtem of the World, in his Firſt and Second Book *de Cœlo*. In the Third and Fourth, he treats of the Gravity and Levity of the Heavenly Bodies, and of the different Opinions of the Ancients on that Subject. In his Firſt Book of Motion he repreſents thoſe that are produc'd in the Air. In the Third and Fourth, thoſe that are generated in the Earth and Sea; here alſo he treats of Winds, Thunder, Lightning, Exhalations, the Rainbow, and the *Parhelia*. In the Fourth, of Heat and Cold, Dryneſs and Moiſture; of Putrefaction, and of Salts; of the various Qualities of mix'd Bodies; their Compoſition and Temperament. In his Three Books of the Soul, he explains all that belongs to its Nature and Operations, whether in reſpect of the outward Senſes, or of the inward Faculties. In his Book of *Parva Naturalia*, he enlarges on the Subject of Senſation, Memory, and Reminiſcence; of Sleeping, Waking, Dreams, Prognoſticks of Dreams; of the Motion of Animals, their Gate and Pace; of the length and ſhortneſs of Life; of Reputation; of Health and Sickneſs. Having not read *Ariſtotle's* Phyſicks, we cannot tell what Reaſons he gives us for bringing Reputation into Natural Philoſophy, which certainly belongs to Ethicks. We deſire the Reader wou'd not take this Confeſſion of ours ill, that we never read *Ariſtotle's* Philoſophy, and yet talk ſo much of it: For *Rapin*, who had read him, furniſh'd us with what is ſaid of it, and his Authority is of much more weight than ours. The *Hiſtory* of *Animals* is *Ariſtotle's* Maſter-Piece; he repreſents their different Species, he examines their various Ways of Multiplication, and enriches the Whole with a vaſt Number of Experiments and curious Diſquiſitions; among which, upon a cloſer View, we may perhaps obſerve the firſt Lines of all the famous Diſcoveries ſo much boaſted of by Modern Philoſophy. We might here mention his Books of Colours, Phyſiognomy, Mechanick Queſtions, Problems, Plants, of Generation and Corruption, *De Mundo*, compos'd for the Uſe of *Alexander*, &c. Upon the whole, the Critick ſays *Ariſtotle's* Natural Doctrine is the moſt Ample and Extenſive that ever appear'd in the World, nothing having eſcap'd ſo vaſt a Genius, which ſtretch'd it ſelf to the univerſal Compaſs of Beings.

What may be ſaid againſt this Natural Philoſophy, is to this Effect in our Author. His Phyſicks are confus'd, without Natural Order and Dependance. The *Materia Prima*, and bringing Forms out of this Matter, extreamly difficult to our Apprehenſion. The whole Treatiſe of Motion, dark. His Arguments to prove it Eternal, unintelligible. His Explication of Comets and the Rainbow, not true in all its Circumſtances. The Situation he gives the Element of Fire, has no manner of Foundation. His pretending the Eaſt uninhabitable under the Equinox, contradicted by Experience, which dreadful Thing will perhaps in time contradict all the Opinions that are not founded upon it, or Demonſtrative Reaſon. What have *Patricius*, *Ramus*, *Gaſſendus*, made of *Ariſtotle's* Phyſicks? What would *Newton* or *Leibnitz* make of 'em, who know much more of the Matter than *Rapin*? Whoever will give themſelves the Trouble to compare Sir *Iſaac Newton's* Book of Colours with *Ariſtotle's*, will doubtleſs find a vaſt difference between the Science of the Men, in this part of Learning at leaſt.

In this little Eſſay we could not talk of the *Egyptians*, *Chaldæans*, and *Ethiopians*, who all are ſaid to have made ſome Progreſs in Natural Philoſophy; and indeed, if we had had more room, it would have been to little purpoſe to have ſaid any thing of what is ſo little known. We are told the *Aſſyrians* were great Aſtronomers. The *Ionick* Philoſophers great Naturaliſts, as were *Democritus* and *Empedocles*. *Plato* borrow'd his Phyſicks from *Pythagoras*. *Theophraſtus* wrote well on Plants. *Zeno* eſtabliſhes two Principles, God and Matter; he ſuppoſes a Soul of the World, diffus'd in all its Parts, and informing it as one great Animal. *Epicurus* builds on the Principles of a *Vacuum* and Atoms. The *Greeks*, as they were Maſters of all the Parts of Learning, ſo they poſſeſs'd this in a ſovereign Degree, in Compariſon with the reſt of the World. The *Romans* ſcarce made any Efforts in Natural Philoſophy. *Lucretius* is founded on *Epicurus*. *Seneca* affects to Moralize, when he ſhould be only Natural. No Latin Author has written ſo largely and elegantly of Phyſicks as *Pliny*. *Plutarch*, *Dioſcorides*, *Ælian*, and *Solinus*, improv'd Phyſicks by their Studies. *Galen* form'd his Syſtem of Nature upon the Model of *Hippocrates*. The learned Men in the following Ages were divided in their Opinions in favour of *Plato* and *Ariſtotle*, particularly the two *Arabians*, *Avicenna* and *Averroes*. The major part of the School-men embrac'd the *Ariſtotelian* Syſtem. And thus we have gone lightly thro' the Ancient to the Modern Natural Philoſophy, of which *Galilæo* of *Florence* is reckon'd the Founder. He found out the Proportion of the Vibrations of Pendulums, and the Acceleration of the Motion of heavy Bodies in their Deſcent, the Principles of which Doctrine he borrow'd from *Ariſtotle*. He reform'd and enrich'd *Copernicus's* Syſtem of the World; and by the Uſe of the Teleſcope diſcover'd many new Stars; obſerv'd the Spots in the Sun; found out Mountains and Vallies in the Moon; and diſtinguiſh'd the *Phaſes* of the Planet *Venus*; he ſhew'd a great Force in all his Reaſonings upon the Idea of that new Motion which he invented; he was in ſome Trouble with the Inquiſition, about his Phyſical Diſcoveries; the Inquiſitors, generally ſpeaking, being ſo Ignorant, that they are apt to miſtake Science for Hereſy. We come now to a Country-man of our own, and being always glad of opportunities to do Juſtice to the Merit of an *Engliſhman*, ſhall, out of the Mouth of a Foreigner and a *Frenchman*, ſpeak next of my Lord *Verulam*. *Pere Rapin* ſays, "Nor did *Bacon* leſs revive the Love of Philoſophy in *England*; he had a vaſt and comprehenſive Genius for the Study of Nature, but ſucceeded in no part better than in his Hiſtory of the Winds, tho' he appears ſometimes too eaſy and credulous in admitting the Memoirs that were ſent to him on that Subject." This learned Jeſuit, by his Character of a Critick, cannot give a Character without a *But* or a *Tho'*. 'Tis below a Man of that Profeſſion, to allow any kind of Perfection in Writers; and the greateſt part of 'em fanſie they who come neareſt to it, are thoſe who can find out moſt Faults; they look upon themſelves always when they would contemplate ſomething Perfect, and if all the Criticks abroad were like ours in *England*, they are leaſt likely to find it where they ſeek for't. To proceed with our Author and the Lord *Bacon*, "The reſt of his Phyſicks is not of the ſame Strength and Accuracy, yet he always ſhews ſome ſtrokes of his Genius and Character. His Writings contributed very much to the engaging his Country-men in Natural Purſuits, who have in great Numbers imitated his Paſſions for Nature, and have carry'd experimental Knowledge to a high and flouriſhing Condition." *Viviani* of *Florence*, who was *Galilæo's* Diſciple, wrote excellently well of Motion.

Gaſſendus reſtor'd *Epicurus's* Theory, and improv'd it, and manag'd it by *Galilæo's* Doctrine of Motion: In all other reſpects he is an *Epicurean*, ſoften'd and mitigated by Principles of Conſcience: He acknowledges the Creation of Atoms, which *Epicurus* deny'd: He maintains, That they receive from God their Motion, Extenſion, and Figure; all which *Epicurus* would have to be Eſſentially and Originally in themſelves: He aſſerts a Providence which that Philoſopher excluded from his Syſtem. In a Word, he makes *Epicurus* an Honeſt Man, being, ſays our Critick, really ſuch himſelf: He charges *Ariſtotle* with Ignorance, Folly and Extravagance. *Van Helmont* allows nothing to be Rational in *Ariſtotle*'s Syſtem, but his Judgment is not much valu'd by the Learn'd. We ſhall ſay nothing of *Campanella*, *Teleſius*, *Gilbert*, *Fromondus*, *Borellus*, &c. becauſe *Rapin* has given us an Occaſion to employ our Pen better, on ſuch as are more agreeable to our Inclination and Curioſity. " *Harvey*, according to this *Great Critick*, " has Reaſon'd with the Greateſt " Judgment on the Progreſs of the Generation of " Animals, and on the Circulation of the Blood; " *Willis* has written beſt of the Brain and its Parts; " *Grew* of the Anatomy of Plants. *Thomas Hobbs*, " in his Phyſicks has ſhewn a Depth of Wit; but " as he is the boldeſt and moſt thorough-pac'd " *Epicurean* of theſe latter Times without any Mi- " tigation or Allay, ſo he has reaſon'd very ab- " ſurdly as to the Nature of the Underſtanding and " its Principal Operations, which he referrs wholly " to the Fancy and Imagination. *Boyl* has a True " and Rational Genius, and has very much enrich'd " Natural Philoſophy by his Experimenss and Re- " marks, ſuch as are always Solid and well Ex- " pounded." What wou'd an Author have ſaid of the many Great Men which *England* has produc'd ſince of a Superiour Character, even to our Illuſtrious Country-men before-mention'd; as *Wilkins*, *Halley*, *Whiſton*, and Him of whom never enough can be ſaid, Sir *Iſaac Newotn*. We ſhould now ſpeak of *Deſcartes*, but ſhall omit it in this Place, becauſe it will come more naturally when we Treat of the *Carteſian* Philoſophy.

Father *Rapin* has a mean Opinion of the Chymiſts. He tells us they have advanc'd nothing Good in the Doctrine of Nature, and are a ſort of Separate Traders in Philoſophy, who not being able to embrace it in its full Extent and Compaſs, have choſen a Bounded Subject to Exerciſe a Limited Genius. Indeed he can hardly give 'em a better Name than that of *Diſtillers*, whoſe Trade is by no means Honourable enough to deſerve a Place with the Sciences; ſo we ſhall leave them and their Brethren, as alſo the Cabaliſts and Judicial Aſtrologers, than which nothing can be more abſurd; wherefore it will not be expected that much ſhou'd be ſaid of them. what follows in our Author is remarkable to us *Engliſh-men*. This I cannot excuſe my ſelf from ſaying, That the Royal Society for Improvement of Natural Knowledge in *England*, &c. have ſo happily reviv'd the Love of Natural Philoſophy in the Preſent Age, that there's ſcarce any Study more in Requeſt. There have been more Diſcoveries made in Phyſicks within this Sixty Years, than had been done in Two Thouſand Years before: They have found out the way to diſtinguiſh the ſeveral Affections of the Air, by the *Thermometer*. They have made new Deſcriptions of the Body of the Moon by a Chart repreſenting its Monthly Phaſes with the Variety of Appearances that are caus'd by the Shade of its Eminent or Depreſt Parts reſembling our Mountains and Valleys. They Calculate the Revolutions of the Stars with as much Exactneſs as the Movement of a Watch or the Stroke of a Dial, and have found out ſome ſort of Irregularity in the Heavenly Bodies, the moſt Regular Works of Nature. *The World*, as this Elegant Jeſuit expreſſes himſelf, *ſeems to have chang'd its Face; the Heavens to roul upon other Principles and new Syſtems; the Air has been more clear and illuminated by the Doctrines of Meteors; the Sea has been render'd more free and eaſy to Commerce by the Improvements of Navigation; the Earth has been laid open to our View by the Perfect Knowledge of Simples and Compounds, of Salts and Minerals, and all the Circle of Arts has been enlarg'd and ennobled by uſeful Inventions,* &c. *What ſhall I ſay of the New and Excellent Diſcoveries of the Secret Springs of Nature; the Circulation of the Blood; the Contexture of the Brain, and the whole Oeconomy of Humane Bodies, or of thoſe Surprizing Wonders diſplay'd in the ſmalleſt Inſects or Flies!* Theſe Wonders of Flies are a Diſcovery which the *Engliſh* may pretend to as much as any People in the World; but perhaps there have been ſome who have with too much Paſſion purſu'd their Inquiries into Flies, Maggots, Cockle-ſhells, Dirt, *&c.* and neglected Sublimer and more Uſeful Studies. This Vicious Taſte is like that of the Green-Sickneſs; it flies wholſome and generous Food, and ſeeks after Chalk, Mud-Walls, Tobacco Pipes, *&c.* Whatever great Genius a Man may have in Reſearches of this Kind, if they are his Principal Study, there's as much Difference between him and a True Philoſopher as between an Inſect and an Animal. *Rapin* ſpeaking of the many Curious Diſcoveries before-mention'd, proceeds; *Upon theſe the* Engliſh *have lately Publiſh'd a Large Volume full of Curious Obſervations, hitherto in a manner unknown to the World. If they go on with equal Vigour in their Remarks upon Particular Nature, they will be able in a little time to give us a Second Volume of Natural Hiſtory, worthy to be added as a Continuation of that of* Pliny. This ſaid by a *French-man* is enough to animate the *Britiſh* Philoſophers in theſe Purſuits. What, tho' *Wilkins* is dead; tho' *Wallis* is gone after him; tho' *Ward*, *Boyle*, and thoſe Great Genius's are no more Living, but in their Immortal Works; Why may not the *Royal Society* hope to ſee others in their Room, and extend their Diſcoveries as far as Reaſon and Nature can go. The *Britiſh* Soil is not ſo Poor but it will bear more than one Crop; if it lies fallow a while, the Harveſt is afterwards the richer for it.

We ſhall Cloſe this Introduction to our Phyſicks with a Reflection of *Pere Rapin's*, on the Liberty taken by Philoſophers in their Natural Philoſophy, by extending the Power of Nature beyond thoſe Bounds which the Author of Nature had preſcrib'd. *Alcuindus* wrote a Treatiſe to prove that all thoſe Effects reſult from Material Nature, which are commonly attributed to Spirits above Nature; that is, to Angels or Dæmons. Thus *Peter d' Apono* and *Pomponatius*, Two Great Patrons of Nature attempted to demonſtrate, that whatever paſſes the Courſe of Sublunary Things is owing to the Impreſſion of the Heavenly Bodies. *Galen* aſcrib'd all to Complexion and Conſtitution; *Albertus Magnus* to the Specifick Form; *Marcellus Ficinus* to the Planets. *Montaigne* often commences Infidel, that he may appear Eaſy and Natural, and is the more dangerous with reſpect to Religion, the more he affects to ſeem unconcern'd about it. Our Author having touch'd on *Deſcartes*, proceeds thus; " An *Engliſh* Profeſſor [Dr. *More*,] has lately " ſhewn this whole Syſtem of Philoſophy to be " very prejudicial to Religion in attributing all " Effects to Art and Mechaniſm. And indeed, ge-

“nerally ſpeaking, Natural Knowledge, in Conjunction with Phyſick, Aſtronomy and Chymiſtry, is apt ſo to tie Men down to Viſible Nature, as that they cannot aſcend to the Author and Maker of it. It gives too much to Senſe to be able to get above the Power and Sphere of Senſe, *&c.* Let us contemplate Nature with Modeſty and Caution with all Reverence: Let us not be too Bold in pronouncing upon thoſe Operations which we ought not to be Judge of without Trembling.” Thoſe who will carry theſe Reflections along with them in their Studies of Natural Philoſophy, will, inſtead of Corrupting, Confirm their Belief of One Infinite Omnipotent Creator; and ſuch as are fully and heartily convinc'd of this Important Truth, will be in a good Diſpoſition to ſeek him out in his Revelation. Young Scholars and Men of looſe Morals are apt to catch at every Thing extraordinary in Nature to magnifie its Excellence, and ſet it in the Throne of the Almighty: But they catch at Shadows; and when Reaſon and Vertue have operated upon them, they find there's nothing left but a Poor, Short, Finite Capacity, which, far from being able to comprehend Infinity, is ignorant ſtill of an Infinite Number of the Effects of Nature. The following Eſſay is taken from the Beſt Authority, and will, we hope, be ſufficient to let Gentlemen as far into Phyſicks as they are willing to go for their *Recreation* only.

N*Atural Philoſophy* is the Speculative Knowledge of all Natural Bodies; and of their Proper Natures, Conſtitutions, Powers, and Operations. The *Object* of it is a Natural Body.

Natural Philoſophy is either

General, which relates to the Principles, Properties, or Affections of Body in General. Or

Special and *Particular*, which conſiders Matter as form'd or diſtinguiſh'd into ſuch and ſuch Species, or determinate Combinations.

The Principles of a Natural Body are *Matter* and *Form*. *Matter* is the common Subject of all Bodies, out of which, by the different Modificatious *Motion* makes in it, all Forms ariſe. And therefore, in order to a better underſtanding of theſe Principles, we will firſt conſider *Motion*.

Motion is a continual and ſucceſſive Mutation or Change of Place. All Motion may be conſider'd either *abſolutely* or *relatively*. *Abſolute Motion* is the Change of the *Locus Abſolutus* of any Body, and therefore its Celerity will be meaſur'd by the Quantity of the Abſolute Space which the Moveable has run thro'. But *Relative Motion* is the Mutation or Change of the *Relative* or *Vulgar* Place of the Moving Body, and ſo hath its Celerity accounted or meaſur'd by the Quantity of *Relative Space* which the Moveable runs thro'.

The Incomparable Sir *Iſaac Newton* has reduc'd all the Laws of Motion to theſe Three.

1. That every body will continue in its State, either of Reſt or Motion uniformly forward in a Right Line, unleſs it be made to change that State by ſome Force impreſs'd upon it.

2. That the Change of Motion is proportionable to the moving Force impreſs'd; and it is always according to the Direction of that Right Line in which the Force is impreſs'd.

3. That Re-*Action* is always equal and contrary to *Action*; or which is all one, the Mutual *Actions* of Two Bodies one upon another are equal, and directed towards contrary Parts: As when one Body preſſes and draws another, 'tis as much preſs'd or drawn by that Body.

The Quantity of any Motion is diſcoverable by the joint Conſideration of the Quantity of Matter in, and the Velocity of the Moving Body: For the Motion of any whole, is the Sum of the Motions of all its Parts. And conſequently, if a Body be twice as great as another, and be mov'd with an equal degree of Swiftneſs, the Quantity of Motion is *double* in the former; but if the Swiftneſs be alſo *double*, then the Quantity of the Motion is Quadruple of that of the latter.

Matter is an Impenetrable, Diviſible, and Paſſive Subſtance, extending into Length, Breadth, and Thickneſs. This, when conſider'd in the General, remains the ſame in all the various Motions, Configurations, and Changes of Natural Bodies, being capable of putting on all manner of Forms, and of moving according to all manner of Directions and Degrees of Swiftneſs.

The Quantity of Matter in any Body, is its Meaſure, ariſing from the Joint Conſideration of the *Magnitude* and *Denſity* of that Body. As if any Body be twice as *denſe* as another, and take up *twice the Space*, 'twill be four times as great. This Quantity of Matter is beſt diſcoverable by *Weight*, to which it is always proportionable; as the Excellent Sir *Iſaac Newton*, by moſt accurate Obſervations on Pendulums, found true by Experience.

Dr. *Woodward* aſſerts matter to be originally and really very different; being at its firſt Creation divided into ſeveral *Ranks*, *Sets*, or kinds of *Corpuſcles*: That all the *Corpuſcles* which are of the ſame *Kind* or *Set* agree in every thing, and are moſt exactly like unto one another in all reſpects. But thoſe that are of *different Kinds*, differ from one another every way, as well in *Subſtance*, in *Specifick Gravity*, in *Hardneſs*, in *Flexibility*, and in ſeveral other ways; as in *Bigneſs* and *Figure*. And he ſuppoſes from the various *Compoſures* and Combinations of theſe Corpuſcles together, happen all the Varieties of the Bodies form'd out of them; and all their Differences in Colour and outward Appearance, in Taſte, in Smell, in Hardneſs, in Specifick Gravity, and in all other reſpects.

The *Form* of any Natural Body, is the Eſſential, Specifical, or diſtinguiſhing Modification of the Matter of which it is compos'd, ſo as thereby to give it a peculiar manner of Exiſtence: And this is an Aggregate or Convention of as many particular Qualities, as ſerve to denominate the Body of ſuch a Nature, and to give it ſuch a Name, and which diſtinguiſhes it from other Bodies. Thus the Qualities of greateſt Specifick Gravity, Fixity in the Fire, Ductility under the Hammer, Fewneſs and yet Largeneſs of of Pores, Diſſolubility in *Aqua Regis*, and not in *Aqua Fortis*, and Yellowneſs of Colour, make up the Form of that Metal which they call Gold; ſo that 'tis not any kind of Subſtantial Soul or Subſtance diſtinct from Matter, but only ſuch a proper and agreeable Convention of Accidents, as by common Conſent are reputed ſufficient to make a Portion of Univerſal Matter, belong to this or that determinate Species of Natural Bodies. But yet ſome are of Opinion, that the Humane Soul may properly enough be called, a *Subſtantial Form.*

The *Properties* or *Affections* of a Natural Body are either

Inſeparable,
Separable.

Inſeparable are
Extenſion,
Diviſibility,
Place,
Time.

Extenſion is the moſt General and Eſſential Property of a Natural Body; and the Followers of *Des Cartes* are ſo fond of it, that they place the very Eſſence of Matter in it; becauſe they can have no other *Idea* of Extenſion but ſuch as is proper to a Body, ſince where-ever there is Extenſion, a Body muſt of Neceſſity be there. But whether Extenſion cannot be conceiv'd without including the Idea of a Body, Philoſophers are ſtill in Doubt: So that tho' it were allow'd to be a juſt Inference that we cannot conceive Extenſion without the Incluſion of a Body; yet we cannot draw this Conſequence from it, That Extenſion is a Body.

Diviſibility, is that Diſpoſition of Body, whereby it is conceiv'd to have Parts into which it may actually or mentally be divided. All Quantity is infinitely or rather indefinitely diviſible; for ſhou'd it be otherwiſe it would be diviſible into Parts that are not *quantæ*, which cannot be; for no accidental Change can deſtroy the Eſſential Properties of any Being. Yet this Infinite Diviſibility can never actually be effected, becauſe when you have divided a Line or any other Quantity into any other Number of Parts, every one of theſe Parts is further diviſible into as many Parts as the whole was, and ſo on; as is many ways demonſtrable in *Geometry*. Wherefore there can be no ſuch Thing as a determinate number of actual Parts in any continu'd Quantity; which is further alſo demonſtrable from the Conſideration of incommenſurable Quantities.

That the Parts of Solid Bodies are almoſt infinitely ſmall, and that they are capable of being divided wonderfully minutely, the Honourable Mr. *Boyle* ſhews by theſe Inſtances.

1. A Piece of Silver Wire was drawn ſo ſmall, that the Weight of but one Grain wou'd reach to 27 Foot or 342 Inches in Length; and ſince an *Engliſh* Inch can eaſily be divided into 200 equal Parts, one Grain of this Wire may be divided into 64800 Parts. And ſince this Diviſion relates only to the Surface of the Wire, its Solidity may eaſily be conceiv'd to conſiſt of many Millions of ſuch Parts.

2. One of the Oval Caſes of Silk-Worms was drawn out into a Length that much exceeded 300 Yards, and yet weigh'd but Two Grains and an half; ſo that each Cylindrical Grain of that Silk was at leaſt 120 Yards in Length.

3. A Grain of Leaf-Gold was extended into an Area of above 50 Inches, and then ſuppoſe the Area reduc'd to a Square, and the Sides divided after the manner before mention'd, *i. e.* ſo that there be 200 Diviſions in an Inch: If Parallel Lines be ſuppos'd to be drawn thro' thoſe ſubtile Diviſions, the Area will be divided into no leſs than Two Millions of little Squares.

4. If you ſuppoſe the Silver-wire mention'd above to be gilt with Gold (and allow for the gilding eight Grains of Gold to one Ounce of Silver, which is yet more than is commonly us'd) you will find an Ounce of Gold may cover as much Wire as will reach One Hundred Fifty-five Miles and half in length.

5. By diſſolving one Grain of crude Copper in a good Portion of Spirit of *Sal Armoniack*, a deep blue Colour was produc'd; and after this a good Quantity of diſtill'd Water was put to it, yet ſo as that the blue Colour did ſtill remain viſible; and on comparing the weight of the Liquor with the Grain of Copper firſt diſſolv'd, it was found, that a Grain was capable of imparting a ſenſible Colour to above 513620 times its bulk of Liquor.

Place is uſually diſtinguiſh'd into

Internal, which properly ſpeaking, is that Part of Space which any Body takes up or fills.

External, which, according to *Ariſtotle*, is determin'd by the Surfaces or Confines of the adjoyning or ambient Bodies. But it is better divided into *Abſolute*, which is the former *Internal* Place; and into *Relative*, which is the apparent, ſecundary, or ſenſible Poſition of any Body, according to the determination of our Senſes, with reſpect to other contiguous, or adjoyning Bodies.

Time, is a certain Meaſure depending on the Motion of the Luminaries, by which the diſtance and duration of things is meaſur'd; and is either *Aſtronomical*, which is taken from the Motion of the Stars; or *Civil*, which is Aſtronomical Time, accommodated to vulgar uſes. *Aſtronomical*, *Mathematical*, or *Abſolute Time*, flows equally in it ſelf without relation to any thing External. But *Relative*, *Apparent*, or *Vulgar Time*, is the ſenſible and external Meaſure of any duration eſtimated by Motion, and this the vulgar Uſe, inſtead of true Time.

Separate Qualities or *Affections* of a Body are *Heat*, *Cold*, *Fluidity*, *Firmneſs*, *Rarefaction*, *Denſity*, *Light*, *Colours*, *Sound*, *Taſte*, and *Smell*. To theſe may be added *Gravity* and *Magnetiſm*.

Heat conſiſts only, or at leaſt chiefly, in the local Motion of the ſmall Parts of a Body mechanically modify'd by certain Conditions, of which the Principal is the vehement and various Agitations of thoſe ſmall inſenſible Parts. In which Deſcription it plainly appears there are theſe three Conditions neceſſary to produce *Heat*.

1. That the ſmall Parts be vehemently and rapidly agitated, or mov'd in a much greater degree than is neceſſary to produce the Quality call'd *Fluidity*.

2. That the Determinations of the inſenſible Corpuſcles thus vehemently agitated, be alſo very various; ſome moving up, ſome down, ſome to the right-hand, others to the left, *&c.* And hence, tho' Air and Water are, we find, often very vehemently mov'd, as in Tempeſts and Cataracts, yet there is no reaſon to expect that they ſhould grow hot upon this Motion; becauſe the *Vehemency* belongs to the progreſſive Motion of the whole Body; and notwithſtanding that, yet the Parts it conſiſts of, may not in any thing near be ſo much quicken'd in their Motions made according to other various Determinations, as to grow ſenſibly hot; but in Bodies very hot or enkindled, the rapid Motion of

the inſenſible Parts ſeems to have all manner of Directions, and to be darted round in a kind of burning Sphere, all manner of ways.

3. 'Tis requiſite alſo to the Production of Heat, that the thus variouſly and vehemently agitated Particles, be alſo ſo ſmall, as generally ſpeaking, to be ſingly inſenſible. For unleſs they are exceeding fine and ſubtil, they cannot penetrate readily into the Pores of contiguous Bodies, and ſo warm or burn them.

As to the Operation of Heat upon our Senſes, the reſult of which we often call Heat, it is uſually eſtimated by its relation to the Organs of our feeling; for we don't eſteem any Body to be hot, unleſs the Motion of its ſmall Parts be violent or briſk enough to encreaſe or ſurpaſs that of the Particles of the Organ. For if it be more languid in the Object than in the Sentiment, we pronounce the Body to be cold; but if it be more violent in the Object than in the Sentiment, we ſay, the Body is hot; as, any one may experiment by putting his Hand cold into warm Water; for then the Water will appear warm to him, whereas, had his Hand been hot, it would have felt cold.

Cold, is nothing but the arriving of the Minute and inſenſible Parts of a Body, at ſuch a ſtate, as that they are more ſlowly or faintly agitated, than thoſe of the Organs of feeling; for from this Effect we pronounce a Body to be cold.

Mr. *Hobbs* thought the cauſe of Cold to be only a Wind raking the condens'd or frozen Body.

Whether Cold be barely a Privation of Heat, or rather a ſtop put to that violent, tumultuary Motion of the inſenſible Particles of Bodies, as the *Carteſians* aſſert; or whether Cold be introduc'd by the entrance of Adventitious Particles, actually cold themſelves, and therefore call'd *Frigorifick Particles*, according to the Opinion of the learn'd and ingenious *Gaſſendus*, is a Controverſy not ſo eaſy to be determin'd, as at firſt ſight it may appear. For tho' the *conſiderable Increaſe of the Dimenſions* of the ſame Quantity of Water when turn'd into Ice; and the *prodigious force of Freezing*, by which Water may be made to lift up vaſt weights, and to break to pieces ſome of the ſtrongeſt Bodies that are; and alſo ſince it is true, that a briſk, nay, furious Agitation of the ſmall Parts of a Mixture may be produc'd, and yet on the Conflict the Mixture will become not only *not hot*, but ſenſibly and conſiderably *cold*; tho' theſe ſeem to bid very fair for a Proof of *Gaſſendus*'s Opinion; yet on the other hand 'tis certain, that a *bare Privation of Motion*, will produce or rather occaſion Effects, as conſiderable as any of thoſe of *Cold*; as the Excellent Mr. *Boyle* largely ſhews in his Dialogue about the *Poſitive* or *Privative* Nature of *Cold*. And if it ſhould be ask'd how the Frigorifick Particles themſelves became cold? What degree of Gravity or Levity they have? What kind of Structure in them is proper to produce ſuch an Effect? Whether there was not Cold in the World 'till theſe *Frigorifick Particles* were produc'd? And whether they are Primitive Bodies or not? If theſe or ſuch like Queries were made about the Nature and Circumſtances of the Frigorifick Particles, it would, I believe, puzzle the Maintainers of the Opinion of *Gaſſendus* to give ſatisfactory Anſwers to them; and therefore the Deciſion of this Point muſt be ſuſpended further.

Mr. *Boyle* found, that tho' *Water* uſually *Expands* it ſelf, yet 'tis always firſt *contracted* or *condens'd*; and that Spirits of Wine, common expreſs'd Oyl, and chymical Oyl of Anniſeeds, it ſelf, will be notably condens'd when expos'd to an intenſe degree of Cold. And he found that no other Liquor but Water, or one in which there are ſtore of watry Particles, will ever be expanded by Cold. The reaſon of which perhaps may be, that Water contains more Air in its Pores than any other Fluid, and 'tis not improbable, that from the Co-aleſcence of many of the Aerial Particles into one during the Action of freezing, their Spring may by that means be encreas'd; and this ſeems to be evident from thoſe numerous and large Bubbles we obſerve in Ice, which occaſion it to be ſpecifically lighter than Water.

The *Expanſive force of Cold* is ſo great, that if the Barrel of a Gun be fill'd with Water, and then have its Muzzle and Touch-hole well ſtop'd, the Water within the Barrel, when either by natural Cold or a freezing Mixture is turn'd into Ice, will break the Barrel in ſeveral places, as Mr. *Boyle*, and many others have try'd.

That notable Philoſopher contriv'd ſeveral Experiments to eſtimate or meaſure the Quantity of this *Expanſive force*, which were made with a Braſs Cylinder, of two or three Inches in Diameter, into whoſe Cavity was put a Bladder fill'd with Water, and ſtrongly ty'd about the Neck, and over it was put a wooden Plug to ſtop the upper Orifice of the Cylinder, and on the Plug was put a broad flat Board, on which was laid as much weight as one time amounted to above an hundred Pounds; another time to above an hundred and twenty Pounds; and another time to two hundred and fifty four Pounds; and yet in all the Experiments, when the Water in the Bladder was turn'd into Ice, it Expanded ſo as to raiſe up all this Weight very conſpicuouſly, as appear'd by a Circle deſignedly made on the wooden Circle.

He tells us alſo, that by mingling together three ſaline Bodies, each of them purify'd by the Fire, tho' there aroſe a very great Commotion, Hiſſing, and Exploſion, yet a very conſiderable degree of Cold was thereby produc'd; and tho' he was under an Obligation of not diſcovering what theſe Ingredients were, yet he gives a *Succedanium* to that Experiment, by telling us, that by putting good Salt of Tartar into Spirit of Vinegar, there were a Struggle, Commotion, and Hiſſing; and yet inſtead of Heat, as is uſual in ſuch caſes, a very ſenſible degree of Cold was produc'd.

Sylvius alſo acquaints us with a Method of producing Cold by mingling Spirit of Vitriol, with another ſaline Spirit.

If into three or four times its weight of Water, you put about half a Pound of *Sal Armoniack* well powder'd, and ſtir it about to haſten the Diſſolution, ſo great a degree of Cold will, even in the heat of Summer, be produc'd, as is very ſurprizing; for if you nimbly ſhake it, or ſtir it about, it will produce actual Ice on the outſide of the Glaſs, if you purpoſely wet it with Water. This noble Experiment Mr. *Boyle* firſt made, and thereby plainly prov'd the mechanical Producibleneſs of Cold; and the Experiment may be of great uſe to cool Wine, &c. in the hot Months, or in ſuch Places where no good Cellarage is to be had. The *Sal Armoniack*,

niack, by evaporating the Water from it, may be recover'd again, and will ſerve many times for the ſame Experiment.

Neither *our Senſes*, nor common *Weather-Glaſſes*, can enable us to make an accurate Judgment of the degree of *Cold*.

For as to *our Senſes*, the Organs of feeling are in a continual State of Mutability, and that (in general) appears cold to us which hath its parts leſs mov'd than thoſe of our Hands or Bodies; and therefore if one hand be very cold, and the other moderately warm, the ſame Water will appear *warm* to the *cold*, and *cold* to the *warm* Hand.

As to common *Weather-Glaſſes*, ſome part of the Liquor being contiguous to the open Air, the Weight and Preſſure of the Atmoſphere have ſo great an Effect on them, that their riſing and falling depend more on that than on Heat and Cold, and therefore they will often miſinform us.

Fluidity ſeems to conſiſt in this, that parts of any Body being very fine and ſmall, are ſo diſpos'd by Motion and Figure, as that they can eaſily ſlide over one anothers Surfaces, all manner of ways. It ſeems requiſite alſo, as Mr. *Boyle* obſerves, that they ſhould be variouſly and ſeparately agitated to and fro, and that they ſhould touch one another, but in ſome parts only of their Surfaces. And that learned Gentleman, in his Hiſtory of Fluidity, intimates, that the Conditions requiſite to conſtitute a fluid Body are chiefly theſe three.

1. *Littleneſs of its Parts.* Thus we ſee Fire, by dividing Metals into parts very fine and ſmall, will melt them, and make them fluid.

2. It ſeems requiſite to Fluidity, that there be ſtore of vacant places interſpers'd between the Corpuſcles of the fluid Body; for elſe there will not be room for each Particle to continue its Motion and Agitation on the Surface of the Neighbouring ones. For,

3. The chief Condition requiſite to conſtitute a fluid Body is, That its Particles be agitated variouſly, and apart, either by their own proper Motion, or by ſomething of Subſtance which tumbles them up and down by its Paſſage thro' them. That this Qualification chiefly is requiſite to Fluidity, you may gather from that common Experiment, of putting of Powder of Alabaſter, or of common Plaſter of *Paris*, finely ſifted, in a flat bottom'd Veſſel over the Fire; for in a little time the Powder will boil like Water, and imitate all the Motions of a boiling Liquor; it will tumble variouſly over in great Waves like that, it will bear ſtirring with a Stick or Ladle like that, without reſiſting, as it will do cold; nay, if you ſtir it ſtrongly near the ſide of the Veſſel, its Waves will apparently daſh up againſt the ſides; but yet if you take any of it out, and lay it ſpeedily on a piece of white Paper, you will ſee 'tis nothing but a dry Powder.

So that from hence 'tis plain there is a real difference between a *fluid Body* and a *wetting Liquor*: For not only this boiling Powder, and melted Metals, but the Air, Æther, and even Flame it ſelf, are properly fluid Bodies, tho' not moiſt Liquors.

Dr. *Hook* has a pretty Experiment or two to prove this Account of *Fluidity*, viz. that if a Diſh of Sand ſet on a Drum-head briskly beaten with the Sticks, or on the upper Stone of a Mill, running ſwiftly round, or the (empty) lower one, it will in almoſt all reſpects emulate the Properties of a fluid Body. For a heavy Body will immediately ſink in it to the bottom, and a light one emerge to the top; each Grain of Sand has a conſtant vibrating and dancing Motion; and if a hole be made in the ſide of the Diſh, the Sand will ſpin out like Water.

Solidity or *Firmneſs*, is a Quality of a Natural Body contrary to Fluidity, and appears to conſiſt in the Parts of Bodies being interwoven and intangled one with another, ſo that they cannot diffuſe themſelves ſeveral ways, as Fluid Bodies can.

Mr. *Boyle* deſcribes it to conſiſt principally in this, That the Particles compoſing ſuch Bodies as we call firm or ſolid, are pretty groſs; and either are *ſo much at reſt*, or are ſo intangled one with another, that there is a mutual Cohæſion of their Parts, and that they cannot flow from, ſlide over one another, or diffuſe themſelves every way, as the Parts of Fluid Bodies can; and conſequently the Figure of Firm or Solid Bodies ought rather to be attributed to the Connection of the Parts that compoſe them, than to the Impreſſions of outward Bodies.

And in his Hiſtory of Firmneſs, he proves by Experiments and good Conſiderations upon them, the ſeveral Parts of the above-given Deſcription. As

1. He ſhews the *groſſer Parts* are requiſite to Firmneſs or Solidity, becauſe Minuteneſs he had before prov'd, was neceſſary to the Parts of Fluid Bodies.

2. Reſt alſo and *Juxta-Poſition* of Parts, he demonſtrates by many Experiments, are in a degree abſolutely requiſite to produce this Effect.

3. The Preſſure and Weight of the Incumbent Atmoſphere he judges contributes much towards it, becauſe of the ſtrong Adherence of Two Pieces of Poliſh'd Glaſs, or Marble together, in the open Air, which will immediately ſeparate in the Exhauſted Receiver.

4. The Texture of Bodies, and the Figures of their Parts may contribute much to this Effect, as if they be of an hook'd Form, or any way entangled one in another, they muſt be disjoyn'd with difficulty, and conſequently will be in the form of a Solid.

Rarefaction of any Natural Body, is, when it takes up more Dimenſions, or a larger Space than it did before. There are three ways of explaining of *Rarefaction*.

1. That of the *Ariſtotelians*, who ſuppoſe the ſame Body doth not only obtain a greater Space in Rarefaction, but alſo adequately fill it; and acquires larger Dimenſions, without having either any Pores or Vacuities between its Corpuſcles, or admitting any other Body or ſubtil Matter to be joyn'd with them.

2. That of the *Carteſians*, which was alſo the Opinion of many of the old Philoſophers, who aſſert, That in Rarefaction the Pores of the rarify'd Body are dilated, and repleniſh'd with ſome fine, ſubtil and ethereal Subſtance, which inſinuates it ſelf into the Interſtices between its disjoyn'd Particles.

3. That of the *Atomiſts* or *Vacuiſts*, who ſuppoſe the Parts of the rarify'd Body to be disjoyn'd and remov'd farther from each other, and yet no other Body neceſſarily comes in between them. So that this laſt *Hypotheſis* ſuppoſes a *Vacuum*.

Vacuum is a Space devoid of all Body. This is by Phyſiologiſts diſtinguiſh'd into

Vacuum Diſſeminatum, or *Interſperſum*, i. e. ſmall void Spaces interſpers'd about between the Particles of Bodies. Or,

Vacuum Coacervatum, which is a larger void Space made by the meeting together of the ſeveral interſpers'd or diſſeminate Vacuities before-mention'd.

So that without allowing a *Vacuum*, how can there be any ſuch thing as either Rarefaction or Condenſation? For if all Space is adequately full of Body, nothing can poſſibly take up a greater or leſſer room than it had at firſt; and yet we find by evident Experience, that Air is capable of a very great degree of Compreſſion, and that Water can be rarify'd into Air, or Vapour, and then take up vaſtly larger room than it did before.

Denſity or *Condenſation* of any Natural Body, is when it takes up leſs Space, or is confin'd within leſs Dimenſions than it was before.

Light is us'd to ſignify three Things.

1. That Senſation which ariſes in us from the view of any luminous Object, as the Sun, a Star, or a Candle.

2. It ſignifies the Cauſe of that Senſation in us, as it is an Action or Property exiſting in the luminous Body.

3. By this word ſome underſtand the Action of the *Medium* interpos'd between us and the luminous Object; and others, that the *Train of Rays*, which coming forth from thence, pervades the *Medium* before it can come to affect our Eyes.

Light is undoubtedly produc'd by Motion, but yet it is not every Motion that will produce it. The learned Dr. *Hook* judges the Motion that produces Light ought to have theſe Requiſites.

1. That it be *exceeding quick*, like the Motions of Fermentation and Putrefaction, as you ſee in ſhining Pickles and rotten Wood.

2. It muſt be a *vibrative Motion*, and alſo have its Vibrations exceeding ſhort. This he concludes from the ſhining of Diamonds, when chaf'd or rubb'd.

Colour may be conſider'd two ways.

1. As it is a Quality reſiding in the Body, which is ſaid to be ſo and ſo colour'd, or which does modify the Light after ſuch and ſuch a manner.

2. As more properly, the Light it ſelf which ſo modify'd, ſtrikes upon the Organ of Light, and produces that Senſation which we call Colour.

The *Peripateticks* aſſert Colours to be real Qualities, and inherent in the colour'd Body, and ſuppoſe that Light does only diſcover them, but not any Effect of their Production.

The *Carteſians*, who make the Senſation of Light to be the Impulſe made on the Eye by certain ſolid, but very minute Globules eaſily permeating the Pores of the Air and diaphanous Bodies, derive Colours from the various Proportion of the direct Motion of the Globules, to their Circumrotation round their own Centers; by which means they are qualify'd to ſtrike the Optick Nerve after diſtinct and divers manners, and produce the Perception of various Colours.

Dr. *Hook* ſays, the Phantaſm of *Colours* is caus'd by the Senſation of the oblique or uneven *Pulſe* of Light; and that this is capable of no more Varieties than two, which ariſe from the two ſides of the oblique *Pulſe*; ſo that there is in reality but two ſimple *Colours*, Yellow and Blue; from a Mixture of which, and a due Proportion of Black and White, *i. e.* Darkneſs and Light, all Colours may be produc'd.

Sound ſeems to be produc'd by the ſubtiler, and more etherial Parts of the Air, being form'd or modify'd into a great many ſmall Maſſes or Contextures, exactly ſimilar in Figure; which Contextures are made by the Colliſion and peculiar Motion of the ſonorous Body, and flying off from it, are diffus'd all round in the *Medium*, and there affect the Organ of our Ear in one and the ſame manner.

Sir *Iſaac Newton* demonſtrates, That Sounds, becauſe they ariſe from the tremulous Motion of Bodies, are nothing elſe but the Propagation of the Pulſe of the Air. And this he ſays is confirm'd by thoſe great Tremors that ſtrong and grave Sounds excite in Bodies round about, as the ringing of Bells, noiſe of Cannon, &c.

Taſte is probably caus'd by the Salts that are in Bodies; which according to their various Configurations, affect the Tongue as variouſly; and either communicate a grateful or unpleaſant Senſation to the Brain.

Smell is either the Diſpoſition of the Body, or the Senſation occaſion'd by the *Effluvia* of odorous Bodies mingling themſelves with the Air, and entring up the Noſtrils, inſinuate themſelves into the Proceſſes of the Olfactory Nerve; and according as this is differently mov'd, ſo it either produces a ſweet or ſtinking ſmell.

Gravity is that Quality by which all heavy Bodies, towards the Center of the Earth, accelerate their Motion as they come nearer towards it. And this admirable and univerſal Law of Nature, is that which, generally ſpeaking, keeps all Bodies in thoſe Places and Stations, which they are deſign'd for.

About the Cauſe of this great and catholick Affection of Matter, there have been various Sentiments.

1. *Ariſtotle* will have all earthly Bodies, by a natural Inclination, tend towards the Center of the Earth, as to their proper Place: But it has been prov'd over and over, that there is no ſuch thing as *poſitive* or *abſolute Gravity* or *Levity*.

2. *Copernicus* aſſerts Gravity to be an innate Principle in all the parts of Matter, when they are by any means ſeparated from their Wholes, to reduce themſelves thither the neareſt way, or in right Lines.

3. *Gaſſendus*, *Kepler*, and many others, define Gravity to be a motion impreſs'd on all Bodies,

dies, by a certain Magnetick Attraction of the Earth or Globe, to which any Body deſcends.

4. *Deſcartes* ſuppoſes the Particles of the Celeſtial Matter, by being reflected from the Surface of the Earth, and conſequently aſcending up again from thence, to drive down into their places the Terreſtrial Bodies which they find above them.

5. The learn'd Mr. *Halley*, owns Gravity to be an Effect inſolvable by any Philoſophical Hypotheſis, and modeſtly and religiouſly reſolves it into the immediate Will of our All-wiſe Creator; who by appointing this Law thro' all the material World, keeps all Bodies in their proper Places and Stations, which without it would ſoon fall to pieces and be utterly deſtroy'd.

6. Sir *Iſaac Newton* obſerves very well, that of all Bodies conſider'd within the Confines of any Fluid, there is a two-fold *Gravity*; the one *True* and *Abſolute*, the other *Apparent* and *Vulgar*, and *Comparative*.

Abſolute Gravity is the whole force by which any Body tends downwards; but the *Relative* or *Vulgar*, is the Exceſs of Gravity in any Body above the ſpecifick Gravity of the Fluid, whereby it tends downwards more than the ambient Fluid does.

In reference to *Abſolute Gravity*, the parts of all Fluids, and all Bodies, do really gravitate in their proper Places; and therefore by their joynt Weights do make the weight of the whole.

The latter kind of *Gravity* is ſuch, that in reference to it, Bodies do not gravitate in their Places, or rather do not, when compar'd one with another, pre-gravitate; but by hindering one another in their mutual Endeavours to deſcend, do remain in their proper Places, all one as if they were not heavy at all.

The Notion of Weight among the Vulgar, is only the Exceſs of any Bodies weight above the Air. And conſequently they account thoſe things to be *light*, which being leſs heavy than Air, are ſupported by it, or buoy'd up in it. Whereas theſe *comparatively* light Bodies are not ſo *really*, ſince, *in Vacuo*, it has been found by Experiment, that they deſcend as faſt as other heavy Bodies do in the Air.

Magnetiſm, or *Magnetical Attraction*, is effected, ſay they, by the *Effluvia* of each Body, which drive away the Air between the Iron and the Stone; ſo that the Union of the Stone and Iron is occaſion'd by the joynt Protruſion or Pulſion of the Air behind each. But this Opinion is plainly refuted by Mr. *Boyle*'s Experiment of a Loadſtone's being equally vigorous and attractive in the exhauſted Receiver, as in the open Air.

Sturmius obſerves that the attractive Quality of the *Magnet* has been taken notice of beyond all Hiſtory. But that it was our Country-man *Roger Bacon*, who firſt diſcover'd the *Verticity* of it, or its Property of turning towards the Pole, and this about Four Hundred Years ſince. The *Italians* firſt diſcover'd that it would communicate this Vertue to Steel or Iron. The various Declination of the Needle, under different Meridians, was firſt diſcover'd by *Sebaſtian Cabott*; and its Inclination to the nearer Pole by our Country-man *Robert Norman*. The *Variation* of the *Declenſion*, ſo that 'tis not the ſame always in one and the ſame place, he obſerves was taken notice of but a few Years ago by *Hevelius*, *Auzout*, *Petit*, *Volikamer*, and others.

The *Magnet*, or *Loadſtone*, is a Foſſil approaching to the Nature of Iron-Ore, and endow'd with the Property of attracting Iron; and, of both pointing it ſelf, and alſo enabling a Needle touch'd upon it, and then pois'd, to point towards the Poles of the World.

The particular part of Natural Philoſophy conſiders the *World*, which is divided into *Heaven*, *Air*, and *Earth*. The Conſideration of the *Heavens*, with its Motions, and that of the Stars, is the Object of *Aſtronomy*.

The *Air*, or the *Atmoſphere*, in which we breath, is a diaphanous, compreſſible, and dilatable fluid Body, covering the Earth and Sea to a great height above the higheſt Mountains, and differs from the Æther; among other things, in this, that it refracts the Rays of the Moon and other remoter Luminaries. Dr. *Hook* ſeems to think the Air to be nothing elſe but a kind of Tincture or Solution of Terreſtrial and Aqueous Particles diſſolv'd in, and agitated by the Æther; and theſe Particles he ſuppoſes to be of a ſaline Nature.

The weight of the *Air* was firſt diſcover'd by the great *Gallilæo*, who finding that Water by pumping could not be rais'd higher than Thirty-four or Thirty-five Feet, concluded that the Notion of an infinite *fuga vacui* could not do in this place; and therefore happily fell on thinking of the Counter-balance of the Air's Weight, which *Torricelli* afterwards purſu'd and improv'd; inventing as a farther Proof of the Notion of the Gravity of the *Air*, that which we call the *Torricellian Experiment*.

The *Air-Pump* is an Engine to exhauſt *Air* out of proper Veſſels. Mr. *Boyle* owns he had the firſt hint of it from *Schottus*, who had publiſh'd it to the World; but Mr. *Boyle* had not ſeen the way that one *Otto Gerick*, Conſul of *Magdeburgh*, had found to evacuate Glaſs-Veſſels, by ſucking out the *Air* at the Mouth of the Veſſel plung'd under Water. But this Engine being very defective in many reſpects, Mr. *Boyle* directed one Mr. *G*——; and Dr. *Hook*, to contrive a newer and better *Air-Pump*, which Dr. *Hook* effected. But the Deſcription of it being ſo very long, and it being ſo well known, we ſhall omit it here.

The Place of *Meteors* is the Air; which, according to the Opinion of Dr. *Woodward*, are in a great meaſure of a Mineral Nature. For he ſuppoſes that *Thunder* and *Lightning*, and other fiery Compoſitions, are form'd out of ſulphureous, nitrous, and other active Mineral Particles.

The *Earth* may be conſider'd either as to its exterior, or inward Parts. The exterior Parts of the *Earth* is either that which is properly call'd ſo, or the Water. The Surface of the *Earth* is the immediate Object of *Geography*.

The *Water* is either that great Conflux of it which is call'd the *Sea*, or *Springs* and *Fountains* from whence proceed Rivers.

The moſt amazing *Phænomenon* of the *Sea*, is the Ebbing and Flowing of it, uſually ſpecify'd by that one Word *Tide*; there having been ſeveral *Hypotheſes* fram'd to ſolve this Difficulty, but the beſt of the Theory of the Tides is that extracted from Sir *Iſaac*

Newton, by that moſt Excellent Mathematician, Captain *Halley*. The Principle upon which this Author proceeds to explain the Surprizing Appearances of Nature, is no other than that of *Gravity*; that this Principle of *Gravity* agrees to the *Sun* and *Moon*, and that the Earth is within the Activity of their Attractions; ſo that upon this Account the Equality of the Preſſure of Gravity towards the Centre will be diſturb'd; and tho' the Smallneſs of theſe Forces, in reſpect of the Gravitation towards the Earth's Centre, make 'em altogether imperceptible by any Experiment we can diviſe, yet the Ocean being a Fluid Body, yielding to the leaſt Force, by its riſing Shews where it is leaſt preſs'd, and where it is more preſs'd by its ſinking; and this is the Cauſe of the Ebbing and Flowing of the Sea.

Concerning the Origin of *Springs* and *Fountains*, there is much Diſpute, eſpecially of ſuch as are found on the Tops of High Mountains.

Some, as Dr. *Hook* and Dr. *Plott*, and many others, think that they ariſe from Sea-Water percolated thro' the Bowels of the Earth, which by that means being depriv'd of its Salt, is render'd much lighter than before, and ſo is capable of riſing to the Height we commonly find Springs at, as Water riſes in a Filtre, or very ſmall Tubes.

The Learn'd Captain *Halley* ſuppoſes them to be caus'd from the Vapours exhal'd by the Sun out of the Sea.

The Ingenious Dr. *Woodward*, in his Natural Hiſtory of the Earth ſuppoſes That the great Abyſs of Waters, plac'd in the Bowels of the Earth, is the Standing Fluid, or Promptuary, which ſupplies Water to the Surface of the Earth, and furniſhes as well Springs and Rivers, as Vapours and Rain.

In the interior Parts of the Earth are found *Metals* or *Minerals*, which are hard Bodies dug out of the Earth, being part of a metalline, part of a ſtony Subſtance, and ſometimes with ſome Salt and Sulphur intermix'd with the other.

Of the *Carteſian Philoſophy.*

NONE of all the Modern Philoſophers have made ſo much Noiſe in the Learn'd World as *Des Cartes*: He had a Great Genius for Philoſophy, which diſcover'd itſelf at the Schools, but broke out with greater Vehemence, when after having been diverted by Arms he retir'd to *Holland*, where at *Egmond* he was 25 Years forming his Syſtem. To what was ſaid at the Firſt Appearance of this Undertaking, will be added ſome few Obſervations on this Famous Author.

He calls his Book the *Principles* of *Philoſophy*, which he has divided into Four ſeveral Parts.

The Firſt concerns the *Principles* of *Humane Knowledge*, wherein he ſhews, that they who enquire after Truth, muſt once doubt of every thing in the World, even of *Senſible Things*, and *Mathematical Demonſtrations*.

Of *Senſible Things*, becauſe we find the *Senſes* often err; and alſo becauſe in our *Dreams* we often think we ſee thoſe things which neither are, nor ever were; and there are no certain *Signs* to a Man thus doubting, whereby he can diſtinguiſh *Sleeping* and *Waking*.

Of *Mathematical Demonſtrations*, becauſe we can have no Certainty of the Truth of our *Faculties*: But that we our ſelves really are he proves, becauſe we *Think*; for even our *Doubting* or *Thinking* neceſſarily ſuppoſes or implies ſomething that do's *doubt* or *think*.

And hence he infers, That our *Minds* are more cognoſcible or obvious to our *Knowledge* than any *Subſtance or Body*; becauſe by their Help and Aſſiſtance it is, that we come to underſtand *Bodies* with all their *Notions* and *Affections*, and the more we learn of the Nature or Being of our own *Minds*.

Nor can we (as he ſays) having *finite Minds*, judge or comprehend any thing rightly concerning *Infinity*. And hence it is, that we are always at a Loſs about Infinite Extenſion of *Body* or *Space*, and Infinite Diviſibility of *Matter*; and hence he wou'd teach us to diſtinguiſh betwixt *Infinite* and *Indefinite*. He concludes his *Firſt Book* of *Principles*, with ſhewing the Principal Cauſes of all *Errors*, which he reduces to theſe Four:

1. The Firſt are the Prejudices of our *Infancy*, before we come to the Right Uſe of our *Reaſon*.

2. The Second Cauſe of *Error* is, becauſe we can't forget or drive out of our *Minds* thoſe Prejudices.

3. The Third is, That we weary and buſie our ſelves in attending to thoſe things that are not preſent or obvious to our *Senſes*; and ſo we do not judge of them from our own *Perception*, when preſent; but from a former conceiv'd *Opinion* or *Imagination*.

4. The Fourth and Laſt [Cauſe of *Error* is, That we tie our Conceptions to *Words* and *Terms*, which do not rightly and juſtly anſwer the Nature of Things.

His *Second Part* of *Philoſophy* treats of the Principles of *Material Things*.

Here he proves the Exiſtence of *Things Material*, or ſuch as are without us, becauſe they do affect our *Senſes*. Now we can't make our ſelves perceive one Thing more than another, ſo that this Affection of our *Senſes* muſt needs proceed from the *Things* themſelves, and conſequently thoſe *Things* muſt be.

He places the Nature or Eſſence of *Matter* in its *Extenſion*, and not in any other of its Affections; and hence takes occaſion to ſhew the Prejudices which we commonly have of *Rarefaction* and a *Vacancy*.

His Notions of *Place* and *Motion* are alſo new; to which he adds (after he has ſpoken of *God* as the *firſt Cauſe* and *Mover* of all Things) the *Laws* of *Nature*. And in ſhort, in this Book of his *Princi-*

ples he ſhews what it is that in *Ariſtotle's Philoſophy* is call'd, The *Affections of Body in general.*

His *Third Part* treats of the *Viſible World*, and of its ſeveral Parts.

He places the *Sun* in the *Center*, and ſuppoſes all the reſt of the *Planets* to be mov'd about it.

And according to this *Hypotheſis* he ſolves all the ſeveral *Phænomena* of the *Earth*, the *Planets*, *fix'd Stars*, and the like.

Afterwards, for the Expoſition of the *Phænomena* of *Nature*, he aſſumes certain *Principles*; to wit, That one Part of the *Matter* or *Subſtance* of the *Heavens* conſiſts of many little Particles, and theſe he calls his *Globuli*. And then about theſe *Globuli*, or little Parts, he places another *Matter*, whoſe Parts are much leſs, and much more fluid; and theſe he calls his *Materia Subtilis*, which fills up the *Corners* or *Spaces*, as he ſuppoſes, amongſt his *Globuli*. And then he ſuppoſes ſome other Parts of *Matter*, whoſe *Figures* are not ſo apt or fit for Motion; and theſe he calls his *Particulæ Striatæ*. And out of theſe Three, as out of ſo many *Elements*, he ſuppoſes all *Bodies* to be made.

According to this Suppoſition he expounds the Nature of *Light*, and how it is diſpers'd by the *Sun*, and the reſt of the *Luminary Bodies*; as alſo the Nature of the *Comets*, with their Motions.

He aſſigns every *Star* and *Comet* its ſeveral *Vortex* or *Whirlpool*; and according to that Suppoſition, he demonſtrtes their *Spots* and *Changes*.

According to his own *Principles*, he ſhews how all the *Bodies* might at firſt be generated; and gives an Account of their ſeveral *Changes* and *Revolutions*, together with the Reaſon of the Equality of thoſe *Motions* which are found in all *Bodies*.

His *Laſt Book* of *Principles* contains a Diſcourſe of the *Earth* and *Sea*, with the Nature of the ſeveral Bodies therein. And here he gives you his Notion of *Gravity* and *Levity*, and tells you why *Bodies* are not *heavy*, according to his, as well as *Ariſtotle's Hypotheſis*, in their own natural places. How it comes to paſs, that *heavy Bodies* tend towards the *Center* of the *Earth*, whence proceed the *Flux* and *Re-flux* of the *Sea*, and how it comes to differ upon ſeveral Shores, and the Reaſon that there's none in *Pools*, *Lakes*, and *ſtanding Waters*.

He treats alſo in this Book of *Heat*, *Vapours*, *Spirits*, *Exhalations*, and the *Saltneſs* or *Freſhneſs* with the different Taſtes of *Water*.

He treats likewiſe of *Metals* and *Minerals*; of *Fire*, and *Combuſtible Bodies*; of the Motion of *Nitre*, and the ſpreading of *Gunpowder* when ſet on fire; of the *Load-ſtone*, and how it is that it draws *Iron* to it; as alſo of the Attractive Power of *Jet*, *Amber*, and ſuch like *Bodies*.

And in the Latter End of this Book, he diſcourſes of the *Senſes* both External and Internal; wherein his *Notions* are all New and Curious. And indeed the Deſign of *Philoſophy* being principally to quicken and perfect the *Judgment*, this of his being of a more fine and ſublime Nature than that of *Ariſtotle's*, and the other Old *Philoſophers*, muſt certainly very well deſerve Reading, eſpecially ſince (as he tells us) he has omitted nothing in *Nature* (yet excepting thoſe Things which *Philoſophers* in former times us'd to call *Occult Qualities*) of which he has not given an Account, or at leaſt laid down ſuch *Principles* in his Diſcourſes upon other Subjects, that any of thoſe may eaſily be ſolv'd by them.

And whereas ſome may poſſibly think his *Hypotheſis* (eſpecially about the *Creation*, wherein *Moſes* is very particular) may ſeem to be different from all receiv'd Doctrines of the *Church*, he vindicates his Opinions with ſo much Deference for Revelation, that 'tis plain he wou'd have no Man ſcandaliz'd by them.

We know very well that this will be thought a Short and Imperfect Account of the *Carteſian Philoſophy*, but having introduc'd moſt of his Eſtabliſh'd Principles in our *Natural Philoſophy*, we did not think it neceſſary to add more in a Place where we are crowded ſo much for Room. However, we ſhall give the Reader what *Rapin* ſays of this Great Philoſopher, by whoſe Judgment he may ſafely form his own. “*Deſcartes* is one of the moſt Extraordinary Wits that has appear'd in theſe Latter Ages, of a Fertile Invention, and a Profound Meditation. The Thread of his Doctrine is finely drawn out; the Method, according to his Principles, exactly contriv'd; and his Syſtem, tho' partly Ancient and partly Modern, as has been already obſerv'd elſewhere, very well put together. Indeed he inclines too much to Scepticiſm, and is a very ill Pattern for thoſe who are naturally of an incredulous Temper. In a Word, he is an Original and Ingenious, but muſt be examin'd a little before he is believ'd: His Doctrine gain'd Followers by Shoals, to the great Diſcredit of *Ariſtotle's*; and his Diſciples deſir'd to ruine the Authority of the latter only to build up that of *Deſcartes*, whoſe Syſtem of Phyſicks is altogether new; and as we have taken notice in the foregoing Pages what he did not pretend to impoſe on the World as Infallible. He was very perplex'd in his Expreſſions, ſometimes affecting, like his Brother Philoſophers, a certain Myſtery which they ſuppoſe will procure a Reverence from the People. He gives alſo perplex'd Anſwers to the Queſtions he has propos'd which keeps the Reader ſtill in Difficulty. *Rohault*, who pretended to render him more Intelligible by a new Explication of his Phyſicks, has robb'd him of Part of his Beauty, by giving him a more eaſy and familiar Turn. His Admirable Genius ſeems to have been pleas'd with nothing ſo much as with the Pains and Difficulty of being apprehended: His Obſcurity has a Venerable Myſterioufneſs in it; and 'tis *Rapin* who ſays it, *His Character of Incomprehenſible is the moſt Charming Quality that attracts the Admiration of his Diſciples.*

We have mention'd in our Eſſay on Logick, ſomething taken out of a Manuſcript of *Deſcartes* by *Meſſieurs de Port Royal*: He had written a Logick but never finiſh'd it; and tho' this Account of him relates only to his Philoſophy, yet we ſhall add what our Jeſuit tells us of his Performances in the Art of Thinking alſo. Some Fragments of his Treatiſe are ſtill in the Hands of his Diſciples under this Title of *Erudition*. There are ſome Strokes of Logick in his Method, where he tells us that the Mind of Man being Finite, it ought to begin with the Conſideration of Simple Objects, and then gradually to accuſtom itſelf to the Knowledge of Compound Things, and the Art of diſtinguiſhing them from each other. He ſays if we wou'd make a Right Diſcernment between Truth and Falſhood, we muſt diveſt our ſelves of Prejudices by learning firſt to doubt of all Things. Father *Rapin* calls this Principle, *I think therefore I am*, cited by the *Port Royal*, a Frivolous Repetition. After all, continues our Author, he is the beſt Notionaliſt of all the Moderns; what he delivers, how new ſoever, is not ill conceiv'd, but diſcovers that Depth of Meditation which was his peculiar Excellence. But nothing is more Immethodical than his Diſcourſe of Method; 'Tis a Medley of Morality, Phyſicks, and Metaphyſicks, that ſcarce aſſerts or eſtabliſhes any one Doctrine; yet we find in it ſome Marks of Sincerity, which ſhew us the True Character of his Genius, eſpecially where he makes that very Ingenious Confeſſion, *That the only Advantage to be acquir'd by Philoſophy, is the Art of Speaking probably of all Things, and of raiſing the Admiration of ſuch as know leſs than our ſelves.* This ſmall Digreſſion ſo nearly relating to *Des Cartes*, and not a little to Philoſophy, will be the more excuſable.

As to *Des Cartes*'s Phyſicks, the Critick, who has been ſo uſeful to us in our Philoſophical Eſſays, goes on to this Effect. We muſt acknowledge his Syſtem of Natural Philoſophy to be one of the moſt Subtle and the moſt Accompliſh'd that have been Publiſh'd by the Moderns: That he has ſome very Curious and Fine Conceptions, and that upon a nearer View his Theory will appear to be more regular and conſiſtent than that of *Galilæo*. He exceeds *Gaſſendus* in Point of Novelty and Invention: His Syſtem is well digeſted and put into an agreeable Order: His Method is entirely Geometrical, proceeding from Principle to Principle, from Propoſition to Propoſition, *But*. It will, as we have obſerv'd, be always ſo where we have to do with Criticks, and the preſent *But* is a very dreadful one againſt *Des Cartes*. *But* let us conſider in what Reſpects he is liable to Cenſure; His Principles of Nature are *Motion*, *Figure*, and *Extenſion*, very little different from thoſe of *Democritus* and *Epicurus*. There goes a Pleaſant Story that Father *Marſennus*, who was his Reſident at *Paris*, having declar'd in a Meeting of Learn'd Men, that *Des Cartes*, whoſe Character was already pretty well eſtabliſh'd by his Geometry, was upon a Project of Phyſicks, in which he admitted a *Vacuum*, the Deſign was rail'd at by *Robertval* and others, who judg'd from hence that it could contain nothing extraordinary, upon which Father *Marſennus* wrote to *Des Cartes* to let him know a *Vacuum* was not modiſh at *Paris*; and this oblig'd him to find out ſome ſort of Temperament, and ſome way of Compounding with the Modern Naturaliſts, whoſe Approbation he much Courted. And in order to this to admit the *Plenum* of *Leucippus*, and thus his Excluſion of a *Vacuum* was owing to a Principle of Politicks. The Reader will ſee how we are treated, indeed how whole Nature is treated by the Philoſophers, that we are to believe or diſbelieve Things; that Nature muſt be black or white, according as it conſiſts with their Reputations. *Gaſſendus* put him under new Difficulties by giving him to underſtand, that without a *Vacuum* his Principle of Motion wou'd be abſurd and impoſſible, becauſe nothing can move in an abſolute *Plenum*. To remedy this Inconvenience, *Des Cartes* invented his Subtle Matter, which ſerv'd him for a good Expedient in many Exigencies, and was a Salvo for the Doctrine, either of a *Vacuum* or a *Plenum*, as he had occaſion to make uſe of them. But this *Plenum* and this Subtle Matter being added only as a Shift, and in Compliance with the Humour of the Age, *Des Cartes*'s Syſtem was left very weak and unguarded in the whole Doctrine of Motion, which is one of his main Principles. For he tells us, That all the Motion now in the World was Created at the Beginning of Things; and that there's no new Motion produc'd, but the old communicated and tranſmitted from one Body to another: That the Impulſion of Subtile Matter is the Cauſe of all Gravity or Levity in Bodies: That the Acceleration of Heavy Bodies in their Motion towards the Center, proceeds from the ſame Impulſion: That Heat is nothing but the Motion of the Particles of the Air, agitated by the Subtile Matter, which is the *Fac Totum* of the *Carteſian Phyſicks*: That the Vegetation of Plants and Generation of Animals are caus'd only by the Fortuitous Motion of Little Particles; as if Stones by a Chance Leap ſhould range themſelves into an Orderly and Beautiful Palace. We may here again perceive the Vanity and Ingratitude of Humane Science, which is apt to make any thing the firſt Mover, rather than God the Author of Life, Motion, and Univerſal Nature. How natural is it for their Proud and falſe Judgments to give into any thing that brings the Origin of Things to their Senſes? and how ridiculous is it in them to be willing rather to owe their Being to a Dance of Atoms, than the Forming Wiſdom of the All-Wiſe Creator? How *Des Cartes* hangs after *Epicurus*, and how loath are Chriſtian Philoſophers to be oblig'd to Revelation for Things which they imagine within the reach of this Exalted Reaſon, which perhaps never got out of the *Atmoſphære* with Certainty, but when ſhe was guided by Experiment. *Des Cartes* further aſſerts, That Brutes are utterly deſtitute of all Senſation: That the Tokens which they ſometimes diſcover of Joy, Friendſhip, Averſion and Grief, with all the Impreſſions of Pleaſure or Pain, are but the Reſult of Certain Springs that play in the Machine according as the Matter is diſpos'd: That Heat is not in the Fire, nor Hardneſs in the Marble, nor Moiſture in the Water; but that all this is in the Soul, which by Thought and Reflection finds the Fire to be hot, the Marble hard, and the Water moiſt, and by no means in any ſuch Qualities which are meerly Fictitious. He inſiſts upon it, as we have ſaid before, as a Preliminary that we ſhou'd doubt of all Things, ſhut up all our Lights, diveſt our ſelves of all our preconceiv'd Opinions, of Cuſtom, Education, Senſe, Judgment, and all other Impreſſions whatſoever; and all this, that we may arrive at ſome little and ſcanty Notions of Things, by which he makes his Promiſes vaſtly diſproportionable to his Demands, when in order to the explaining the Nature of Things, he ſays they are caus'd by a Certain Figure, a Certain Motion, and a Certain Exiſtence, he has ſaid all that he can; for he never goes into the Depth of a Subject. His *Hypotheſes* of the Loadſtone, with thoſe little Hook'd Bodies, is Arbitrary and Groundleſs: His Account of the Ebbing and Flowing of the Sea, by the Impreſſion of the Moon's Atmoſphere is found to be falſe: Thoſe Parts of the Water that are ſubject to the

Lunar Body, being indeed raiſ'd, and not as he conceives, depreſs'd. His Explication of the Motion of the Soul in the ſeveral Paſſions, by that Conjunction of the Nerves and Fibres terminating in the *Glandula Pinealis*, is pure Chimæra, there being really no Nerves that terminate in that Gland. On the Nature of Sounds, he advances nothing that looks like a Rational Conjecture. In a word, he may not unfitly be reſembled to thoſe *Pythagoreans* mention'd by *Ariſtotle*, who were leſs ſollicitous to render the true Reaſon of Things, than to reduce all to their own Principles and Syſtems; yet as he aim'd rather at the Oſtentation of Wit, than the Diſcovery of the Truth, his Phyſicks may afford ſome ſort of Satisfaction to thoſe who are moderate enough to take up with Probabilities. However, we can by no means defend the Haughtineſs of ſome of his Diſciples, who treat all other Philoſophers as meer Idiots; becauſe, according to our Author, *They themſelves have had the Fortune to make ſome Noiſe by repreſenting Philoſophy under a new Dreſs*, as Novelties are always agreeable and ſurprizing.

The Reader will not accuſe us of Partiality, when he remembers that we have taken only what one *French-man* ſays againſt another, and all of that Nation are known to be particularly Partial to themſelves, and in their own Favour, whenever Religion or Arbitrary Power are not concern'd. He therefore may truſt us in this Caſe; and if he can truſt *Pere Rapin*, he will form a Judgment which will not pleaſe the Diſciples of *Des Cartes*, who Idolize their Maſter. This Jeſuit has another Charge againſt him, telling us the *Carteſian* Phyſicks do not advance Thought and Spirit above the Pitch of external Senſe, and go no higher than the Body to explain the moſt refin'd and exalted Operations of the Soul. Againſt which Principles Dr. *More*, whom he calls an *Engliſh* Profeſſor, has written with good Reaſon. Dr. *More*, ſays *Rapin*, in his late Treatiſe of Metaphyſicks, has invalidated all the New Reaſonings made uſe of by *Des Cartes* to prove the Exiſtence of a God, and conſequently has ruin'd a great part of his Metaphyſical Speculations. But what is ſtill more ſevere, he will ſcarce allow *Des Cartes* to have any ſenſe of Religion, but maintains that his Phyſicks are as looſe and libertine as thoſe of Mr. *Hobbs*. The *Carteſians*, who are very Nice, as to the Credit and Honour of their Philoſophy, have occaſion to ſhew their Zeal againſt this Author, by juſtifying their Doctrine, and vindicating the Reputation of their Maſter. For 'tis a moſt unhappy Spirit of Philoſophy, far from the Genius of a Chriſtian, to refine upon the Knowledge of the Creature, and to be weak and doubtful as to Faith in the Creator; which Reflection, naturally brings us to treat of that which cloſes *Rapin*'s Philoſophical Reflections.

Reflections on the Uſe of Philoſophy in Religion.

REASON being the firſt Inſtrument Religion uſes in eſtabliſhing its Laws, it makes Philoſophy uſeful in Religion. For Reaſon cannot well be ſet to work but by Philoſophy, which ſupplies it with Principles, and reduces it to Method and Order. *Lactantius* ſays, Philoſophy is of great Advantage to a Man, if his Mind be firſt ſeaſon'd with Religion. When Humane Reaſon has once ſubmitted to Divine Faith, Faith, notwithſtanding the Privilege of its Divinity, is pleas'd to uſe the Service of Humane Reaſon, that by this means Reaſon it ſelf may be brought more fully under Subjection to the Obedience of Faith: But Faith cannot be entirely pure and uncorrupted, unleſs Philoſophy, which is the Inſtrument of Faith, be alike free from Impurity and Corruption. For from reading of corrupt Syſtems, the Faith of many have been perverted. The *Valentinian* Hereticks from the School of *Diogenes* and *Epicurus*, the *Gnoſticks* from *Plato's*, the *Manichees* from *Pythagoras's*, the *Marcionites* from *Zeno's*, *Manes* from a *Saracenical* Philoſopher, the *Pelagians* from the *Stoicks* alſo. *Alphonſus*, King of *Caſtile*, came to ſuch an height of Impiety, by converſing with *Arabian* Philoſophers, as to Cenſure the Works of God, and Criticize on thoſe of Nature. *Agrippa* debauch'd his Underſtanding by reading *Porphyry*, *Proclus*, and *Pleſſius*. *Servetus* and *Socinus* grounded their impious Innovations in Religion on Philoſophical Notions. And what our Jeſuit cannot omit, and for which perhaps he has not been at all tender in his Critick on the *Carteſian* Philoſophy, *Des Cartes* got ground in the North, becauſe he favour'd *Calviniſm*, and attack'd the Contradictions in Tranſubſtantiation by ſome Parts of his Syſtem. If ſo, he is ſtill nearer Perfection than he makes him to be. Wherefore, if we would regulate the Uſe of our Reaſon by Philoſophy, we muſt firſt learn to eſtabliſh the Uſe of Faith; we muſt be Chriſtians before we can pretend to be Philoſophers; we muſt make Religion our chiefeſt Philoſophy, and higheſt Wiſdom; whatſoever is not conformable to the Goſpel, leads to Error and Diſorder. The Doctrine of *Plato* or *Ariſtotle*, of *Gaſſendus* or *Des Cartes*, is to be valu'd no farther than it recognizes the Truths of Religion, which ought to be the firſt and chief Philoſophy. When Truth has once convinc'd a Man of the Falſeneſs of thoſe Lights that glitter'd in Pagan Philoſophy, it then teaches him to forbear reaſoning upon ſuch things as God has not ſubjected to his Deciſion; it informs him how much better it is, not to know that which God has remov'd from our Comprehenſion, and with humble Ignorance to adore thoſe Myſteries which he has not been pleas'd fully to open to us, than to pretend to fathom this great Abyſs of Light by the raſhneſs of our Conjectures, and the imperfect Views of our Reaſon.

After Reaſon has been taught to keep its proper Place, and ſubmit to Revelation, Philoſophy, which is its Rule and Guide, may aſſiſt it in uttering its Conceptions. This is the firſt Uſe of Philoſophy in Religion. The *Ariſtotelian* Method was introduc'd by theſe Fathers of the Church, *Anatolius*, Biſhop of *Laodicea*, St. *Jerom*, St. *Auſtin*, *Theodoret*, *Didymus* of *Alexandria*, as alſo by *Boetius*, and others. The School-men follow'd it. The Univerſity of *Paris*, in the Year M DC XI. ſolemnly reviv'd and reinforc'd that Ancient Rule, which oblig'd the Profeſſors ſtrictly to teach the *Ariſtotelian* Philoſophy. Beſides thoſe Terms, and that Method of Reaſoning which Religion may derive from Philoſophy, as the Rule of its Thoughts and the Organ of its Words, it may from that Store be furniſh'd with Arguments and Notions to arm its Defendants, and diſarm its Oppoſers. It may alſo add Weight and Authority to thoſe Teſtimonies upon which Religion eſtabliſhes its Maxims, may aſſiſt in pulling off the various Maſks and falſe Appearances of Error. But the Terms, the Method and Reaſonings with which Religion is ſupply'd from Philoſophy, would ſtill be inſufficient for its uſe, if it did not farther derive from the ſame Aſſiſtance an exactneſs of Perception and Judgment, ſuch as prepare the Mind to admit the Light of Faith, by the Light of Natural Senſe, which is the firſt Foundation of all the Workings of the Soul. An Ancient Father lays it down as a Maxim, That the only true Philoſophy muſt conſiſt in Reflection upon Eternity. 'Twas the great Study of the firſt Chriſtian Philoſophers to inquire into that ſupream Truth which is the Source and Origin of all other Truths. They dedicated their Philoſophy to the Service and Support of their Faith, by refuting the Calumnies of the Pagan Teachers. 'Twas thus *Tertullian* expreſs'd his Zeal in his admirable Apology; in which, among other Reaſons, inſpir'd by ſo juſt a Cauſe, one that he principally inſiſts upon, was the Life of Chriſtians; that Life ſo pure, ſo holy, ſo rais'd above Senſe, that diſintereſted Fidelity, that noble Charity which animated all their Actions. In a word, he alledg'd the Innocence of their Practice, as the moſt lively Teſtimony to the Holineſs of that Religion which they preach'd. *Origen* proves the Truth of Chriſtianity by the Divinity of our Lord, obſerving that no Exception can be made againſt Jeſus Chriſt, which will not lie againſt *Moſes*; for Chriſt cannot be, as he certainly is, the End and Accompliſhment of the Law, without being at the ſame time the ſtrongeſt Proof and Confirmation of the Authority of the Legiſlator; and unleſs we ſuppoſe the Truth of his Miſſion, we muſt give up the Law and the Prophets. St. *Hippolytus* urges another ſort of Reaſon, You are unable to conceive the Formation of your own Nature, and would you preſume to comprehend the eternal Generation of the Son of God? The falſeneſs of Idols, and ridiculous Vanity of Pagan Worſhip, is the Argument upon which St. *Cyprian*, *Arnobius*, *Lactantius*, &c. eſtabliſh'd the Truth of our Religion. The Roman Catholicks are fond of the *Ariſtotelian* Philoſophy, becauſe there's more Subtlety than Subſtance in it, and it helps them to evade ſome Truths to puzzle others, and colour their own Falſhoods. The Proteſtants, whoſe Religion is founded on the Holy Scriptures, want none of thoſe Shifts; and the Proteſtant Philoſophers, at leaſt out of the Schools, have generally fall'n into a newer and more convincing Philoſophy, as well as Logick; Reaſon prevails, Sophiſtry is expos'd, and Truth triumphs. Let the Papiſts keep to their Peripatetick and School-men; we ſhall have as ill Opinion of their Philoſophy, as of their Religion, and be no ſooner convinc'd by their Reaſoning, than by their legendary Miracles, the ſhame of reaſonable Creatures.

ARITHMETICK.

ARITHMETICK.

ARITHMETICK is a Science by which we come to know what Number of Quantities there are (either Real or Imaginary) of any kind, contain'd in another Quantity of the ſame Kind. Now this Conſideration is very different from that of *Geometry*, which is only to find out true and proper Anſwers to all ſuch Queſtions as demand how *long*, how *broad*, how *big*, &c. But when we are to conſider either of more *Quantities* than one, or how often one *Quantity* is contain'd in another, then we have Recourſe to *Arithmetick*, which is to find out true and proper Anſwers to all ſuch Queſtions, as Demand how *many*, what *Number* or *Multitude* of *Quantities* there are. In a Word, the Subject of *Geometry* is that of *Quantity*, with reſpect to its Magnitude only, and the Subject of *Arithmetick* is *Quantities* with reſpect to their *Number* only.

From this General Idea of it we come to a Particular. *Arithmetick* therefore, or the Art of *Numbring*, is divided into Three diſtinct Parts, Two of which are properly call *Natural*, and the Third *Artificial*.

The *Firſt* being the moſt *Plain* and *Eaſy*, is commonly call'd *Vulgar Arithmetick* in Whole Numbers, becauſe every *Unite* concern'd in it repreſents ſome whole *Quantity* of ſome Species or Thing propos'd.

The *Second* is that which ſuppoſes an *Unite* (and conſequently the *Quantity* repreſented by that *Unite*) to be *broken* or *divided* into equal Parts (either even or uneven) and conſiders of them either as Pure *Parts*, in each leſs than an *Unite*; or elſe of Parts intermix'd, and is uſually call'd the Doctrine of *Vulgar Fractions*.

The *Third*, or Artificial Part, is call'd *Decimal Arithmetick*, being an *Artificial* invention of managing *Fractions* or *broken Numbers* by a much more commodious and eaſy way than that of *Vulgar Fractions*; for the ſeveral Operations perform'd in *Decimals* differ but little from thoſe in *Whole Numbers*; and therefore *Decimal Arithmetick* is now become of General Uſe, eſpecially in *Geometrical* Computations.

Arithmetick in all its Parts is perform'd by the various ordering and diſpoſing of Ten *Arabick* Characters or Numeral Figures.

One,	*Two*,	*Three*,	*Four*,	*Five*,	*Six*,	*Seven*,	*Eight*,
1	2	3	4	5	6	7	8
Nine,	*Cypher*.						
9	0						

The Uſe of theſe Characters, according to Dr. *Wallis* [*Algebr. p.* 12.] was firſt introduc'd in *England* about 60 Years after the Conqueſt, *A. D.* 1130.

The Firſt of theſe Characters is call'd *Unity*, and repreſents one of any kind of Species and *Quantity*; as *One World*, *One Man*, *One Houſe*, &c. 'Tis the Beginning of all *Numbers*; for, according to *Euclid* 7. *Def.* 2. Number is a Multitude of *Units*; for *One more One* makes *Two*, and *One more One more One* makes *Three*, &c. which is the Firſt and Chief *Axiom* in *Arithmetick*.

For the more convenient ordering of theſe *Numeral Figures*, according to the ſeveral Varieties that happen in Computations, the following Algebraick Signs will be of Excellent Uſe, as being a much ſhorter and more ſignificant way of ſhewing what is to be done in moſt Operations, than can otherwiſe be expreſs'd in Words at Length.

The Sign of	*Addition*	+	as 8+7 is 8 add 7.
	Subſtraction	—	as 9—6 is 9 leſs 6.
	Multiplication	×	as 9×6 is 9 times 6, or 9 multiply'd by 6.
	Diviſion	÷	as 8÷2 is divide 8 by 2.
	Equation	=	as 9=9 that is 9 is equal to 9.
	Proportion	: :	as 2 : 8 : : 6 : 24. As 2 is to 8, ſo is 6 to 24.

All the *Rules* of *Arithmetick* are comprehended in the due Conſideration of theſe Six, *Numeration*, *Addition*, *Subſtraction*, *Multiplication*, *Diviſion*, and *Extraction of Roots*.

NUMERATION

COnſiſts of Two Parts;

The Due Order of placing down Figures.

The true Value of each Figure in its Place, as by the following Table is ſhewn.

Period of Thouſands of Millions	6	*Hundreds of Thouſands of Millions,*
	7	*Tens of Thouſands of Millions,*
	8	*Thouſands of Millions,*
Period of Millions.	9	*Hundreds of Millions,*
	8	*Tens of Millions,*
	7	*Millions,*
Period of Thouſands.	6	*Hundreds of Thouſands,*
	5	*Tens of Thouſands,*
	4	*Thouſands,*
Period of Units.	3	*Hundreds,*
	2	*Tens,*
	1	*Units, the firſt Place in Counting.*

The Order of Places is reckon'd from the Right Hand to the Left: The Firſt is for *Units*, the Second for *Tens*, the Third for *Hundreds*, the Fourth for *Thouſands*, &c. that is, each Place towards the *Left* Hand is *Ten* Times the Value of the next towards the *Right*.

Example.

Suppoſe 759 were to be read; the firſt *Figure* is 9, becauſe it ſtands in the Place of *Units*, and therefore ſignifies but its own Simple Value, 9 *Units* or 9. The Second *Figure* 5 ſtands in the Place of *Tens*, and therefore ſignifies 5 *Tens*, or *Fifty*. The Third *Figure* 7 ſtands in the Place of *Hundreds*, and therefore ſignifies *Seven hundred*; and the Sum is to be read thus, *Seven hundred fifty nine*.

Tho' the *Figure* 7, according to the Order of *Numbring*, ſtands in the *Third* Place, yet when the *Sum* is read 'tis firſt pronounc'd; for in reading you muſt always begin with the outmoſt Figure towards the Left Hand.

As many Figures as are plac'd together without any Point, or other Note of Diſtinction between them, are all but one *Sum*: As for *Example*:

763596 is but one entire *Sum*, tho' it conſiſts of 6 Places of Figures, and is thus read, *Seven hundred ſixty three thouſand five hunnred ninety ſix*.

The like is to be obſerv'd in reading the True Value of any Sum conſiſting of Seven, Eight, Nine or more Places of *Figures*, each *Figure* being to be valu'd according to the Diſtance from the Place of *Unity*, as in the *Table*; which Value may as well riſe by *Cyphers* as by other Figures. For Inſtance: 6 ſtanding by itſelf ſignifies 6 *Units*, but add a Cypher 0 to it, and it makes *Sixty*, 60; and another Cypher would make it *Six hundred*, 600, &c. for tho' a *Cypher* of itſelf ſignifies nothing, yet being plac'd on the Right Hand of any Figure, it augments the Value of that Figure by advancing into a higher Place than otherwiſe it wou'd have been, had not the Cypher been there.

ADDITION.

A*ddition* is that Rule by which ſeveral Numbers are collected and put together, that ſo their *Sum Total* may be known.

Obſerve in this Rule to place the Numbers ſo, that each Figure may ſtand directly underneath thoſe Figures of the ſame Value; as *Units* under *Units*, *Tens* under *Tens*, &c. then draw a Line to ſeparate the *given* Numbers from the *Total Sum*.

Example.

$$\begin{array}{r} 3578 \\ 496 \\ 742 \\ 184 \\ 95 \\ \hline \end{array}$$

Then carefully obſerve to add together each Row of Figures that ſtand over one another of the ſame Value, which is done thus.

Begin your *Addition* at the Place of *Units*, and add together all the *Figures* that ſtand in that *Place*, and if their *Sum* be under *Ten*, ſet it down below the Line underneath its own Place; but if their *Sum* be more than *Ten*, ſet down only the *Odd* Figure above the *Ten* or *Tens*; and ſo many *Tens* as the *Sum* of thoſe *Units* amount to, carry the Place of *Tens*: Adding them, and all the *Figures* that ſtand in the ſame Place of *Tens* together in the ſame manner as thoſe of the *Units* were added, then put down the *Overplus* of the *Tens*, if any underneath the *Tens*, and carry the *Tens* to the *Hundreds*, as you did the *Units* to the *Tens*; then proceed in the ſame Order to the Place of *Hundreds*, and ſo on to each Place 'till all is done. The *Sum* ariſing by theſe *Additions* under the *Line*, will be the *Sum Total*. As for

Example.

Suppoſe it was requir'd to find the *Sum* of the *Numbers* above ſet down, *viz.* 3578+ the *Sign* for Adding 496+ 742+ 184+95. Place them directly under each other, as before mention'd and plac'd; then begin at the Place of *Units*: Say 5 and 4 is 9, and 2 is 11, and 6 is 17, and 8 is 25; ſet down the 5 *Units* underneath their own Place of *Units*, and carry the 20, or Two *Tens*, to the Place of *Tens*, at which Place they are only 2: Then ſay, 2 and 9 is 11, and 8 is 19, and 4 is 23, and 9 is 32, and 7 is 39; ſet down the 9 underneath its own Place of *Tens*, and carry the 30 or Three *Tens* (which indeed is 300) to the Place of *Hundreds*, at which Place they are but 3: Then ſay, 3 and 1 is 4, and 7 is 11, and 4 is 15, and 5 is 20; here, becauſe there is no Figure *Overplus*, ſet down a *Cypher* underneath the Place of *Hundreds*, and carry the 2 *Tens* (or rather the 2000) to the Place of *Thouſands*, ſaying as before, 2 and 3 is 5, which being the laſt, ſet it down underneath its own Place. and you'll find the Sum Total to be 5095. Thus,

$$\begin{array}{r} 95 \\ 184 \\ 742 \\ 496 \\ 3578 \\ \hline 5095 \\ \hline \end{array}$$

For put any of theſe Sums exactly under each other, according to their Period, and the Total will be the ſame; but the Example of the *Addition* is according to the Order of their Firſt Places.

SUBSTRACTION

IS that Rule by which one *Number* is taken out of another, that ſo the *Remainder*, *Difference*, or *Exceſs* may be known: As 6 taken out of 9, there *Remains* 3. This 3 is alſo the *Difference* between 6 and 9; or it is the *Exceſs* of 9 above 6. The *Number* to be *Subſtracted* muſt be always leſs than the *Sum* out of which the Subſtraction is to be made; we need not tell the Reaſon, it being eaſily apprehended that a *Greater* cannot be Subſtracted out of a *Leſs*. *This Rule is the direct con-*

trary to Addition; and the ſame Caution muſt be obſerv'd in this as in that, to place the *Units* of the Sum to be Subſtracted, exactly under the *Units* of the Sum out of which the Subſtraction is requir'd to be made; and ſo the *Tens* under the *Tens*, and *Hundreds* under the *Hundreds*, &c. Then having plac'd the Leſs Number under the Greater, perform the Operation thus.

Begin with the *Units* as in *Addition*, and *Subſtract* the Lower *Figure* in that Place from the *Figure* that ſtands over it; ſet down the *Remainder* or *Difference* under a *Line* drawn beneath the Two *Sums* exactly in its own Place: If the Two *Figures* chance to be equal ſet down a *Cypher*; but if the Upper *Figure* be leſs than the Lower *Figure*, then you muſt add Ten to the Upper *Figure*, or call it in your Mind 10 more than it is; and from that Sum Subſtract the Lower *Figure*, ſetting down the *Remainder* as before directed: The 10 thus added, being ſuppos'd to be borrow'd from the next Superior Place, *viz.* of *Tens* in the Upper *Figures*, you muſt either call the Upper *Figure* in that Place one *leſs* than it is; or elſe you muſt call the Lower *Figure* in that Place one more than really it is; and then proceed to *Subſtraction* in that Place as in the former, and ſo from one Row of Figures to another, till all be done.

Example.

Let it be requir'd to know the *Difference* between 830476 and 741068; then let the Latter be Subſtracted from the Former; theſe Numbers being plac'd as before directed, exactly under each other will ſtand thus.

830476
741068

Remainder 89408

Beginning at the Place of *Units* ſay, 8 from 6 I cannot, but 8 from 16 and there remains 8, to be ſet down under its own Place: Next proceed to the Place of *Tens*, where you muſt now pay the *Ten* that was borrow'd to make the 6, 16, by accounting the Lower Figure in that Place one more than it is; ſaying, one that I borrow'd and 6 is 7, from 7 and there remains Nought, or a *Cypher*, to be ſet down under its own *Place*. Then proceed to the Place of *Hundreds*, and ſay, Nought from 4 and there remains 4, to be ſet down under its own Place; Proceed then to the Period or Place of *Thouſands*, and ſay, One from Nought I cannot, but 1 from 10, which you muſt borrow, and there remains 9, to be ſet down under its own Place; the Ten you borrow'd muſt be paid when you come to the next Place, by ſaying, One that I borrow'd and 4 is 5, from 3 I cannot, but borrowing 10 again, ſay 5 from 13 and there remains 8, to be ſet down under its own Place: Then proceed to the next Place, or the Laſt Figure, ſaying, One that I borrow'd and 7 is 8, taken from 8 and there remains nought; which Cypher need not be ſet down, and the *Difference* requir'd will be 89408. By this Example alſo, 'tis plain that *Cyphers* in the Numbers to be *Subſtracted* do not diminiſh the Number from whence *Subſtraction* is made.

The Common and Infallible Method of *Proofing Sums* in *Subſtraction* is by *Addition*, viz. by adding the *Remainder* to the Number that was *Subſtracted*, and it will make the Number of the Sum out of which it was *Subſtracted*. As for Example; Take the *Remainder* of the above Example,

	89408	*Add*
Add to it the Number that was *Subſtracted*,	741068	
It makes the Sum of which it was *Subſtracted*.	830476	*Proof.*

MULTIPLICATION

IS a Rule by which any given Number may be ſpeedily *encreas'd*, according to any propos'd Number of *Times*.

One *Number* is ſaid to *multiply* another, when the Number *multiply'd* is ſo often added to itſelf, as there are *Unites* in the Number *Multiplying*.

Again; *Multiplication* is only a *Conciſe* way of *adding* any given *Number* to itſelf, ſo often as any *Number* of Times may be propos'd.

Before any Operation can be readily perform'd in *Multiplication*, the ſeveral Products of the Single Figures one in another, which is call'd *Multiplication Table*, muſt be perfectly learnt by Heart, *viz.* That Twice 2 is 4, 3 Times 3 is 9, 3 Times 6 is 18, &c. according as is expreſs'd in the following *Table*, wherein multiplying with 2 is omitted, it being ſo very eaſy that any one may do it.

Note; × *is the Sign of* Multiplication, *and ſignifies Times*, as 3×3 *is* 3 *Times* 3, *and* = *is the Sign of Equality, as* 3×3=9, *makes it equal to* 9, *as is mention'd in the* Signs.

MULTIPLICATION TABLE.

3×3= 9	4×4=16	5×5=25	6×6=36	7×7=49	8×8=64
3×4=12	4×5=20	5×6=30	6×7=42	7×8=56	8×9=72
3×5=15	4×6=24	5×7=35	6×8=48	7×9=63	9×9=81
3×6=18	4×7=28	5×8=40	6×9=54		
3×7=21	4×8=32	5×9=45			
3×8=24	4×9=36				
3×9=27					

Note further, 4×3=3×4, 4 *Times* 3 *is the ſame as* 3 *Times* 4, *and* 7 *Times* 5 *as* 5 *Times* 7, &c. *and the like muſt be underſtood of all the reſt in the Table.*

When you have got the *Table* by heart, and a Sum is propoſ'd to be multiply'd by another, the firſt is call'd *Multiplicand*, the other *Multiplier*; and you go to work thus, Begin with that Figure which ſtands in the *Units* place of the *Multiplier*, and with it multiply the *Figure* which ſtands in the *Units* place of the *Multiplicand*; if their *Product* be leſs than 10, ſet it down underneath its own place of *Units*, and proceed to the next Figure of the *Multiplicand*; but if their Product be above 10, or *Tens*, then ſet down the *Overplus* only (or *odd* Figure as in Addition) and bear the ſaid 10, or *Tens* in Mind 'till you have multiply'd the next Figure of the *Multiplicand* with the ſame Figure of the *Multiplier*; then to their *Product* add the 10, or *Tens* born in Mind, ſetting down the *Overplus* of their Sum above *Tens*, as before, and ſo proceed on in the very ſame manner, 'till all the Figures of the *Multiplicand* are multiply'd with that Figure of the *Multiplier*.

Example.

Let 3213 be the *Multiplicand*,
And 3 the *Multiplier*.

9639

Begin with the *Units*, ſaying 3 times 3 is 9, which becauſe 'tis leſs than 10, ſet down underneath its own place; and proceed to the next place, ſaying 3 times 1 is 3, which ſet down underneath its own place; then go on to that of *Hundreds*, and ſay 3 times 2 is 6, which ſet down as before; and at the place of *Thouſands*, ſay 3 times 3 is 9, which being ſet down under its own place, the Operation will be done, and the Product amount to 9639.

DIVISION.

Diviſion is a Rule by which one *Number* may be ſpeedily *ſubſtracted* from another, ſo many times as it is contain'd therein; that is, it ſpeedily diſcovers how often one Number is contain'd, or may be found in another.

To perform this, there is 2 Numbers to be given; 1 of them is that Number which is propoſ'd to be divided, and is call'd the *Dividend*; 2 the other is that Number by which the ſaid *Dividend* is to be divided, and is call'd the *Diviſor*. By comparing theſe two together, there will ariſe a third Number, call'd the *Quotient*, which ſhews how often the *Diviſor* is contain'd in the *Dividend*.

If the *Diviſor* be multiply'd with the *Quotient*, their Product will be the *Dividend*; whence it follows, that *Diviſion* and *Multiplication* are direct contrary one to another, (as *Subtraction* is to *Multiplication*) and mutually prove the Truth of each others *Operations*.

Let it be requir'd to find how often 6 is contain'd in 24, that is divide 24 by 6.

To perform any ſuch Operation, place the given Numbers always in this Order; firſt ſet down the *Diviſor*, and to the left-hand of it draw a crooked Line; then ſet down the *Dividend*, and to the right of it draw another crooked Line, in which the *Quotient* Figures, as they become found, muſt be plac'd thus,

Dividend
Diviſor 6) 24 (4 *Quotient*.

You ask your ſelf how many times 6 in 24, and finding 4 times 6 is 24, therefore 4 is the *Quotient*.

All Operations in *Diviſion* begin contrary to thoſe in *Multiplication*, viz. At the firſt Figure to the left-hand, and decreaſe the *Dividend* by a repeated *ſubſtraction* of each Product ariſing from the *Diviſor*, when multiply'd into the *Quotient* Figure. The only difficulty in *Diviſion* of whole *Numbers* (or indeed of any Numbers) lies in making choice of ſuch a *Quotient* Figure as is neither too big nor too little.

As often as the firſt Figure of the *Diviſor* is taken from the firſt Figure of the *Dividend*, ſo often muſt the ſecond Figure of the *Diviſor* be taken from the ſecond Figure of the *Dividend*, when 'tis joyn'd with what remains of the firſt, and ſo often muſt the third Figure of the *Diviſor* be takēn from the third Figure of the *Dividend*.

But if the firſt Figure of the *Diviſor* cannot be taken from the firſt Figure of the *Dividend* ſo often as the firſt Figure of the *Diviſor* is taken from the two firſt Figures of the *Dividend*, ſo often muſt the ſecond Figure of the *Diviſor* be taken from the third Figure of the *Dividend*, when 'tis joyn'd with what remain'd of the ſecond; and ſo often muſt the third Figure of the *Diviſor* be taken from the fourth Figure of the *Dividend*, &c. that is, the *Quotient* Figure muſt be ſuch, as being multiply'd into the *Diviſor*, will produce a *Product* equal to ſuch a part of the *Dividend* as is then taken for that *Operation*; but if ſuch a *Product* cannot be exactly found, then the next leſs muſt be taken, and order'd as in the following *Example*.

Let it be requir'd to divide 68552 by 8.

8) 68552 (*Quotient* when found.

Compare 8 the *Diviſor*, with 6 the firſt Figure of the *Dividend*, and finding you cannot take it from that, conſider how often 8 can be taken from 68, the two firſt Figures of the *Dividend*, and you will find it may be taken 8 times; for 8 times 8 is 64, therefore place 8 in the *Quotient*, and with it multiply 8 the *Diviſor*, ſetting down their *Product* underneath the ſaid two firſt Figures of the *Dividend*, ſubſtracting it from them, and then the Work will ſtand thus,

8) 68552 (8
64

4

Then make a Point under the next Figure of the *Dividend*, the 5, and bring it down underneath its own place to the Remainder 4, which will by that means become 45; then ask your ſelf how many times 8 can be taken from 45, and finding it to be 5 times, for 5 time 8 is 40, place 5 in the *Quotient*, and with it multiply 8, the *Diviſor*, ſetting down and ſubſtracting their *Product* as before, after which the Work will ſtand thus,

```
8) 68552 (85
   64
   --
    45
    40
    --
     5
```

Make a Point under the next Figure of the *Dividend*, the 5, and bring it down as before, proceeding in all reſpects after the ſame manner, and the Work will ſtand thus,

```
8) 68552 (856
   64
   --
    45
    40
    --
     55
     48
     --
      7
```

Point and bring down the Figure of the *Dividend* to the *Remainder* 7, which will then become 72; and proceeding, as in the other Operations, you will find that 8, the *Diviſor*, can be taken juſt 9 times from 72, and the Work is finiſh'd, and will ſtand thus,

```
8) 68552 (8569
   64
   --
    45
    40
    --
     55
     48
     --
      72
      72
      --
```

The true *Quotient* is 8569.

We ſhall now proceed to ſome other Parts of Arithmetick, dependant on the former Rules, and commonly taught in the following Order.

REDUCTION.

BY this Rule, Numbers of different Denominations are brought into one, that is, it alters or changes any ſuperior Denomination into any inferior or leſs Denomination requir'd, ſtill keeping them equivalent in Value, and by that means they are prepar'd for *Multiplication* and *Diviſion*. *Reduction* is very uſeful in the Rule of Three, to ſuch as do not underſtand *Vulgar* or *Decimal* Fractions. 'Tis perform'd thus,

Conſider how many *Units* of the Denomination requir'd, makes one of that Denomination propos'd to be reduc'd; and with thoſe *Units*, multiply the *Denomination* propos'd, and their *Product* will be the Number requir'd.

Example.

To reduce 357 *l.* into Shillings, and theſe Shillings into Pence, which ſhall ſtill be equal.

```
                  357 Pounds
Multiply with      20 the Shillings in one Pound.
                 ----
                 7140
Multiply with      12 the Pence in one Shilling.
                -----
                14280
                714
                -----
                85680 the Pence in 357 l. as requir'd.
                -----
```

But when the Numbers propos'd to be reduc'd are of ſeveral Denominations, and 'tis requir'd to bring them all to the loweſt; you muſt reduce the greateſt Denomination to the next leſs, adding the Numbers that are of that leſs Denomination together; then reduce their Sum to the next lower Denomination, adding together all the Numbers that are of that Denomination, and ſo proceed gradually 'till all is done; which is ſo plain, that there hardly needs any other Example than the firſt.

Suppoſe 17 Shillings and 10 Pence ¾ Farthings were added to the

```
  7140 Shillings before ſet down.
    17 Add either by Memory or ſetting down.
  ----
  7157
    12 Pence in a Pound.
 -----
 14314
  7157
 -----
 85884
    10 Add
 -----
 85894 Pence.
     4 Farthings
 ------
343576
     3 Add
------
343579 Farthings in 357 l. 17 s. 10 d. ¾ q.
------
```

'Tis the ſame with Weights and Meaſures, as with Coins; ſo the next thing is to ſhew how to bring Numbers from a leſs to a greater Denomination, which is commonly and improperly call'd,

Reduction Aſcending.

THis Work is the Reverſe of the laſt, and is perform'd by Diviſion, thus,

Conſider how many of the Denomination propos'd, make one of the Denomination requir'd, and divide by that Number the Denomination propos'd, the Quotient is the Number requir'd.

Example.

Suppoſe it be requir'd to find how many Shillings and Pounds are contain'd in 85680 Pence.

The Pence in 1 Shilling are 12) 85680 (7140 Shillings.

Again, the Shillings in 1 Pound are 20) 7140 (357 Pounds in 85680 Pence.

If there are Farthings in the Sum propos'd, you divide that Number firſt by 4, the Number of Farthings in a Penny, and then by 12, *&c.* as before. If there are any odd Figures in the Sum divided, the Remainder is always of the ſame Denomination with the Dividend.

Of Vulgar Fractions.

A Fraction or Broken Number is that which repreſents a Part or Parts of any thing propos'd, and is expreſs'd by Two Numbers plac'd one above the other, with a Line drawn between them, thus,

$$\frac{3 \text{ Numerator,}}{4 \text{ Denominator.}}$$

The Denominator, or Number plac'd underneath the Line, denotes how many equal Parts the thing is ſuppos'd to be divided into, (being only the *Diviſor* in *Diviſion)* and the Numerator or Number plac'd above the Line, ſhews how many Parts are contain'd in the *Fraction*, it being the Remainder after Diviſion.

There are three ſorts of Fractions, $\begin{cases} \textit{Proper,} \\ \textit{Improper,} \\ \textit{Compound.} \end{cases}$

A *Proper Fraction* is that which is leſs than an *Unit*; that is, it repreſents the immediate Part or Parts of any thing leſs than the *Whole*, and therefore its *Numerator* is always leſs than the *Denominator.*

Ld Napier

As, $\frac{1}{4}$ is one Fourth, $\frac{1}{2}$ is one Half,
$\frac{1}{3}$ is one Third, $\frac{2}{3}$ is two Thirds, *&c.*

An *Improper Fraction* is that which is greater than an *Unit*; that is, it repreſents ſome Number of Parts greater than the whole *Thing*, and its *Numerator* is always greater than the *Denominator.*

As, $\frac{5}{3}$, $\frac{9}{7}$, $\frac{41}{15}$, *&c.*

A *Compound Fraction* is a Part of a Part, conſiſting of ſeveral *Numerators* and *Denominators*, joyn'd together with the word *Of*,

As, $\frac{1}{3}$ of $\frac{3}{4}$ of $\frac{2}{5}$, the One Third of Three Fourths of Two Fifths.

That is, when an *Unit* is firſt divided into any Number of equal Parts, and each of thoſe Parts is ſubdivided into other Parts, and ſo on; then theſe laſt Parts are call'd *Compound Fractions*, or *Fractions of Fractions.*

For Example, Suppoſe a Pound Sterling of 20 Shillings to be the *Unit*, then is 8 Shillings the $\frac{2}{5}$ of it, and 6 Shillings the $\frac{3}{4}$ of thoſe Two Fifths, and 2 the $\frac{1}{3}$ of thoſe Three Fourths.

All *Compound Fractions* are reduc'd to ſingle ones, thus, Multiply all the Numerators into one another for a Numerator, and all the Denominators into one another, for the Denominator.

Thus the $\frac{1}{3}$ of $\frac{3}{4}$ of $\frac{2}{5}$ will become $\frac{6}{60}$ or $\frac{1}{10}$.

For 1 multiply'd with 3, and 3 with 2 makes 6, the Numerator; and 3 multiply'd by 4 makes 12, and that by 5 makes 60, the Denominator.

Thus, $\frac{6}{60}$ or $\frac{1}{10}$ of a Pound Sterling is 2 Shillings, as above.

Different Fractions may be alter'd into one Denomination, retaining the ſame Value. If both the Numerator and Denominator of any Fraction be Equally multiply'd into any Number, their Product will retain the ſame Value of that Fraction.

As in theſe, $\frac{2 \text{ multiply'd with } 2 \text{ makes } 4,}{3 \text{ multiply'd with } 2 \text{ makes } 6,}$ Or, $\frac{2 \text{ multiply'd with } 3 \text{ makes } 6,}{3 \text{ multiply'd with } 3 \text{ makes } 9,}$ Or, $\frac{2 \times 5 \text{—makes } 10}{3 \times 5 \text{—makes } 15}$

Of Decimal Fractions.

'TIS Uncertain when, and by whom this excellent Invention of *Decimal Arithmetick* was firſt found out, but 'tis without doubt to later Years that we owe its Improvements and Perfection. In Decimal Fractions, the *Integer*, or whole Thing is ſuppos'd to be divided into 10 equal Parts, and every one of thoſe 10 Parts to be ſubdivided into other 10 equal Parts, *&c. ad Infinitum.* The *Integer* being thus divided into 10, 100, 1000, 10000, *&c.* equal Parts, becomes the Denominator to the Decimal Fractions,

Thus, $\frac{2}{10}$, $\frac{3}{100}$, $\frac{7}{1000}$, $\frac{53}{10000}$, $\frac{754}{100000}$, *&c.*

Now theſe Denominators are ſeldom or never ſet down, but only the Numerators; and theſe are ſeparated from whole Numbers by a *Point* or *Comma*,

Thus, 5,4 is $5\frac{4}{100}$, 07, is $\frac{7}{10}$, 35,05 is $35\frac{5}{100}$, *&c.*

Here it will not be improper to inſert a Table taken out of Mr. *Oughtred's Clavis Mathematica*, which ſhews the very Foundation of Decimal Fractions.

Whole Numbers.						*Decimal Parts.*					
5	4	3	2	1	0,	1	2	3	4	5	6
&c.	*Tens of Thouſands.*	*Thouſands.*	*Hundreds.*	*Tens.*	*Units Place.*	*Parts of Ten, or* $\frac{1}{10}$	*Parts of a Hundred.*	*Parts of a Thouſand.*	*Parts of* 10 *Thouſands.*	*Parts of* 100 *Thouſands.*	*Parts of Millions.* *&c.*

This Table ſhews that as in *Integers* every Degree from the *Unit's* Place increaſes towards the left-hand by a ten-fold Proportion, ſo in Decimal Parts every Degree is decreas'd towards the right-hand by the ſame Proportion; wherefore theſe Decimal Parts or Fractions are really more Homogenial, or agreeing with Whole Numbers, than Vulgar Fractions. For indeed, all Plain Numbers are in effect but Decimal Parts one to another; for ſuppoſe any Series of equal Numbers, as 444, the firſt four towards the left is Ten times the Value of the 4 in the middle, and that 4 in the middle is Ten times the Value of the laſt 4 to the right of it, and but the tenth Part of that 4 towards the left. All of them may be taken as Integers, or Parts of an Integer; if Integers, then they muſt be ſet down without any Comma between them, thus, 444; but if Part be a Fraction, then put a Comma between them, thus, 44,4 which ſignifies 44 Whole Numbers and 4 Tenths of an Unit. Again, if two Places of Parts be requir'd, divide them with a Comma, thus, 4,44 *viz.* 4 Units and 44 Hundred Parts of an Unit, *&c.*

From whence, if rightly compar'd with the Table, it will be eaſy to conceive that Decimal Parts take their Denomination from the Place of their laſt Figure.

$$\text{That is,}\left\{\begin{array}{l},5\,\frac{2}{10}\\ ,56\,\frac{56}{100}\\ ,56\,\frac{56}{1000}\end{array}\right\}\text{Parts of an Unit.}$$

Cyphers annex'd to Decimal Parts alter not their Value, as 50 and 500 and 5000, *&c.* are each but 5 Tenths of an Unit.

For, $\frac{50}{100}$, $\frac{5}{10}$, and $\frac{500}{1000}$, $\frac{5}{10}$, or $\frac{5000}{10000}$, $\frac{5}{10}$.

But Cyphers prefix'd to Decimal Parts, decreaſe their Value by removing them further from the Comma.

0,5=5 Tenth Parts.
,05=5 Parts of a Hundred.
,005=5 Parts of a Thouſand.
,0005=5 Parts of Ten Thouſands.

Thus the true Value of all Decimal Parts are known by their diſtance from the Units Place.

They muſt be added or ſubſtracted, as if they were all Whole Numbers, and from their Sum or Difference, as many Decimal Parts muſt be cut off as are the moſt in any of the given Numbers. As to the Multiplication of *Decimals*, 'tis much the ſame with Whole Numbers, only ſo many Places of Decimal Parts in the Product muſt be cut off with a Comma, as there are in both the *Multiplicand* and *Multiplier.*

Diviſion is reckon'd the moſt difficult Part of Decimal Arithmetick, and requires particular Care.

The Deſign of this Treatiſe being only to give the Reader ſuch an Idea of all the Parts of Arithmetick as may be uſeful to him in common Affairs, we enter no farther into any of them than is neceſſary for ſuch an Idea; and tho' the Addition, Subſtraction, &c. of *Fractions* and *Decimal Fractions* are of great uſe in *Extraordinary* Operations; yet, conſidering they ſeldom enter into *Ordinary* ones, we muſt for thoſe Parts of Arithmetick refer the Reader to Treatiſes more at large, as *Oughtred, Ward,* &c. and proceed to that Rule in Arithmetick which, for its Uſe, is call'd,

The Golden Rule; Or, The Rule of Three,

BY ſome term'd alſo *Proportion Disjunct.* It is either *Direct* or *Reciprocal,* call'd Inverſe; and theſe are both Simple and Compound.

Direct Proportion is when of 4 Numbers the *Firſt* bears the ſame *Proportion* to the *Second,* as the *Third* does to the *Fourth,*

As in theſe, 2 : 8 :: 6 : 24.

Conſequently the greater the *Second* Term is in reſpect to the *Firſt,* the greater will the *Fourth* Term be with reſpect to the *Third.* Again, the leſs the *Second* Term is in reſpect to the *Firſt,* the leſs will the *Fourth* be in reſpect to the *Third.*

As in theſe, 18 : 6 :: 12 : 4.

That is, 18 : 18÷3 :: 12 : 12÷3.

But 18 × 12 [illegible] =18÷3 × 12, *Viz.* 18 × 4=6 × 12.

Conſequently 2 : 8 : 6 : 24, and 18 : 6 : 12 : 4 are true *Proportionals.* From theſe Conſiderations comes the Invention of finding a *Fourth* Number in Proportion to any *Three* given Numbers, whence 'tis call'd the *Rule* of *Three.*

For if the *Second* Number multiply'd into the *Third,* be equal with the *Firſt* multiply'd into the *Fourth,* 'tis eaſie to conceive that if the *Product* of the *Second* and *Third* be divided by the *Firſt,* the *Quotient* muſt needs be the *Fourth* Number; for if that Number, which divides another, be multiply'd into the *Quotient* produc'd by that *Diviſion,* their *Product* will be equal to the Number divided.

All Queſtions in Direct Proportion, may be anſwer'd three ſeveral ways.

1. Multiply the *Second* and *Third* Terms together, and divide their Product by the *Firſt,* the Quotient will be the Anſwer requir'd.

As if 4 Sheets make 64 Pages, what will 9 make?

4 : 64 : 9 : 144
9

4) 576 (144 Pages, becauſe the *Second* Term was Pages.

2. Divide the *Second* Term by the *Firſt*, then multiply the Quotient into the *Third* Term, and their Product will be the Anſwer requir'd.

As thus, 4 Sheets, 64 Pages : 9 : 144.

4) 64 (16 × 9 makes 144.

3. Divide the Third Term by the Firſt, then multiply that Quotient into the Second Term, and their Product will be the Anſwer.

4—64—9 . 144.
(1 Rem. (1 Rem.
4) 9 (2 — 64 — 2 128
16 *Remainder* 16.

144

Of theſe Ways the Firſt is moſt practis'd, the Two Laſt are not ſo readily perform'd; when the Second and Third Terms cannot be divided by the Firſt, as is in the above Inſtance, but is of Uſe in the *Rule of Fellowſhip*. Take another Example where the whole Operation runs eaſy.

1. *Way*. 3 Yards 9 Shillings, what 6?
6

3) 54 (18 Shillings.

2. *Way*. 3 Yards 9 Shillings 6 × 18.
3) 9 (3 × 6 makes 18.

3 *Way*. 3—9—6—18
3) 6 (2 and 9 × 2 = 18

To explain the Uſe of this Rule the better, take the following Examples.

If 8 ℔ of Hops Coſt 14 Shillings, what will half a hundred, *viz.* 56 ℔ Coſt at the ſame rate?

8 . 14 . 56 . 4 *l.* 18 *s.* *Anſwer.*
14

224
56

8) 784 (98 *s.* is 4 *l.* 18 *s.*

If 14 *s.* will Buy 8 ℔ of Hops, how much will 4 *l.* 18 *s.* Buy?

Stated thus, 14 *s.* 8 ℔ 4 *l.* 18 *s.* 98 *s.*
Then 98 × 8 = 784. And 14) 784 (56 *l.* *Anſwer.*

Reduction is of great Uſe in this Rule; as ſuppoſe the Queſtion to be,
What will $\frac{3}{4}$ of a Yard of Velvet Coſt when the Price of 21 Yards and a half is 22 *l.* 10 *s.* 6 *s.*

Bring the Firſt and Third Terms into one Denomination, *viz.* into Quarters, and reduce the Second Term into its Leaſt Denomination.

Thus 21 Y. $\frac{1}{2}$ make 86 Q. and 22 *l.* 10 *s.* 6 *d.* = 5406 *d.*
Then 86 : 5406 : : 3 : 15 : $8\frac{50}{88}$. For 5406 × 3 ÷ 16218
And 86) 16218 (= $188\frac{50}{86}$
Then $188\frac{50}{88}$ Pence 15 *s.* 8 *d.* $2\frac{14}{43}$ Farthings. *Anſwer.*

Having ſpoken of *Vulgar Fractions*, we'll State the ſame Queſtion in them.

Thus $22\frac{1}{2} = \frac{43}{2}$: $22\frac{21}{40} = \frac{901}{40}$: : $\frac{3}{4}$
Then $\frac{901}{40} \times \frac{3}{4} = \frac{2703}{160}$ And $\frac{43}{2}$) $\frac{2703}{160}$ (= $\frac{5406}{6880}$

Theſe $\frac{5406}{6880}$ Parts of a Pound are brought into Shillings by *multiplying* the *Numerator* with 20, and *Dividing* the *Product* by its *Denominator*, &c.

Thus, 5406 × 20 = 108120 And 6880) 108120 (15 *s.*
And there remains 4920. Again 4920 × 12 = 59040
Then 6880) 59040 (8 *d.* and $\frac{50}{88}$, *&c.* as before

We do not work it in *Decimal* Fractions, becauſe there are very few Gentlemen who for Recreation ſake enter ſo far into the Labyrinth of Numbers; and thoſe whoſe Affairs make it neceſſary for them, will meet with helps enough in *Ward* and *Oughtred* before-mention'd.

Of the Rule of Three Inverſe.

A *Reciprocal Proportion*, which is when of *Four* Numbers the *Third*, viz. (that which moves the Queſtion) bears the ſame Proportion to the Firſt as the Second does to the *Fourth*; therefore the Leſs the *Third* Term is with reſpect to the Firſt, the Greater will the Fourth Term be in reſpect to the Second.

Example.

Queſt. 1. If 16 Men can do a Piece of Work in 16 Days, how many Days muſt 8 Men require to do the ſame Work at the ſame rate of Working?

Queſt. 2. If 8 Men can do a Piece of Work in 12 Days, how many Days muſt 16 Men require to do the ſame Work?

The manner of placing down the Propos'd Terms is the ſame in both *Rules*. The Firſt Term in the Suppoſition muſt be of the ſame Denomination with the Third Term which moves the Queſtion, and the Term ſought muſt be of the ſame Denomination with the Second Term in the Suppoſition; as in the Two Laſt Examples.

	Men		*Days*		*Men*		*Days.*
Queſt. 1.	16	:	6	: :	8	:	
Queſt. 2.	8	:	12	: :	16	:	

Work the Queſtions thus: Multiply the Firſt and Second Terms together, and divide their Product by the Third Term, the Quotient will be the Anſwer requir'd.

Thus in the Second Example. 12 × 8 = 96

16) 96 (= 6 Days.

That is, 16 Man can do the ſame Work in Six Days as Eight Men can do in Twelve Days.

The Proof of this Inverſe Rule is eaſily deduc'd from its Operations, *viz.* the Product of the Firſt and Second Terms muſt be equal to the Product of the Third and Fourth.

Of the Double Rule of Three,

OR *Compound Proportion,* which is, when there are 5 Numbers given, to find out a 6th *Proportional*; and this is generally perform'd by a Double Poſition; that is, by Stating and Working the Queſtion at Two Operations, either in *Direct* or *Reciprocal Proportion,* according as the Queſtion requires.

Example.

If 100 *l.* gain 6 *l.* in 12 Months, how much will 300 *l* gain in 9 Months at the ſame rate.

Firſt, 100 . 6 300 . 18 *l.*
6
100) 1800 (18 *l.* the Intereſt of 300 *l.* for 12 Months.

Months *Months*
Then, 12 . 18 *l.* 9 13 *l.* 10 *s.*
9
12) 162 (13 *l.* 10 *s.* Anſwer requir'd.

Of the Rule of Fellowſhip,

WHich is that by which the Accounts of ſeveral Trading in a Company are ſo adjuſted that every Partner may have the Juſt Part of the Gain, or ſuſtain his Juſt Part of the Loſs, according to his Proportion or Share of Money in the Joint Stock: In the Rule are Two Parts:

1. *The Single Rule of Fellowſhip,*

By which is adjuſted the Accounts of thoſe Partners that put their ſeveral and perhaps different Sums of Money into a Common Stock at one and the ſame time. Now all Queſtions of this Nature are anſwer'd by ſo many Operations in the *Rule of Three Direct,* as there are Partners in the Stock: For as the Sum Total of Money in the Stock is in Proportion to the whole Gain or Loſs; ſo is every Man's particular Part of that Stock to his particular Share of that Gain or Loſs.

Example.

There are Three Partners, A B and C in a Joint Stock of 96 *l.* as follows.

A puts in 24 *l.* B puts in 32 *l.* and C puts in 40 *l.* what was each Man's Gain?

The Firſt Operation for A's Part of the Gain will ſtand thus;

96 *l.* 12 *l.*:: 24 *l.* 3 *l.* A's Gain.
The Second for B 96 *l.* 12 *l.*:: 32 *l.* 4 *l.* B's Gain.
The Third for C 96 *l.* 12 *l.*:: 40 *l.* 5 *l.* C's Gain.

Proof. 3 add 4 add 5 makes 12, the whole Gain, for if the Work is true, each Man's *Particular* Gain added together will make the *Whole.*

The Double Rule of Fellowſhip

is ſo call'd, becauſe each Man's Money is to be conſider'd with Relation to the Time of its Continuance in the Joint Stock.

Example.

A and B join in Partnerſhip on theſe Terms.

A agrees to lay down 100 *l.* and employ it in Trade 3 Months; then B is to lay down 100 *l.* and with the whole Stock of 200 *l.* they are to Trade 3 Months more; now at the End of the Time they find they have got 21 *l.*

Queſt. What is each Man's Part of the Gain according to his Stock of the Time of employing it?

For ſolving this Queſtion, ſuppoſe A's 100 *l.* employ'd 3 Months gain'd R= a Sum as yet unknown, then it muſt gain 2 Z in 6 Months, and to find what B muſt gain, it will be

l. Months.
100——6 2 Z's=A's Gain.
100——3 B's Gain

$$\frac{100\times3=2\,Z}{100=6}=\text{B's Gain.}$$

But A's Gain added to B's Gain muſt make 21, the whole Gain by the Queſtion.

$$\text{Therefore } a\times Z\times\frac{100\times3\times2Z}{100\times6}=21$$

That is $100\times6\times2Z\times100\times3+2Z=21\times100\times6$

Which contracted is $900\times2Z=$make 21×600

Conſequently $2Z=\frac{21\times600}{900}$ which gives this following Analogy.

Viz. 900 : 21 : 600 : 2Z=14 *l.* for A's Gain.
900 : 21 : 100×3=300 7 *l.* for B's Gain.

This may produce a General Rule for reſolving all Queſtions of this Nature: *Multiply every Particular Man's Stock with the Time it is employ'd; then it will be, as the Sum of all thoſe Products is to the whole Gain (or Loſs) ſo is every one of thoſe Products to its Proportional Part of that whole Gain or Loſs.*

Of

Of Bartering.

WHen Merchants Exchange One Commodity for another, 'tis call'd Bartering; and the only Difficulty in this way of Dealing lies in the due proportioning the Commodities to be Exchang'd.

Example.

Two Merchants, A and B Barter, A would Exchange 5 Hundred 3 Quarters and 14 Pounds of Pepper, which is worth 3 *l.* 10 *s.* with B for Cotton worth 10 *d.* per Pound Weight. *Queſt.* How much Cotton muſt B give to A for his Pepper?

In order to the reſolving of this Queſtion and all others of this Nature, you muſt find by the *Rule of Three* (or otherwiſe) the true Value of that Commodity whoſe Quantity is given (which in this Queſtion is Pepper) and then find how much of the other Commodity will amount to that Sum at the Rate propos'd.

Reduce the 5 Hundred 3 Quarters and 14 Pounds into Pounds, and the 3 *l.* 10 *s.* into Shillings.

112 70 658
658

560
350
420 $\left(\frac{28}{112}\right.$ Rem. is $\frac{1}{4}$ 3*d.*

112) 46060 (411 . 20 . 11 . 3 *the Anſwer.*

Now 'tis eaſie to conceive that A ought to have as much Cotton at 10 *d* a Pound as comes to 20 *l.* 11 *s.* 3 *d.*

Reduce the Pounds into Pence, and ſay thus;

If 10 *d.* buys 1 what will 4935, there being no need of dividing the 4935 by 1, for cutting off the Laſt Figure does, there will remain 493, 5, or 4 Hundred 1 Quarter 17 Pound and half; and ſo much Cotton B muſt give to A in Exchange for his 5 Hundred 3 Quarters and 14 Pound of Pepper.

The *Learner* being Maſter of the foregoing Rules, eſpecially the *Rule of Three,* this will be eaſily comprehended by him; ſo we proceed.

Of Exchanging Coins.

IN Order to perform this, it will be neceſſary to have a true Account at all Times of the Juſt Values of thoſe Foreign Coins which are to be Exchang'd, becauſe the *Par* of Exchange differs almoſt every Day from *London* to other Countries.

The *Engliſh* generally reckon their Exchange with other Countries by Pence, *viz.* other Countries value their Crowns, Dollars, *&c.* by *Engliſh* Pence, except in ſome Parts of the *Low Countries,* with whom the Exchange is in Pounds *Sterling.*

The Par riſing and falling ſo often renders it of very little Uſe to Gentlemen to know a Year hence how it is now; ſo we omit giving a Table of Exchanges, and proceed to ſome Examples.

I draw a Bill of Exchange on a Merchant at *Amſterdam* for 400 *l. Sterling,* at 1 *l.* 13 *s.* 6 *d. Flemiſh* per Pound *Sterling,* How much Money muſt be paid at *Amſterdam?*

1 *l. Sterl.* is 240 *d.* and 1 . 13 : 6 *Flem.* 402.

Then if 240 *d.* is 402 what 400
4

12) 160800 (13400 *Anſwer;* that is, 670 *l. Flem.*

A Merchant draws upon me for 236 *l. Flemiſh* from *Antwerp,* Exchange at 1 *l.* 4 *s.* 7 *d. Flemiſh* per Pound *Sterling,* What muſt I pay him at *London?*

1 *l.* 4 *s.* 7 *d. Flem.* is 295 1 *l. Sterl.* 240

Then if 295 : 240 : : 236 : 192 *Anſwer.*

I pay 162 *l.* 18 *s. Sterling,* to receive the Contents at 4 *s.* 6 *d.* per Dollar.

Thus, 162 *l.* 18 *s.* makes 3258 and 4 *s.* 6 *d.* makes 4, 5.
Then 4, 5 : | :: 3258 : 724 *Anſwer.*

Or, Reduce the Queſtion into the Loweſt Denomination, Pence.

Then 54 *d.* 1 Dollar, what 38996 . 162 . 18.

54) 38996 (724 *Anſwer.*

ALLIGATION.

WHen 'tis requir'd to mix ſeveral Sorts of Ingredients together, or to Compoſe Medicines, *&c.* The Method of proportioning ſuch Mixtures is call'd the *Rule of Alligation,* and is divided into Two Parts or Branches call'd *Medial* and *Alternate.*

Medial Alligation is that by which the mean rate of any Mixture is found, when the particular Quantity of their Mixture and the Rates are given; It is thus perform'd.

Firſt find out the Sum of all the Quantities propos'd to be mix'd, and alſo the Sum of all their particular Rules, then the Proportion will be,

> As the Sum of all the Quantities is to the Sum of all their Rates, ſo is any Part of Mixture to the mean Rate or Price of that Part.

Suppoſe 15 Buſhels of Wheat at 5 *s.* the Buſhel, and 12 Buſhels of Rye at 3 *s.* 6 *d.* the Buſhel, were mix'd together, what is the mean Rate it may be Sold at without Loſs or Gain?

Thus, 15 Buſh. Wheat at 5 *s.* comes to 900 *d.*
12 Buſh. Rye at 3 comes to 504 *d.*

27 Buſhels. Total Value 1404

Then, If 27 . 1404, what 1 Buſh.

27) 1404 (52 or 4 *s.* 4 *d.* *Anſwer.*

If the Mixtures are of many Denominations, and ſeveral Prices, there's no difference in the Operation, but in the length of the Sums in Addition.

Theſe Operations are prov'd by comparing the Value of all the Mixture being ſold at the Mean Rate, with the Total Value of all the Particular Quantities, ſuppoſing they had been ſold at their Reſpective Rates unmix'd. If theſe Sums are equal, the Work is true.

Alternate Alligation is that by which the Particular Quantities of every Ingredient, concern'd in any Mixture, are found; when the Particular Rates of every one of theſe Ingredients, and the Mean Rate are given. This is the Reverſe of Medial Alligation.

Queſt. How much Wheat, at 5 *s.* a Buſhel, and Rye at 3 *s.* 6 *d.* a Buſhel, will compoſe a Mixture that may be ſold for 4 *s.* 4 *d?*

N.B. In all theſe Queſtions 'tis convenient to place the Mean Rate ſo, that it may eaſily be compar'd with the Particular Rates, in order to find every one of their Differences from the Mean Rate by the firſt glance of the Eye.

$$\text{Thus the Mean Rate, } 4\,s.\ 4\,d. \text{ or } 52\,d.\left\{\begin{array}{ll}\text{Wheat,} & 60\,d.\\ \text{Rye,} & 42\,d.\end{array}\right.$$

Then take the ſeveral Differences between the Mean Rate and the Particular Rates, ſetting down thoſe Differences alternately, and they will be the Quantities requir'd.

$$\text{Thus, } 52\left\{\begin{array}{l}60\\42\end{array}\right\}\left\{\begin{array}{l}10=52-42\\ 8=60-52\end{array}\right.$$

$$\text{That is, }\left\{\begin{array}{l}52-42=10 \text{ for the Quantity of Wheat.}\\ 60-52=\ 8 \text{ for the Quantity of Rye}\end{array}\right.$$
that will Compoſe the Mixture requir'd.

The Proof is by the Medial Alligation.

$$\begin{array}{ll}\text{Add}\left\{\begin{array}{l}10 \text{ Buſhels of Wheat at } 60\,d. \textit{ per } \text{Buſh.}\\ \ 8 \text{ Buſhels of Rye at } 42\,d. \textit{ per } \text{Buſh.}\end{array}\right. & \begin{array}{r}600\,d.\\ 336\end{array}\\ \hline 18 & 936\\ \hline\end{array}$$

Then 18) 936 (52 *d.* for 1 Buſhel, 4 *s.* 4 *d.*

Partial Allegation, is when the Particular Rates of all the Ingredients propos'd to be mix'd, the Mean Rate of the whole Mixture, and any one of the Quantities to be mix'd, are given to find how much of every one of the other Ingredients is requiſite to Compoſe the Mixture.

Queſt. How much Wheat at 5 *s.* a Buſhel muſt be mix'd with 12 Buſhels of Rye at 3 *s.* 6 *d.* a Buſhel, that the whole Mixture may be ſold for 4 *s.* 4 *d?*

Set down all the Particular Rates with the Mean Rates, and find their differences juſt as before, without any regard had to the Quantity given.

$$\text{Thus Mean Rate, } 52\,d.\left\{\begin{array}{ll}\text{Wheat,} & 60\,d.\\ \text{Rye,} & 42\,d.\end{array}\right\}\begin{array}{r}10\\ 8\end{array}$$

Then, as to the Quantity found by the differences of the ſame Name with the Quantity given, is to the Quantity given, ſo is any of the other Quantities found by the differences to the Quantity of its Name.

Thus 8 : 12 : 10 : 15 the Number of Buſhels of Wheat requir'd.

Alligation Total, is when the Particular Rates of all the Ingredients propos'd to be mix'd, and the Sum of all their Quantities, with the Mean Rate of that Sum, are given to find the Particular Quantities of the Mixture. It is thus perform'd.

Set down all their Particular Rates with the Mean Rate, and find their differences as before. Add together all the differences into one Sum.

Then, as the Sum of all the differences is to the Sum of all the Quantities given, ſo is every Particular Difference to its Particular Quantity.

Suppoſe Wheat at 5 *s.* a Buſhel were to be mix'd with Rye at 3 *s.* 6 *d.* a Buſhel, ſo that the whole Quantity may be made 27 Buſhels, to be ſold for 4 *s.* 4 *d.* a Buſhel, what Quantity of each muſt be taken to make up the Mixture?

$$\text{Mean Rate, } 52\left\{\begin{array}{ll}\text{Wheat,} & 60\\ \text{Rye,} & 42\end{array}\right\}\begin{array}{r}10\\ 8\\ \hline 18\\ \hline\end{array}$$

$$\text{Then } 18 : 27\left\{\begin{array}{l}10 : 15\\ \ 8 : 12\end{array}\right\}\text{the Quantities requir'd.}$$

Thoſe that are curious to know ſomething further in this Matter, are referr'd to Sir *Jonas More's* Arithmetick.

The next thing to be treated of is the laſt Principal Rule in Arithmetick.

The Extraction of Roots.

CAll'd alſo Evolution, which is the Unfolding and Reſolving any propos'd Number into the ſame Parts of which it was compos'd, or ſuppos'd to be made up of; in order to which 'twill be proper to conſider how theſe Numbers or Powers are compos'd, &c.

A Square Number is that which is entirely equal, as the Square Number 4 is compos'd of the two equal Numbers, 2 and 2, *viz.* $2\times2=4$.

The Square Number 9 of the two Equal Numbers, 3 and 3, *viz.* $3\times3=9$.

A Cube is that Number which is equally equal, or which is contain'd under three equal Numbers. Thus the Cube Number 8 is compos'd of the three Equal Numbers, 2 and 2 and 2, *viz.* $2\times2\times2=8$, &c.

The two Numbers, the *Square* and the *Cube*, borrow their Names from Geometrical Extenſions, or Figures.

That is, a Root is repreſented by a Line or Side, having but one Denomination, *viz.* Length. The Square is a Plain or Figure of two Dimenſions, having equal Length and Breadth. The Cube is a Solid Body of three Dimenſions, having equal

Length, Breadth, and Thickneſs. Beyond theſe three, Nature does not go as to Local Extenſions; that is, the Nature of Place or Space admits no room for other ways of Extenſion than Length, Breadth, and Thickneſs. Neither is it poſſible to form any Figure or Body beyond that of a Solid. Wherefore all the Superior Powers above the Cube, or Third Power, as the Biquadrate, or Fourth Power, the Sur-Solid, or Fifth Power, *&c.* are beſt explain'd by a Series of Numbers in Geometrical Proportion.

Example.

Suppoſe any Series of Geometrical Proportionals, whoſe Ratio are the ſame, and to them let there be aſſign'd a Series of Numbers in *Arithmetical Progreſſion,* beginning with an Unit, or 1, whoſe common difference is alſo 1.

Thus, 1. 2. 3. 4. 5. 6. 7. Indices.
2. 4. 8. 16. 32. 64. 128. *&c.* in ∺

Then are thoſe Numbers in ∺ produc'd by a continu'd *Multiplication* of the firſt Term or Root into it ſelf; and thoſe in Arithmetical Progreſſion, or Indices, ſhew what Degree or Power each Term in Geometrical Proportion is of.

For inſtance; In the Series of ∺ 2, is both the firſt Term or Root, and common Ratio of the Series.

Then 2 × = 4 the ſecond Term or Square.

And 2 × 2 × 2 = 8 or 4 × 2 = 8 the Cube, or third Term.

Again, 2 × 2 × 2 × 2 = 16, or 8 × 2 = 16 the fourth Term, or Biquadrate, and ſo on to the reſt.

When any Number is drawn into it ſelf, and afterwards into that Product, and 'tis ſaid to be ſo often involv'd into it ſelf, and is call'd Involution, the Indices are the Exponents of the reſpective Powers ſo involv'd.

According to theſe Involutions, is form'd the following Table of Powers, wherein the Root is only one ſingle Figure.

Root, or ſingle Side.	*Square, or ſecond Power.*	*Cube, or the third Power.*	*Biquadrate, or Square, ſquar'd, being the fourth Power.*	*Sur-Solid, or fifth Power.*	*Square cub'd, or Cube ſquar'd; the ſixth Power.*	*The ſecond Sur-Solid, or ſeventh Power.*	*The Biquadrate ſquar'd, or eighth Power.*	*The Cube cub'd, or ninth Power.*
	Index. 2	*Index.* 3	*Index.* 4	*Index.* 5	*Index.* 6	*Index.* 7	*Index.* 8	*Index.* 9
1	1	1	1	1	1	1	1	1
2	4	8	16	32	16	128	256	512
3	9	27	81	243	729	2187	6561	19683
4	16	64	256	1024	4096	16584	65536	262144
5	25	125	625	3125	15625	78125	390625	1953125
6	36	216	1296	7776	46656	279936	1679616	10077696
7	49	343	2401	16807	117649	823543	5764801	40353607
8	64	512	4096	32768	262144	2097152	16777216	134217728
9	81	729	6561	59049	531441	4782969	43046721	387420489

This Table plainly ſhews any Power under the Tenth, of all the Nine Figures, and from thence may be taken the neareſt *Root* of any *Square, Cube, Biquadrate,* &c. of any Number, whoſe Root or Side is a ſingle Figure.

But if the Root conſiſts of two or three, or any more Places of Figures, then it muſt be found by Parcels, or Figure after Figure.

When any Number is propos'd to have its Root extracted, the firſt Work is to prepare it by Points ſet over or under their proper Figures, according as the given Power whoſe Root is ſought requires; and that's done by conſidering the Index of the given Power, which for the Square is 2, for the Cube 3, *&c.* Then allow ſo many Places of Figures in the given Power, for each ſingle Figure of the Root, as its Index denotes, always beginning thoſe Points over the Place of Units, and aſcend towards the left-hand, if the given Number be Integers, and deſcend towards the right if otherwiſe.

Suppoſe a given Number, as 75640387246, which will be call'd the Reſolvend. If it be requir'd to Extract any of the following Roots, it muſt be pointed (according to the Conſideration before mention'd) in this manner.

Square Root, $\dot{7}5\dot{6}4\dot{0}3\dot{8}7\dot{2}4\dot{6}.$
Cube Root, $7\dot{5}64\dot{0}38\dot{7}24\dot{6}.$
Biquadrate Root, $75\dot{6}403\dot{8}724\dot{6}.$
Sur-Solid Root, $\dot{7}5640\dot{3}8724\dot{6}.$

The Reaſon why in Pointing the Given Reſolvend Two Figures is allow'd in the Square, Three in the Cube, and Four in the Biquadrat: For one Figure in the Root may ſeveral ways be made evident. But the Table of Single Powers explain it, in which you may obſerve that all the Powers of the Figure 9, which is but a ſingle Figure, have the ſame Number of Places or Figures as the Index of thoſe Powers denotes, therefore ſo many Places of Figures muſt be aſſign'd for every Single Figure in the Root. By theſe Points conſequently is known how many Places of Figures, there will be in the Root; that is, ſo many Points as there are ſo in any Figure, there muſt be in the Root, and whether they muſt be Integers or Decimal Parts is eaſily determin'd by the reſpective Places of the Points.

To Extract the Square Root.

Having Pointed the Given Reſolvend into Periods of Two Figures, then by the Table of Powers find the Greateſt Square that is contain'd in the firſt Period towards the Left Hand, ſetting down its Root like a Quotient Figure in Diviſion, and Subſtract the Square out of the ſaid Period of Figures for a Dividend, and double the Root of the firſt Square for a Diviſor, inquiring how often it may be had in that Dividend; ſo as when the Quotient Figure is annex'd to the Diviſor, and that encreas'd Diviſor being multiply'd with the ſame Quotient Figure, the Product may be the greateſt Number that can be taken out of that Dividend, and to the Remainder bring down the next Period of Figures for another new Dividend; then ſee how often the laſt encreas'd Diviſor can be had in the new Dividend, with the ſame Caution as was before, *viz.* ſo as that the Quotient Figure being annex'd to the Diviſor, and that increas'd Diviſor multiply'd by the ſame Quotient Figure, their Product may be the greateſt Number that can be Subſtracted from the new Dividend as before; and ſo proceed from Period to a Period, that is, from Point to Point in the ſame manner till all is done. As neceſſary as Examples wou'd be in this Science, we muſt omit 'em here, having a narrow Sphere to work in.

Of ALGEBRA.

A Very Great Mathematician ſaid of *Algebra*, that none but *Maſters* ſhou'd read what's written upon it. If ſo, this Treatiſe might have been very well ſpar'd, ſince it ſeems a little too Intricate to make a Part of a Gentlemans Recreation; but this Deſign had been Imperfect if we had omitted it entirely as it was in the Firſt *Edition*, wherefore we have here from the beſt Authority inſerted as much upon this Subject as conſiſted with the Brevity to which we were confin'd. The Principal Rules in *Algebra* are the ſame as thoſe in *Arithmetick*, but differently perform'd, and therefore ſome call it *Algebraick Arithmetick*, others *Arithmetick* in *Specie*, becauſe all the Quantities concern'd in any Queſtion remain in their Subſtituted Letters (let 'em be manag'd either by *Addition, Subſtraction, Multiplication, Diviſion, Involution* or *Evolution)* without being deſtroy'd or chang'd into others as Figures in Common Arithmetick are.

Of *Notation.* The Method of Noting down *Letters* for *Quantities* is various, according to every one's Fancy. We ſhall here repreſent the *Quantity* taught by ſmall *a*, and if more *Quantities* than one are taught, mark them by the other ſmall Vowels, *e i o u* and *y*.

The Given *Quantities* are repreſented by the ſmall *Conſonants b c d f g.* &c. and for Diſtinction ſake mark the Points of *Lines* in all *Schemes* with the Capital Letters, A B C D F, *&c.*

When any Quantity, either given or taught, is taken more than once, you muſt prefix its Number to it, as 3*a* ſtands for A taken three times, and 7 6 for 6 taken 7 times.

All Numbers thus prefix'd are call'd *Co-efficients*, becauſe they multiply the Quantity; and if any Quantity be without a Co-efficient, it is always ſuppos'd to have a Unit prefix'd to it, as *a* is 1*a*, *&c.* As to the Signs by which Quantities are manag'd, they are the ſame as in *Arithmetick*, and 'tis abſolutely neceſſary, that whoever wou'd be acquainted with either this Science or that, ſhou'd be perfectly Maſter of them. To thoſe mention'd in the Beginning of our Diſcourſe of *Arithmetick* muſt be added theſe.

ᘓ the Sign } of Involution,
u u } of Evolution or Extraction of Roots.

All Quantities expreſs'd by Numbers only are call'd *Abſolute Numbers*; thoſe that are repreſented by Single Letters, or by ſeveral joyn'd together, are call'd Simple Quantities: But when different *Quantities* repreſented by different *Figures* are joyn'd together by the Signs (+ or —) as $a+b$, or $a-b$, &c. They are call'd Compound Quantities; and when Quantities are expreſs'd by theſe Signs, thus $\frac{a}{b}$ or $\underline{a+d}$ Like Vulgar Fractions they are call'd *Broken Quantities.*

The Sign by which *Quantities* are joyn'd, always belongs to that *Quantity* which immediately follows it, and therefore all the Quantities concern'd in any Queſtion may ſtand in any Order at Pleaſure, as is moſt convenient for the next Operation: As $a+b-d$ may ſtand thus, $b-d+a$, or thus $a-d+b$ or $d+a-b$, &c. theſe being ſtill the ſame, tho' differently plac'd. That Quantity which has no *Sign* before it is always underſtood to have the Sign + before it, As *a* is $+a$, or $b-d$ is $+b-d$, &c. for the Sign + is the *Affirmative Sign*, and therefore all Leading Quantities are underſtood to have it as well as thoſe that are to be added. But the Sign — being the *Negative* Sign, or *Sign* of *Defect*, 'tis neceſſary to prefix it before that Quantity to which it belongs.

The Method of *Tracing Steps* us'd in bringing *Quantities* to an *Equation*, is to Regiſter the ſeveral Operations with Figures and Signs plac'd in the Margent of the Queſtion: For Inſtance, If it be requir'd to ſet down and Regiſter the Sum of the Two *Quantities* A and B, the Work will ſtand

Thus	1	a
	2	b
1+2	3	$a+b$

	1	$a=9$
	2	$b=6$
1+2	3	$a+b=9+6=15$

Firſt ſet down the Propos'd *Quantities* A and B over againſt the Figures 1 . 2 in the Small Column, (which are here call'd Steps) and againſt 3 (the Third Step) ſet down their Sum, *viz.* $a+b$; then againſt that Third Step ſet down 1+2 in the *Margent*, which denotes that the Quantities againſt the Firſt and Second *Steps* are added together, and that thoſe in the Third *Step* are their Sum, as if it had been mark'd in Numbers as in the Margent.

There are ſeveral *Axioms* which relate equally to *Algebra* and *Geometry*, and the Reader is referr'd to what is ſaid in the Latter, where he will find 'em. The Five Firſt are applicable to *Algebra*, and therefore a Learner ought to get 'em by Heart: He muſt alſo be Careful not to go to the Second Rule before he is Maſter of the Firſt; that is, not to meddle with *Subſtraction* till he underſtands *Addition*.

Addition in *Algebra*,

OR *Addition* of Whole Quantities, admits of Three Caſes.

Caſe 1. If the *Quantities* are like, and have like *Signs*, add the *Co-efficients* together, and to their Sum joyn the *Quantities* with the ſame *Sign*, as Thus

	1	a	$-a$	$5b$	$-7bc$	$3a+5b$	$3a-5b$
	2	a	$-a$	$3b$	$-8bc$	$2a+5b$	$2a-7b$
1+2	3	$2a$	$-2a$	$8b$	$+15bc$	$5a+12b$	$5a-12b$

Caſe 2. If the Quantities are alike, and have unlike *Signs*, *Subſtract* the Co-efficients from each other, and to their Difference joyn the *Quantities* with the Sign of the Greater.

	1	$+5a$	$-5a$	$7bc$	$-9abd$
	2	$-3a$	$+3a$	$6bc$	$+7abd$
1+2	3	$+2a$	$-2a$	bc	$2abd$

Caſe 3. When the *Quantities* are *unlike*, ſet them all down without altering their *Signs*, and thence will ariſe Compound Quantities, which can be no otherwiſe added but by their *Signs*.

	1	$a-$	a	$5b+7dc$
	2	b	$-b$	$4a-20$
1+	3	$a+b$	$a-b$	$5b+7dc+4a-20$

Subſtraction in *Algebra*.

SUBSTRACTION of Whole *Quantities* is perform'd by one General Rule.

Change all the Signs of thoſe *Quantities* which are to be Subſtracted, or ſuppoſe them in your Mind to be Chang'd.

Then add all the Quantities together as before in *Addition*, and their Sum will be the Remainder requir'd.

For to Subſtract an Affirmative Quantity from an *Affirmative*, is the ſame as to add a Negative Quantity to an *Affirmative*; that is $+2a$ taken from $+3a$ is the ſame with $-2a$ added to $+3a$, and to Subſtract the Negative Quantity from an Affirmative, will be the ſame as to add an Affirmative *Quantity* to an Affirmative; that is, $-2a$ taken from $+3a$, will be the ſame with $+2a$ added to $+3a$. Thus,

		Example 1.	*Exam.* 2.	*Exam.* 3.	*Exam.* 4.
	1	$2a$	$-2a$	$8b$	$-15bc$
	2	a	$-a$	$3b$	$-8bc$
1—2	3	a	$-a$	$5b$	$-7bc$

If theſe Examples be compar'd with thoſe in *Addition* the Work will appear very *Evident*, theſe being only the Converſe or Proof of thoſe.

Multiplication in *Algebra*.

MULTIPLICATION of *Whole Quantities* admits of Three Caſes.

Caſe 1. When the Quantities have Like *Signs*, and no *Co-efficients* joyn them together, prefix the *Sign* + before them, and that will be the *Product*. Thus,

	1	a	Again,	1	$-a$
	2	b		2	$-b$
1+2	3	ab	1+2	3	$+ab$

Again,	1	$a+b$	Again,	1	$-a\ -b$
	2	d		2	$-d$
1+2	3	$ad+ba$	1+2	3	$+ad+bd$

Caſe 1. If there be *Co-efficients*, multiply them, and to their Product joyn the Quantities ſet together as before. Thus,

	1	$5a$	$-6d$	$3a+2b$	$a+b$
	2	$3b$	$-7b$	6	$5b$
1+2	3	$15ab$	$+42db$	$18a+12b$	$5ab+5bb$

Caſe. When the *Quantities* have unlike *Signs*, joyn them and the Product of their Co-efficients together, as before, but prefix the *Sign* — before them. Thus,

	1	$+a$	$-6d$	$4a-7b$	$4a-7b$
	2	$-b$	$+7b$	$3f$	$-3f$
1+2	3	$-ab$	$-42db$	$12af-21bf$	$-12af+21bf$

If the *Multiplier* conſiſts of ſeveral Terms, then every one of thoſe Terms muſt be multiply'd into all the Terms of the Multiplicand; and the Sum of thoſe particular Products will be the Product requir'd, as in Common Arithmetick.

	1	$a+b-d$	$7b+5d$
	2	$a-b$	$3a+5f$
1+a	3	$aa+ba-da$	$21ba+15da$
1+l	4	$-ba-bb+dl$	$-35lf-25df$
3+4	5	$aa-da-bb+dl$	$21ba+15da-35bf-25df$

Diviſion in *Algebra*.

DIVISION of Whole *Quantities* is the direct Contrary to that of *Multiplication*, and conſequently perform'd by direct contrary *Operations*. It admits of four Caſes.

Caſe 1. When the *Quantities* in the *Dividend* have like *Signs* to thoſe in the *Diviſor*, and no Co-efficients in either, caſt off all the Quantities in the *Dividend*, that are like thoſe in the *Diviſor*, and ſet down the other *Quantities* with the Sign + for the *Quotient*. Thus,

	1	ab	$-ab$	$ad+6d$	$-ad-bd$
	2	b	$-b$	d	$-d$
1÷2	3	a	$+a$	$a+b$	$a+b$

Caſe 2. When the *Quantities* in the *Dividend* have unlike Signs to thoſe in the *Diviſor*, then ſet down the *Quotient* Quantities found as before, with the Sign — before them. Thus,

	1	$+ab$	$-ab-bd$	$abc+bcd+bcf$
	2	$-b$	$+b$	$-bc$
1÷2	3	$-a$	$-a-d$	$-a-d-f$

Caſe 3. If the *Quantities* in the *Dividend* and the *Diviſor* have Co-efficients, divide the Numbers (as in Common Arithmetick) and joyn to their *Quotient* the *Quotient* Quantities. Thus,

	1	$15ab$	$42db$	$12af-21bf$
	2	$3b$	$-7b$	$3f$
1÷2	3	$5a$	$-6d$	$4a-7b$

Caſe 4. When the *Quantities* in the *Diviſor* cannot be exactly found in the *Dividend*, then ſet them both down like a Vulgar Fraction, as in Common Arithmetick. Thus,

	1	a	$6bc$	$5b+4a$
	2	b	$3d$	$5d+7b$
1÷2	3	$\frac{a}{b}$	$\frac{2bc}{d}$	$\frac{5b+4a}{5d+7b}$

Involution of *Whole Quantities* is the Raiſing *Power* from any propos'd *Root*, and is in all things like Multiplication; except in that *Multiplication* admits of any different Factors, but *Involution* ſtill retains the ſame Examples.

	1	a	$-a$	*The Root, or ſingle Power.*
1 @ 2	2	aa	$+aa$	*Square, or 2d Power.*
1 @ 3	3	aaa	$-aaa$	*Cube, or 3d Power.*
1 @ 4	4	$aaaa$	$+aaaa$	*Biquadrate, or 4th Power.*
1 @ 5	5	$aaaaa$	$-aaaaa$	*Sur-Solid, or 5th Power.*

The Figures plac'd in the *Margent* after the *Sign* of *Involution*, ſhew to what height the Root is involv'd, and are call'd *Indices* of the Power. They are uſually plac'd over the involv'd Quantities, in order to contract the Work, eſpecially when the Powers are any thing high. Thus,

$$\left.\begin{array}{l} a=a\\ a^2=aa\\ a^3=aaa\\ a^4=aaaa \end{array}\right\}\left\{\begin{array}{l} a^5=aaaaa.\\ a^6=aaaaaa.\\ a^5b^5=aaaaabbbbb.\\ a^3b^2d^4=aaabbdddd, \text{ \&c.} \end{array}\right.$$

If the *Quantities* have Co-efficients, they muſt be involv'd along with the *Quantities*, as in theſe,

	1	$2a$	$-3a$	$5bc$
1 @ 2	2	$4aa$	$+9aa$	$25bbcc$
1 @ 3	2	$8aaa$	$-27aaa$	$125bbccc$
1 @ 4	4	$16aaaa$	$+81aaaa$	$b25b^4c^4$
1 @ 6	5	$32aaaaa$	$-243a^5$	$3125b^5c^5$, &c.

Involution of Compound *Quantities* is perform'd in the ſame manner, due regard being had to their Signs and Co-efficients. As for Example.

Suppoſe $a+b$ were given to be involv'd to the fifth Power. Thus,

	1	$a+b$ call'd a Binomial Root.
		$a+b$
1×a	2	$aa+ab$
1×b	3	$+ab+bb$
1 @ 2	4	$aa+2ab+bb$ the Square of $a+b$
		$a+b$
4×a	5	$aaa+2aab+abb$
4×b	6	$+aab+2abb+bbb$
1 @ 3	7	$aaa+3aab+3abb+bbb$ the Cube of $a+b$
		$a+b$
7×a	8	$a^4+3a^3b+3aabb+abbb$
7×b	9	$+a^3b+3aabb+3abbb+b^4$
1 @ 4	10	$a^4+4a^3b+6aabb+4abbb+b^4$
		$a+b$
10×a	11	$a^5+4a^4b+6a^3bb+4aab^3+ab^4$
10×b	12	$+a^4b+4a^3bb+6aab^3+4ab^4+b^5$
1 @ 5	13	$a^5+5a^4b+10a^3bb+10aab^3+5ab^4+b^5$
		$a+b$, &c.

As to the *Reſidual Root*, the Powers rais'd from it are the ſame with their like Powers rais'd from a *Binomial Root*, (or the Sum of two *Quantities*) except the *Binominal Powers* have the Sign + to every Term, but the *Reſidual Powers* have the Signs + and — interchangeably to every other Term.

Evolution of Whole *Quantities*, is the Extracting of *Roots* from any given Power, that is, 'tis the direct Contrary Work to *Involution*, and is eaſy in ſingle *Quantities*, if the given Power has ſuch a *Root* as is requir'd; which is thus to be known.

If the given Power has no Numbers prefix'd to it, and its Index can be divided by the *Index* of the *Root* requir'd, the *Quotient* will be the Index of the *Root* ſought; thus, if the Cube of $aaaaaa$ were requir'd (the Index of the Cube is 3) (then 3) 6 (2 that is 3) a^6 (a^2 the *Root* requir'd) and ſuch Operations are uſually ſet down thus,

	1	a^6	a^6b^6	$a^6b^6d^6$
1 *uu* 2	2	a^3	a^3b^3	$a^3b^3d^3$
1 *uu* 3	3	aa	$aa\ bb$	$aa\ bb\ dd$
3 *uu* 4	4	a	ab	abd

The Figures plac'd in the *Margent*, after the Sign (*uu*) of Evolution, denote the Index of the *Root* to be extracted.

If the given Powers have Co-efficients, or Numbers prefix'd to them, then Extract their reſpective *Roots*, as in Vulgar Arithmetick. Thus,

	1	$81a^4$	$1296a^8b^8$	$20736a^4b^4c^4$
1 *uu* 2	2	$9aa$	$36a^4b^4$	$144aabbcc$
1 *uu* 4	3	$3a$	$6aabb$	$12abc$
1 *uu* 2	4	$3a$	$6aabb$	$12abc$

If the *Root* requir'd cannot be extracted out of both the Co-efficients and Indices of the given Power, then 'tis a *Surd*, and muſt have the Sign of the *Root* requir'd prefix'd to it. Thus,

	1	a^5	$67aaaa$	$216bbbddd$
1 *uu* 2	2	$\sqrt{a^5}$	$\sqrt{67aaaa}$	$\sqrt{216bbbddd}$
1 *uu*	3	$\sqrt[3]{a^5}$	$\sqrt[3]{67aaaa}$	$6bd$

As to the Evolution of Compound Quantities, it muſt be preſum'd that if either the Sum or Difference of ſeveral *Quantities* be involv'd to any Power, there will ariſe ſo many ſingle Powers of the ſame height, as there are different Quantities. As for Inſtance,

If $a+b+d$ be ſquar'd, that is, involv'd to the ſecond Power, it will be $aa+2ab+2ad+bb+2bd+dd$, or aa, bb, dd. Again, if $a+b+d$ were cub'd, that is, involv'd to the third Power, it would be aaa, bbb, and ddd. Wherefore in Extracting the *Roots* of all Compound Quantities, there muſt be conſider'd,

1. How many different *Letters* or *Quantities* there are in the given Power.

2. Whether the ſingle Powers of each of thoſe Letters be of an equal height, and have in them ſuch a ſingle *Root* as is requir'd; if ſo, it muſt be extracted.

3. Thoſe ſingle *Roots* muſt be joyn'd with the Sign +, and involv'd to the ſame height with the given Power; that being done, the new rais'd Power muſt be compar'd with the given Power, and if they are alike in all their reſpective Terms, then you have the *Root* requir'd; or if they differ only in their Signs, the *Root* may be eaſily corrected with the Sign —, as occaſion requires.

Example.

Let it be requir'd to Extract the ſquare *Root* of $cc+2cb-2cd+bb-2bd-dd$. In this Compound Square there are three diſtinct Powers, viz. bb, cc, dd, whoſe ſingle *Roots* are $b\ c\ d$; wherefore I ſuppoſe the *Root* ſought to be $b+c+d$, or rather $b+c-d$, becauſe in the given Power there is $-2cd$ and $-2bd$, therefore I conclude it is $-d$, then $b+c-d$ being ſquar'd, produces $bb+2bc-2bd+cc-2cd-dd$, which is the ſame in all its Terms with the given Power, tho they ſtand in a different Poſition, conſequently $b+c-d$ is the true *Root* requir'd.

The Difficulties in theſe Matters are ſo great, that there's occaſion of as many Examples as poſſible to explain and enlighten them; but our Deſign being only to preſent an Idea of them to the Reader, as clear as conſiſts with the Brevity of it in all its Parts, we muſt deſire him to be ſatisfy'd with this one Example, and refer him to *Oughtred*, *Pell*, *Ward*, *Jones*, and others, who have treated of this Intricate Subject more largely, and with good Reputation.

Algebraick Fractions, or broken Quantities, are expreſs'd like Vulgar Fractions. Thus,

$$\frac{a}{b}\quad\frac{2bc}{d}\quad\frac{5^b+4^a}{4^d+7^b}\quad\begin{matrix}\text{Numerators.}\\ \text{Denominators.}\end{matrix}$$

Fractional Quantities are manag'd in all reſpects like Vulgar Fractions in Common Arithmetick.

To alter or change different Fractions into one *Denomination*, returning the ſame Value, *multiply all the Denominators into each other, and each Numerator into all the Denominators but its own, for Numerators.* As for Inſtance,

Let it be requir'd to bring $\frac{a}{b}$ and $\frac{d}{c}$ into one Denomination.

Firſt, $a\times c$ and $d\times b$ will be the Numerators, and $b\times c$ will be the common Denominator.

Viz. $\frac{ca}{bc}$ and $\frac{bd}{bc}$ are the two Fractions requir'd.

That is, $\frac{ca-a}{bc\quad b}$ and $\frac{bd-d}{bc\quad c}$

Again, Let $\frac{b+c}{a+b}$ and $\frac{d-c}{b-d}$ be brought into one Denomination, and they will be,

$$\frac{bb+bc+bd-dc}{ba+bb-da-bd}\text{ and }\frac{ad-ac+bd-bc}{ba+bb-ad-bd}\text{ \&c.}$$

To bring Whole Quantities into *Fractions* of a given *Denomination, multiply the Whole Quantities into the given Denominator, under which ſubſcribe the given Denominator, and you will have the Fraction requir'd.*

Example.

Let it be requir'd to bring $a+b$ into a Fraction, whoſe Denomination is $d-a$: Firſt, $a+b$ $d-a$ is $da+bd-aa-ba$.

Then $\frac{da+bd-aa-ba}{d-a}$ is the Fraction requir'd.

Again, $b+\frac{a}{d}$ will be $\frac{db+a}{d}$ and $\frac{da}{a}-a$ will be $\frac{aa+da}{d}$ and $a+b+\frac{aa+bb}{a-b}$ will be $\frac{2aa}{a-b}$.

When whole *Quantities* are to be ſet down Fraction-wiſe, ſubſcribe an Unit for the Denominator

Thus, ab is ab, and $aa-bb$ is $\frac{aa-bb}{1}$, &c.

To *reduce* Fractional Quantities into their loweſt Denominations. *Divide both the Numerator and Denominator by their greateſt Common Diviſor,* viz. *by ſuch Quantities as are found in both, and their Quotients will be the Fraction in its loweſt Term:*

Thus, $\frac{aac}{de}$ is $\frac{aa}{d}$ and $\frac{abbb}{abc}$ is $\frac{bb}{a}$ alſo $a+\frac{bdc}{bc}=a+d$.

In Compound Fractions it muſt be done by dividing the Numerator by the Denominator till nothing remains, when that can be done, or elſe finding their Common Meaſure by dividing the *Denominator* by the *Numerator*, and the *Numerator* by the *Remainder*, and ſo on as in Vulgar Fractions; but if after all Means us'd there cannot be found One Common Meaſure to both the *Numerator* and *Denominator* then is that Fraction in its leaſt terms already.

In *Addition* and *Subſtraction* of *Fractional Quantities* add or ſubſtract their Numerators as occaſion requires, and to their Sum or Difference ſubſcribe the Common *Denominator*, as in Vulgar Fractions.

Example in Addition.

$$\begin{array}{r|c|c|c|c|c}
 & 1 & \frac{bb}{c} & \frac{a+b}{d} & \frac{2a-b}{d+c} & \frac{a-b+d}{d+a} \\
 & 2 & \frac{aa}{c} & \frac{2a+c}{d} & \frac{2b-a}{d+c} & \frac{a+b-d}{d+a} \\
\hline
1+2 & 3 & \frac{bb+aa}{c} & \frac{3a+b+c}{d} & \frac{a+b}{d+c} & \frac{2a}{d+a}
\end{array}$$

Example in Subſtraction

$$\begin{array}{r|c|c|c|c|c}
 & 1 & \frac{bb+aa}{c} & \frac{a+b}{d+c} & \frac{3a+b+c}{d} & \frac{2a}{d+a} \\
 & 2 & \frac{bb}{c} & \frac{2b-a}{d+c} & \frac{2a+c}{d} & \frac{a+b-d}{d+d} \\
1-2 & 3 & \frac{aa}{c} & \frac{2a-b}{d+c} & \frac{a+b}{d} & \frac{a-b+d}{d+a}
\end{array}$$

In *Multiplication* of Fractional Quantities prepare Surd Quantities if there be any by making them improper Fractions, and whole Quantities by ſubſcribing an Unit under them; then *multiply the Numerators together for a new Numerator, and the Denominators together for a new Denominator; as in Vulgar Fractions.* Thus,

$$\begin{array}{r|c|c|c}
 & 1 & \frac{ab}{c} & \frac{-3a-2b}{2d+c} \\
 & 2 & \frac{d}{f} & \frac{4a+2b}{d} \\
1+2 & 3 & \frac{abd}{cf} & \frac{12aa-2ab-4bb}{2dd+dc}
\end{array}$$

Any Fraction is multiply'd with its Denominator by taking the Denominator away; as $\frac{b}{a}+a$ gives b for $\frac{b}{a}+\frac{a}{1}=\frac{ba}{a}=b$, &c.

Diviſion of *Fractional Quantities* is perform'd thus, after the Quantities are prepar'd, as is obſerv'd *in Multiplication, Multiply the Numerator of the Dividend into the Denominator of the Diviſor; for a new Numerator. And multiply the other Two together for a new Denominator; as in Vulgar Fractions.*

Example.

Let $\frac{abd}{cf}$ be divided by $\frac{ab}{b}$ the Work may ſtand thus:

$$\frac{ab}{c}\Big)\,\frac{abd}{cf}\,\Big(\frac{abde}{abcf}=\frac{d}{f}$$

As by the Reduction of Fractional Quantities before ſpoken of may appear. Or thus:

$$\begin{array}{c|c|c|c}
1 & \frac{abd}{cf} & \frac{a+b}{d} & \frac{aaa-bbb}{a+b} \\
2 & \frac{ab}{c} & \frac{c-b}{a} & \frac{aa-ab+bb}{c} \\
\hline
3 & \frac{d}{f} & \frac{aa+ba}{dc-db} & \frac{aaac-bbbc}{aaa+bbb}
\end{array}$$

When *Fractions* are of one *Denomination*, caſt off the *Denominators*, and divide the *Numerators*, thus:

If $\frac{ab^3}{c}$ were to be divided by $\frac{bb}{c}$ it will be $bb)\,ab^3\,(ab$ the Quotient requir'd.

Involution of Fractional Quantities, is done thus: *Involve the Numerator into itſelf, for a new Numerator, and the Denominator into itſelf for a new Denominator: Each ſo often as the Power requires.*

$$\begin{array}{r|c|c|c|c}
 & 1 & \frac{b}{a} & \frac{3bc}{2ad} & \frac{b+d}{a-c} \\
\hline
1\ @\ 2 & 2 & \frac{bb}{aa} & \frac{9bbcc}{4aadd} & \frac{bb+2bd+dd}{aa-2ac+cc} \\
\hline
1\ @\ 3 & 3 & \frac{bbb}{aaa} & \frac{27bbbccc}{8aaaddd} & \frac{bbb+3bbd+3bdd+ddd}{aaa-3aac+3acc-ccc}
\end{array}$$

In *Evolution* of *Fractional Quantities*, if the *Numerator* and *Denominator* of the given *Fraction* have each of them ſuch a *Root* as is required, which (very rarely happens) then *evolve* them, and their reſpective *Roots* will be the Numerator and Denominator of the new Fraction requir'd thus:

	1	$\frac{9aabb}{4dd}$	$\frac{aa+2ab+bb}{aa-2ab+bb}$
1 uu 2	2	$\frac{3ab}{2d}$	$\frac{a-b}{a-b}$

When the *Numerator* has ſuch a *Root* as is requir'd, and the *Denominator* has not, or the *Denominator* has ſuch a *Root* when the *Numerator* has not, then the Operations may be ſet down thus:

		$\frac{aabb}{ddd}$	$\frac{aaa+4bb-dd}{aa+2ab+bb}$
1 uu 2	2	$\frac{ab}{\sqrt{ddd}}$	$\frac{\sqrt{aaa+4bb-dd}}{a+b}$

As to Surd Quantities, if we enter'd upon 'em we ſhou'd carry the Reader too far in ſo ſhort an Eſſay, ſo we are well pleas'd with our uſual excuſe for not medling with them, and proceed to *Equations.*

We come now to the Nature of Equations, and how to prepare them for a Solution.

Having got ſo clear an Underſtanding of the Queſtion propos'd, as to place down all the Quantities concern'd, *viz.* all the ſubſtituted Letters in ſuch order as the Nature of the Queſtion requires. The next Thing to be conſider'd is, Whether it admits of more Anſwers than one; in order to which, obſerve the Two following Rules.

1. *When the Number of the Quantity ſought exceeds the Number of the given Equations the Queſtion is capable of innumerable Anſwers.*

Example, *There are Three ſuch Numbers, that if the Firſt be added to the Second, their Sum will be 22. And if the Second be added to the Third, their Sum will be 46. Queſt.* What are thoſe Numbers?

Let the 3 Numbers be repreſented by 3 Letters thus: Call the Firſt a, the Second e, and the Third y,

$$\text{Then } a+e = 22$$
$$e+y = 46$$

Here the Number of Quantities ſought are Three, a, e, y, and the Number of the given Equations are but Two, therefore this Queſtion admits of various Anſwers; becauſe for any of thoſe Three Letters you may take any Number at pleaſure that's leſs than 22.

2. *When the Number of given Equations, not depending upon one another, are juſt as many as the Number of the Quantities ſought, then each Quantity ſought has but one ſingle Value.*

Let there be Three Numbers, a, e and y as before. If the Firſt be added to the Second, their Sum will be 22; if the Second be added to the Third, their Sum will be 46; and if the Firſt be added to the Third, their Sum will be 36.

That is $a+e = 22$ $e+y = 46$ and $a+y = 36$

Now here each ſingle Quantity has but one Value, to wit, $a = 6$ $e = 16$ and $y = 36$ where the Queſtion is ſtated in its ſubſtituted Letters, and found to have but one *Anſwer*; let all thoſe ſubſtituted Letters be ſo order'd and compar'd together either by adding, ſubſtracting, multiplying, or dividing them according as the Nature of the Queſtion requires till all the unknown Quantities, except one, are caſt off. Great care muſt be taken to keep them to an exact *Equality*, and when that unknown Quantity, or ſome Power of it (as Square, Cube, &c.) is found equal to thoſe that are known; then the Queſtion is ſaid to be brought to an *Equation*, and conſequently to a *Solution.* There are no Rules for this caſting off Quantities which is only to be obtain'd by Care and Practice. The buſineſs of reducing Equations is grounded, and depends upon a right Application of the 5 firſt Axioms in Geometry, to which we refer the Reader. If thoſe Axioms be well underſtood, the Reaſon of ſuch Operations will appear very plain.

Of Reduction by *Addition.* This is grounded upon the Firſt *Axiom*, and is only the *tranſpoſing* any Negative Quantity from either ſide of an *Equation* to the other ſide, with the ſign + before it; as,

	1	$a-b=d$
	2	$a-d+b$
	3	$b=b$
$1+3$	4	$a=d+b$

Again,	1	$3a-4=6-a$
$1+\underline{4}$	2	$3a=6+4-a$
$2+a$	3	$4a=6+\ -10$

When any abſolute Number is regiſter'd in the Margent, draw a Line over it to diſtinguiſh it from the other Numbers, as 4 in the ſecond Step of this Example.

Reduction by *Subſtraction*, is grounded upon the Second *Axiom*, and perform'd by *tranſpoſing* any *Affirmative Quantity* from either ſide of the *Equation*, to the other ſide with the Sign — before it; as in theſe *Examples.*

	1	$a+b=d$
	2	$b=b$
$1-2$	3	$a=d-b$

Again,	1	$3a+4=6+a$
$1-\underline{a}$	2	$2a+4=6$
$2-4$	3	$2a=6-4=2$

Reduction by *Multiplication* is perform'd by multiplying every Term in the *Equation*, with the *Denominators* of the Fractions, as by the Third *Axiom* and theſe *Examples.*

Suppoſe,	1	$\frac{a}{5} = 6$
Then,	2	$a = 6\times5=30$, for $\frac{a}{5}\times5=\frac{5a}{5}=a.$

	1	$3a = \frac{dc}{2b}$
$1\times2b$	2	$6ba = dc$

	1	$a = \frac{dd}{a-b}$
$1+ab$	2	$aa-ba=dd$

Reduction by *Diviſion* is thus: When any *Quantity* known or unknown is in every Term of an *Equation*; if the whole Equation be divided by that Quantity, it will be reduc'd into lower Terms, as by the Fourth *Axiom* and theſe *Examples.*

$$\begin{array}{r|c|r|} \text{Suppoſe,} & 1 & baa+bca=bcd \\ 1\div b & 2 & aa+ca=cd \\ \hline \end{array} \qquad \begin{array}{r|c|r} \text{Again,} & 1 & aa=7a \\ 1\div a & 2 & a=7 \\ \hline \end{array}$$

10

Or when the unknown Quantity is multiply'd with any that is known, let the whole *Equation* be divided by the known Quantity, that ſo the unknown may be clear'd, as thus:

$$\begin{array}{r|c|r} & 1 & ba-ca=d \\ 1\div b-c & 2 & a=\dfrac{d}{b-c} \\ \hline \end{array}$$

$$\begin{array}{r|c|r} \text{Again,} & 1 & caa-daa=cd-dd \\ 1\div c-d & 2 & aa=\dfrac{cd-dd}{c-d}=d \\ \hline \end{array}$$

We ſhall ſay no more of *Algebra*, which is a Science ſo conciſe of itſelf, 'twill not bear to be abridg'd, and we cannot enlarge upon it.

GEOMETRY

IS an Art of well meaſuring any *Magnitude*, that is, any continu'd *Quantity*, by which a Thing is call'd *Great* or *Small*.

The continu'd *Quantity* is that in which the *Parts* are continu'd in a common *Term*.

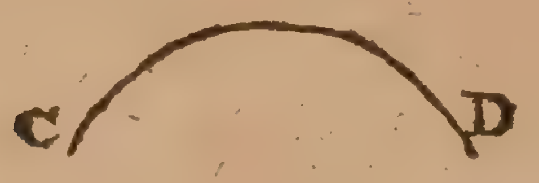
A *Term* is the utmoſt *Part* or *Point* of *Magnitude*.

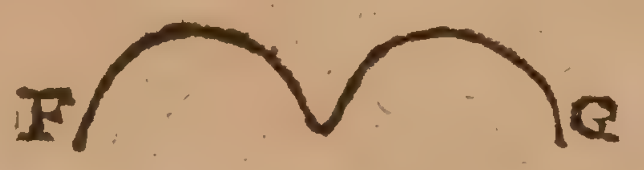
A *Point* has no Parts, that is, a Geometrical *Point* is not any *Quantity*, but only an *aſſignable Place* in any *Quantity*, denoted by a Point, as at A. and B. Such a Place may be conceiv'd, tho' infinitely ſmall, as to be void of *Length*, *Breadth*, and *Thickneſs*, wherefore a Point is ſaid to have no Parts.

A *Line* is call'd a *Quantity* of one *Dimenſion*, becauſe it may have any ſuppos'd Length, but no Breadth nor Thickneſs being made or repreſented to the *Eye* by the Motion of a *Point*; that is, if the Point at A be mov'd (upon the ſame *Plane*) to the *Point* at B, it will deſcribe a *Line*, either *Right* or *Crooked*, according to its *Motion*. Wherefore the *Ends* or *Limits* of a *Line* are *Points*.

A *Right Line* is that *Line* which lies *Even* or *Streight*, between thoſe *Points* that limit its *Length* being the ſhorteſt Line that can be drawn between any two Points, as the *Line* A———B. Wherefore between any two *Points* there can lie or be drawn but one *Right Line*.

A *Crooked Line* is that which lies bending between thoſe *Points* which limit its *Length*, as the Line



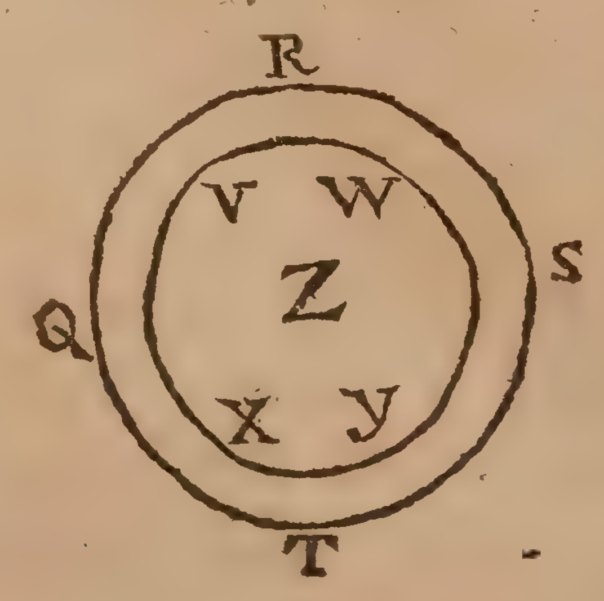


There are ſeveral ſorts of theſe Lines, but the Circle, the Parabola, Ellipſis, and Hyperbola, are moſt us'd in Geometry.

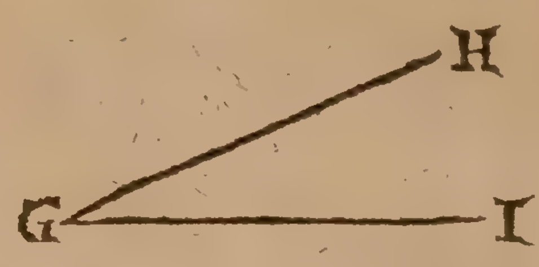
Parallel Lines are thoſe that lie equally diſtant from each other in all their Parts, which being extended infinitely, would never touch, as the Lines

M———N
O———P

A *Circular Parallel* is a *Line* drawn within or without another *Circle* upon the ſame *Center*, as the two Circles Q R S T V W X Y Z, which being drawn upon the ſame *Center* Z, are Parallel one to the other.

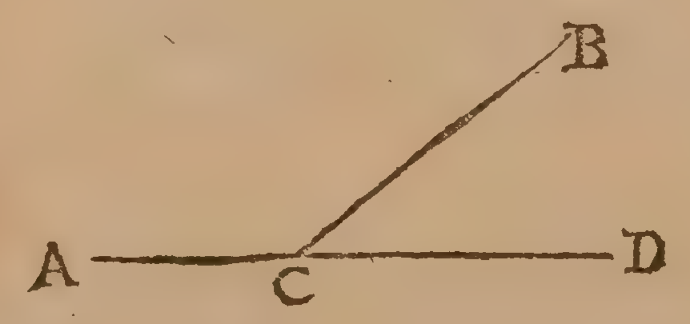


An *Angle* is the Inclination or Bowing of two Lines one towards the other, the one touching the other, and not being directly joyn'd together, it is commonly ſign'd by three Letters.



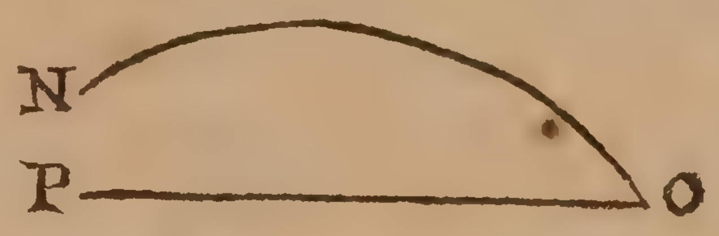
If the Lines that contain the *Angle* are Right Lines, then 'tis call'd a *Right Angle*, as G H I.

An *Obtuſe Angle* is that which is greater than a Right Angle. Such is the Angle included between the Lines A C and C B.

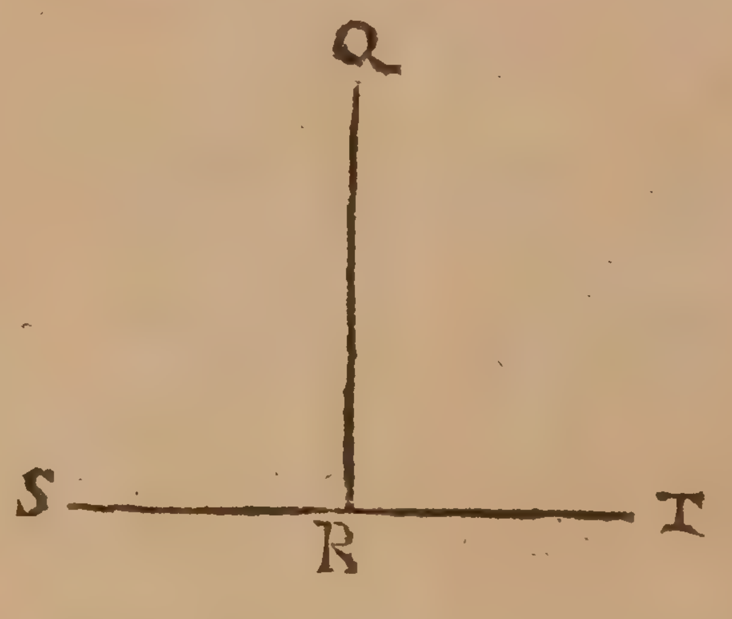


An *Acute Angle* is that which is leſs than a *Right Angle*, as the *Angle* included between the Lines B C and C D.

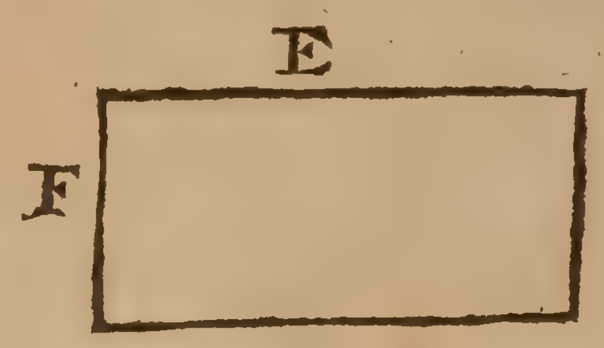
A *Mix'd Angle* is that which is contain'd both of a *Right* and *Crooked* Line, as the Angle N O P.



When a *Right Line*, Q R, ſtanding upon a Right Line S T, makes the *Angles* on either ſide of it Q R S and Q R T equal one to the other; then both thoſe Equal *Angles* are *Right Angles*, and the Line Q R, which ſtands on the other, is term'd a *Perpendicular* to that S T whereon it ſtands.



A *Superficies* has only *Length* and *Breadth*,



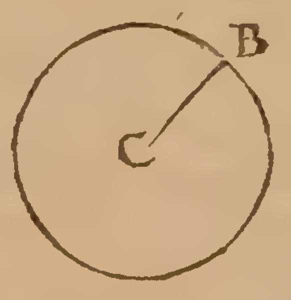
The *Extreams* or *Limits* of a *Superficies* are Lines.

A *Superficies* is the Limit of a Body or Solid, and repreſents its Shape to the Eye. 'Tis uſually call'd the Area of any Figure.

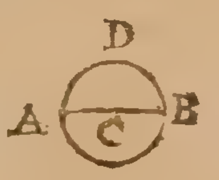
A Plain *Superficies* is that which lies equally between its *Lines*.

A *Circle* is a *Plain Figure*, contain'd under one *Line*, call'd a *Circumference*.

Suppoſe a *Right Line*, as C B to have one of its Extream *Points*, as C, ſo fix'd upon any *Plane*, as that the other *Point* at B may move about it; then if the *Point* at B be ſo mov'd on the ſame *Plane*, it will deſcribe a *Line* equally diſtant in all its *Parts* from the *Point* C, which will be the *Circumference* or *Periphery* of that Circle. The *Point* C will be its *Center*, the contain'd *Space* its *Area*, and the *Right Line* C B, by which the *Circle* is thus deſcrib'd, its *Radius*.



The *Diameter* of a *Circle* is twice its *Radius* joyn'd into one *Right Line*, as A B, drawn thro' the *Center* C, and ending at the *Circumference* on each ſide.

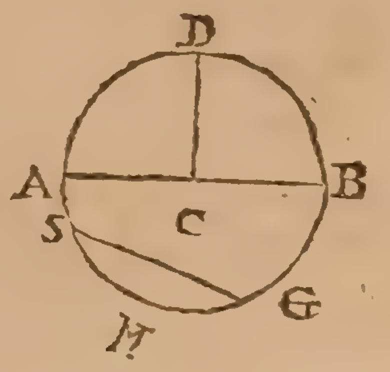


A *Semicircle* is a *Figure* contain'd under the *Diameter*, and that part of the *Circumference* cut off by the *Diameter*, as A B D.

A *Quadrant* is half a *Semi-circle*, and is made by a *Radius*, as D C, ſtanding *Perpendicular* upon the *Diameter* at the *Center* C, cutting the *Periphery* of the *Semi circle* in the middle, as at D.

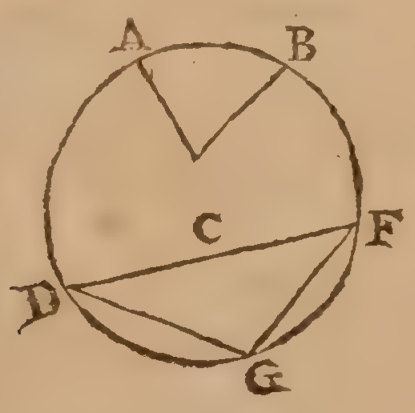
A *Chord* Line is any Right Line that cuts the Circle into two unequal Parts, as the Line S G.

A *Segment* of a Circle is a Figure included between the *Chord* and the *Arch* of the *Periphery*, which is cut off by the *Chord*, and it may either be greater or leſs than a *Semi-circle*, as the Figure S M G or S D G.



A *Sector* is a *Figure* included between two *Radius's* of a *Circle*, and that Arch of its *Periphery* where they touch, as the Figure A C B, and the Arch A B is the Meaſure of the Angle at C, included between the *Radius's* A C and B C.

An *Angle* in the *Segment* of a *Circle*, is that which is included between two *Chords* that flow from the ſame Point in the *Periphery*, as at D, and meet with the ends of another *Chord* Line, as at F and G.

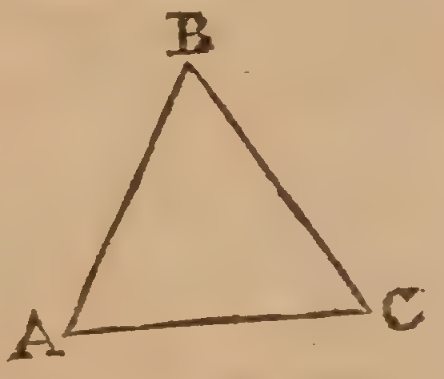


Of Triangles.

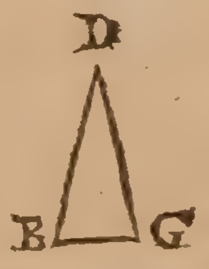
A *Plain Triangle* is a Figure, whoſe *Superficies* is contain'd within the *Limits* of three *Right Lines*, call'd *Sides*, including three *Angles*; and it may be divided, and takes its Name either according to its *Sides* or *Angles*.

By its *Sides*,

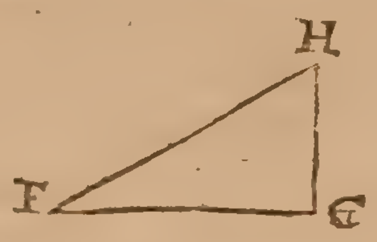
As an *Equilateral Triangle*, is that which has all its three *Sides* equal, as A B C, that is, $AB=BC=AC$.



An *Iſoſcheles* is that which has two *Sides* only *Equal*, as

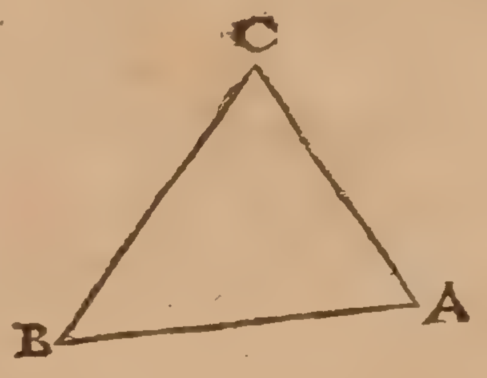


A *Scalenum* has all its three *Sides* Unequal.

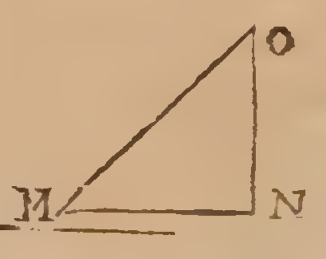


By its *Angles*,

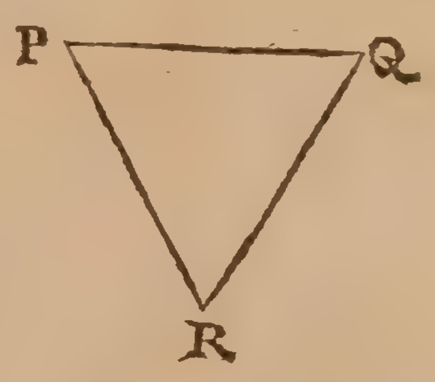
A *Right Angled Triangle*, is that which has one *Right Angle*, as



An *Ambligonium*, or an *Obtuſe Angled Triangle*, has in it one *Obtuſe Angle*, as

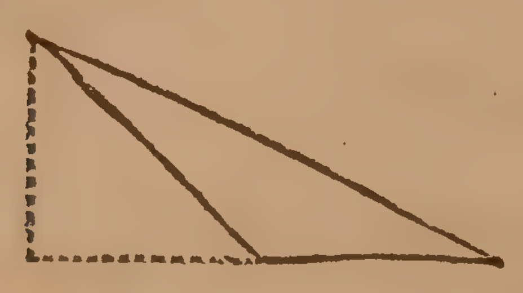


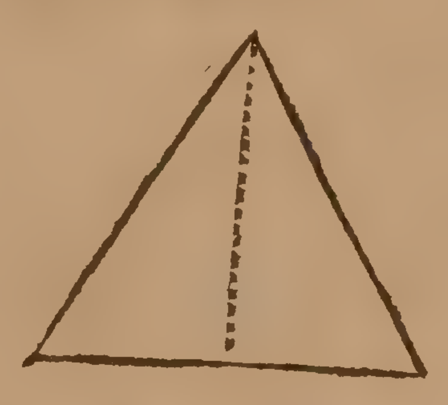
An *Oxygonium*, or an *Acute Angled Triangle*, has all its *Angles Acute*, as



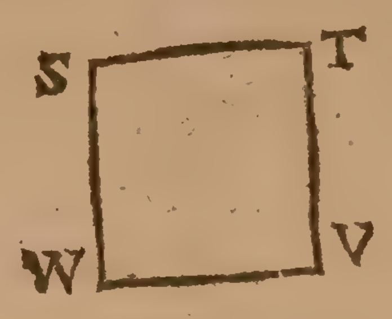
All *Triangles* that have not a *Right Angle*, whether they are *Acute* or *Obtuſe*, are in general Terms call'd *Oblique Angles*; and the longeſt Side of every *Oblique Angle* is uſually call'd *Baſe*, the other two are term'd the *Sides* or *Legs*.

The *Altitude* of any *Plain Triangle*, is the Length of a *Right Line*, let fall *Perpendicular* from any of the *Angles* on the Side oppoſite to that Figure from whence it falls, and may be either within or without the *Triangle*, as occaſion requires, being mark'd by the two *Prick'd* Lines in the next *Triangles*.

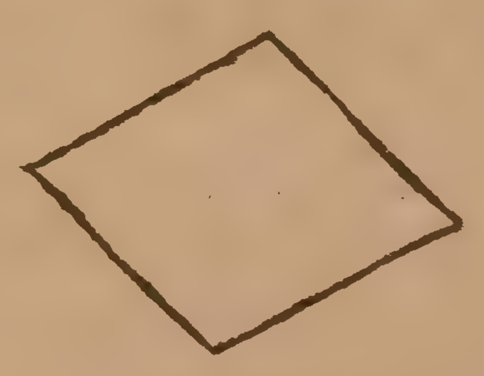




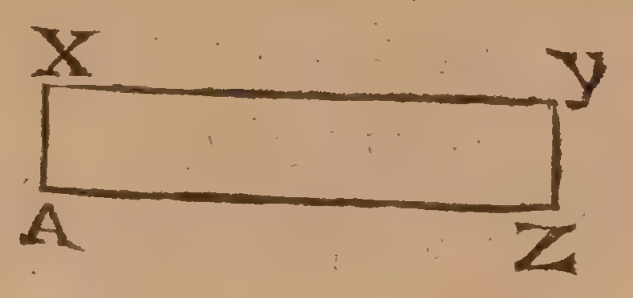
A *Square* is that whoſe *Sides* are *Equal*, and *Angles Right*.



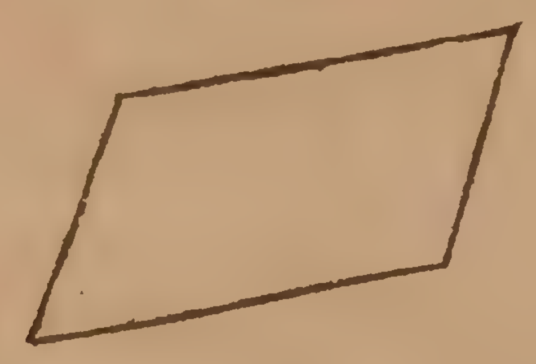
A *Rhombus* or *Diamond* is that which has four *Equal Sides*, but not *Right Angles*, as



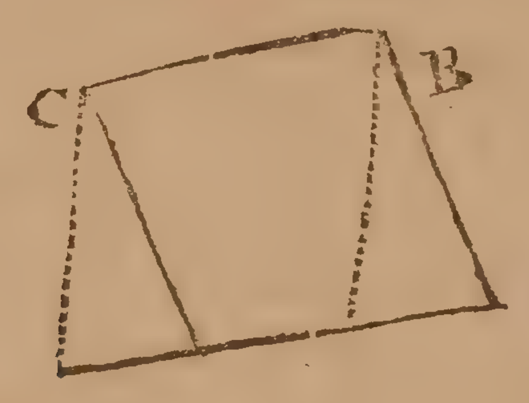
A *Rectangle*, often call'd an *Oblong Square*, has four Right *Sides*, and its two Oppoſites *Equal*, as



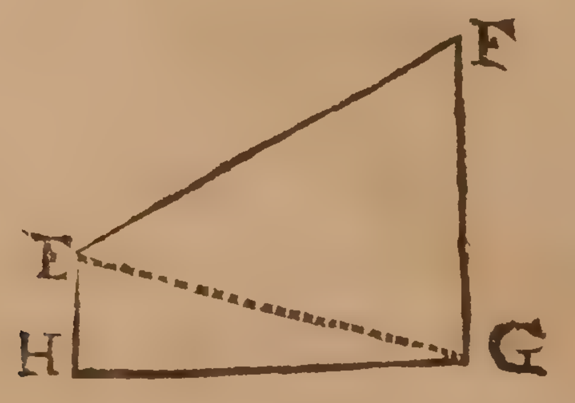
A *Rhomboides* is a Figure whoſe Oppoſite *Sides* and *Angles* are *Equal*, but has neither *Equal Sides* nor *Right Angles*, as



The *Altitude* of either Rhombus or Rhomboides, is a Right *Line* let fall *Perpendicular* from any Angle on the Oppoſite Side to that Angle, and it may be either within or without the Figure, as the Prick'd Lines B C.



All other Figures of four *Sides* are call'd *Trapezia's*, that is, when they have neither Oppoſite Sides nor Oppoſite Angles Equal, as



A *Diagonal Line* is a *Right Line* drawn from any *Angle* in a four ſided Figure to its Oppoſite *Angle*, and divides the *Superficies* of the Figure into two *Triangles*, as the Prick'd Line E G.

Polygons are Right Lin'd Figures, which have more than four ſides, and are either *Regular* or *Irregular*.

A *Regular Polygon* is that which has all its *Sides Equal*, ſtanding at Equal *Angles*, and is nam'd according to the Number of its Angles, *Pentagon*, *Hexagon*, *Heptagon*, *Octagon*, i. e. *Five*, *Six*, *Seven*, or *Eight Angles*. All *Regular Polygons* may be *inſcrib'd* in a Circle.

An *Irregular Polygon* has many unequal *Sides* ſtanding at unequal *Angles*; but they may all be reduc'd to *Regular* Figures, by drawing *Diagonal* Lines in them.

Problems in *Geometry*.

FOR the performing a Problem in Geometry, the Performer muſt be provided with a thin ſtraight Ruler, and two Pair of Compaſſes, one call'd three pointed Compaſſes, uſeful for drawing of Figures, or Schemes, either with Black-Lead, or Ink, and one Pair of Plain Compaſſes, with very fine Points, to meaſure and ſet off Diſtances; He ſhould alſo have a very good Steel drawing Pen, and be ſure to make himſelf Maſter of the Reaſon of one Problem, before he undertakes another. They are all grounded on theſe following *Poſtulata's*.

1. That a *Right Line* may be drawn from any one given *Point* to another.

2. That a *Right Line* may be produc'd, increas'd, or made longer from either of its Ends.

3. That upon any given *Point* or *(Center)* and with any given *Diſtance*, viz. with any *Radius* a Circle may be deſcrib'd.

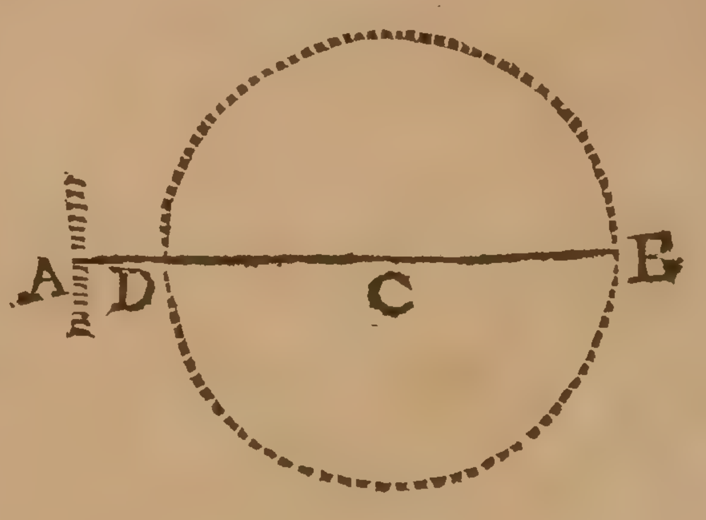
A *Problem* is that which propoſes ſomething to be done, and relates more immediately to *Practical* than *Speculative Geometry*; the Nature of it being to be perform'd by ſome known Rules, without regard to their *Inventions* or *Demonſtrations*.

Problem I.

Two *Right* Lines being given to find their *Sum* and *Difference*.

Let the given Lines be A———C.
C———B.

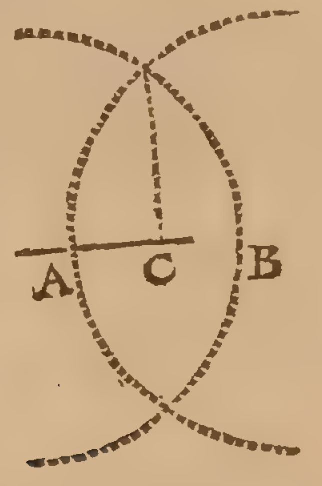
Make the ſhorteſt *Line* at C B *Radius*, and with it deſcribe a Circle. From its Center C, ſet off the other Line A C, and joyn A C B with a *Right Line*, then will $AB=AC+CB$ and $AD=AC=CB$, as was requir'd.



Problem II.

To divide a *Right Line* given, as A B, into two *Equal Parts*.

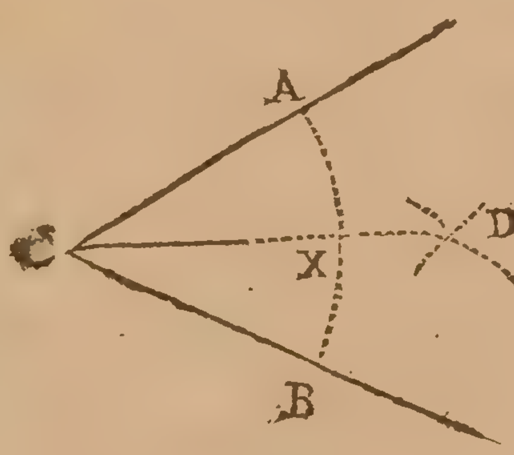
From both ends of the given *Line*, viz. A B with any *Radius* greater than half its *Length*, deſcribe two *Arches*, that may croſs each other in two *Points*, as at D F; then joyn thoſe *Points* D F with a *Right Line*, and it will divide the *Line* A B in the middle at C, that is, it will make AC=CB, as was requir'd.



Problem III.

To divide a *Right-lin'd Angle* given, into two Equal *Angles*.

Upon the *Angle Point*, as at C, with any convenient *Radius*, deſcribe an *Arch* as A B; and from thoſe *Points*, A and B, deſcribe two Equal *Arches*, croſſing each other, as at D; then joyn the *Points* C D, with a *Right Line*, and it will divide the *Arch* A B, and conſequently the *Angle*, as was requir'd.



It will be eaſily imagin'd that theſe Problems might be continu'd to what Length we pleas'd. Enough is already propos'd and work'd to give the Curious Reader an Idea of this Part of Geometry, and more is not pretended in a Science which requires ſo much Application to maſter; we therefore proceed to

Theorems.

A *Theorem* is when any Common Rule, or any new Propoſition is requir'd to be demonſtrated, ſo that it may afterwards become a *Certain Rule*, to be rely'd upon in Practice.

Demonſtration

Here ſuppoſes the higheſt Degree of Proof that Humane Reaſon is capable of by a Train of Arguments, deduc'd from ſuch Plain Axioms, and other ſelf-evident Truths as cannot be deny'd by any one that conſiders them.

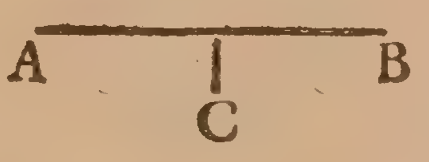
In order to ſhorten the following *Demonſtrations* of the *Theorems* propos'd; *Note*,

1. That the *Circumference* of every *Circle* is ſuppos'd to be divided into 360 Equal Parts, call'd Degrees; and every one of theſe Degrees are divided into 60 Parts, call'd Minutes.
2. All Angles are meaſur'd by the Arch of a Circle, deſcrib'd upon the Angular *Point*, and are eſteem'd *Greater* or *Leſs*, according to the Number of Degrees contain'd in that Arch.
3. A *Quadrant*, or *Quarter* Part of any Circle, is always 90 Degrees, being the Meaſure of a *Right Angle* and a *Semi-circle* is 180 Degrees, being the Meaſure of two *Right Angles*.
4. *Equal Arches* of a *Circle* meaſure *Equal Angles*.

Before the Learner goes farther, 'twill be neceſſary he ſhould underſtand the following

Axioms.

1. If *Equal Quantities* be added to *Equal Quantities*, the *Sum* of thoſe *Quantities* will be *Equal*.
2. If *Equal Quantities* be taken from *Equal Quantities*, the *Quantities* remaining will be *Equal*.
3. If *Equal Quantities* be multiply'd with *Equal Quantities*, their Products will be *Equal*.
4. If *Equal Quantities* be divided by *Equal Quantities*, their Quotients will be *Equal*.
5. Thoſe *Quantities* that are *Equal* to one and the ſame Thing, are *Equal* to one another.
6. Every *Whole* Thing is *Greater* than its *Part*, that is, the Whole Line A B is *Greater* than its *Part* A C.



7. Every *Whole* is *Equal* to all its *Parts* taken together; thus, the *Whole Line* A B is *Equal* to its *Parts*, AC+*cd*+*d*+*e*+*e*B.

8. Thoſe things which being laid one upon another, *agree* or *meet* in all their *Parts*, are Equal one to the other.

This Axiom relates particularly to *Lines* and *Angles*, and not to *Superficies*, unleſs they be alike in Figure and Form; for a *Circle* may be *Equal* in *Area* to a *Square*, yet if laid one upon another, 'tis plain they cannot *meet* in all their *Parts*, becauſe they are unlike Figures.

☞ The Reader muſt be very careful to remember the Signs ſet down in the beginning of the Diſcourſe on Arithmetick, to diſtinguiſh the Rules of Numeration, Addition, Subſtraction, Multiplication, &c. by, as alſo the following Marks, which are to ſhorten the *Operations* in Geometry.

Thus, L ſignifies an *Angle*, LL *Angles*, Δ a *Triangle*, □ a *Square*, ▭ a *Parallelogram*. When an *Angle* is denoted by three Letters, as A B C. The middle Letter, as B always denotes the *Angular Point*, and the other two Letters, as A B and B C, or Sides of a *Triangle*, which includes that *Angle*.

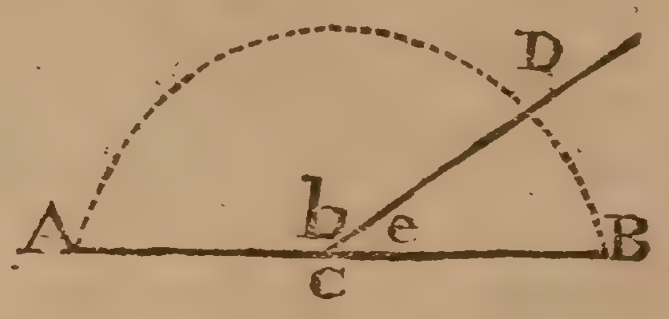
Theorem.

If a *Right Line* ſtand upon or meet with another *Right Line*, and make *Angles* with it, they will either be two *Right Angles*, or two *Angles* Equal to two *Right Angles*.

Demonſtration.

Suppoſe the Lines to be A B and D C, meeting in the *Point* at C; upon C deſcribe any *Circle* at pleaſure, then will the *Arch* A D be the Meaſure of the Angle *b*, and the Arch D B, the *Meaſure* of the

Angle *e*, but the Arches $AD+AB=180^\circ$, *viz.* they compleat the *Semi-circle*, conſequently the $Lb+Le=180^\circ$, which was to be prov'd.



Corollaries.

1. Hence it follows that if the L $b=90$, then L $e=90$; but if L be obtuſe, then the L e will be acute, &c.

2. Hence it will be eaſie to conceive, that if ſeveral *right Lines* ſtand upon or meet with any *right Line* at one and the ſame *Point*, all the *Angles* taken together will be $=180$, *viz.* two right Angles.

Note, *Corollaries* or *Conſectaries*, in *Geometry*, are ſome *conſequent* Truths, or gain'd from any *Demonſtration*.

Lemma's are the *Demonſtration* of ſome *Premiſes* laid down or propos'd as a *Preparative* to obviate or ſhorten the Proof of a *Theorem*.

A *Scholium* is a brief *Obſervation* made on ſome *precedent Diſcourſe*.

We have ſo often obſerv'd to the Reader that we have not room to enter far into the various Operations of any of the *Parts* of theſe *Sciences*, that he will not now expect it, ſo we ſhall in the next Place give the *Solution* of eaſie *Problems* in *Plain Geometry*.

Note, When a Line, or the Side of any Plain *Triangle*, is any way *cut* in two or more *Parts*, either by a Perpendicular Line let fall upon it or otherwiſe, thoſe *Parts* are uſually call'd *Segments*; and ſo much as one of thoſe Parts are longer than the other is call'd the Difference of the *Segments*.

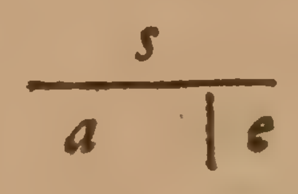
And when any *Side* of a *Triangle* or any Segment of its *Side* is given 'tis uſually mark'd with a ſmall Line croſs it thus +, and thoſe *Sides* or Parts of *Sides* that are ſought are mark'd thus ÷.

Problem.

To cut or divide a given *right Line* (as S) into *extream* and *mean* Proportion. (11 e 2)

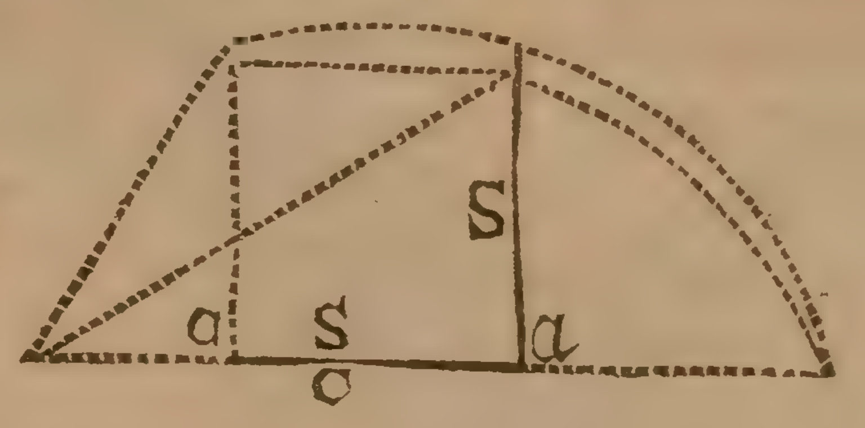
That is to divide a *Line* ſo, that the *Square* of the greater *Segment* or Part *a*, may be equal to the *Rectangle*, made of the whole Line *S*, and the leſs Segment *e*, *viz.*

	1	$S=aa$, by the Problem.
	2	$S-a=e$, for $S=a+e$.
$1+S$	3	$\frac{aa}{S}=e$.
2 and 3	4	$\frac{aa}{S}=S-a$ *per Axiom* 5.
$4+S$	5	$aa=SS-Sa$
$5+Sa$	6	$aa+Sa=SS$
6 ſolved	7	$a=\sqrt{SS+\frac{1}{4}SS}:-S$



This *Problem* cannot be truly anſwer'd by *Numbers*, but *Geometrically* it may be perform'd thus:

1. Make a Square, whoſe ſide is = S the given Line, and cut off one of its *ſide* G, S, in the *Middle*, as at C, upon the Point C deſcribe ſuch a *Semi-circle* as will paſs through the remoteſt *Points* of the *Square*, and compleat its *Diameter*.



2. Then will either Part of the *Diameter* on each end of the ſide S be $=a$, the greater *Segment* ſought.

$$\text{For, } a+S:S::S:a$$
$$\text{Therefore, } aa+Sa=33.$$

Problems may be continu'd *ad infinitum* by altering the Propoſitions. The Variety of which wou'd ſwell this Treatiſe to what bulk we pleas'd; but for the Reaſons often mention'd before, we ſhall content our ſelves with this, and go forward to *Practical Problems*, for finding the *Areas* of *Right Lin'd* Figures.

The *Area* of any Figure, whether it be *Right Lin'd* or *Circular* is made up of *Squares* either *greater* or *leſs*, according to the different Meaſures by which the *Dimenſions* of the *Figure* are taken; that is, if the *Dimenſions* are taken in *Inches*, the *Area* will be compos'd of Square *Inches*. If the *Dimenſions* are taken in *Feet*, the *Area* will be compos'd of Square Feet, &c. Theſe Things being underſtood, and the *Definitions* at the beginning of this Diſcourſe of *Geometry* well conſider'd, will help to render the following *Rules* eaſie.

Problem I.

To find the *Area* of a *Square*, or any *right Angled Parallelogram.*

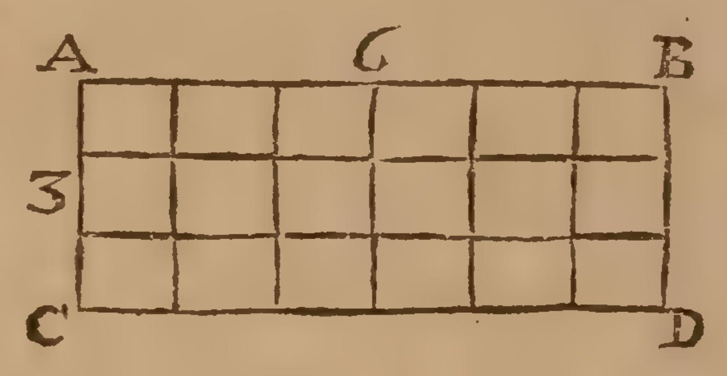
Rule.

Multiply the *Length* into its *Breadth*, and the *Product* will be the *Area* requir'd.

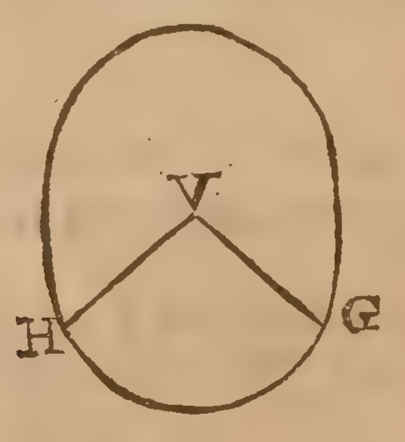
Example.

Suppoſe the *Line* A B=6 Yards, and the *Breadth* A, C, or B, D=3 Yards, then A, B, + A, C, 6 + 3=18, will be the Number of Square *Yards* contain'd in the *Area* of the *Parallelogram*.

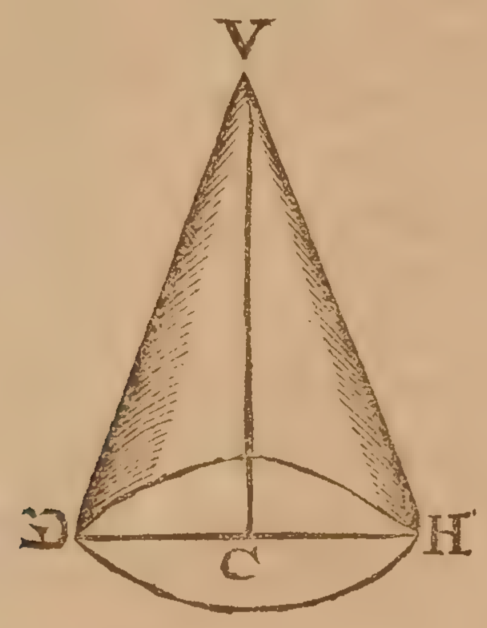
This need no *Demonſtration*, 'tis ſo evident by the *Figure*.



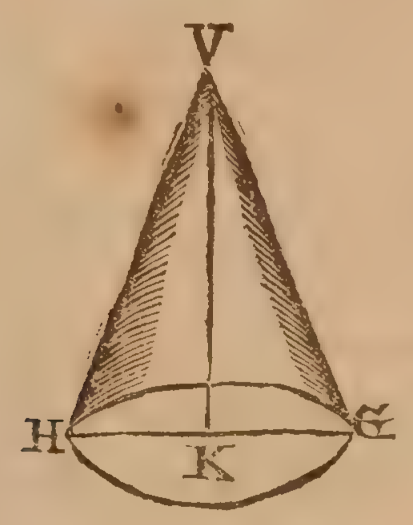
From theſe Problems my Author leads me to an eaſie Method to find out the Circle, Periphery and Area to any aſſign'd Exactneſs (or Number of Figures) by one Equation only; but the Working of ſuch a Geometrical Propoſition wou'd take up too many Figures, and we muſt refer the Reader to the Treatiſe at large, and proceed to Cones, and their Sections. A Cone is thus defin'd by the ſame Mathematician. If a Circle deſcrib'd upon Paper (or any other pliable Matter) of what Buſineſs you pleaſe be cut into two, three, or more Sections, and one of thoſe Sections be ſo roll'd up as that the Radius may exactly meet each other, it will form a conical Superficies; that is, if the Section H, V, G, be cut out of the Circle, and ſo roll'd up as that the Radius's V, H, and V, G, may firſt meet each other in all their Parts, it will form a Cone, and the Center V will become a ſolid Point, call'd the Vertex of the Cone; the Radius V, H, being every where equal, will be the Side of the Cone, and the Arch H, G, will become a Circle; whoſe Area is call'd the Conick Baſe.



A right Line being ſuppos'd from the Vertex or Point V, to the Center of the Cone's Baſe, as at C that Line, *viz.* V, C, will be the Axis or Perpendicular Height of the Cone.

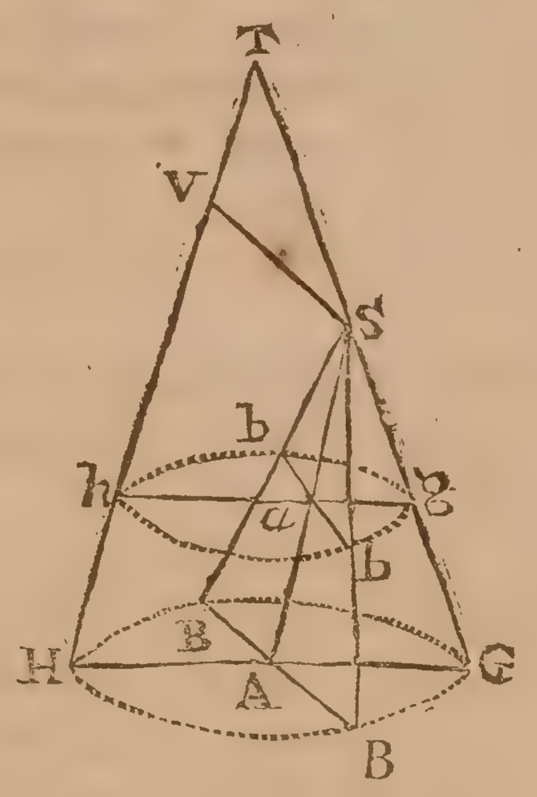


If a Solid be exactly made in ſuch a Form it will be a compleat Cone. Any Cone, whoſe Axis is not at right Angles with the Plane of its Baſe, may be properly call'd an imperfect Cone; becauſe its Sides are not every where equal (as in this Figure). This is uſually call'd a Scalenum or Oblique Cone.



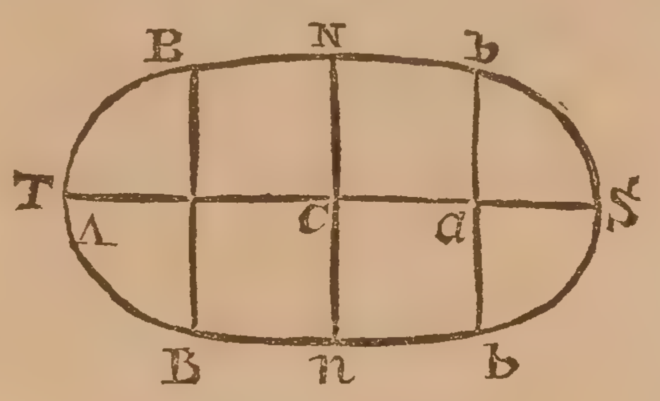
A Conick Section is the Figure made by the Solidity of a Cone, being ſuppos'd to be cut by a Plane. If the Section be made by the Axis, or thro' the Vertex, the Figure ariſing is a Triangle. If by a Plane parallell'd to the Baſe of the Corner or ſubcentrarily poſited, the Figure produc'd is a Circle. If the Section be made parallel to one Side of the Cone, the Figure produc'd is a Parabola. If thro' both Sides of the Cone, 'tis an Ellipſis; and if thro' one Side of the Cone, thro' the Baſe, and not parallell'd to the other Side of the Cone, 'tis an Hyperbola. *Archimedes, Euclid,* and other Mathematicians, call'd that only a Conick Section when the Plane cutting that Cone was at right Angles to the Side of the Cone; and according as the Angle made by the Sides of the Cone meeting in the Vertex, as it was in right Obtuſe or Acute one; they call'd it the Section of a Right Angled, Obtuſe Angled, or Acute Angled Cone; by which Word they underſtood what we now call the Parabola, Hyperbola, and Ellipſis. We ſhall ſay ſomething of each in particular, and Firſt of an Ellipſis.

If the tranſverſe Diameter of an Ellipſis as T, S, in the following Figure, be divided into any two Parts by an Ordinate rightly apply'd; As at the Points A, c, a, *&c.* then are thoſe Parts T, A, T, C, T, a, and S, A, S, C, S, a, *&c.* what are call'd Abſciſſes, which ſignify Lines or Parts cut off; and by the Rectangle of any two Abſciſſes, is meant the Rectangle of ſuch two Parts, as being added together will be equal to the tranſverſe Diameter. As,



T, A, + S, A, = T, S, and T, C, + S, C, = T, S, or, T, a, + S, a, = T, S, *&c.*

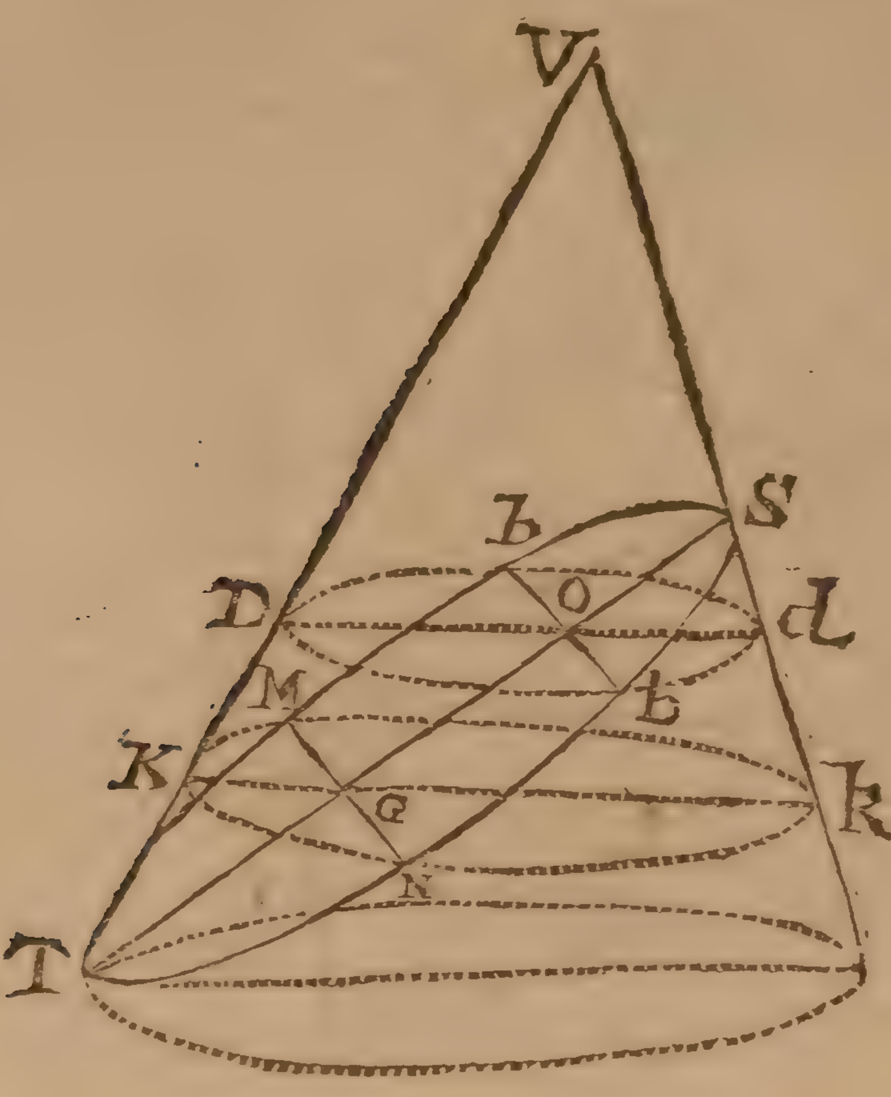
Every Ellipſis is proportion'd, and all ſuch Lines as relate to it are regulated by help of one general Theorem. As the Rectangle of any two Abſciſſes, is to the Square of half the Ordinate, which divides them, ſo is the Rectangle of any other two Abſciſſes to the Square of half that Ordinate which divides them. That is,



T, A, + S, A, : □ B, A, : : T, a, + S, a, : □ b, a.
T, A, + S, A, : □ B, A, : : T, e, + S, e, : □ n, e.
T, C, + S, C, : □ N, C, : : T, a, + S, a, : □ b, a.

The further Demonſtration of this ſhou'd be prov'd by a regular Working, but it wou'd be of too great Length; however we ſhall go ſo far as to obſerve: Let the annex'd Figure repreſent a right Cone, cut thro' both its ſides by the right Line T, S, then will the Plane of that Section be an Ellipſis, T, S will be the tranſverſe Diameter N, C, N, and b, a, b, will be Ordinates rightly apply'd as before. Again, if the Lines D, d, and K, k, be parallel to the Cone's Baſe, they will be Diameters of Circles then will Δ T, C, K, and T, a, d, be alike; alſo Δ G, a, d, and Δ S, c, k, will be alike.

The



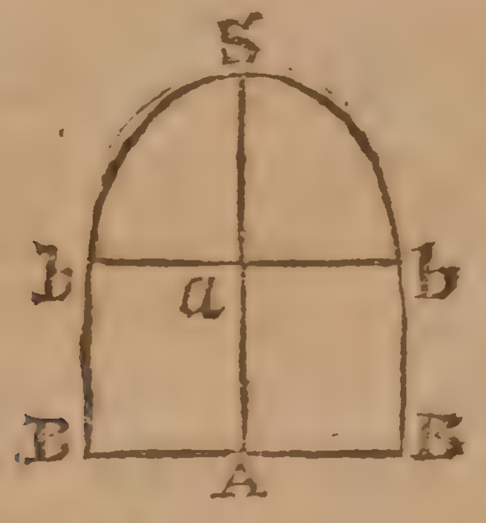
The Plane or Figure of every Parabola is proportion'd by its Ordinates and Abſciſſa's, as in the following Theorem.

> As any one Abſciſſa : is to the Square of its Semi-ordinate : : ſo is any other Abſciſſa : to the Square of its Semi-ordinate.

That is if we ſuppoſe the annex'd Figure to be a Parabola, wherein a, and f, a, and S, A, are Abſciſſa's, and b, a, b, B, A, B, Ordinates rightly apply'd, it will be,

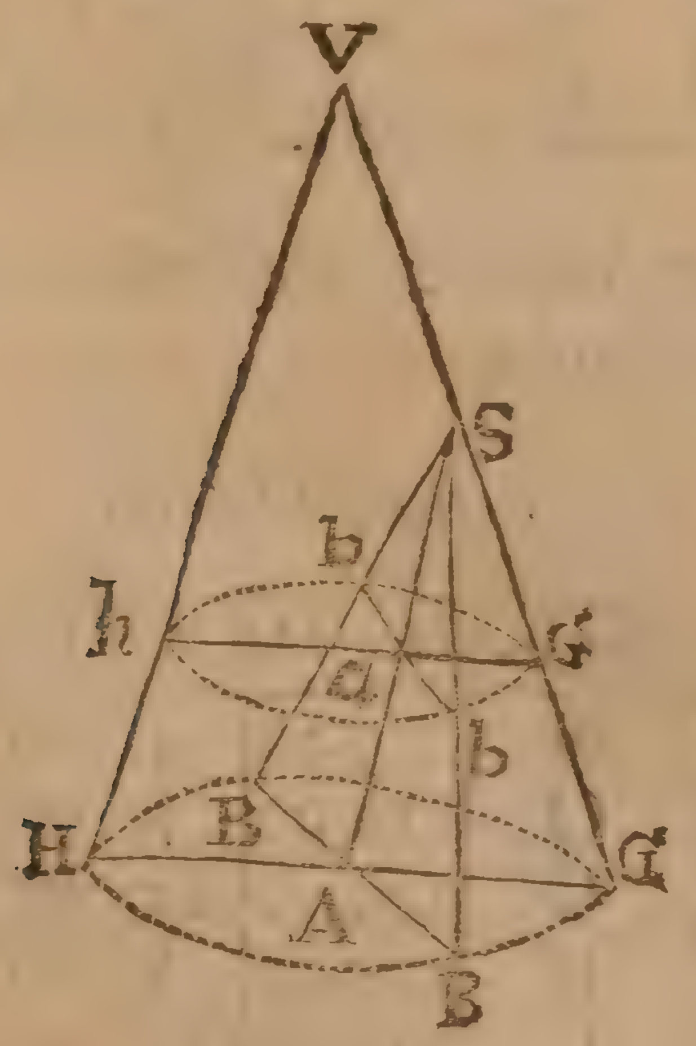
s,a, : □ b, a, : : s, A, : □ B, A, } Whereſoever the Point
Or, s, a, : s, a, : : □ b, a, : B, A, } a, A are taken.

And ſo for any other Abſciſſa, &c.



Demonſtration.

Let the following Figure H, V, G, repreſent a right Cone cut into two Parts by the right Line S, A, Parallel to its ſide V, H, then the Plane of that Section, *viz.* B, b, S, b, B, will be a Parabola; wherein, let us ſuppoſe, S, A, to be its Axis, and b, a, b, B, A, B, to be Ordinates rightly apply'd to that Axis. Again, imagine the Cone to be Cube, by the right Line h, g, Parallel to its Baſe H, G, then will h, g, be the Diameter of a Circle. And Δ s, a, g, like to Δ s, A, G.



SURVEYING.

SURVEYING of Land, or *Planometria*, is the Art of Meaſuring all manner of Plain Figures, in order to know their Superficial Content, which how to do Geometrically has been in part treated of already; but how to bring this to Practice, ſo as to Meaſure the Area's of real Lands, Fields, Grounds, &c. by the help of proper Inſtruments, is what is uſually call'd Surveying. In order to which, the Surveyor being furniſh'd with a good Inſtrument to take Angles, as a Theodelite, or entire Braſs Circle, with a well-graduated Limb and Teleſcope-Sights, as alſo with a well divided Pole-Chain, an Off-ſet-Rod, Station-Staves, &c. he may proceed thus.

1. *Take the Plot of a Field at one Station in any place of it, from whence you may ſee all the Angles.*

Suppoſe A B C D E F G to be a Field, of which you are to take the Plot. Having ſet your Inſtrument in any convenient place of it, as at ⊙, and let Marks or Station-Staves, with Paper, be ſet up in every Angle; ſet your Inſtrument, ſo that the Needle may hang directly over the Meridian Line of the Cord, and there ſcrew faſt the Inſtrument. Then direct your Sights to A, and you will find the Index cutting 36.45, which note down in your Field-Book, in the ſecond Column of it, and Meaſure the Diſtance from ⊙ to +, containing, ſuppoſe 8 Chains and 10 Links, which ſet down alſo in the third Column of your Field-Book. Then direct your Sights to B, the Index cutting 99 Degrees 15 Minutes, and the Diſtance from ⊙ to B is 8 Chains and 75 Links, both which ſet down in your Field-Book as before; do the like for the reſt of the Angles, from ⊙ to C D E, and ſet them down as you obſerve them, with their Diſtances meaſur'd from the Station, as you ſee ſet down in this following Table, which is a Copy of the Field-Book, and will ſhew you the Method how to note down your Obſervations.

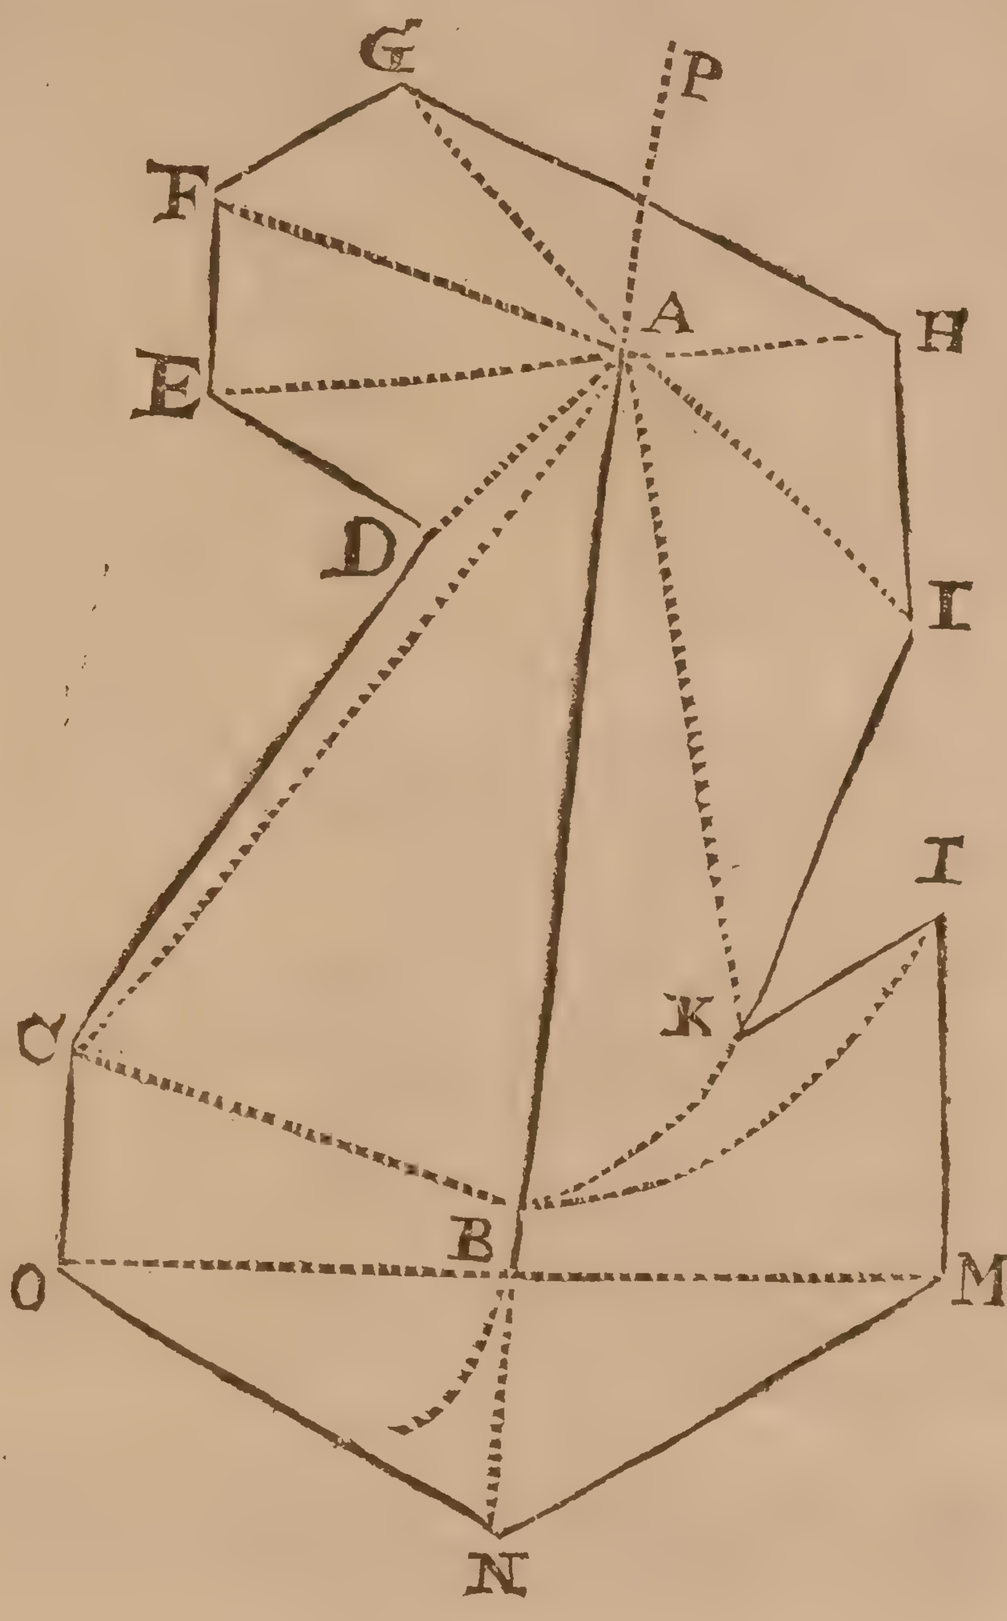
	D. M	Ch. Lin.
A	36.45	8. 10
B	99.15	8. 75
C	163.15	16. 65
D	212.00	8. 53
E	287.15	8. 15
F	342.00	9. 55

Having thus finiſh'd your Work in the Field, the next Buſineſs muſt be to Protract it, that is, lay down a Plot of it on Paper or Parchment, which is done thus; Draw a Line, as N S, repreſenting the Meridian Line; then in part of that Line, as at ⊙, make a Point, repreſenting your Place of ſtanding in the Field; upon this Point place the Center of your Protractor, ſo that its Diameter may be directly upon a Line, N S. This Protractor is commonly made of a well poliſh'd thin Piece of Braſs, and conſiſts of a Semi-circle, divided into Degrees, and a Parallelogram with Scales upon it, and may be of any bigneſs deſir'd. On the Limb of your Protractor, againſt 36.45, ſet a Point repreſenting the Degrees of your firſt obſerv'd Angle, and let the ſame be done with the ſecond and third Obſervations. To Prick off the fourth, *viz.* 212, the Protractor muſt be turn'd downwards, becauſe the Degrees are greater than a Semi-circle. Then proceed to Protract the reſt of the Angles, then take away the Protractor, and laying a Ruler to the Station-Point ⊙, draw obſcure Lines from thence to thoſe Points, on which Lines ſet their reſpective Meaſures from your Scale, as 8 Chains, 10 Links, from ⊙ to A, and 8 Chains, 75 Links from ⊙ to B, and ſo of the reſt, as you have them down in your Field-Book. Then correct theſe Points by the Lines A B, B C, C D, D E, E F, and F A, ſo ſhall you have the true Figure of the Field.

2. *To take the Plot of a Field at two Stations, when the Field is ſo irregular, that from one Station you cannot ſee all the Angles,*

Let C D E F G H I K L M N O be the Field, in which from no one Place all the Angles of it may be ſeen, wherefore chuſe two Places for your Stations, as A B.

Set your Inſtrument at A, and look thro' the Sights towards your ſecond Station B, and then fix your Inſtrument; and as before taught, with the Index, take all the Angles at that end of the Field, as C D E F G H I K, and Meaſure the Diſtance between your Inſtrument and each Angle, as alſo the Diſtance between the two Stations. Then remove your Inſtrument to the ſecond Station B, and having made it faſt, ſo as thro' the Back-Sights you may ſee the firſt Station A; take the Angles at that end of the Field, as N O C K L M, and Meaſure their Diſtances as before; all which being done, your Field-Book will ſtand thus.



Firſt Station.

	D. M.	Ch. Lin.
Angle.	25.00	20. 75
C	31.00	8. 10
D	67.00	9. 85
F	101.00	10. 80
G	137.00	7. 00
H	262.00	6. 70
I	316.00	13. 17
K	354.00	24. 50

The Diſtance between the two Stations B A, is 31 Chains, 60 Links.

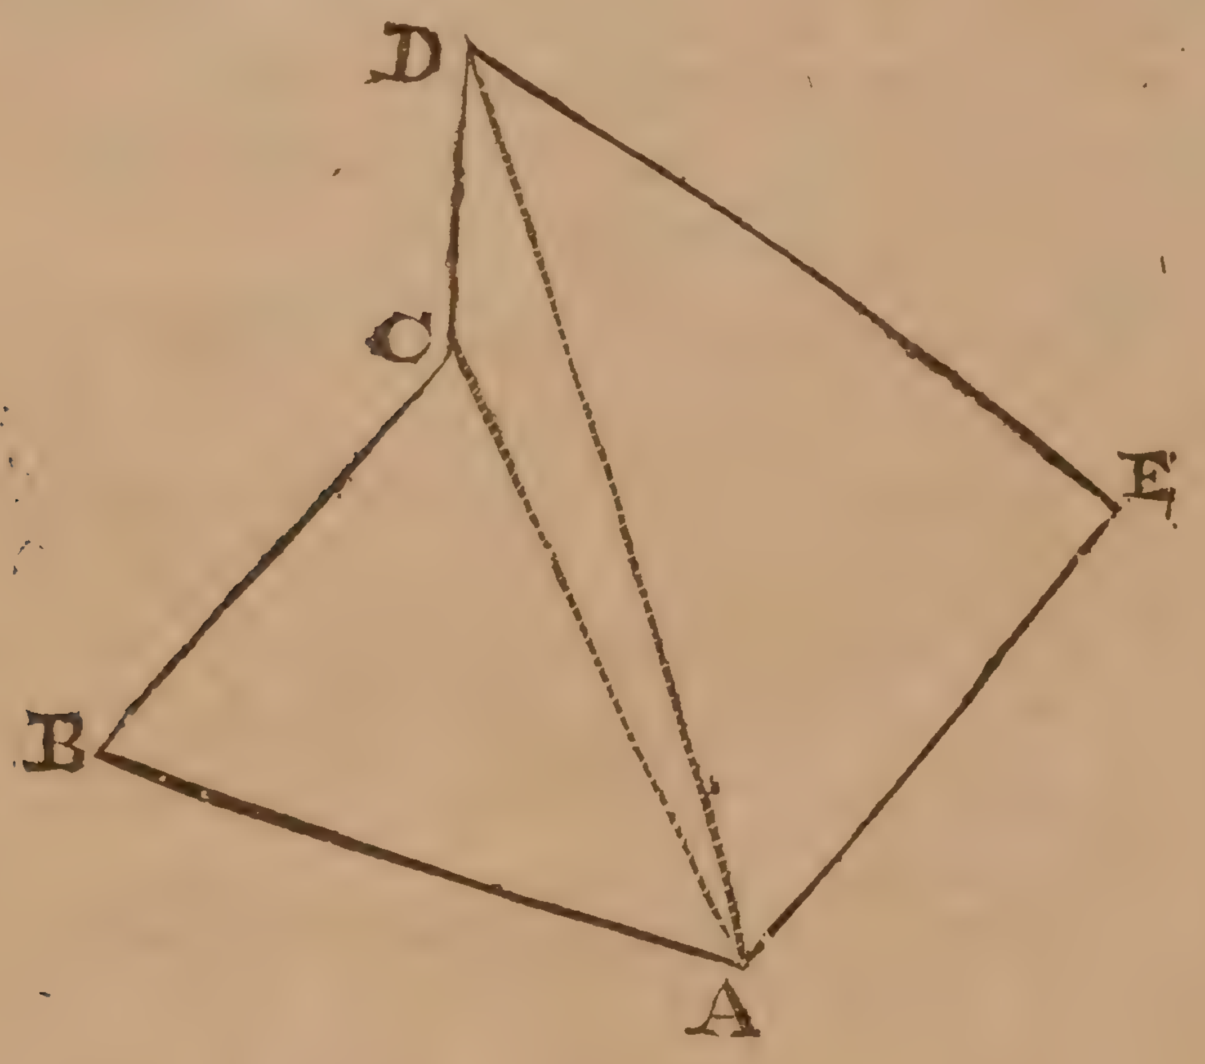
Second Station.

Angle.	D. M.	Ch. Lin.
N	3.30	4. 00
O	111.00	7. 00
C	145.00	15. 60
K	205.00	8. 40
L	220.00	15. 00
M	274.00	11. 20

To Protract this, draw a Right Line at adventure, as P A B B, on which let from your Scale 31 Chains, 60 Links, (the Diſtance between the two Stations) making Marks with the Compaſs, as A and B for your firſt and ſecond Station. Lay the Protractor to A, the North end of the Diameter being towards B, and mark out the ſeveral Angles obſerv'd at your firſt Station, draw Lines and ſet off the Diſtances meaſur'd; do the ſame at B, the ſecond Station; and when you have mark'd out all the Diſtances between theſe Marks, draw the Bound-Lines. If the Field be very irregular, you may after the ſame manner make three, four, or five Stations, as you pleaſe; tho' 'tis much better to go round ſuch a Field, and to Meaſure the Bounding-Lines.

3. *To take the Plot at one Station in an Angle (ſo that from that Angle you may ſee all the other Angles) by meaſuring round about the ſaid Field.*

Suppoſe A B C D E the Field, and A the Angle appointed for the Station; place your Inſtrument in A, and turn it round 'till you ſee (thro' the fix'd Sights) the Arch at B, then ſcrew it faſt and turn the Index to C, obſerving what Degrees are there cut on the Limb, which ſuppoſe to be 68 Degrees, turn it further 'till you ſee D, and note down the Degrees there cut, *viz.* 76 Degrees; do the like at E, and the Index will cut 124 Degrees. This done, Meaſure round the Field, noting down the Length of the Side-Lines between Angle and Angle, your Field-Book will ſtand thus.



Lines.	Ch. Lin.
AB	14. 00
BB	15. 00
CD	7. 00
DE	14. 40
EA	14. 05

To Protract which, draw A B as you pleaſe, and applying the Center of the Protractor to A (the Diameter lying upon the Line A B) prick off the Angles, and make Marks, thro' which draw Lines, A C, A D, and A F, in which you may find the Points C D E, by the Meaſures taken, as you have them in your Field-Book, and taken of a Scale, then draw the Bounding-Line, and you have done.

4. *To take the Plot of a Park, Wood, a very great Common, or a large Champagne Field, by going round about it, and making Obſervations.*

Let A B C D E F G be a large Field, or Wood, thro' which you cannot ſee to take the Angles, but muſt be forc'd to go round it; place your Inſtrument at the Angle A, and lay the Index on the Diameter of it, moving the whole Inſtrument about 'till, thro' the Sights, you ſee the ſecond Angle at B, and there fix it; then turn the Index about backwards 'till you ſee the Angle at C, the Index cutting 97 Degrees, which is the Quantity of the Angle G A B. Meaſure the Line A B, it contains 12 Chains, 5 Links, which ſet down in your Field-Book. Then remove your Inſtrument to B, the Index lying upon the Diameter, turn it about 'till you ſee the Angle at A, then ſet down the Degrees cut on the Limb, and the Meaſure of the Line B C in your Field-Book. Remove to C D F and G, making your Obſervations after the ſame manner, and Meaſuring the length of every Line, they'll ſtand thus in the Field-Book.

	D. M.	Ch. Lin.
A	97.00	12. 5
B	120.30	4. 45
C	132.00	8. 85
D	125.00	13. 4
E	121.30	7. 70
F	80.00	5. 67
G	227.00	7. 87

The manner of Protracting this is nearly the ſame as before.

How to diſcover whether the Angles made at their ſeveral Stations, be truly taken or not.

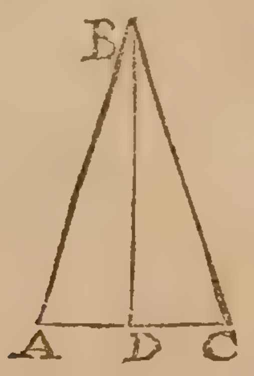
Rule.

Multiply 180 Degrees by a Number leſs by two than the Number of Sides or Angles in your Plot, the Product ſhall be equal to the Sum of all the Angles obſerv'd, if you have wrought true, otherwiſe not. Thus, there were ſeven Angles or Sides in the laſt Plot, therefore I multiply 180 by 5, the Product is 900, which is equal to all the Angles reckon'd in the inſide of the Plot, for the outward Angles are not included in the Rule.

To take the Horizontal Line of a Hill.

When you Meaſure a Hill you muſt take the Superficies of it, and accordingly caſt up the Contents. But when you plot it down, becauſe you cannot make a Convex Superficies upon the Paper, you muſt only plot the Horizontal Line or Baſe of it, which you muſt ſhadow over with the Reſemblance of a Hill; that Horizontal or Baſe-Line, is found after this manner.

Suppoſe A B C D a Hill, whoſe Baſe you would know; your Inſtrument being plac'd at A, cauſe a Mark to be ſet up at B, ſo high above the Top of the Hill, as the Inſtrument ſtands from the Ground at A, then take the Angle B A D, 58 Degrees, Meaſure the Diſtance A B, 16 Chains, 80 Links. Then ſay,



As Radius : A B :: S. B A D : A D.
S. 90°, 00 : 16 Chains, 80 Links :: S. 32°, 00.
8 Chains, 90 Links.

Then remove your Inſtrument to B, and take the Angle C B D, 46 Degrees, Meaſure the Diſtance B C, 21 Chains, then ſay,

As Radius : B C :: S. C B D : D C.
S. 90 D. : 21 Ch. :: S. 46 D. : 15 Ch. 12. Links.

The 15,12 added to 8,90 makes 24 Chains, 2 Links for the whole Baſe A C.

Otherwiſe thus,

Take the Angles B A C, 58 Degrees, and A B C, 78 Degrees, Subſtract theſe two from 180 Degrees, there will remain the Angle C, 44 Degrees; Meaſure A B, then ſay,

As S. C : A B :: S. B : A C.

To find the Contents of your Field in Acres and Parts of an Acre.

Since Mr. *Gunter*'s 4 Pole-Chain, all along here us'd, is ſuppos'd to be divided into 100 equal Links, and that every Acre contains 160 Square Poles. Therefore 160 Poles divided ÷ into 160 Poles = a Square Acre; but the Chain being decimally divided, ſo that in one 4 Pole-Chain there are 100 Links, therefore 10 Square Chains muſt make an Acre, that is, an Acre will contain 10000 Links.

Suppoſe therefore the Baſe of any Triangle, in my Plot were 27 Chains, 53 Links, whoſe Area in Acres and Parts of an Acre I would find by multiplying its half Altitude, 8 Chains, 25 Links, into that Baſe or Side, Work juſt as in Decimals, thus,

```
C. L.
27.53
 8.25
------
 13765
 5506
22024
------
22|71225
```

Only from the Product I cut off 5 Places (or which is all one, divide it by 10000) there remains 22 Acres; · 71225, to reduce which Decimal Fraction 71225 into Roods or Poles, I conſider there are 4 Roods in an Acre, and therefore I multiply by 4, and cut off 5 Places as before.

```
71225
    4
------
2|84900
```

This gives me 2 Rood, and this Fraction:

```
 84900
    40
-------
33|96000
```

Which I multiply by 40, becauſe there are 40 Poles in a Rood, and the Product is 33,96000; from whence cutting off 5 Places as before, it gives me 33 Poles or Perches, ſo the whole Content is 22 Acres, 2 Rood, 33 Perches. Which way of working is very eaſy, and will give a Gentleman a quick Apprehenſion of the manner of it. 'Twill ſoon be perceiv'd of what neceſſity the Chain is, wherefore we ſhall deſcribe it, and therein treat of the ſeveral kinds us'd in meaſuring.

The firſt is a Chain of 100 Foot long, each Link being 1 Foot in length; and at each 10 Foot there is a Plate of Braſs with a Figure engraven on it to ſhew readily how many Feet are from the beginning of the Chain; and for more eaſe in accounting, there's a Braſs Ring at every 5 Links. This Chain is moſt Commodious for meaſuring of large Diſtances or Lengths.

The ſecond is a Chain of 16 Foot and a half in length, and made ſo as to contain 100 Links, with Rings at every tenth Link. This Chain is to meaſure ſmall Gardens and Orchards by Perch or Pole-Meaſure.

The third is a Chain of 4 Pole or Perches in length, which is 66 Foot, or 22 Yards, for each Perch contains 16 Foot and a half. This whole Chain is divided into 100 equal Parts or Links, whereof 25 are a juſt Pole; and for ready accounting, there's uſually a remarkable Diſtinction by ſome Plate or Ring at the end of every 25 Links. Alſo at the end of every tenth Link, 'tis uſual to faſten a Plate of Braſs, with Notches therein, denoting how many Links are in the beginning of the Chain. This Chain is the moſt Commodious for Land-Meaſure.

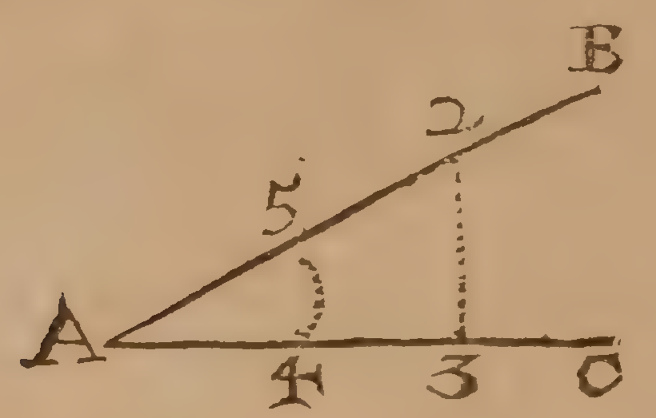
When you are to meaſure any Line by the Chain only, you need not regard any other Denomination but Chain and Links, ſet down with a Point between them. Thus, if you find the ſide of a Cloſe to be 6 Chains, 35 Links, put down 6.35; but if the Links be under 10, prefix a Cypher, as for 7 Chains, 9 Links, ſet down 7.09.

How to caſt up the Contents of a Figure, the Lines being given in Chains and Links.

Having multiply'd Length by Breadth, or Baſe by the half Perpendicular, *&c.* from the Product cut off 5 Figures towards the right-hand with a daſh of your Pen, ſo ſhall thoſe to the left-hand ſignify Acres, as by the Example before-mention'd, of Acres, Rods, and Poles.

How by the Chain to take an Angle in the Field.

Firſt meaſure along the Hedge A B, any ſmall diſtance, as A 2, two Chains; alſo meaſure along the Hedge A C what Number of Chains you pleaſe, no matter whether they be equal to the former or not, as A 3, two Chains; then meaſure the Diſtance 2, 3, ſuppoſe it be 1 Chain, 68 Links.



To Plot which, draw the Line A B at pleaſure, and ſet off 2 Chains from A to 2, then take in your Compaſſes the Diſtance A 3, 2 Chains, ſetting one Foot in A, deſcribe the Arch 2, 3; take alſo your Compaſſes in 1 Chain 68 Links, ſet from 2 to 3, and thro' the Point 3 draw A C, ſo you have the Angle B A C of the Field truly plotted. By this means you may Survey a Field by going round it with the Chain only, by taking all the Angles, and meaſuring the Sides.

Knowing the Contents of a Piece of Land, to find what Scale it was Plotted by.

By any Scale meaſure the Contents of the Plot, then ſay,

As the Content found is to the ſquare of the Scale I try'd by,

So is the true Content to the ſquare of the true Scale it was plotted by.

As ſuppoſe there's a Plot of a Piece of Land containing 10 Acres, and I meaſure it by the Scale of 11 in an Inch, and find it to contain 12 Acres, $\frac{1}{10}$ of an Acre. Then ſay,

As $12\frac{1}{10}$: 121 (=) Sq.) :: 10 : 100.

And the Square Root of 100 is 10, therefore I conclude the Plot to be made by a Scale of 10 in an Inch.

How to change Cuſtomary Meaſure into Statute-Meaſure, and the contrary.

Say, as the ſquare of one ſort of Meaſure is to the ſquare of the other,

So is the Content of the one to the Content of the other.

Thus, Suppoſe a Field meaſur'd by a Perch of 18, contain 100 Acres, how many Acres ſhall the ſame Field contain by a Perch of 16 Foot and an half.

Say, if the ſquare of 16 Foot and an half, *viz.* 272.25, give the ſquare of 18, *viz.* 324, what ſhall 100 Acres, Cuſtomary give? Anſwer, $119\frac{9}{10}$ Statute Acres.

The *Scale* us'd in Surveying is call'd the *Surveying* or *Reducing Scale.* 'Tis a thin broad Piece of Box, with ſeveral different Scales of equal Parts and Lines, to turn Chains and Links into Acres and Rods by Inſpection, and is by Surveyors to reduce any Map or Draught.

What follows will be of uſe to Country Gentlemen if they will give themſelves the trouble to enquire a little into it. As,

How to lay out ſeveral Quantities in Common Fields to Tenants.

Plot out the Field, Common, or ſeveral, with its particular Bounds, as you obſerve them in the Survey of the whole Mannor; or if you only Survey that Particular, take no notice of all the Bounds, provide a Book rul'd with 10 Columns, in the Firſt write the Tenant's Name, and the Tenour by which he holds his Land. The Three next Columns are to contain the Breadth of every Man's Parcel of Lands, noted over the Head of every Column with theſe Three Characters 0, 1, 2, anſwering to the ſeveral Diviſions of your Chain 0, ſignifying *Unites*, 1 *Prime*, and 2 *Seconds.* In the next 3 Columns is expreſs'd the Length of every Tenant's Parcel, having the like Characters of 0, 1, 2, over the Head of each Column as that of the Breadth; and in the Three laſt Columns is to be expreſs'd the Quantity of each Tenant's Parcel.

In laying out of ſeveral Parcels in this kind, you will uſe your Chain only; then when you begin your Work, firſt write the Name of the Field by way of Title; the Tenant's Name in the firſt Column, and Tenure as aforeſaid from what Place you begin to meaſure, and upon what point of the Compaſs you paſs from thence; which Direction being obſerv'd in all the reſt, you may, if need requires, bound every Parcel.

This being noted in your *Book*, obſerve the Species or Shape of the Furlong, whether it be all of one Length or not; if all of one Length, then take the Length but once for all; but if of different Lengths, then take the Length at every ſecond, or third Breadth, and expreſs the ſame in your *Book* under the *Title* of Lengths. As for the expreſſing the ſeveral Breadths only croſs over the whole Furlong, taking every Man's Breadth by the middle thereof, entring the ſame as you paſs along. But in caſe there be a conſiderable difference at either end, then take the Breadth at either end, adding them together into one Sum; take the Half of that Sum for your Mean, or true Breadth, and enter it in your *Book* or *Paper* under the Title of *Breadth.*

In this manner you may proceed from one Furlong to another, till you have gone thro' the whole *Field*; which when you have done, and noted down the ſeveral Lengths and Breadths in your *Book*, Multiply the Length and Breadth of every Parcel together, and ſo ſhall you have the quantity of every Parcel by it ſelf, which quantity muſt be noted down in the three laſt Columns of your Book, as in the following Example appears.

GRAVEL-PIT FIELD.

Tenants Names	Breadth			Length			Quantity		
	0	1	2	0	1	2	a	r	p

To take the Plot of a Mannor, or of divers Severals, whether Wood-lands, or otherwiſe.

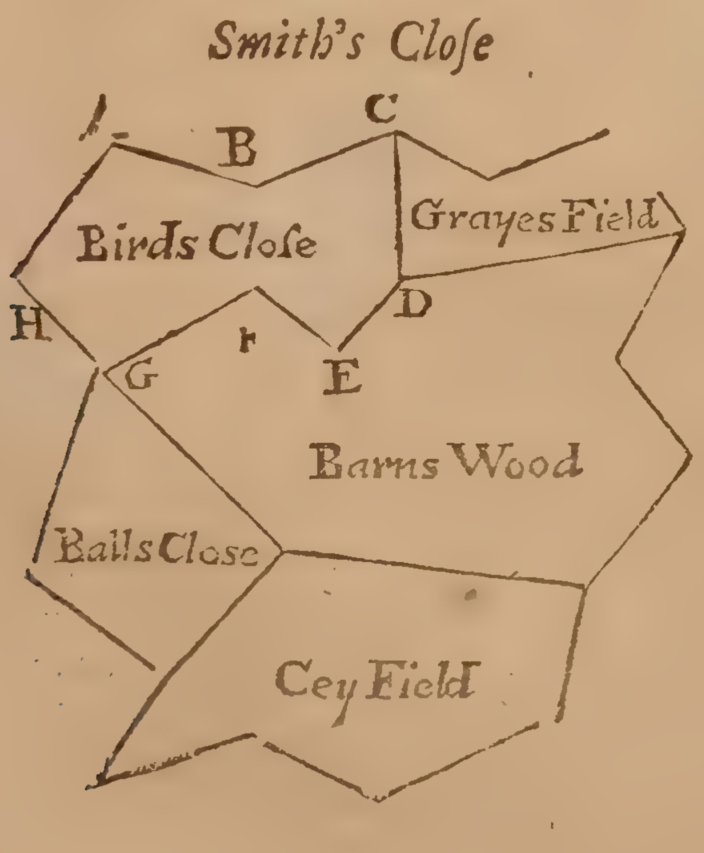
SUPPOSE therefore that the following Figure were part of a Mannor, as the Mannor of *Hutton*, you muſt firſt write the Title in your *Field-Book*, thus.

Mannor of Hutton, *in* Com. Som.

Then having your *Field-Book* in a readineſs, write over every Cloſe as you Survey, the Tenant's Name, and the Tenure by which he holds the ſame, as in the following Example; for the firſt Cloſe, *Richard Price, Bird's Cloſe, Paſture free*; then beginning to Survey this Parcel, firſt place your *Inſtrument* at *A*, and direct your Sights to *B*, obſerving the *Degrees* there cut, which will be 195, Note it in the firſt Column of your *Field-Book*; then with your *Chain* meaſure the diſtance from *A*, to *B*, and you ſhall find it to contain 30 *Perches*, 4 *Primes*, which place in the third and fourth Columns.

2. Remove your *Inſtrument* to *B*, and direct your Sights to *C*, the *Index* cuting 205 *Degrees*, 30 *Minutes*, Note it in the firſt and ſecond Columns of your *Field-Book*; then meaſure the diſtance *B*, *C*, 26 *Perches*, 7 *Primes*, which obſerve in the third and fourth Columns; Now in regard you are to leave the *Hedge*, or *Border A*, *B*, *C*, adjoyning to *Smith's Cloſe*, (which belongs to another Mannor, and therefore naming is ſufficient for your remembrance) draw a *Line* quite croſs your *Field-Book*, and in the laſt Column thereof, which is very broad, write the Name of the *Bounder* you went againſt, as in the *Example*. Theſe two Obſervations being made by the Hedge, or Bounder of *Smith's Cloſe*, therefore againſt theſe Obſervations write *Smith's Cloſe*; and being you are now to leave that Bounder, therefore draw a *Line* quite through your *Field-Book*, which denotes that you leave the Bounder of *Smith's Cloſe*.

3. Place your *Inſtrument* at *C*, and direct your Sights to *D*, the *Degrees* cut being 120, and 45 *Minutes*, and the diſtance *C*, *D*, being 27 *Perches*, 8 *Primes*; theſe 120 *Degrees*, 45 *Minutes*, muſt be noted in the firſt and ſecond Columns of your *Field-Book*, and the 27 *Perches*, 8 *Primes* in the third and fourth Columns. Now becauſe at theſe three Obſervations you went againſt the Hedge, or Bounder of *Gray's Field*, you muſt againſt them in the broad Column of your *Field-Book* ſet down *Gray's Field*; and becauſe at your next Obſervation you are to leave that Bounder, therefore draw a *Line* croſs your Book, ſhewing that you have done with that Bounder.



4. Place your *Inſtrument* at *D*, and direct your Sights to *E*, the *Index* cutting 86 *Degrees*, 15 *Minutes*, and the diſtance *D*, *E*, being 10 *Perches*, 4 *Primes*, the *Degrees* and *Minutes* muſt be noted in the firſt and ſecond Columns of your *Field-Book*, and the 10 *Perches*, 4 *Primes*, in the third and fourth.

5. Remove your *Inſtrument* to *E*, and direct your Sights to *F*, the *Index* cutting 300 *Degrees*, and the diſtance *E*, *F*, being 12 *Perches*, 3 *Primes*, the *Degrees* and *Minutes* ſet down in the ſecond and fifth Columns of your *Field-Book*, and the 12 *Perches*, 3 *Primes* in the third and fourth Columns.

6. Place your *Inſtrument* at *F*, and direct your Sights to *G*, the *Index* cutting 55 *Degrees*, 30 *Minutes*, and the diſtance *F*, *G*, being 16 *Perches*, 4 *Primes*; the 55 *Degrees*, 30 *Minutes* muſt be noted in the firſt and ſecond Columns of your *Field-Book*, and the 16 *Perches*, 4 *Primes* in the third and fourth.

Now becauſe in theſe three laſt Obſervations you went againſt the Hedge or Bounder of *Barns's Wood*, and that you are now to leave it, you muſt againſt theſe three Obſervations, in the broad Column of your Book, write *Barns's Wood*, and being now to leave that Bounder, draw a ſingle *Line* croſs your *Book*.

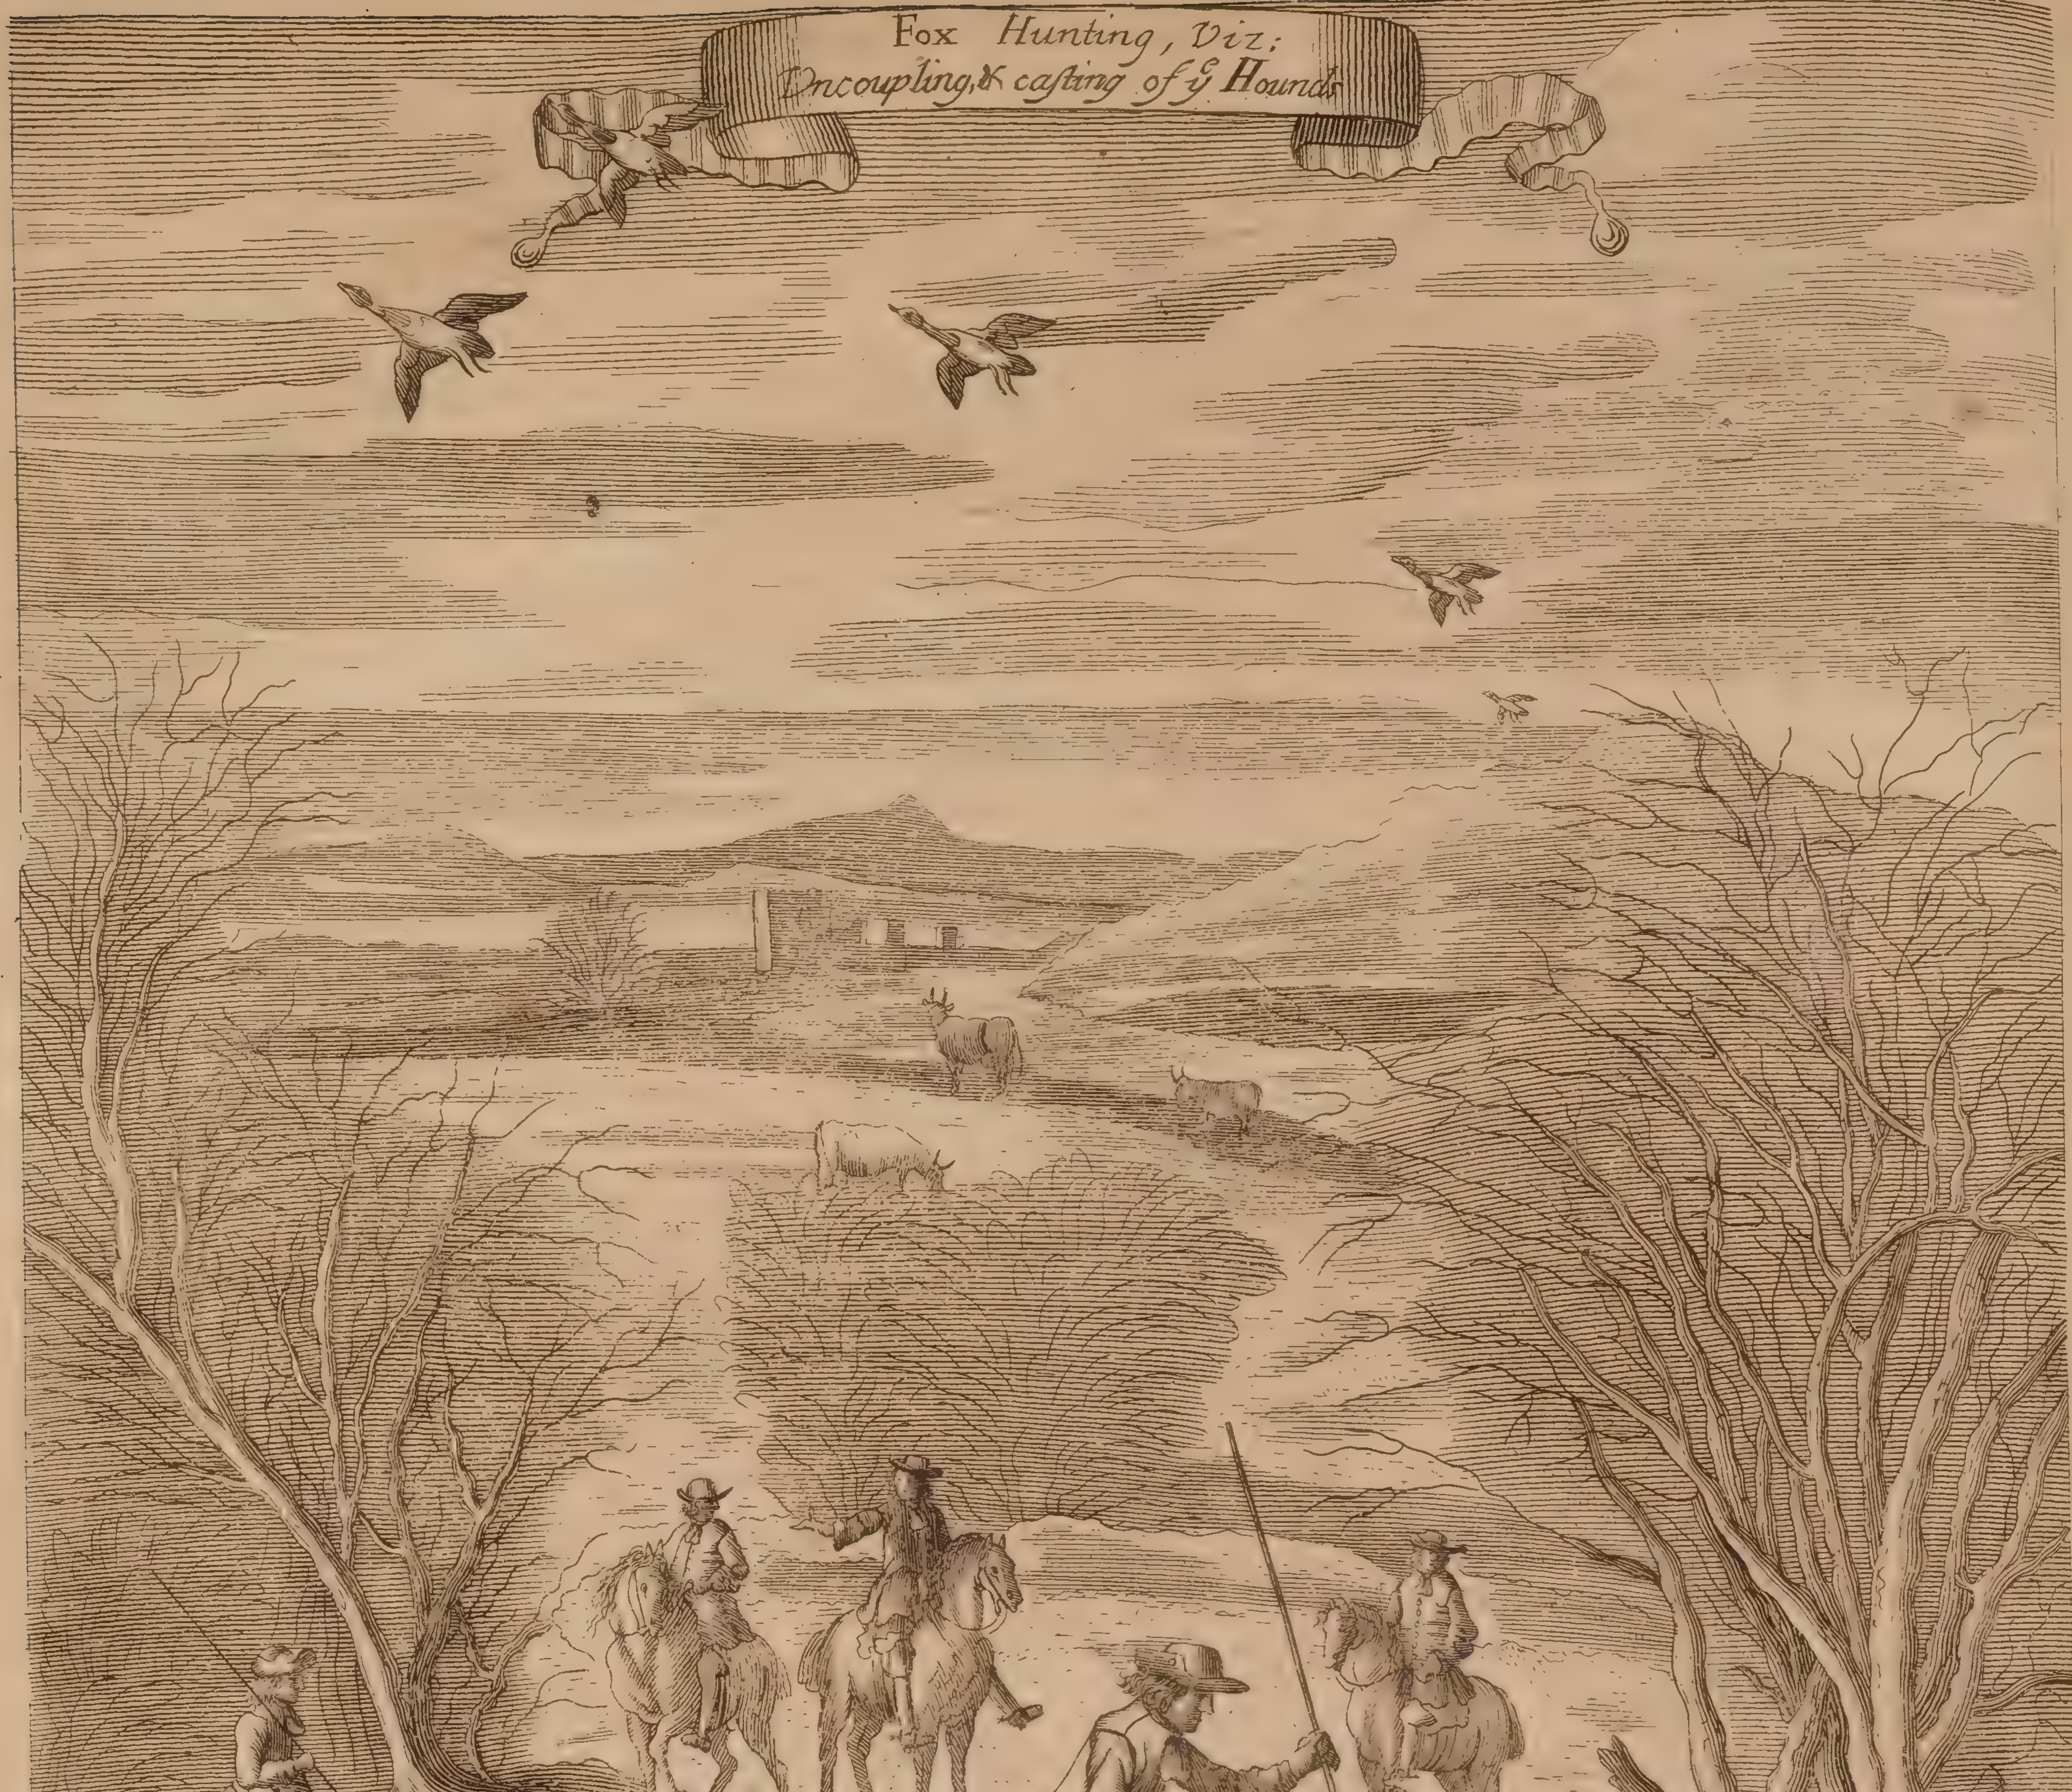
7. Place your *Inſtrument* at *G*, and direct your Sights to *H*, the *Index* cutting 324 *Degrees*, 15 *Minutes*, and the diſtance *G*, *H*, being 36 *Perches*, 2 *Primes*, the *Degrees* and *Minutes* muſt be noted, in the firſt and ſecond Columns, and the *Perches*, and *Primes* in the third and fourth.

8. Remove your *Inſtrument* to *H*, and direct your Sights to *A*, where you began the *Index*, cutting 107 *Degrees*, 15 *Minutes*, and the diſtance *H*, *A*, being 34 *Perches*, 6 *Primes*. The *Degrees* and *Minutes* muſt alſo be noted in the firſt and ſecond *Columns*, and the *Perches* and *Primes* in the third and fourth. Now becauſe in theſe two laſt Obſervations you went by the River-ſide, therefore againſt them write the River; and becauſe you have now finiſh'd your firſt Cloſe, draw a double *Line* for a remembrance.

Then conſider which Cloſe is next fitting to be Survey'd, which let be *Gray's Field*, and withal at what *Angle* it is beſt to begin, which let be at *C*, and here (for your help when you come to Protraction) expreſs in the Title of this ſecond Cloſe at what *Angle* you begin, (unleſs you had begun where you ended the laſt): Wherefore ſeeing you begin at *C*, look in your Book on the Work of your laſt Cloſe, at what place the Line *B*, *C*, ended, as at the end of 205 *Degrees*, 30 *Minutes*, and 26 *Perches*, 7 *Primes*, and againſt that Number make this * or any other Mark, on the right ſide of your down-right *Lines*, and then write your Title for your ſecond Cloſe thus:

Thomas Rich, Gray's Field, free, begin at *.

By this means you ſhall readily know when you come to Protraction, where to begin with this Cloſe, and in the *Margin* place (2) for the Number of your ſecond Cloſe, and then proceed in your Work, as before taught for your laſt Cloſe, until you come to *K*; where obſerving that you want but one *Line*, as *K*, *D*, to incloſe this ſecond Cloſe, and alſo that this *Angle R*, is the fitteſt place to begin your third Cloſe at, place there your *Inſtrument*, and directing your Sights to *D*, where you are to incloſe, and then write in the *Margin* of your



Fox Hunting, Viz:
Uncoupling, & casting of ye Hounds

To the Right Honourable Thomas Earle of Ailisbury
& Elgin, Viscount Bruce of Ampthill, Baron Bruce of
Wharlton, Skelton and Kinloss, Hereditary High=
Steward of ye Honour of Ampthill, Gentleman of
his Majesties Bedchamber, Lord Leiutenant and
Custos Rotolorum of ye Countys of Bedford, &
Huntington, Recorder & High=steward of Bedford
& Huntington &c.

Fuimus

This Plate is humbly dedicated by Ric: Blome

your Book (againſt the Degree here taken) draw a ſhort *Line*, as thus —— 21, 30, 40, 2, which ſerves to put you in mind when you come to *Protraction*, that you are to begin your third *Field*, where now you are at the *Angle K*, where you took your laſt Sight; and then having incloſ'd this ſecond Cloſe, proceed to the third from *K*, in the Title of which you need not make mention at what place you begin, for the former Reaſon, but working in that and all the reſt, as before ſhew'd, and if there were never ſo many Incloſures you may without confuſion eaſily diſtinguiſh the Work of the one from the other, and be able to draw a *Plot* thereof at any time, remembring always that theſe Numbers in the *Margin* of your Book, are to be plac'd ſeverally in your *Plot* in thoſe Cloſes they repreſent; And by this means you are eas'd of much trouble that you muſt by the other ways be put to in protracting upon the Table it ſelf: For then in every *Plot* you muſt write the Name of the Tenant, or the Cloſe, or the *Tenure* or Quality of it, which breeds confuſion, and occaſions much trouble in caſting up the Contents.

Theſe *Inſtructions* being ſufficient for the Application and Uſe of the *Field-Book*, it were convenient to practiſe the ſame, and compare this *Book* with the *Plot*, and protracting it according to the Directions hereafter given.

An Example of a Leaf of the Field-Book, as it ought to be Rul'd, and taken according to the preceding Example.

	Ric. Price, Bird's Cloſe, Paſture, tree.				
	Deg.	Mim.	Perch.	Prim.	
(1)	191	00	30	4	Smith's Cloſe.

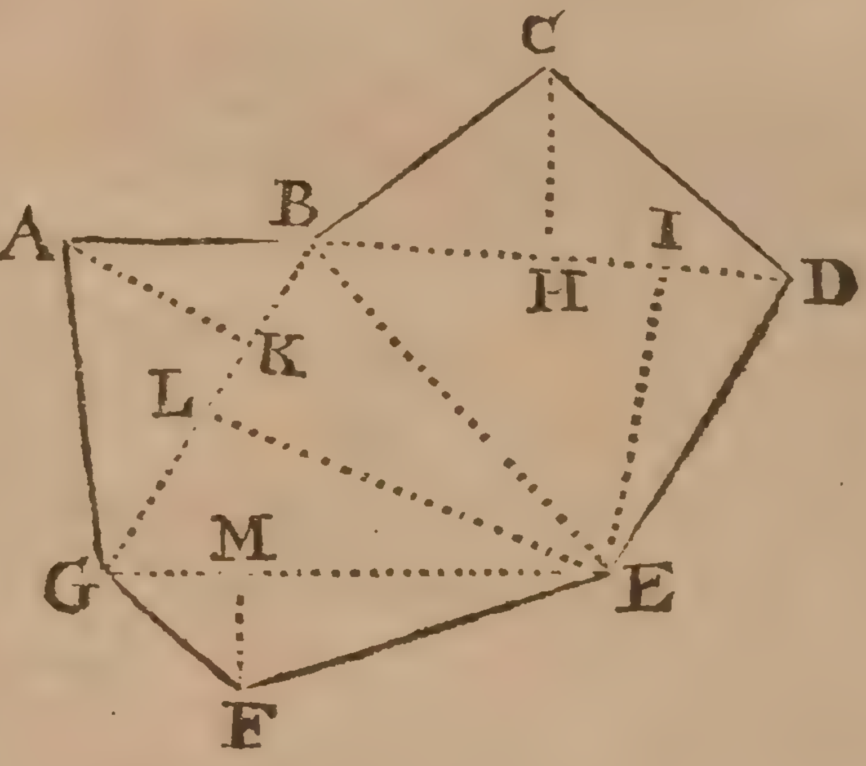
	95	15	14	7	
(3)	21	30	40	2	Barn's Wood.

To protract, or lay down mountainous and uneven Grounds, with the beſt way to find the Area, or Content of ſuch Irregulars.

LET *A, B, C, D, E, F, G*, be a mountainous Piece of Ground to be meaſur'd; Firſt, place your *Inſtrument* at *A*, and direct your Sights to *B*: then meaſure the *Line A, B*, draw the ſame by the Side of the *Ruler* upon the *Table*; then in regard that from *B*, to *C*, there is an Aſcent, find the *Horizontal Line* of it, and draw it upon your *Table*, reckoning thereon the Length of the *Hypothenuſal Line*; then meaſure round the Field according to former Directions, and having the Figure thereof upon your *Table*, reduce it into *Trapezias*, as *A, B, E, G*, and *B, C, D, E*, and the *Triangle G, E, F*; then from the *Angles A, C, E, F*, let fall the *Perpendiculars*.

Now by reaſon there are many *Hills* and *Valleys* all over the *Field*, you muſt meaſure with your *Chain* in the *Field* over *Hill* and *Dale* from *B*, to *D*, and to the *Line B, D*, ſet the Number of *Perches* as you find them by meaſuring, which will be much longer than the ſtreight *Line B, D*, meaſured on the *Scale*; then by the help of your *Inſtrument* find the Point *H*, in the *Line B, D*, and meaſure with your *Chain* from *C*, to *H*, over *Hill* and *Dale*, as aforeſaid, and to the Perpendicular *C, H*, ſet the Number, as you find it by the *Chain*; then likewiſe find the *Perpendicular I, E*, and alſo meaſure that with your *Chain*; all which *Lines* in reſpect of the *Hills* and *Valleys* will be found much longer than if meaſur'd by your *Scale*: Then by the meaſur'd *Lines BD, CH*, and *IE*, caſt up the Contents of the *Trapezium B, C, D, E*, and in this manner caſt up the Content of the *Trapezium AB, EG*, and the *Triangle G, E, F*; and this is the exacteſt way to be preſcrib'd from the Menſuration of uneven Grounds, which being carefully perform'd, will not much vary from the true Content. And to diſtinguiſh theſe from other Grounds, Shadow them off in your *Plot* with *Hills* and *Valleys*, leſt any ſhould meaſure your *Plot* by your *Scale*, and find your work to differ.



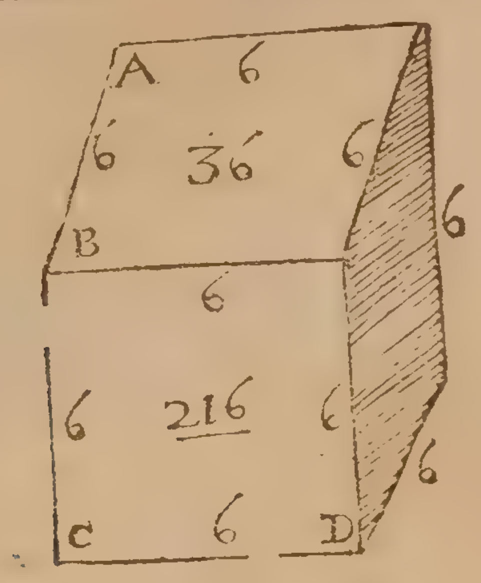
STEREOMETRY is the Art of Meaſuring all ſorts of ſolid Bodies.

Directions how the Content of moſt Regular Figures may be attain'd; alſo how to find the Craſſitude, or ſolid Content of any Timber, either ſtanding, rough, or ſquar'd.

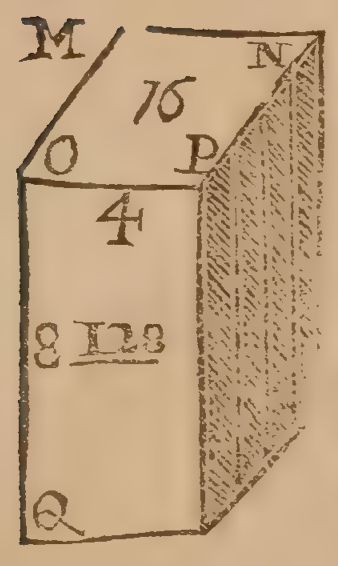
To meaſure the Solidity of a Cube.

A *Cube* is a Figure comprehended under 6 equal Sides, each being a *Geometrical Square*. Now for the finding the *Solidity* thereof, do thus; Meaſure one of the Sides, which Multiply in itſelf, which being again Multiply'd by the Side, will give the *ſolid* Content thereof. For Example, Let the *Figures A, B, C, D*, be a *Cube*, whoſe Side *A, B*, ſuppoſe 6 *Foot*, this 6 being Multiply'd in its ſelf produces 36, which Multiply by 6, and the *Product*

duct will be 216, and ſo many *ſolid Feet* of Timber or Stone are contained within the *Cube A, B, C, D.*



To meaſure the Solidity of a long Cube.



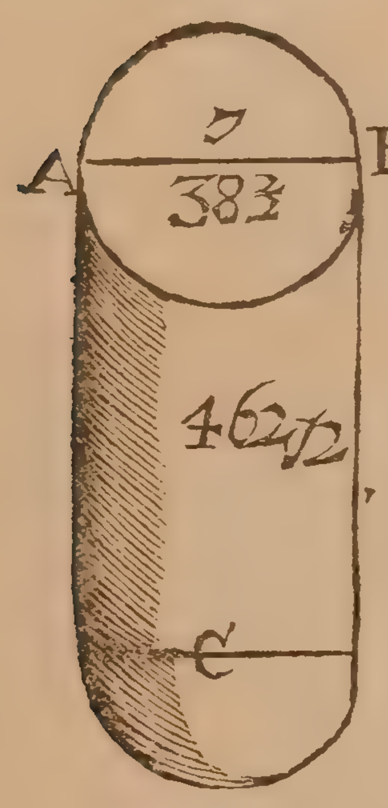
Let *M, N, O, P, Q,* be the *Figure* of a long *Cube,* or Oblong, the Side whereof O, P, is 4 *Foot,* which being Multiply'd in itſelf, gives 16 *Foot* for the *Square M, N, O, P*; this 16 being Multiply'd by 8, the Length of the Side O, Q, gives 128, and ſo many ſolid Feet of *Stone* or *Timber* are contain'd in the whole Figure *M, N, O, P, Q.*

To meaſure the Solidity of a Cylinder, or Pillar.

Let the *Cylinder* given be *A, B, C,* the Craſſitude, or ſolid Content whereof is requir'd. Let the *Diameter* of the *Circle* at the end *A, B,* be 7 *Foot*; then is the ſuperficial Content thereof 38 ½ *Foot.*

This Number being Multiply'd by 12, the Length of the *Cylinder,* gives 462 for the *Craſſitude* of the whole *Cylinder.*

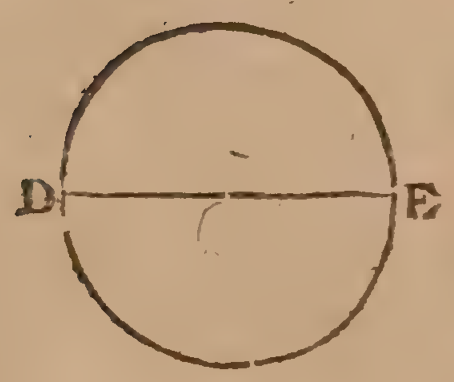
To meaſure the Content of a Cone.



Let the *Cone* given be *A, B, C,* the Height whereof *A, C,* is 12 *Foot,* and the *Diameter* of the *Baſe* is 10, by which the ſuperficial Content of the Circle will be found to be 78 $\frac{4}{7}$, which Multiply'd by 4, the third Part of the *Perpendicular*, gives 314 $\frac{2}{7}$ for the Content requir'd.

But by reaſon it is not eaſie to meaſure the Altitude of a *Cone,* without the true knowledge of the *Perpendicular,* it will be neceſſary to ſhew how that may be found; Firſt take half the *Diameter C, B,* which is 5, and Multiply'd it in itſelf, makes 25, which Number keep; then meaſure the Side C, *A,* 13, which Multiply'd in itſelf, makes 169, from which take the Square of half the *Baſe*, which is 25, (your Number being found) and there remains 144, the *Square Root* whereof is 12, and that is the Length of the *Perpendicular.*

To find the Content of a Sphere.

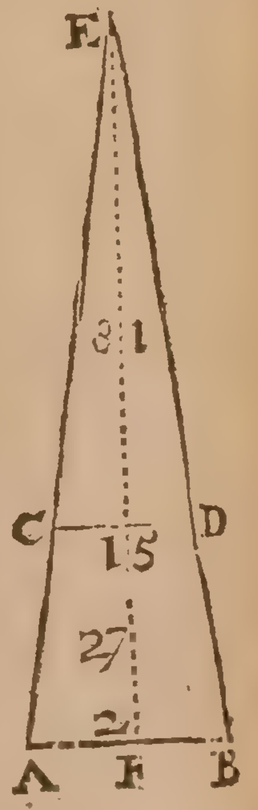


Take the *Diameter,* which Multiply by 11, and divide by 21, gives the *Solidity.*

In this Figure, let *D, E,* the *Diameter* contain 14 *Inches*; Firſt, Multiply 14 in itſelf, which makes 196, which being again Multiply'd by 14, gives 2744; this Number Multiplied by 11, makes 30184, and divided by 21, is 1437 $\frac{2}{3}$ the Content of the *Sphere.*

How to meaſure a Taper-grown Piece.

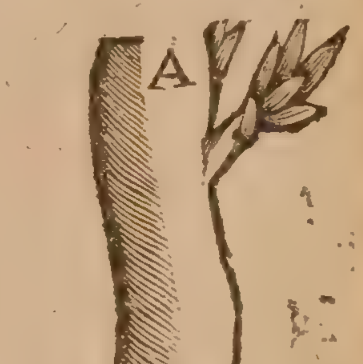
Every Piece of *Taper-grown Timber*, the Sides of which being extended, would be a *Pyramid,* as this Piece *A, B, C, D*; if the Sides *A, C,* and *B, D,* were extended till they meet at *E,* they would include the *Pyramis A, E, B.* Now to meaſure the *Segment A, B, C, D,* Firſt, find the Length of the whole *Pyramis, E, F,* which is thus done. Subtract 1 | 5 Primes, the Length C, *D,* from the *Baſe,* gives 5 *Primes* for the difference; then ſay by the *Rule* of *Proportion:*



As the Difference 5 *Primes,* is to the *Baſe* 2 *Foot,* ſo is the Length 27 to the whole Length *F, E,* 108 *Foot,* out of which ſubtract the Length of the Piece 27 *Foot,* and there remains 81, for the Height of the leſſer *Pyramis C, D.* Secondly the *Baſe A, B,* ſquar'd, makes 4 *Foot,* which Multiply'd by 2 third Parts of 108, the Length of the whole *Pyramis,* which is 36, gives 144 *Foot,* the Content of the whole *Pyramis.* Laſtly, find the Content of the leſſer *Pyramis C, E, D,* by Multiplying 1 | 5 *Primes,* the *Baſe C, D,* in itſelf, and it makes 2 | 25 Seconds, which Multiply'd by one third part of 81, the Heighth of the leſs *Pyramis* 27, which makes 60 | 75 Seconds, that is 60 ¾ *Foot* of the Content of the leſſer *Pyramis,* which being deducted out of the whole *Pyramis,* the Remainder will be 83 | 25 Seconds, the true Content of the Piece *A, B, C, D.*

To meaſure any Timber-Tree as it is ſtanding.

With a *Cord* or *Ring* girt the *Tree* about the middle, then meaſure the Length, which is equal to the *Circumference* of a *Circle,* deſcrib'd upon the mean *Diameter* of the *Tree,* by help of which *Circumference* you muſt find the *Diameter,* and *Area* thereof; Then meaſure the Length of the *Tree,* which being Multiply'd by the Content of the *Circle,* gives the Content of the whole *Tree.* For Example; Let *A, B,* be a ſtanding Tree to be meaſur'd; then firſt girt the ſame about the middle thereof at C, then meaſure the Length of the String, which let be 7 *Foot,* 4 *Inches,* that is 88 *Inches,* which being Multiply'd by 7, gives 616, which divided by 22 gives 28 for the Length of the *Diameter.* Having attain'd the *Diameter* of the *Circle,* find the *Area* of it thus; Multiply the *Diameter* 28 in itſelf, which makes 784, this again, Multiply'd by 11, produces 8624, which divide by 14, and the *Quotient* will be 616, the Content of the ſuppos'd *Circle,* which being Multiply'd by 10 *Foot* (which is 120 *Inches*) the Heighth of the *Tree A, B,* the *Product* will be 73920, and ſo many Square *Inches* are in the *Tree*; which being divided by 1728, the Number of *Inches* in a *Foot* of Square *Timber,* the *Quotient* gives 42 $\frac{21}{27}$, and ſo many *Foot* is in the whole *Tree.*



GAUGING

GAUGING.

IS a Branch of the Art of *Stereometry* or Meaſuring of Solids; becauſe the Contents of all ſorts of Veſſels us'd for Liquors, *&c.* are computed as if they were Solids. 'Tis to be ſuppos'd that before a Man can benefit himſelf of the following Rules, he has acquir'd a competent Knowledge in *Arithmetick* and *Geometry.*

In *Arithmetick* he ſhou'd be a perfect Maſter of Multiplication and Diviſion both in whole Numbers and Decimals.

In *Geometry* he ſhou'd underſtand not only how to take Dimenſions, but alſo how to divide any irregular Figure, as Brewers Backs or Coolers, into the feweſt regular Figures they will admit off, that ſo their Areas may be truly computed with the leaſt Trouble.

He ought alſo to have ſo much skill in Solids as to be able even at firſt ſight to determine what ſort of Figure any Veſſel is off, or what Figure it may be reduc'd to, that its Dimenſions may be truly taken, and the Contents computed with the leaſt Error. We ſay with the leaſt Error; becauſe 'tis very difficult if not impoſſible to do it exactly; for there is not any *Tun* or *Cask*, *&c.* ſo regularly made as by the Rules of Art 'tis requir'd to be.

He muſt know further, that all the Dimenſions in *Gauging* are to be taken in Inches and decimal Parts of an Inch, and if they are taken in Feet or Yards, *&c.* thoſe Meaſures muſt be reduc'd to Inches; becauſe the Contents of all ſorts of Veſſels are computed by the Standard Gallon of its kind, whoſe Content is known to be a certain Number of Cubick Inches.

The Beer or Ale Gallon contains——282
The Wine Gallon —— ——231
The Corn Gallon —— —— ——268,8

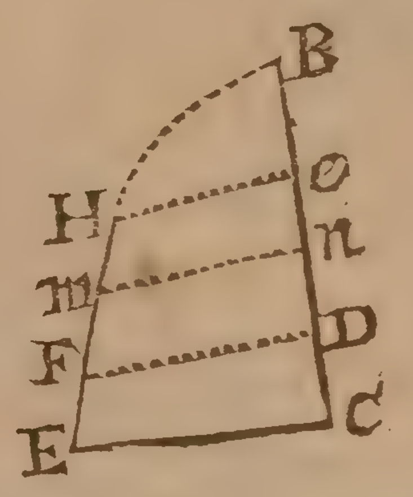
In the Buſineſs of *Gauging*, all Superficies are underſtood to be one Inch deep; otherwiſe it cou'd not be ſaid (as 'tis in the Gauger's Language) that the Area or Superficies of ſuch a Back, or of ſuch a Circle, *&c.* is ſo many Gallons.

Theſe Things being premis'd, the Learner in the Art of *Gauging* may proceed to Experiment, and endeavour to find the Capacities and Contents of all ſorts of Veſſels which hold Liquids, Powder, Meal, Corn, *&c.*

If theſe are of a ſquare Form, like hollow Cubes, ſuch as are many ſorts of Backs, Coolers, Fats, *&c.* their Content is eaſily found by multiplying the Area of the Baſe by the Perpendicular Altitude as you find the Solidity of *Parallel opipeds*, and *Priſms.* If they are of Cylindrical Figure as Buſhels, Gallons, *&c.* you muſt as near as you can find the Area of the Circular Baſe, and multiply that by the Perpendicular Altitude as before.

If they are Casks of the uſual Form of our Hogſheads, Barrels, *&c.* Mr. *Oughtred* conſiders them as Segments of a Spheroid cut off by Two Planes Perpendicular to the Axis.

And then Mr. *Caſwell* thus eaſily deduces his Theorem for Meaſuring Wine and Ale Casks.



Suppoſe C, E, B, a Quadrant of an Ellipſis, whoſe Semi-Axis are C, B, and C, E, and let the Ratio of the Semi-Parameter to C, B, be as l to t; and let E, C, F, D, m, n, H, G, be conſider'd as the *Radii* of Circles; which when turn'd round, the Axis B, C, ſhall form a Spheroid. Therefore the Elemental Circle

$$\begin{array}{r} D,F \\ \odot\, n,m \\ \odot\, G,H \end{array}\left\{\begin{array}{l} = \quad \odot\, C,B - \odot\, C,D \\ = \frac{l}{t} \times \odot\, C,B \times \quad C,n \\ = \quad \odot\, C,B - \quad C,G \end{array}\right.$$

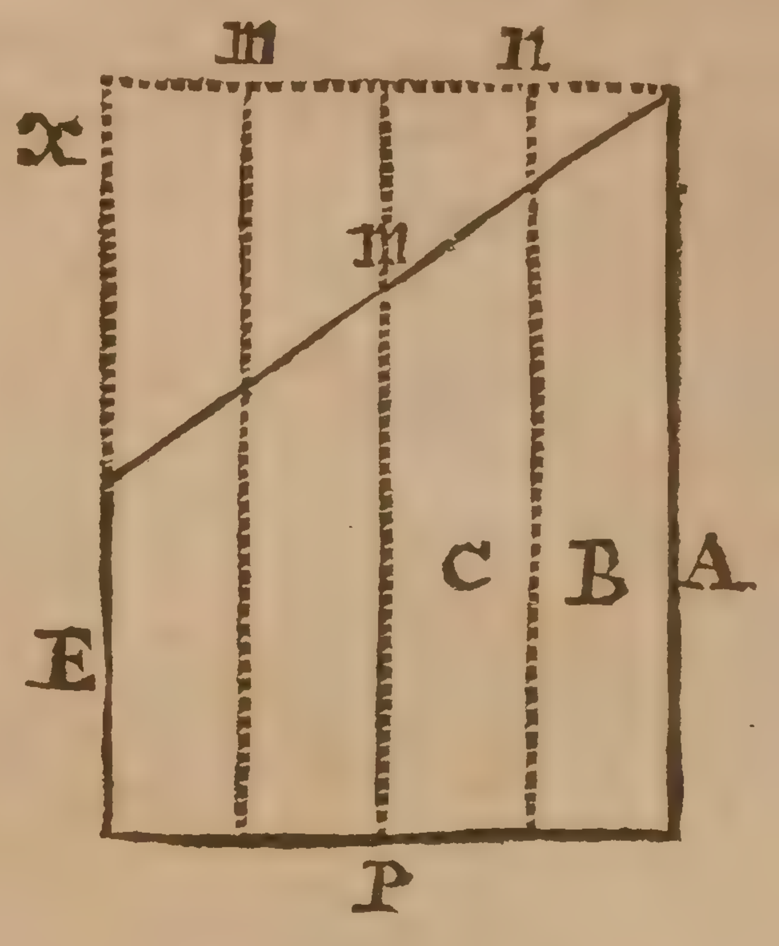
Wherefore the *Fruſtrum* of the Spheroid is =

$$\frac{l}{t}\, p \times C,B - \tfrac{1}{3} \odot C,G := \tfrac{1}{3}\, p \times \frac{l}{t} \odot C,B$$
$$\frac{l}{t} \odot C,G =.$$

$$\boxed{\tfrac{1}{3}\, p + 2 \odot C,E + \odot H,G.}$$

Which laſt is Mr. *Oughtred*'s Theorem, in Words thus: *Add twice the Area of the Circle at the Bung to the Area of the Circle of the Head, and then multiply that Sum by one Third of the Length of the Cask (which* p *ſtands for here as being a Perpendicular to the Planes of theſe Circles)* the Product is the Content of the Veſſel in Cubick Inches.

Having made uſe of the word *Fruſtrum*, 'twill be convenient to explain a little what it is. It ſignifies in Mathematicks a Piece cut off or ſeparated from any Body, as the Fruſtrum of a Pyramid or Cone is a Part or Piece of it cut off, uſually by a Plane parallel to the Baſe; all round and ſquare Timber that is tapering may be conceiv'd as the Fruſtrum of a Cone or Pyramid. To return to *Gauging. But perhaps*, ſays *Mr.* Caſwell, *moſt of our Cask had better be conſider'd as Fruſtra of a Parabolick Spindle, and then the Ground of their Menſuration he thus deduces.*



Suppoſe *A*, the Axis of a Parabola, and P an Ordinate to that Axis divided into innumerable Parts by B, C, *&c.* drawn Parrallel to the Axis, whoſe differences from A, ſuppoſe n, m, *&c.*

$$\text{That is,}\left\{\begin{array}{l} B = A - n. \\ C = A - m. \\ E = A - x. \end{array}\right.$$

$$\text{Therefore,}\left\{\begin{array}{l} B^2 = A^2 - 2An + nn. \\ C^2 = A^2 - 2Am + mm. \\ E^2 = A^2 - 2Ax + xx. \end{array}\right.$$

But $A\,2$, A, &c. is a Series of Equals; therefore $= p\,A\,2$, and $2\,A\,n$, $2\,A\,m$, &c. (by the Nature of the Parabola) is a Series of *Secundans*; therefore $= p + \frac{2}{3}\,A\,x$, and $n\,n$, $m\,m$, $x\,x$, is a Series of Quartans; therefore $= \frac{1}{3}\,p, x\,x$. Therefore the Fruſtrum of a Pyramidoid, made of A^2, B^2, C^2, &c. is $P\,x.\ I^2 - \frac{2}{3}\,A\,x + \frac{1}{3}\,x\,x = \frac{1}{3}\,p + : \frac{3}{5}\,x\,x + 2\,A^2 + (A^2 - 2\,A\,x =)$ $E^2 - x\,x = \frac{1}{3}\,p\,x : 2\,A\,2 + E^2\,\frac{2}{5}\,x\,x$.

Therefore if a Segment of a Parabola, cut off by a Line parallel to the Axis be turn'd about, it's ordinately applicate $p : \surd$ the Fruſtrum of the Acute Paraboilck Conoid ſo generated, or as 'tis alſo call'd a Parabolick Spindle, is $= \frac{1}{3}\,P\,x;\ 2 \odot A + \odot E + \frac{2}{5} \odot x$.

So that the Fruſtrum of a Parabolick Spindle is leſs than the Fruſtrum of the Spheroid of the ſame Baſe and Height by $\frac{7}{3} \odot x\,x\,\frac{1}{3}\,p$, and for the moſt Part he gives the Capacity of Casks nearer the Truth than the Theorem of *Oughtred*; who ſuppoſes Casks to be the Fruſtra of Spheroids, or than that of others *by multiplying the Circles at the Bung and Head into half the Length of the Cask*, which ſuppoſes it to be a Parabolick Conoid; or laſtly, with others to ſuppoſe them for Fruſtra of *Cones*; which is fartheſt of all from the Truth.

The common Rule for all Ale or Wine Casks, is to take the Diameters at the Bung, and at the Head, by which you muſt find the Area of the Circle there; then you muſt take $\frac{2}{3}$ of the Area of the Circle at the Bung, and add them together into one Sum, which Sum multiply'd by the internal Length of the Cask, gives the Content in ſolid Inches. Thoſe Inches you may turn into Gallons, by dividing by 282 for Ale, and 231 for Wine Gallons; but certainly 'tis eaſier and ſhorter to uſe the Theorem, as Mr. *Oughtred* expreſſes it before-mention'd, *viz.* $\frac{1}{3}\,p + 2 \odot C\,E + \odot H\,G$, than to make Fractions of the Area's of thoſe Circles, as in the common Way.

'Tis very plain that the Gauger muſt be pretty far gone in Algebra as well as common Arithmetick and Geometry to work his *Gauge* after this way. Mr. *Ward* is more plain and eaſie to a Man who has not made any progreſs in thoſe Sciences *to find the Area of any ſquare Tun, Back or Cooler*, &c. *either in Ale, Wine or Corn Gallons.*

Rule.

Multiply the given Length or Breath (being here equal) *into itſelf, and the Product will be the Area in Inches. Then divide that Area by* 282, *or* 231, *or* 268, 8, *and the Quotient will be the Area requir'd.*

Example.

Suppoſe the Side of a ſquare Tun, Back or Cooler be 124, 5 Inches, what will its Area be in Gallons?

Firſt, 124, 5. + 124. 5 = 15500, 25 the Area in Inches.

Then 282) 15500, 25 (54, 96, &c. the Area in Gallons of Ale.

231) 15500, 25 (67, 10, &c. the Area in Gallons of Wine.

268, 8) 15500, 25 (57, 66, &c. the Area in Corn Gallons.

To find the Area of any Tun or Back, &c. *in the Form of a Right Angled Parallelogram in Ale Gallons,* &c.

Rule.

Multiply the Length into its Breadth, and the Product will be the Area requir'd: Then divide that Area by the Number of Inches, in the ſeveral Meaſures as before, and you will have the Area in Gallons.

Example.

Suppoſe the Length of a Brewer's Tun, Back or Cooler be 217, 5 Inches, and its Breadth 85, 6 Inches, what will its Area be in Ale Gallons?

217. 5, × 85, 6 = 18648, then 282) 18648 (66. 12, &c. the Area requir'd.

To find the Area of a Triangular Tun, Back or Cooler in Ale Gallons, &c.

Rule.

Multiply the Baſe of the given Triangle into half its Perpendicular Heighth; or, half the Baſe into the whole Perpendicular. Thus divide that Area as before, and you will have the Area requir'd.

Example.

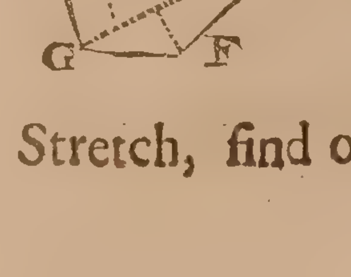
If the Length of the Baſe of a Triangular Cooler be 86, 4 Inches, and its Perpendicular Breadth be 57 Inches, what will its Area be in Ale Gallons?

Firſt 86, 4 + $\frac{57}{2}$ = 2462, 4. Then 282) 2462, 4 (8, 73, &c. the Area in Ale Gallons.

By this way you may eaſily find the Area of any Tun, Back or Cooler, whether it be in the Form of a Rhombus, Rhomboides, Trapezium, or of any other Polygon, either regular, or irregular, in Ale or Beer Gallons, &c. if you firſt divide it into Triangles, and then find the Areas of thoſe Triangles; the Sum of thoſe Area's being divided by its proper Diviſor as above, will give the Area requir'd.

Now the practical way of dividing any Polygonious Tun, Back, &c. into Triangles, is by help of a chalk'd Line ſuch as the Carpenters uſe, and may be thus perform'd.

Suppoſe any Brewer's Tun, Back or Cooler, in the Form of the annex'd Figure, A, B, C, D, F, G, let one end of the chalk'd Line be faſten'd with a Nail in any Corner or Angle of the Back as at A, then ſtraining it to the Angle at C, ſtrike the Diagonal Line A, C, upon the Bottom of the Back, and ſtraining it again to the Angle D, ſtrike another Diagonal Line, as A, D, and ſo on for the Diagonal Line G, D, &c. Then having mark'd out all the Diagonals, the Perpendiculars may be thus found; faſten one end of the chalk'd Line in the Angle B, and then by moving it to and fro upon the Stretch, find out the neareſt Diſtance between the Angle



Angle at B, and the Diagonal Line A, C, there ſtrike a Line, and it will mark out the Perpendicular from B, to the Line A, C, and ſo on for the other Perpendiculars; which being all mark'd out upon the Bottom of the Back meaſure them, and each Diagonal, Line of Inches, *&c.* and then the Area of that Back may be computed as directed above.

Obſerve here that the Number of Triangles will always be leſs by Two; and the Number of the Diagonal leſs by Three than the Number of the Sides of any Right Lin'd Figure that is divided.

Having found the true Area of any Back or Cooler. The next thing will be to find out the true Dipping or Gauging Place in that Back, *&c.* that ſo the true Quantity of Liquor may be computed or caſt up at any depth, which may be done thus:

1. When the Bottom of the Back is cover'd all over with any Liquid, dip it in 8 or 10 ſeveral Places, more or leſs according to the largeneſs of the Back, as remote and equally diſtant one from another as you well can, noting down the Wet Inches and Decimal Parts of every Dip.

2. Divide the Sum of all thoſe Wet Inches by the Number of Places you dip'd in, and the Quotient will be the Mean Wet of all thoſe Dips.

3. Find out ſuch a Place by the Side of the Back that juſt wets the ſame with that Mean, dip and make a Notch or Mark there for the true and conſtant Dipping Place of that Back. Then if any quantity of Liquid, which covers the Back or Veſſel be gaug'd at that Place, and the Wet Inches ſo taken be multiply'd into the Area of the Back in Gallons, the Product will ſhew what quantity of Liquids are in that Back or Veſſel at that time, provided the Sides of ſuch Back or Veſſel ſtand at Right Angles with its Bottom.

We hope that this ſmall Eſſay will give Gentlemen ſome Light into this uſeful and difficult Art; which having moſt relation to Officers of the Exciſe, will not, however, be of general Uſe to Gentlemen, tho' there are few that may not at ſome time or other have occaſion to make uſe of it. Wherefore we ſhall proceed to ſome more difficult Parts of it.

To compute the content of any cloſe Casks in Gallons, viz. *of any Butt, Pipe, Hogſhead, Barrel, &c.*

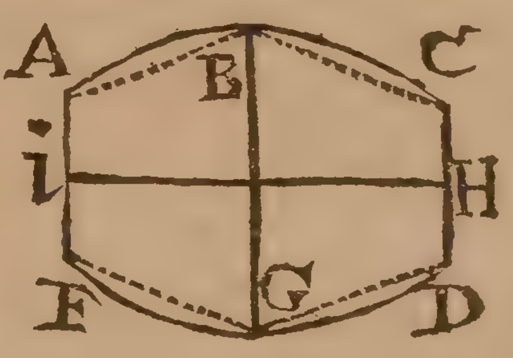
In order to perform this, the Three following Dimenſions of the propos'd Cask muſt be truly taken in Inches and Decimal Parts of an Inch, *viz.*

The Bulge or Bung Diameter within the Cask.
Either of the Head Diameters, ſuppoſing them both equal.
And the Length of the Cask within.

In taking theſe Dimenſions, you muſt carefully obſerve, 1. *That the Bung Hole be in the Middle of the Cask; that the Bung Staff, and the Staff overgainſt the Bung Hole are both regular or even within.* 2. *That the Heads of the Cask are equal and truly Circular; if ſo, the diſtance between the Inſide of the Chine to the Outſide of its oppoſite Staff will be the Head Diameter within the Cask very near.* 3. *Then with a ſliding Pair of Callipers* (made like a ſliding Rule to embrace the Two Heads of any Cask) *take the ſhorteſt Length between the Outſides of the Two Heads* (ſuppoſing them even); *from that Length ſubſtract* 1 ½ *Inch* (more or leſs according to the Largeneſs of the Cask) *for the Thickneſs of the Head, the Remainder will be the Length of the Cask within.*

By theſe Dimenſions one wou'd ſuppoſe the Content of the Cask was perfectly limited; but the Diameters, and the Length of one Cask, may be equal to thoſe of another, and yet one of thoſe Casks may contain ſeveral Gallons more than the other.

As for inſtance, ſuppoſe the annex'd Figure A, B, C, D, G, F, to repreſent a Cask. 'Tis plain if the outward curv'd Lines A, B, C, and F, G, D, are the Bounds of the Cask, it muſt needs hold more than if the inner ſtreight or prick'd Lines were its Bounds. And yet the Bung Diameter B, G, Head Diameters C, D, and A, F, and the Length L, H, are the ſame in both theſe Casks.



We ſhall now ſhew the way to gueſs at the Casks Form, and thereby compute its Content. If the Bounds or Staves of the Casks are very curv'd 'tis ſuppos'd to be the Fruſtrum of a Spheroid. And,

To twice the Area of the Bung Circle, add the Area of the Head Circle, multiply their Sum into one third of the Length, and the Product will be the Content in their reſpective Gallons.

Example.

Suppoſe a Cask in this form, whoſe Bung Diameter is 31.5, Head Diameter 24.5, and its length 42 Inches.

Bung Diameter 31. 5, twice its Circles Area is	5,5270
Head Diameter 24.5, its Circle's Area is	1,6718
The length 42, divided by 3 is 14	7,1988

Then 7,1988 × 14=100,78 the Content in Ale Gallons.

If the Staves of the Cask are not quite ſo curv'd as was ſuppos'd before, the Cask is then taken for the middle Fruſtrum of a Parabolick Spindle, and its Content is computed by this

Rule.

To twice the Square of the Bung Diameter, add the Square of the Head Diameter; from their difference ſubſtract four Tenths of the Square of the difference of Diameters, multiply the Remainder into the length, and divide the Product by 1077 : 15,

Viz. 3,8197 × 282 for Ale Gallons, and by 882,36
Viz. 3,8197 × 231 for Wine Gallons.

Example.

Suppoſe the Dimenſions the ſame as before.

Then 31, 5 × 31, 5 × 2 :+24, 5 × 24,5=2584,75, and 31, 5—24, 5=7.

Again, $7\times7\times0,4=19,6$. And $2584,75-19,6:\times42=107736,3$.
Then 1077,15 (107736,3 (100,01: The Contents in Ale Gallons, *&c.*

If the Staves of the Cask are but very little curv'd, then 'tis ſuppos'd to be in the Form of the Fruſtrums of Two equal *Parabolick Conoids*, and the Contents may be found thus,

To the Area of the Bung Circle add the Area of the Head Circle, Multiply the Sum into half the Length, and the Product will be the Length requir'd.

Example.

Suppoſe the Dimenſions the ſame as before.

Then $31,5:\times24,5\times24,5=1592,5$.
And $1592,5+42\div66885$.
And 718.8) 66885 (93,01 the Content in Ale Gallons.

If the Staves of the Cask are ſtreight from the Buldge to the Head, as the Inner Prick'd Lines in the laſt Figure (if ſuch a Cask can be made) 'tis then taken for the lower Fruſtrum of Two equal Cones joyning together on one common Baſe at the Buldge, and its Contents may be computed thus,

To the Sum of the Square of the Head and Bung Diameters add their Product; then multiply the Sum in the Length, and divide the laſt Product by 1077,15, as before.

Example with the ſame Dimenſions.

Firſt, $31,5\times31,5:24,5\times24,5:\times31,5\times24,5=2364,25$.
$2364,25+42=99298,5$
Then 1077,15) 99298,5 (92,18 the Content in Ale Gallons.

Coſmography and *Aſtronomy.*

BEFORE we enter into the Body of this Diſcourſe, it will be neceſſary to ſet down certain *Definitions* of great Uſe in the Study of *Coſmography.* As

1. The *Globe* or *Sphere* is a Solid *Figure* conſiſting of one Curv'd Superficies, in which all the Right Lines drawn from the Center to the Superficies are equal between themſelves.

2. The Center of the Sphere is that ſame Point from which all the Lines drawn from the Superficies are equal between themſelves.

3. The Diameter of the Sphere is a Right Line which paſſes by the Center, and terminates at both Ends of the Superficies.

4. The Axis of the Sphere is one of its Diameters on which it turns.

5. The Poles are Two Oppoſite Points in its Superficies at the Extremity of its Axis.

6. The Circle in the Sphere is a Superficies made when 'tis cut in any Part whatſoever.

7. The Great Circles are thoſe that paſs by the Center of the Sphere and cut it into Two Equal Parts which cauſes them to be equal between themſelves.

8. The Little Circles are thoſe that do not paſs by the Center of the Sphere nor cut it into Two Equal Parts.

All the Circles of the Sphere are commonly divided into 360 Equal Parts, which are call'd Degrees, each Degree is Subdivided into 60 Minutes, each Minute into 60 Seconds, each Second into 60 Terces, *&c.* The Minutes are mark'd by a little Stroke above the Cypher, the Seconds by Two Strokes, the Thirds by Three, and ſo onwards, as $15^{d}.\ 10'.\ 20''.\ 30'''$, *&c.*

9. The Axis of a Circle is one of the Diameters of the Sphere falling perpendicularly on the Centre of the Circle.

10. The Poles of a Circle are Two Oppoſite Points in the Superficies of the Sphere at the Extremity of the Axis of the Circle.

11. Parallel Circles are ſuch as are deſcrib'd with the ſame Point taken as a Pole in the Superficies of the Sphere. The Greateſt of all theſe Parallels is a Great Circle, and the nearer they are to one of their Poles the leſs they are.

12. A Spherical Angle is form'd by Two Arches of a Great Circle meeting in one Point. Its Meaſure is the Arch of a Great Circle deſcrib'd from the Top of the Angle as a Pole, and diſtant 90 Degrees.

13. A Hemiſphere is Half of a Sphere.

14. The Segment of the Sphere is one of its Parts in two unequally.

15. The Zone of a Sphere is a Part of its Superficies, and generally ſignifies Girdle.

16. An Orb is a Solid Body conſiſting of Two Spherical Superficies, the one *Convex*, the other *Concave*.

17. Concentrical Orbs are thoſe that are within one another, having the ſame Center equally diſtant from each of their Superficies.

18. Excentrical Orbs are ſuch as are within one another, but have each their Particular Centers one without another.

The *World* or *Univerſe* is the Whole Creation, the Principal Parts of which are, the Heaven, the Stars, and the Earth, with the Animals that Inhabit it. The Science which teaches the Diſpoſition of all the Parts of the Univerſe, as the Heaven, the Stars, and the Earth, is call'd *Coſmography*, or the Deſcription of the World; and ſince we ſhall treat of it in Conjunction with *Aſtronomy*, it will be convenient to define the latter Science, which is an Art that teaches the Knowledge of the Stars or Heavenly Bodies, and their Magnitudes, Diſtances, Eclipſes, Order and Motions, having premis'd this, we ſhall begin with *Coſmography*, or the World in General.

The Common Opinion is, That its Figure is Spherical or Round, being the moſt Regular and moſt Perfect which the Soveraign Creator gives to his Works; *Phænomena's* or Appearances have prov'd this Hypotheſis. The Heaven is a Body of an Immenſe and Liquid Subſtance, Tranſparent and extremely Subtle, yielding a Free Paſſage to Light and the Motion of the Stars.

The Stars are diſtinguiſh'd by the Names of Fix'd Stars and Planets. As to Fix'd Stars, 'tis generally thought that they are Bodies which ſhine by their own Light; they are call'd Fix'd, not becauſe they are without Motion, for they have two; One in common with the whole Heaven, which is made in four and twenty Hours from Eaſt to Weſt on the Poles of the World, and which carries with it all the Stars, and even all the Comets, when there are any: The other, which they make on the contrary from Weſt to Eaſt on the Poles of the *Ecliptick*, and is very ſlow, even incomparably ſlower than the Motion of the Planets, ſince, according to the Famous Aſtronomer *Tycho Brache*, they don't finiſh their Revolution in leſs than 25816 Years; but they are term'd Fixt Stars, becauſe they always keep the ſame Diſtance among themſelves: They are divided into ſeveral Conſtellations.

The Region of Heaven where they are plac'd, is call'd the Firmament. There's Reaſon to believe they are not all contain'd in the ſame Spherical Superficies, but ſome are higher and ſome lower; and the loweſt much farther from the Earth than all the other Stars, ſince one cannot find any Parallax or Difference of Aſpect, and they have never Eclips'd any Planet.

The Planets may be term'd Wandring Bodies, as their Name ſignifies, becauſe their Second or Proper Motions from Weſt to Eaſt, are not regular as thoſe of the Stars, and they do not always keep the ſame Diſtance from one another. Thus they are ſometimes nearer, ſometimes farther off; ſometimes joyn'd, being obſerv'd under the ſame Point of Heaven, and ſometimes oppoſite, being Diſtance half its Circle.

There's no Planet but the Sun which ſhines with its own Light: 'Tis he who enlightens them, and Cauſes the Days which are in them as well as in the Earth. There are ſome that turn about on their *Axis* at ſeveral times; and thoſe Planets which one may imagine to be much like our Earth, are Opake Bodies, as the Earth do's, and receive Light from the Sun and reflect it. They are lower than the Fixt Stars, ſince they Eclipſe them and hide their Light from us ſometimes. There's a great deal of Difference among them as to their Luſtre. The Sun ſeems of a Gold Colour, the Moon a Silver, *Venus* very White, Brillant and Luminous, *Jupiter* not ſo White nor Luminous, *Saturn* is of a Pale Lead Colour and do's not ſhine, *Mars* on the contrary glitters very much, and is as Red as Fire; *Mercury* is a Planet which we do not often ſee in our Climates, becauſe of the Obliquity of the Sphere, and being very near the Sun, 'tis almoſt always plung'd in its Rays, or the Vapours of the Horizon; its Colour is a bright Silver, and it glitters a little. 'Tis often ſeen in the Torrid Zone, becauſe the Sphere is not in ſo Oblique a Poſition there.

The Planets are diſtinguiſh'd into great and little Spheres. The Great are Seven in Number; the Names and Characters of which are *Saturn* ♄, *Jupiter* ♃, *Mars* ♂, the *Sun* ☉, *Venus* ♀, *Mercury* ☿, the *Moon* ☽; the Little are Nine in Number, Four of which turn about *Jupiter* and are term'd *Satellites*, and the other Five revolve about *Saturn*, Three of which thoſe neareſt to the Body of that Planet were diſcover'd by M. *Caſſini*, and the Fourth by M. *Huygens.*

As to the Order which theſe Cœleſtial Bodies obſerve among themſelves, and with reſpect to the Earth, it has given riſe to Three Conſiderable Opinions; thoſe of *Ptolemy*, *Copernicus*, and *Tycho Brache*, to which a Fourth has been added, compos'd of all of them: Theſe are call'd Syſtems, and will be explain'd in the Sequel.

The Earth which, with Reference to us, is the moſt Important Part of the Univerſe, forms, with the Water that covers Part of its Surface, a Globe or Body of a Spherical Figure as well as the Univerſe. About it is the Region of Air, compos'd of Parts more ſubtle than thoſe of the Earth and Water. This Globe hangs in the middle of the Air, without any thing to ſupport it; and the Place where it is fix'd is determin'd only by the Equality of the Preſſure of that Subtle Matter that encompaſſes it.

Such is the General Idea of *Coſmography.* 'Tis divided into Two Principal Parts, *viz. Aſtronomy*, which takes in every Thing belonging to the Heaven and Stars, and *Geography*, which includes whatever relates to the Earth and Water.

Of Ptolemy's *Syſtem.*

ACcording to which the Globe of the Earth is in the Centre of the Univerſe. About the Terreſtrial Globe is the Region of Air. After this, and ſtill about the Earth at the Center, are deſcrib'd the Circles of the Motions of the Planets in this Order: Firſt, that of the *Moon*; then thoſe of *Mercury*, *Venus*, the *Sun*, *Mars*, *Jupiter*, *Saturn*, and the *Fix'd Stars.* Above theſe muſt be imagin'd a Spherical Superficies, in which all the Circles that are ſuppos'd to be in the Sphere of the World, are contain'd. The Circle above *Saturn* is call'd the *Firmament*; that above the *Firmament*, the Second *Chryſtallin* that above, the *Firſt*; then the *Primum Mobile*, and at laſt the *Empyrean.* But here Imagination comes too near the Seat of him who has confin'd our Knowledge within very narrow Limits, and makes it a High Preſumption in Man, to ſuffer his Conceptions to form Images of the Dwellings of *Infinity.*

The Copernican Syſtem.

Copernicus was not the Firſt who had the Thought of making all the Planets turn about the Sun, and giving Motion to the Earth. He only perfected his Obſervations, by what *Ariſtarchus* a *Samian*, *Philolaus* a *Pythagoræan*, and others of the Ancients had imagin'd a long time before; inſomuch that *Copernicus's* Hypotheſis is only an Ancient Opinion re-eſtabliſh'd and renew'd, but enlighten'd and enrich'd with ſo many New Obſervations and particular Remarks in favour of this Syſtem that he may very well paſs for the Inventer of it. He places the *Sun* in the Center of the Univerſe, as a great Light which enlightens and vivifies; after which he places *Mercury*, *Venus*, then the Earth about which as its Center the Moon turns. He ſettles the Place of the Fix'd Stars ſo far diſtant from the *Sun*, that the Diſtance between the *Sun* and *Saturn* is nothing in Compariſon to it. About the Planets of *Jupiter* and *Saturn* turn Nine *Satellites*, Five about *Saturn* and Four about *Jupiter.*

Tycho Brahe's Syſtem.

This Aſtronomer, who was a *Daniſh* Gentleman, approv'd of all *Copernicus's* Syſtem, but the Motion of the Earth; ſo he compos'd another, which is very Ingenious.

In the Center of the World he plac'd the Earth, about which he makes the Moon turn after the ordinary manner. Then from the ſame Center, and at a good diſtance, he deſcribes the Circle of the Motion of the Sun, which he calls the Annual Orb, or the Great Orb. He afterwards deſcribes the Circle of the five Planets from the Center of the Sun, as that of *Mercury* firſt, and neareſt to the Sun, then that of *Venus* at a diſtance, ſomewhat greater than that of *Mercury*; then thoſe of *Mars*, *Jupiter* and *Saturn*, the fartheſt of all. So that the Circle of *Mars* cuts that of the Sun into five Points, which is the cauſe that part of the Circle of *Mars* is nearer the Earth than that of the Sun. In fine, from the Earth, as the Center, he deſcribes the Circle of the Revolution of the fix'd Stars, making it paſs above *Saturn*. Thus you have three Circles, that of the Moon, of the Sun, and the Stars, that have the Earth in their Center; and five others, as thoſe of *Mercury*, *Venus*, *Mars*, *Jupiter*, and *Saturn*, which have the Sun for their Center. He deſcribes alſo the Center of *Jupiter* and *Saturn*, the Circles of the Motions of the little Planets that wait on them, as in the *Copernican* Syſtem.

The Compoſite Syſtem.

This Syſtem is only *Ptolemy's* and *Tycho Brahe's* joyn'd together; 'twas invented by *Martianus Capella*, and is call'd alſo the Common Syſtem, becauſe 'tis follow'd by moſt of the Moderns.

In this Syſtem the Earth is in the Center of the World, about which turn the Moon, the Sun, and the fix'd Stars, according to *Tycho* and *Ptolemy*. The three ſuperior Planets, *Saturn*, *Jupiter*, and *Mars*, make their Revolutions eccentrick about the Earth, carrying with them the Center of their Epicicle, about which theſe three Planets turn, as in the Ptolemæan Syſtem. But as to the two inferior Planets, *Venus* and *Mercury*; they turn about the Sun in little eccentrick Circles, according to *Tycho*.

Whatever my Author is pleas'd to ſay of this Syſtem, that 'tis follow'd by the greateſt part of the Moderns, we muſt take the Liberty to adviſe the Reader, That the greater part are not ſo much to be rely'd on, as the beſt Part, and they follow *Copernicus's*, which beſt explains the Phænomena's of the firſt and ſecond Motion of the Stars.

Of Points, Lines, and Circles imagin'd to be in the Sphere of the World.

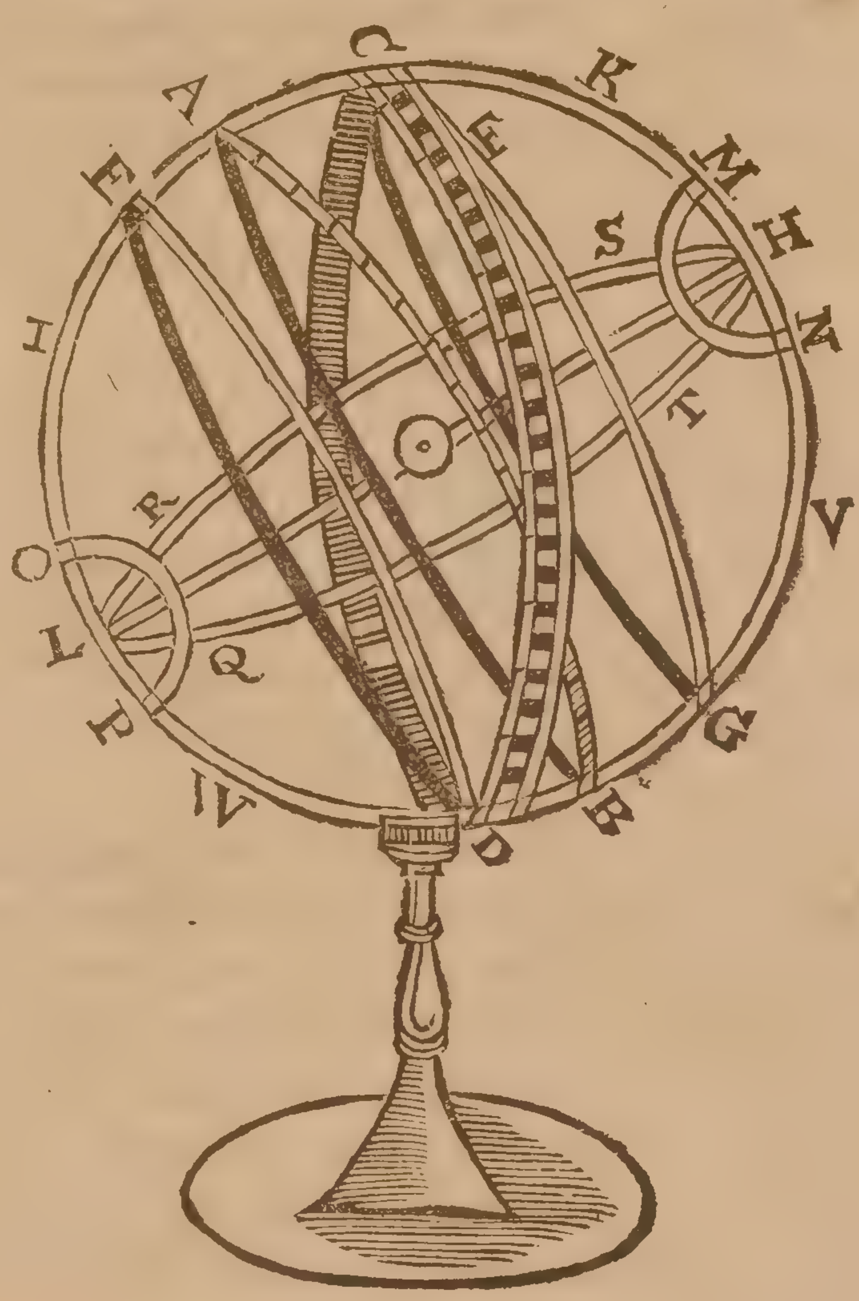
The eight principal Points are the two Poles of the World, the two Poles of the Zodiack, or the Ecliptick, the two Points of Eaſt and Weſt, and of the Zenith and the Nadir.

The two Lines are the Axis of the World, and the Axis of the Zodiack, or the Ecliptick.

The ten Circles are divided into ſix great, and four ſmall; the ſix great are the Equinoctial, or the Equator, the Zodiack, the Colure of the Equinoxes, the Colure of the Solſtices, the Horizon and Meridian; the four leſs, are the Tropick of *Cancer*, the Tropick of *Capricorn*, the Circle of the Artick Pole, and the Circle of the Antartick Pole.

In the middle of the Sphere is plac'd a little Globe, which repreſents the Earth, and within the Circles we have been ſpeaking of, are put two others, thoſe of the Sun and Moon, the nearer to repreſent their Motions and Eclipſes. The Figure of the Sphere will ſhew this more lively.

The ÆQUATOR.



Beſides the Artificial Sphere, you ſhould have the Celeſtial Globe, on the Superficies of which are repreſented; the fix'd Stars, with their different Conſtellations or Aſteriſms, joyntly, with the ten Circles of the Sphere, the Axis, and the two Poles of the World.

There's alſo a Terreſtrial Globe with the ſame Circles, but that relates to Geography, and will be treated of more largely under that Article.

The Poles of the World are the two ſole immovable Points of the Univerſe which terminate the World's Axis, the Northern, is call'd *Artick*; the Southern, *Antartick*. The two Poles of the Zodiack are two other Points at the Extremity of the Axis of the Zodiack. They are 23 Degrees, 29 Minutes from the Poles of the World; they are moveable, and make a Revolution about the Poles of the World. The Points of Eaſt and Weſt are thoſe that mark the Points of the Riſing and Setting of the Sun at the Equinox. The Zenith and Nadir, are thoſe two Points that anſwer each other, the one directly above us, the other directly below us. The Horizon is that great Circle which divides the Heavens and the Earth into two Parts, or Hemiſpheres, diſtinguiſhing the Upper from the Lower. The Axis of the World is an imaginary Line, conceiv'd to run thro' the Center of the Earth from one Pole to another. The Axis of the Zodiack is alſo conceiv'd to paſs thro' the Earth, and to be terminated in the Poles of the Zodiack.

A Deſcription of the Six great Circles of the Sphere.

The Equinoctial in the Heavens, or Equator on the Earth, is a great Circle, whoſe Poles are the Poles of the World; it divides the Globe into two equal Parts, that is, the Northern and Southern Hemiſpheres. It paſſes thro' the Eaſt and Weſt Points of the Horizon, and at the Meridian is rais'd as much above the Horizon as is the Compliment of the Latitude of the Place. When the Sun comes to this Circle, it makes equal Day and Night all round the Globe, becauſe it always riſes due Eaſt and ſets due Weſt, which it does at no other time of the Year. All Stars that are under this Circle, or have no Declination, always riſe due Eaſt, and ſet full Weſt. All People living under it, have their Days and Nights equal; at Noon the Sun is in the Zenith, or directly over their Heads, and caſts no ſhadow. From this Circle on the Globes is the Latitude accounted on the Meridian. 'Tis known in Geography and Navigation by the Name of the Line.

Of the Zodiack.

The Zodiack is a great Circle of the Sphere, dividing it into two equal Parts, cutting the Equator in the Eaſt and Weſt Points of the Horizon; it cuts the Horizon and Equinoctial obliquely, and makes with the former an Angle equal to the Sun's greateſt Meridian Altitude in any Latitude, and with the Equinoctial an Angle of 23 Degrees, 30 Minutes. Thro' the middle of it is drawn a Line call'd the Ecliptick, or *Via Solis*, becauſe the Sun never deviates from it in his Annual Motion, as the Planets do all, more or leſs. 'Tis mark'd in the Globe with the Characters of the Twelve Signs. By this are determin'd the four Quarters of the Year, and accordingly it is divided into four Parts. From this Circle the Latitudes of the Planets and fix'd Stars are accounted from the Ecliptick towards its Poles. Thoſe Poles are 20 Degrees, 30 Minutes diſtant from the Poles of the World, or of the Equinoctial, and by their Motions are the Polar Circles deſcrib'd. The breadth of this Circle is 20 Degrees, for beyond 10 Degrees North, or 10 Degrees South, the Latitude of no Planet ever reaches. 'Tis divided into Twelve Signs, becauſe while the Sun in a Year's Time is running thro' the Zodiack, or Ecliptick, there happens to be Twelve Lunations, or the Moon undergoes all her Changes or Phaſes twelve times. Each Sign is divided into 30 Degrees, ſo that the whole make 360; and they begin to reckon at the Eaſtern Interſection of the Equinoctial and Ecliptick, or at the Vernal Equinox, where they place the firſt Point of Aries ♈, going on thence to Taurus ♉, Gemini ♊, Cancer ♋, Leo ♌, Virgo ♍, Libra ♎, Scorpio ♏, Sagittarius ♐, Capricorn ♑, Aquarius ♒, Piſces ♓; the ſix former are term'd Northern, the ſix latter Southern.

The Colures

Are the two great Circles imagin'd to paſs thro' the Poles of the World, one of them thro' the Equinoctial Points, *Aries* and *Libra*, and the other thro' the Solſtitial Points, *Cancer* and *Capricorn*; theſe are call'd the Equinoctial and Solſtitial Colures, and divide the Ecliptick into four equal Parts or Quarters, which are denominated accordingly. The Points where theſe paſs thro' are call'd the Cardinal Points.

Of the Horizon,

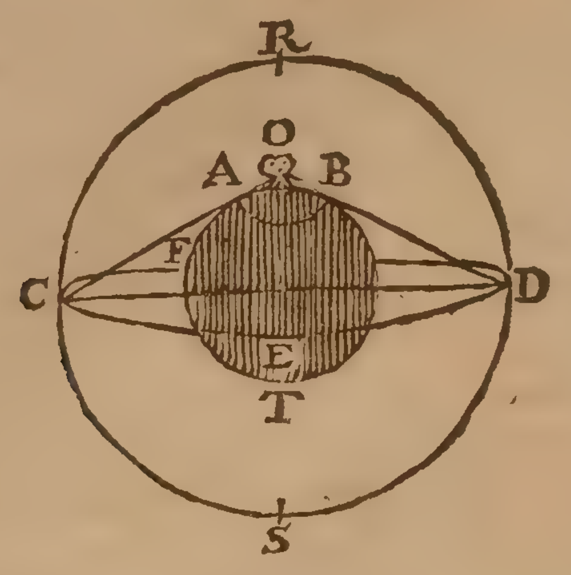
Which is a great Circle ſpoken of before, either Senſible or Apparent, or Rational or True.

The Senſible Horizon is that Circle which limits our Sight, and may be conceiv'd to be made by ſome great Plain, or the Surface of the Sea. It divides the Heaven and Earth into two Parts, the one Light and the other Dark. It determines the Riſing and Setting of the Sun, Moon, or Stars; and from hence their Altitude is accounted, it being their height above the Horizon.

The Rational, or True Horizon, is a Circle which encompaſſes the Earth exactly in the middle, and whoſe Poles are the Zenith and Nadir. The Horizon, on the Globe, is a broad wooden Circle encompaſſing it round, and repreſenting the Rational Horizon. On this Circle ſeveral Circles are drawn, the innermoſt of which is the Number of Degrees of the Twelve Signs of the Zodiack, next to this are the Names of theſe Signs; then the days of the Month, according to the *Julian* Account; and then a Kalendar, according to the *Gregorian*. Without theſe is a Circle divided into 32 equal Parts, which make 32 Rhumbs or Points of the Mariner's Compaſs, with the firſt Letters of their Names annex'd. The Uſe of this Circle on the Globes, is, Firſt, To determine the Riſing and Setting of the Sun, Moon, and Stars, and to ſhew the Time of it by the Hour, Circle, and the Index. Secondly, To limit the Encreaſe and Decreaſe of Day and Night; for when the Sun riſes due Eaſt and ſets Weſt, the Days and Nights are equal; when he Riſes and Sets to the North of the Eaſt and Weſt, the Days are longer than the Nights; when to the Southward of the Eaſt and Weſt, the Nights are longer than the Days. Thirdly, To ſhew the Amplitude and Point of the Compaſs the Sun riſes and ſets upon.

Tho' there's properly but one Horizon, yet thoſe that Travel by Sea or Land, do from time to time change their Horizon, diſcovering ſome part of the Heavens, which before could not be ſeen, becauſe of the roundneſs of the Sea and Land; for tho' a Man changes his Horizon, he does not change it in its kind; for what place ſoever he's in, he will ſee no other Horizon, by reaſon he ſees half of the Heavens.

This Figure further explains it: The *Globe* A B, repreſents the Earth; the Circle C R D S the Heavens; R the Zenith, S the Nadir, C D E F the Rational Horizon, O the Place of the Spectators Eye, T the Antipodes, and O A B the Senſible Horizon, whoſe Semi-Diameter O A, or O B, is not above three Miles, when the Eye is not above ſix Foot from the Surface of the Earth, but increaſes proportionably to the height of the Eye, or thing ſeen.



Of the Meridian.

The Meridian is a great Circle, paſſing thro' the Poles of the World, and both Zenith and Nadir croſſing the Equinoctial at Right Angles, and dividing the Sphere into two equal Parts, one Eaſt and the other Weſt: It has its Poles in the Eaſt and Weſt Points of the Horizon: 'Tis call'd the Meridian, becauſe when the Sun comes to the South Part of this Circle, 'tis then *Meridies*, Mid-day, or High-noon, and then the Sun has his greateſt Altitude for that Day. Theſe Meridians are various, and change according to the Longitude of Places, inſomuch that they may be ſaid to be infinite in Number, for that all Places from Eaſt to Weſt have their ſeveral Meridians; but there is or ſhould be one fix'd, which is call'd the firſt Meridian. The Meridian on the Globe, is repreſented by the Brazen Circle, in which the Globe hangs and turns; 'tis divided into four 90's, or 360 Degrees, beginning at the Equinoctial; on it, each way from the Equinoctial, on the Celeſtial Globes, is counted the South and North Declination of the Sun and Stars; and on the Terreſtrial Globe, the Latitude of Places, North and South. There are two Points of this Circle, call'd the Poles of the World; and a Diameter continu'd from thence, thro' the Center of either Globes, is call'd the Axis of the Earth, or Heavens, on which they are ſuppos'd to turn round; on the Terreſtrial Globe there are uſually 36 Meridians, one thro' every tenth Degree of the Equator, or thro' every tenth Degree of the Longitude. The Uſes of this Circle are, Firſt, To ſet the Globes to any particular Latitude; Secondly, To ſhew the Sun's, or a Star's Declination, Right Aſcenſion, or Greateſt Altitude. Declination in Aſtronomy, is the ſame as Latitude in Geography.

A Deſcription of the Four Little Circles.

The Tropicks have been mention'd already, and are Circles ſuppos'd to be drawn Parallel to the Equinoctial, at 23 Degrees 30 Minutes diſtance from it, one towards the North, term'd *Cancer*, and the other towards the South, term'd *Capricorn*, becauſe they lie under thoſe Signs. The two Tropicks confine the way of the Sun's Motion in the Ecliptick, and are as two Barriers to him, beyond which he never paſſes. 'Tis in theſe Circles the Sun makes the longeſt and ſhorteſt Days in the Year; they mark the Places of the Ecliptick, where the Solſtices are made, at which the Sun has his greateſt Declination, and his greateſt and leaſt Meridian Height. They ſhew in the Horizon his greateſt and leaſt Diſtance from the Zenith, for the Inhabitants of the Oblique Sphere, and have many other Uſes too Numerous to be inſerted here.

Of the Polar Circles.

They are two Circles ſuppos'd to be drawn Parallel to the Equinoctial, tho' 23 Degrees, 30 Minutes diſtance from the Polar Points; that about the North Pole is call'd the Artick Circle, that about the South the Antartick. They ſhew the Revolution the Poles of the Zodiack make about the Poles of the World, which is caus'd by that of the Sphere, as that makes the firſt Motion. They determine all the Places of the Earth into an equal Diſtance from the Poles of the World, and have an Aſtronomical Day, or a Day of 24 Hours for their longeſt, and a Night of the ſame length for their ſhorteſt. They are the Limits of the Frigid and Temperate Zones; the Frigid Zones are thoſe Parts of the Globe, between theſe Circles and the Poles of the World; the Temperate Zones are cut on the North ſide of the Equator, between the Artick Circle and the Tropick of *Cancer*; another on the South ſide, between the Tropick of *Capricorn* and Antartick Circle. There are two Temperate and two Frigid Zones, to which muſt be added the Torrid Zone, containing all that Space of Earth that lies between the two Tropicks.

There are ſeveral other Circles of the Sphere, of which ſomething muſt be ſaid, as

Circles of Longitude, which are great Circles paſſing thro' the Star and the Pole of the Ecliptick, where they determine the Star's Longitude, reckon'd from the beginning of *Aries*. On theſe Circles are accounted the Latitude of the Stars, which is its diſtance from the Ecliptick, being an Arch of a Circle of Longitude, reckon'd from the Ecliptick towards its Poles. The Circle of Oblique Aſcenſion, is that Degree and Minute of the Equinoctial which riſes with the Center of the Sun or Star, or with any Point of the Heavens in an Oblique Sphere. The Circle of the Aſcenſional Difference, is the Difference between the Right and Oblique Aſcenſion or Deſcenſion, or the Space of Time the Sun riſes or ſets before or after Six a Clock. The Circles of Declination are the Meridians on which the Declination or Diſtance from the Equator of any Planet or Star is accounted. A Circle of Perpetual Apparition, is one of the Leſs Circles, Parallel to the Equator, being deſcrib'd by any Point of the Celeſtial Sphere, which makes the Northern Point of the Horizon, and is carry'd about with the Diurnal Motion of the Stars that are included in this Circle, never ſet, but are always viſible above the Horizon. And the Circle of Perpetual Occultation, is another Circle at a like diſtance from the Equator, and contains all thoſe Stars which never appear in our Hemiſphere; but the Stars ſituated between thoſe Circles, inceſſantly riſe and ſet at certain Times. Circles of Poſition are Circles paſſing by the common Interſections of the Horizon and Meridian, and thro' any Degree of the Ecliptick, or the Center of any Star, or other Point in the Heavens, and are us'd for the finding out the Situation or Poſition of any Star.

Of Azimuths and Paralaxes,

Or Verticle Circles, which are great Circles interſecting each other in the Zenith and Nadir, as Hour-Glaſſes do in the Pole, and cutting the Horizon at Right

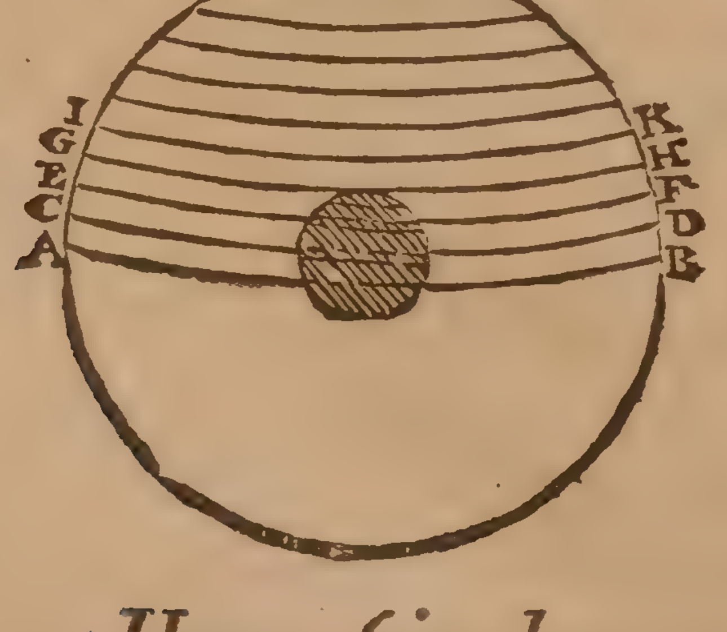
Angles: Theſe Circles are not drawn on the Globe but are repreſented by the Quadrant of Altitude, when 'tis ſcrew'd in the Zenith. On theſe Azimuths, is the Sun's Altitude, when he is not on the Meridian. The Parallax is that Arch of a great Circle, paſſing thro' the Zenith and True Place of the Sun or Stars, and intercepted between the True and Apparent Place. Tho' there be no Paralax of the fix'd Stars, in reſpect of the Earth's Semi-Diameter, the whole Body of the Earth being but a Point in reference to the diſtance between us and the fix'd Stars; yet in reſpect of the Annual Orbit of the Earth, it has juſtly been expected by Aſtronomers that ſome Parallax ſhould be found. And this would be a Diſcovery of great Moment if it could be made, becauſe it would be an undoubted Demonſtration of the Annual Motion of the Earth round the Sun. Mr. *Flamſtead* is ſaid to have obſerv'd it, but whether his Reaſons will prevail on Aſtronomers to admit his Diſcoveries for Demonſtration, we ſhall not enquire after in this Place. The Paralax of Latitude is an Arch of a great Circle paſſing by the Poles of the Zodiack to the Apparent Place of the Star, and intercepted between two Circles of the Ecliptick equally diſtant; of which, the one paſſes by the True Place of the Star, and the other by the Apparent Place. The Parallax of Longitude is an Arch of the Ecliptick, (or Parallel to it) intercepted between two great Circles; of which, the one paſſes from the Poles of the Ecliptick and the True Place, and the other from the ſaid Poles by the Apparent Place. So that the Paralax of Longitude is only the Difference of the True and Apparent Place, according to the Longitude of the Ecliptick. The nearer the Star is to the Horizon and Center of the Earth, the greater is the Paralax; whence it is that the Orbit of the Moon being near us to the Earth, her Paralax is greater and moſt perceptible.

Of Almacanters.

The Name is *Arabick*, and ſignifies the ſame as Parallels of Altitudes, which are Circles Parallel to the Horizon, imagin'd to paſs thro' any Degree and Minute of the Meridian, between the Horizon and Zenith, having their Poles in the Zenith. On the Globes theſe are deſcrib'd by the Diviſions on the Quadrant of Altitude, in its Motion about the Body of the Globe, when 'tis ſcrew'd to the Zenith of any Place. See the Figure; A B is the Horizon, C D, E F, G H, I K, and the other Circles Parallel to the Horizon are Almancanters.



Hour Circles.

The ſame with Meridians, are great Circles meeting in the Poles of the World, and croſſing the Equinoctial at Right Angles. They are ſuppos'd to be drawn thro' every fifteenth Degree of the Equinoctial and Equator, and on both Globes are ſupply'd by the Meridian, Hour-Circle, and Index. The Planes of the Hour-Circle are Perpendicular to the Equinoctial, which they divide into Twenty-four Equal Parts, which make the Twenty-four Hours of the Aſtronomial Day.

Of Day-Circles.

They are Parallel to the Equator, paſſing by each Degree of the Eclipticк, which the Sun goes thro' very near in a day by his particular Motion. They are not exactly Parallel to the Equator, becauſe the Sun does not ſtay always in the ſame Degree of the Ecliptick. The inequality of the Civil Day proceeds from the inequality of the Motion of the Sun in the Ecliptick, caus'd by the eccentricity of the Circle of his proper Motion. Reaſon might be given for the variety of Days; and we might enlarge on the Circles which we enter'd upon, but 'twould take up too much of our Room.

The Crepuſculum,

Is that dubious half Light which we perceive before the riſing of the Sun, and after Sun ſetting; 'tis term'd *Twilight*, and is occaſion'd by the Earth's Atmoſphere, and the Splendor of the Æther, which environs the Sun. The Ethereal accended Atmoſphere of the Sun not ſetting ſo ſoon as, and riſing before the Sun, and the Sun's Rays alſo illuminating the Earth's Atmoſphere before the Body of the Sun it ſelf can appear, cauſes a Light always preceding the Riſe, and ſubſequent to the Setting of that Planet.

Of Conſtellations of fix'd Stars.

Which are Companies of fix'd Stars imagin'd to repreſent the Image of ſomething, and commonly by the Name of that Thing, the Ancients gave them the Name of Aſteriſms, and plac'd them under 48 Conſtellations, of which 12 are in the Zodiack, 21 Northern, and 15 Southern; but there are two more now reckon'd in the North, which make 23 there, and 50 in all. Beſides which is the Galaxy, or Milky Way, a broad white Track encompaſſing the whole Heavens, and extending it ſelf in ſome places with a double Path, but for the moſt part with a ſingle one. Some of the Ancients, as *Ariſtotle*, &c. imagin'd that this Path conſiſted only of a certain Exhalation, hanging in the Air; but by the Obſervation made of late Years with the Teleſcope, it has been diſcover'd to conſiſt of an innumerable quantity of fix'd Stars, different in Situation and Magnitude, from the confus'd Mixture of whoſe Light its white Colour is ſuppos'd to be occaſion'd. As the Galaxy is compos'd of an Infinity of ſmall Stars, ſo it has uſually been the Region in which new Stars have appear'd; as that in *Caſſiopeia*, A. D. 1572. &c. which were ſeen a while, and then became inviſible again. What follows will doubtleſs entertain the curious Reader, becauſe it gives him a ſurprizing Idea of the Creator's infinite Power in the Creation of the Univerſe; we ſhall follow a late Author of good Authority, who is known to be a Maſter of theſe Things. *Fix'd Stars* are ſuch as do not, like the Planets, change their Poſitions in reſpect of another, becauſe they have no ſenſible Parallax ariſing from the Annual Motion of the Earth. They are eſteem'd to be at ſuch an immenſe diſtance as to have no ſenſible Effect on our Earth. Since *Copernicus* reviv'd the *Pythagorean* Syſtem (now follow'd by all Mathematicians whatever our *French* Author may inſinuate to the contrary) there ſeem'd ground to imagine that the Diameter of the Earth's Annual Courſe (which is 40000 times bigger than our Earth's) might give a ſenſible Parallax to the fix'd Stars, tho' the other could not, and thereby determine their diſtance more preciſely. Which as good a Foundation as 'tis for us to build on, has not yet produc'd any Diſcoveries of that kind; and there are ſome Conſiderations that make us doubt whether we ſhall be able to go farther with our Helps than we have already gone. Mr. *Huygens* tells us he could never diſcover any viſible Magnitude in the fix'd Stars, tho' he us'd Glaſſes, that magnify the Apparent Diameter above a hundred times. Now ſince in all likelihood the fix'd Stars are Suns, perhaps of different Magnitude, we may on a reaſonable Medium preſume they are about the bigneſs of our Sun. Let us then, for Example, ſuppoſe the Dog-ſtar to be ſo, the diſtance from us to the Sun being about a hundred times the Sun's Diameter. 'Tis evident that the Angle under which the Dog-ſtar is ſeen in Mr. *Huygens*'s Teleſcope, muſt be near the ſame with the Angle of its Parallax to the Sun's diſtance, or Semi-Diameter of the Earth's Annual Courſe; ſo that the Parallax to the whole Diameter, can be but double ſuch a Quantity, as even to Mr. *Huygens*'s nice Obſervation, is altogether Inſenſible. The diſtance therefore of the Stars ſeem hardly within reach of any of our Methods to determine; but from what has been laid down we may draw ſome Concluſions that will much illuſtrate the prodigious Vaſtneſs of it: Firſt, That the Diameter of the Earth's Annual Orb, which contains at leaſt 160 Millions of Miles, is but a Point in compariſon to it, at leaſt it muſt be above 6000 times the diſtance of the Sun; for if a Star ſhould appear thro' ſuch a Teleſcope half a Minute broad (which is a pretty ſenſible Magnitude) the true Apparent Diameter would not exceed 18 Third Minutes, which is leſs than the 6000th part of the Apparent Diameter of the Sun, and conſequently the Sun's diſtance not the 6000th part of the diſtance of the Stars. Secondly, That could we advance towards the Stars 99 parts of the whole diſtance, the Stars would appear little bigger to us than they do here; for they would ſhew no otherwiſe than they do thro' a Teleſcope, which magnifies a hundred-fold. Thirdly, That between 9 parts in 10 of the ſpace between us and the fix'd Stars, can receive no greater Light from the Sun, or any of the Stars, than what we have from the Stars in a clear Night. Fourthly, That Light takes up more Time in travelling from the Stars to us than we in making a *Weſt-India* Voyage, which is commonly perform'd in ſix Weeks; that a Sound would not arrive to us from thence in 50000 Years, nor a common Bullet in a much longer Time. This is eaſily computed by allowing (according to Sir *Iſaac Newton*) 10 Minutes for the Journey of Light from the Sun hither, and that a Sound moves but 1300 Foot in a Second; but Sir *Iſaac* does not allow above 968 Foot for the Motion of Sound in a Second of Time. What immenſe Idea's are here? How can Imagination ſoar to ſuch a height, which is almoſt too boundleſs for Numbers. The next Thing to be treated of are

The Planets,

Or Erratick Stars, which are not like the Fix'd Ones, always in the ſame Poſition to one another. We Number the Earth among the Primary Planets, becauſe we know it moves round the Sun, as *Saturn*, *Jupiter*, *Mars*, *Venus*, and *Mercury* do, and that in a Circle between *Mars* and *Venus*. The Moon is accounted among the Secondary Planets, or Satellites of the Primary, ſince ſhe moves round the Earth, as *Jupiter*'s four Moons, or Satellites move round him, and *Saturn*'s five round him, if *Caſſini*'s Eyes be to be truſted; for 'tis certain, they have not been viſible to all Aſtronomers. All the Planets have their Motion round the Sun, which makes their Year, and a Motion round their own Axis, which makes their Day, as the Earth's revolving ſo makes ours. 'Tis more than probable, that the Diameters of all the Planets are longer than their Axes, as 'tis known to be in our Earth, and Mr. *Flamſtead* and *Caſſini* have found it to be in *Jupiter*. Sir *Iſaac Newton* aſſerts our Earth's Equinoctial Diameter to exceed the other about 34 Miles. If Sir *Iſaac* has been able to meaſure the Globe to ſuch a Nicety, he muſt be endow'd with Qualities, which with more Helps would enable him to meaſure the Univerſe. We ſhall now ſay a word or two of each Planet in particular, and begin with

Saturn.

The Proportion of the Body of *Saturn* to our Earth is about 30 to 1. The Periodical Time of his Revolution about the Sun is in the Space of 30 Years, or 10950 days. The Semi-Diameter of *Saturn*'s Orbit is 946969690. His greateſt diſtance from the Earth 244330, and his leaſt 175670 Semi-Diameters of the Earth. The diſtance of *Saturn* from the Sun is about 10 times as great as that of our Earth from him; wherefore that Planet cannot have above a 100th part of the Influence of the Sun which we have, and conſequently cannot be habitable by ſuch Creatures as live on our Globe, unleſs there be ſome unknown way of communicating Heat to him. If an Eye were plac'd in *Saturn*, the Diameter of the Sun would appear almoſt 10 times leſs than it does to us, and conſequently his Disks, Light, and Heat, will be there 90 times leſs. *Saturn*'s Year is almoſt 30 of ours, but the length of his Day is yet uncertain; he is ſaid to have 5 Satellites attending him, of which we have met with this Account, In *March*, 1684. Mr. *Caſſini* (of the Academy of Sciences at *Paris*) by the help of excellent Teleſcopes of 70, 90, 100, 136, 155, and of 220 Feet, diſcover'd the two innermoſt, that is, the firſt and ſecond; the firſt he obſerv'd to be never diſtant from *Saturn*'s Ring above $\frac{2}{5}$ of the Apparent Length of that Ring, and 'twas found to make one Revolution about *Saturn* in 1 Day, 21 Hours, and 19 Minutes, making two Conjunctions with him in leſs than 2 Days. 'Tis diſtant from him $4\frac{3}{8}$ of *Saturn*'s Semi-Diameters.

The Second Satellite was obſerv'd by $\frac{3}{4}$ of the Length of his Ring diſtant from it, making his Revolution about him in 2 Days 17 Hours, and 48 Minutes; this is diſtant from his Center $5\frac{3}{7}$ Semi-Diameters of that Planet. The Third is diſtant from *Saturn* 8 of his Semi-Diameters, and revolves round him in almoſt $4\frac{3}{4}$ Days. The Fourth or *Huygenian* Satellite as 'tis call'd, becauſe firſt diſcover'd by Mr. *Huygens*, revolves round *Saturn* in about 16 Days, is diſtant about 18 of his Semi-Diameters. The Fifth is diſtant from his Center 54 Semi-Diameters, and revolves round him in $79\frac{1}{3}$ Days. The *Huygenian* Satellite is beſt known. Monſieur *Caſſini* is ſo great an Aſtronomer, and has had ſuch

Encouragement from the *French* King for carrying on his Study ſucceſsfully, that few or none have had the like Advantages; and 'tis no wonder he has ſeen more. Where ſhall we find an Engliſhman who has had the Advantage of a Teleſcope 220 Foot long?

Jupiter.

The proportion of *Jupiter* to our Earth is about 60 to 1. The Periodical Time of his Revolution about the Sun 12 Years. He revolves round his Axis in 10 Hours. His greateſt diſtance from the Earth according to *Caſſini* is 142919 Semi-Diameters of the Earth, and his leaſt 87081. The Diameter of *Jupiter* is equal to 27 and $\frac{1}{2}$ Semi-Diameters of the Earth; wherefore the Globe of *Jupiter* muſt be greater than that of the Earth by 2460 times. In the Year 1664, *Campani* (by the help of an excellent Teleſcope) obſerv'd ſome Protuberations and Irregularities in the Surface of this Planet. He ſaw alſo in his Body the Shadows of his Satellites, and follow'd them with his Eye till he ſaw them go off the Diſk; ſuch an Advantage gain'd by the Moderns in Aſtronomy over the Ancients, that if what they knew is admirable to us, what we know wou'd have been miraculous to them. In the ſame Year Mr. *Hook* with a Teleſcope of 12 Foot, obſerv'd a ſmall Spot in the biggeſt of the Three obſcurer Belts of *Jupiter*, and within Two Hours after he found that the ſame Spot had mov'd from *Eaſt* to *Weſt* about half the Length of the Diameter of *Jupiter*. Monſ. *Caſſini* obſerv'd alſo near the ſame time a permanent Spot in the Diſk of *Jupiter*, by whoſe help he not only found that *Jupiter* turns about upon his own Axis; but alſo that he does it in 9 Hours and 36 Minutes. The Sun's Heat in *Jupiter* is almoſt not above one twenty fifth Part of what it is with us. His diſtance from the Sun being five times as great as ours. Day and Night (each 5 Hours) is of the ſame Length in *Jupiter* all over his Surface. His Four Satellites were diſcover'd by *Galilæo*, and being as ſo many Moons to him his Night of 5 Hours muſt be very luminous, and as good as a cloudy Day in our Climate. The diſtance of theſe Satellites are according to *Caſſini*

1st	2d	3d	4th

Mars.

There requires a good Teleſcope to view this Planet; it muſt have ſmall Apertures on the object Glaſs, or his Light glares ſo that his Appearance is very confus'd. He borrows his Light from the Sun, and has increaſe and decreaſe of it like the Moon. *March* 10. 1665. Dr. *Hook* obſerv'd this Planet with a 36 Foot Tube, and ſaw his Body at large very near as the Moon at full: He obſerv'd ſeveral Spots in it, and particularly a Triangular one; which having a Motion, he concluded the Planet had a turbinated Motion round its Center. In *Feb.* 9. 1666. Monſ. *Caſſini*, with a 16 Foot Teleſcope obſerv'd Two dark Spots in the firſt Face of *Mars*, moving from 11 at Night till break of Day: He ſaw afterwards other Spots in the other Face of this Planet like thoſe of the Firſt, but much bigger; and continuing his Obſervations, he found the Spots of thoſe Two Faces to turn by little and little from *Eaſt* to *Weſt*, and to return at the ſpace of 24 Hours 40 Minutes to the ſame Situation. Whence he concluded that this Planet revolves round its Axis in 24 Hours 40 Minutes, *Mars* is diſtant from the Sun half as far again as the Earth. His Light and Heat but half what it is here. His Year twice as long as ours. His Natural Day a little greater than ours. His Artificial, or the Time in which the Sun appears above the Horizon, is almoſt every where equal to his Night, and conſequently in one and the ſame Place. On his Surface there can be but little Variety of Seaſons as to Winter and Summer, *&c.* His greateſt diſtance from us 58978 Semi-Diameters of the Earth. His leaſt 21616. His Globe is ſix times as big as the Earth.

The Sun.

Sir *Iſaac Newton* in his *Principia* ſays, The Denſity of the *Sun*'s Light, which is proportional to Heat, is ſeven times as great in *Mercury* as with us; and therefore our Water there wou'd be all carry'd off and boyl away. For he found by Experiments of the *Thermometer*, that an Heat but ſeven times as great as that of the *Sun* Beams in the Summer, will ſerve to make Water boyl. He proves alſo, that the Matter of the *Sun*, to that of *Jupiter*, is nearly as 1100 to 1, and that the diſtance of that Planet from the *Sun* is in the ſame *Ratio* to the *Sun*'s Semi-Diameter. And conſequently, that the common Center of Gravity of the *Sun* and *Jupiter*, is nearly in the Superficies of the Sun; of *Saturn* and the *Sun* a little within it. And by the ſame manner of Calculation it will be found that the common Center of Gravity of all the Planets cannot be more than the Length of the Solar-Diameter diſtant from the Center of the Sun. This common Gravity he proves to be at reſt, and therefore tho' the Sun by reaſon of the various Poſition of the Planets may be mov'd every way, yet it cannot recede far from the common Center of Gravity; and this he thinks ought to be accounted the Center of the World. The Opinion of ſuch a Maſter is of ſuch conſequence to a Learner, that we ought not to loſe a Word of what he ſays. By means of the ſolar Spots, it has been diſcover'd that the *Sun* revolves round his own Axis without moving (conſiderably) out of his Place in about 25 Days; and that the Action of his Motion is inclin'd to the Ecliptick in an Angle of 87 Degrees 30 Minutes. The *Sun*'s apparent Diameter being ſenſibly ſhorter in *December* than in *June* as is plain, and agreed from Obſervations. The *Sun* muſt be proportionably nearer to the Earth in Winter than in Summer. According to Monſ. *Caſſini*, the *Sun*'s greateſt diſtance from the Earth is 22374 Semi-Diameters of the Earth. His mean diſtance 22000, and his leaſt diſtance 8022. The *Sun*'s Diameter is equal to 100 Diameters of the Earth, and therefore the Body of the *Sun* muſt be 1000000 times greater than that of the Earth.

Venus.

The Time of the Periodical Revolution of this Planet round the *Sun*, is 2243 Days and $\frac{2}{3}$ of a Day, or $7\frac{1}{2}$ of our Months. According to Monſ. *Caſſini*, the greateſt diſtance of *Venus* from the Earth is 38415 Semi-Diameters of the Earth; its leaſt 5585. Its Diameter contains 7 of the ſame Semi-Diameters, and its Globe is 43 times as big as the Earth. Dr. *Gregory* ſays, That to an Eye plac'd in *Venus*, the *Sun*'s Diameter wou'd appear one and $\frac{1}{2}$ as big again as it does to us, and therefore his Disk will be more than double of what it appears to us; and the Light and Heat in this Planet, and its Gravity towards the *Sun*, will be in the ſame Proportion in reſpect of ours. The Length of the Day in *Venus* is but 23 Hours. In *October 1666*, *Caſſini* obſerv'd ſeveral Spots in the Body of this Planet, by whoſe Motion he judg'd that ſhe mov'd either by a Circulation or a kind of Libration round her Axis in the Time above-mention'd. The ſame Aſtronomer in 1672 and 1684, with a Teleſcope of 34 Foot, believes he ſaw a Satellite moving round this Planet, and diſtant from it about $\frac{3}{5}$ of *Venus*'s Diameter. It had the ſame Phaſis with *Venus*; but had no well deſign'd Form.

Mercury

Is according to Monſ. *Caſſini* diſtant from the Earth 32704 Semi-Diameters of the Earth at its greateſt diſtance, and 11296 at its leaſt; the Mean being 22000 Semi-Diameters, or about 88000000 *Engliſh* Miles. The Diameter of this Planet is $\frac{3}{4}$ of the Diameter of the Earth, and his Globe $\frac{2}{5}$ of that of the Earth. Sir *Iſaac Newton* makes the Heat of *Mercury* ſo great as to be ſeven times as much as the Heat of our Summer *Sun*; which he found, by Experiments deſignedly made by *Thermoſcopes*, is as has been hinted enough to make Water boyl, therefore undoubtedly this fiery Planet is uninhabitable by ſuch Creatures as live on our Earth.

The Moon.

The Periodical Revolution of the *Moon*, in reference to the fix'd Stars, is 27 Days 7 Hours 43 Minutes. And in the ſame ſpace of Time by a ſtrange Correſpondence and Harmony of the Two Motions, it revolves the ſame way about its own Axis, by which means (one Motion converting it to, as the other turns it from the Earth) the ſame Side is always expos'd to our Sight. The mean Horary Motion of the *Moon* in reſpect of the fix'd Stars is 32 Minutes, 56 Seconds, 27 Thirds, 12 Fourths and a Half. This Planet is diſtant from the Earth, according to moſt Aſtronomers, 61 Semi-Diameters of the Earth at its greateſt diſtance, and 51 at its leaſt; but if the Earth and *Moon* move both round the *Sun*, that excellent Aſtronomer, Sir *Iſaac Newton*, demonſtrates that the diſtance between the Centers of the Earth and *Moon* will be 60 and $\frac{1}{2}$ of the Earths Semi-Diameters. As to the Inequality of the *Moon*'s Motion (which proceeds from the Action of the *Sun*'s diſturbing the Motion of the Secondary Planets) ſhe moves ſwifter, and deſcribes (by a Radius drawn from it to the Earth) a greater Area in proportion to the Time, has an Orbit leſs curv'd, and by that means comes nearer to the Earth in her Conjunctions than in her Quadratures, unleſs the Motion of her Eccentricity hinders it, which Eccentricity is greateſt when the Apogæum of the *Moon* happens in the Conjunctions; and is leaſt when the Apogæum happens in the Quadratures. The *Moon* perpetually changes the Figure of her Orbit. There are alſo ſome other Inequalities in the Motion of this Planet which can hardly be reduc'd to any certain Rule.

The Cauſe that the obſcure Part of the *Moon* appears like kindled Fire juſt before and after the Change or New *Moon*, is the *Sun*'s Rays reflected from the bright Hemiſphere of the Earth to thoſe dark Parts of the *Moon*, and thence again reflected to the Earth deſtitute of the *Sun*'s Light. Sir *Iſaac Newton* ſuppoſes the Moon at its firſt Original to have been a Flood like to our Sea, and then Calculates that the Attraction of our Earth wou'd raiſe the Water there to near 90 Foot high, as the Attraction of the Moon raiſes the Water of our Earth to 12 Foot, whence the Figure of the Moon muſt be a Spheroid, whoſe greateſt Diameter extended will paſs thro' the Center of our Earth, and will be longer than the other Diameter perpendicular to it by 180 Feet. And from hence it comes to paſs that we ſee always the ſame Face of the *Moon*; for ſhe cannot reſt in any other Poſition but continually endeavours to conform her ſelf to this Situation. The *Moon* has properly no Atmoſphere; ſuch as our Earth has abounding with Clouds, Winds, Thunder or Lightning, becauſe her Face always (when our Air is clear) appears diſtinct and clear. And by Teleſcopes the *Sun*'s Light may be ſeen to paſs regularly and uniformly from one mountainous Place to another. The Denſity of the *Moon* according to Sir *Iſaac Newton*'s Concluſion, and we can have no better, is to that of the Earth as 9 to 5 nearly. The Maſs or Quantity of Matter in the *Moon*, to that of the Earth, is as 1 to 26 nearly; and her Globe $\frac{1}{55}$ of the bigneſs of the Earth. The Reaſon why the *Moon* appears to our common Sight ſo much bigger when near the Horizon than ſhe does when near the Meridian, tho' ſhe be then almoſt one Semi-Diameter of the Earth nigher to us than when ſhe is near the Horizon is, that the Horizontal Moon is capable of being compar'd with many intervening Objects, interpos'd Hills, *&c.* but the Meridional *Moon* has nothing to be compar'd withal, and therefore the diſtance between us and her is judg'd to be vaſtly greater than when ſhe is in the Horizon. Dr. *Wallis* ſays, This cannot be from the Refraction of Vapours near the Horizon; becauſe that can only encreaſe the Altitude of her, but not her Breadth: For the Horizon in the whole will always be but a Circle. By means of the Spots in the *Moon* the Lunar Ecclipſes are more accurately obſerv'd than formerly, to the great Advancement of Geography and Navigation, in ſettling the Longitudes of Places; for the Immerſions and Emerſions of theſe Spots from the Shadow of the Earth are moſt nicely determin'd. Tho' the *Moon*'s Period round the Earth be 27 Days, 5 Hours, $\frac{3}{4}$ of an Hour (which is the Periodical Month) yet becauſe, in that ſpace, the Earth alſo with its Satellite the *Moon* is mov'd on almoſt an entire Sign, therefore the Point of the *Moon*'s Orbit, in the laſt Conjunction or New *Moon*, will be gotten too far to the Weſtward. And the *Moon* cannot come yet to a New Conjunction with the *Sun*, but wants of it 2 Days and 5 Hours; which being added to the Periodical makes a Synodical Month. The other Secondary Planets move ſwifter round their Axis than the Moon. Tho' the *Moon* as well as the Earth, *&c.* be of a Figure oblately Spheroidical, that is having its Diameter at the Equator larger than its Axis, yet the exceſs of the Equatorial Diameter in her is ſo inconſiderable that ſhe may well enough paſs for a Globe; and, perhaps, her Figure's being ſo nearly Spherical may be the reſult of her ſlow Motion round her Axis. For *Jupiter*, which moves the ſwifteſt of any round its Axis, is of a Figure more oblate than any other Planet. The Lunar Day wou'd appear to a Lunar Spectator to be near equally divided into Light and Darkneſs; becauſe the Axis of the *Moon*'s Revolution is nearly at Right Angles with the Plane of her Orbit round the *Sun*, ſo that ſhe enjoys a Perpetual Equinox. And there can be no Twilight becauſe this Planet has no Atmoſphere. In one half of the *Moon*'s Surface (except juſt near the Edge of the other Hemiſphere) the Earth cannot be ſeen by a Spectator in the *Moon*; whereas, in the other half, it will be always viſible, and ſeem fix'd in the Heavens like a Star. We regret very much we cannot preſent the Reader with Sir *Iſaac Newton*'s Theory of the *Moon*; but he by this time knows the Reaſons that hinder us; that Theory being ſo ſhort and perfect 'tis not capable of an Abridgment, and yet too long for our Limits.

Of Comets,

Comets or Blazing Stars, as the Vulgar call them, have been from the beginning look'd upon as terrible things portending Wars, Plagues and Famine. But not to enter into God's ways of declaring his Anger to Guilty Man, let us ſee what the Learn'd write of theſe Appearances, and whenever we can find that Sir *Iſaac Newton* has ſaid any thing on theſe Comets we ſhall make uſe of no other Guide; but we cannot do Juſtice to that Great Man for want of Room to give the Reader all he ſays, for a Word of his cannot well be ſpar'd. He proves [*Princip. Hiſt. Nat.* p. 473.] Comets are above the Moon, and in the Region of Planets, becauſe they have no Diurnal Parallax to find its Diſtance. From the Light of the Apparent Star at the Head of the Comet, he concludes its Vicinity to the Sun and Earth; and from the thick Vapour with which its Head is always encompaſs'd, that it muſt often deſcend below the Sphere of *Saturn*, as he had before found by its Parallax, which he concludes alſo by examining into the Cauſe of the *Cauda*, or Tail: He then draws theſe Corollaries; 1. That Comets ſhine by the Light of the Sun's Beams reflected from them. 2. That the Heavens are devoid of all Reſiſtance, ſuch as our Air and other Mediums have: for theſe Comets move every way with all the Freedom that can be, obliquely, directly, and often againſt the Courſe of the Planets, and yet continue their Motion for a very long while. He proves that Comets move round the Sun in Conick Sections, having their *Umbelici* in the Center of the Sun: He proceeds to conſider more particularly what the Bodies of Comets are, and concludes, they are Solid, Compact and Durable, like thoſe of the other Planets: He refutes *Ariſtotle* and his Followers Opinion of their being Meteors or Exhalations from this, That in their Tranſits ſo near the Sun, as 'tis found they go, they would be perfectly diſſipated, diſpers'd and deſtroy'd.

The Heat of the Sun he had before ſhewn to be as the Denſity of the Rays, or reciprocally as the Squares of the Diſtance of the Comet which appear'd in the Year 1680, being in its Perihelion, or the Point neareſt to the Sun, *December* the 8th, was then to the Diſtance of the Earth from the Sun, as 6 to 1000; the Sun's Heat in the Comet at that Time was to his Heat at *Midſummer*, as 28000 to 1, whereas the Heat of Boyling Water as he try'd, was but very little more than triple the Heat of our Dry Earth expos'd to the Midſummer Sun; and the Heat of red-hot Iron he conjectures to be about three or four times as great as that of Boyling Water; wherefore the Heat of the Dry'd Earth of the Comet in its Perihelion was near 2000 times as great as that of red-hot Iron; and conſequently, if the Comet had been an Exhalation the Sun wou'd have render'd it Inviſible. We ſee *Ariſtotle* is not able to ſtand againſt our own Philoſopher in theſe wonderful Inquiries. He goes on; The Comet there acquir'd ſo immenſe a Degree of Heat in its Perihelion, that it muſt needs be a long time before it could be cold again; for he computes that a Globe of red-hot Iron of the Dimenſions of our Earth wou'd ſcarce be cool in 50000 Years. If therefore we ſuppoſe the Comet to cool 100 times as faſt as a red-hot Iron, yet ſince his Heat was 2000 times greater than that of red-hot Iron, ſuppoſing his Body to be of the ſame Bigneſs of our Earth, he will not be cool in a Million of Years. He obſerves that the Tails of all Comets are longeſt and largeſt after their paſſing from the Sun, which ſhews that the Sun's Heat contributed to their Tail, when 'tis more than probable that the Tail of a Comet is only a long and very thin Smoak or Train of Vapours, which the fiery Head of the Comet emits from it: This he proves by many ſtrong and convincing Arguments, refuting all thoſe that were made uſe of to confirm other Opinions. *Caſſini* obſerv'd of the Comet which appear'd in 1680, that 'twas but 22 or 23 Degrees from the Sun. He thinks it too raſh in the Modern Philoſophers, to condemn as ridiculous, the Notion of Comets being bad Preſages; but then he does not go to Work like our Enthuſiaſts, and impute all to ſupernatural Judgments: For he ſays, If the Tail of a Comet ſhould be intermingled with our Atmoſphere; or if the Matter of it ſhould by its Gravity fall down upon our Earth, it may induce Changes in our Air that may be very ſenſible among Animal and Vegetable Bodies. He ſhews [*Aſtron.* p. 408.] how to determine the Way and apparent Place of a Comet; How to find the Poſition of the Bodies of a Comet's Orbit, and when the Comet will be in them; and treats largely of them, to which the Reader muſt be referr'd. *James Bernoulli*, in his *Syſtema Cometarum*, [*An.* 1682.] ſuppoſes there is ſome Primary Planet revolving round the Sun in the Space of 4 Years and 157 Days; and at the diſtance from him of 2583 Semi-Diameters of the *Magnus Orbis*. This Primary Planet he ſuppoſes either from his vaſt Diſtance or Smallneſs not to be viſible to us, but however to have at various Diſtances from him ſeveral *Satellites* moving round him, tho' none deſcending ſo low as the Orbit of *Saturn*; and that theſe becoming viſible to us when they are in their *Perigæum*, the neareſt Point to the Earth, are what we call Comets. He has in ſome of his Works pretended to foretel when a Comet will appear again, but therein is left by moſt Aſtronomers.

Of Eclipſes.

An *Eclipſe* is a Deprivation of Light of one of the Luminaries, when by its Conjunction in the Orbit of the Sun, or in the Ecliptick, his Face, by the Interpoſition of the Moon's Body is hidden from our Sight; or when by its Oppoſition in the ſame Orbit, the Moon by the Shadow of the intervening Earth is obſcur'd. So that in a Lunar Eclipſe ſhe really loſes her Light, and is obſcur'd by wanting the Illumination of the Sun, either Totally or Partially. But in an Eclipſe of the Sun he loſes not his Light, but only we are depriv'd of it in Part by the Interpoſition of the Moon's Body between us and the Sun, and therefore it ought rather to be call'd an Eclipſe of the Earth; for 'tis the Earth that's depriv'd of its Light, and not the Sun. A Central Eclipſe of the Moon is, when not only the entire Body of the Moon is cover'd by the Shadow (which is a Total One, as when 'tis cover'd by it in Part 'tis call'd a Partial One) but alſo the Center of the Moon paſſes thro' the Center of that Circle, which is made by a Plane cutting the Cone of the Earth's Shadow at Right Angles with the Axis, or with the Line that joins the Centers of the Sun and the Earth. Becauſe the Earth always moves in the Ecliptick, the Moon can never be Eclips'd but when the *Plenilunium* happens in or near her Nodes (that is, in the Interſection of the Plane of the Orbit with that of the Ecliptick.) The Shadow of the Earth obſcuring the Moon, tho' projected into a Cone of a vaſt Length, yet reaches not ſo far as the Planet *Mars*, for he is never Eclips'd by it tho' he be in the Plane of the Ecliptick, and at Oppoſition to the Sun. If the Moon be ſo near the *Node*, that the Aggregate of the Apparent Semi-diameters of the Moon, and of the Earth's Shadow, be greater than the Moon's Latitude, ſhe will be Eclips'd, otherwiſe not: And becauſe the Sum of the Semi-Diameter of the Moon, and of the Earth's Shadow, is always greater than that of the Semi-Diameters of the Sun and Moon; for the former is never leſs than 53', and the latter never greater than 35'. 'Tis plain that Lunar Eclipſes may happen in a Greater Latitude of the Moon, or when ſhe is farther from the Node than the Solar Ones; and in this Reſpect of one and the ſame Place upon Earth will more often become Viſible there, tho' in regard to the View of the whole Earth the Solar Eclipſes will happen more frequently. Aſtronomers Calculate the Motions of the Planets ſo exactly, That they foretel Eclipſes with the exact Time of their Beginning and End, their Total Duration, their Bigneſs, and generally all the Circumſtances, with reſpect to the Surface of the Earth from whence they may be perceiv'd. For this Method of Calculating ſuch Eclipſes, See Dr. *Gregory's Aſtronomy.* Mr. *Flamſtead's Doctrine of the Sphere,* Sir *Jonas More's Mathematicks.*

We have treated of Time in Natural Philoſophy, which being meaſur'd by the Courſe of the Stars, has alſo ſome Relation to *Aſtronomy*; ſo we ſhall add here the Rapid Motion of the Earth about the Sun, determining that Part of Time which we call *Day*, divided into Natural and Civil. The former is determin'd by the Earth or Sun's Motion in 24 Hours; the latter is the Time between the Sun's Riſing and Setting, including alſo the more Luminous Part of the *Crepuſculum.* To this Day Night is oppos'd, which is the Time that the Sun is under the Horizon. Month, properly ſpeaking, is the Time in which the Moon runs through the Zodiack. The Lunar Month is either Periodical, the Time of the Moon's Motion from any one Point of the Zodiack to the ſame again, and is ſomething leſs than 27 Days 8 Hours. Or elſe Synodical; the Time between New Moon and New Moon ſomething more than Twenty-nine Days and half. There's alſo a Solar Month, the Time the Sun takes in running thro' one of the Signs of the Zodiack, almoſt 30 Days and half. The Common Month is one of thoſe of which the Solar Year is Compos'd. The Year is the Time the Sun takes to go through the Twelve Signs of the Zodiack. This is the Tropical or Natural Year of 365 Days 5 Hours and 12 Minutes. The Syderical Year is that Time in which the Sun departing from any Fix'd Star, comes to it again; and this is as Sir *Iſaac Newton* ſays, in 365 Days, 6 Hours, 9' 14". The Tropical he makes 365 Days 5 Hours, 48', 57". The Civil Year, which is commonly us'd by all Nations, is very various, both as to its Beginning and alſo as to its Length, according as they follow the Courſe of the Sun, Moon, or both. The Year we uſe in *England* (for we cannot enter into the Regulation of others, Ancients and Moderns) is the *Julian Year*, ſo call'd from *Julius Cæſar*, who diſcovering there were 10 Days more than in *Numa Pompilius*'s Year, made the Year 365 Days 6 Hours, and reſerving the 6 Hours for every Fourth Year, made another Day, which was added before the 6th of *Kal.* of *March*, ſo that in this 4th Year, the 6th of the *Kal.* of *March* was accounted twice *Bis-ſexto-calendas*, whence came the Word *Biſſextile* or *Leap-Year*, as we call it, which was 366 Days. But becauſe there was ſtill found an Error in this Calculation, and that the Equinoxes did plainly, tho' inſenſibly recede from the Points where *Cæſar* had fix'd 'em; as alſo that the Year was diſcover'd to want 11 Minutes of 365 and 6 Hours, which 11 Minutes will in 131 Years make the Equinoxes go back a Day. Pope *Gregory* XIII. pretending to reform this Error, order'd 10 Days to be taken from the Year, to bring the Equinoxes that Year (1582) to *March* 21. and *Sept.* 22, 23. This is the *Gregorian Year* or *New Style*, us'd by moſt of the Popiſh Nations, but not by all, as an Eminent Mathematician aſſerts in a Late Piece of his. The Great Year, or the *Annus Magnus*, is about 25 or 26000 Years, in which Time the Fix'd Stars will appear to come to the ſame Point again exactly after one entire Revolution. This *Annus Magnus* may do well in *China*, where the Hiſtories come up to Thirties and Forties of Thouſands of Years; but 'tis very probable 'twill be of no Service to any other People, and if the *Chineſe* follow'd it, they wou'd never have Occaſion for a *New-Years-Day.*

Of the Earth.

We ſhall here only Treat of it as a Planet, and have touch'd upon't laſt becauſe we wou'd ſay a little the more of it. Mr. *Keil* makes the Surface of it 170981012 *Italian* Miles, which are little leſs than *Engliſh* Miles; the Circumference of the Earth is $24649\frac{46}{50}$ *Engliſh* Miles; the Mean Semi-Diameter of the Earth 3933 Miles or 5000 Feet; its Radius 200000000 Feet; the Solid Content of the Globe of the whole Earth is 3000000000000000000000000 Cubick Feet. The Diſtance of the Earth from the Sun has been mention'd already. On the Suppoſition that the Sun's Parallax be 32 Seconds, the Earth's mean Diſtance from the Sun will be 54000000 Miles, this is according to Mr. *Whiſton.* Sir *Iſaac Newton*, and Mr. *Flamſtead* make it much Greater. The Earth's Figure is moſt probably that of an Oval Spheroid, ſwelling out towards the Equatorial Parts, where 'tis 17 Miles higher than at the

Poles, it being flatted there ſo, that the Diameter of it at the Equator is longer than the Axis by about 34 Miles, as Sir *Iſaac Newton* has calculated it. If the Earth was ever in a Fluid State, its Revolution round its Axis muſt neceſſarily make it put on ſuch a Figure, becauſe near the Equatorial Parts the greateſt Centrifugal Force muſt needs be, and conſequently the Fluid wou'd there riſe and ſwell moſt. It ſeems neceſſary that it ſhould be ſo now to keep the Sea from overflowing the Earth in the Equinoctial Regions. Experiments alſo made on Pendulums, which require different Lengths to ſwing Seconds here, and at the Equator prove the ſame thing aſſerted alſo by *Caſſini* and Dr. *Gregory.* The Earth's mean Revolution, in reſpect of the Fix'd Stars, is 23 Hours 56 Minutes, according to Capt. *Halley*, the Annual Motion of the Earth is ſo exceeding ſwift as for to exceed that of a Bullet ſhot out of a Cannon, and to be after the rate of 3 *Engliſh* Miles and an half in a Second, which is 210 Miles in a Minute. Oh the wondrous Infatuation of Mankind to fly to Chance or any other Cauſe than God to be the Author of ſuch a Motion or Body of near 25000 Miles in Circumference, to whirl about 210 Miles in a Minute. Who but the Great Creator, of whom we conceive by our Religion ſo Infinite an Idea, cou'd give ſuch a Motion. That the Earth is nearer to the Sun in *December* than it is in *June*, and conſequently that its Perihelion is in the Month of *December* is moſt plain, becauſe the Sun's Apparent Diameter is then greater than at *Midſummer*; hence it is there are about 8 Days more in the Summer Half-Year from *March* to *September*, than in the Winter from *September* to *March*. Mr. *Whiſton* proves very eaſily, That the Annual Motion belongs to the Earth about the Sun, and not to the Sun about the Earth. For from the Moon's Orbit, and the Planets Orbits and Periodical Times, 'tis certain that the Law of Gravitation towards the Earth and towards the Sun is the ſame, and by Conſequence all the Periodical Times of Bodies revolving about them are in the ſame Proportion to one another, compar'd with their ſeveral Diſtances from each of 'em; on which Hypotheſis this Proportion ſuits the Phænomena of Nature, the ſame muſt be the true one, and to be fully acquieſc'd in. Now 'tis known that on the Hypotheſis of the Earth's Annual Motion, her Periodical Time exactly ſuits, and 'tis ſo between that of *Mars* and *Venus*, on the Proportion obſerv'd thro' the whole Syſtem, but in the other Hypotheſis 'tis enormouſly different; for when the Moon undoubtedly, and on this Hypotheſis the Sun alſo revolves about our Earth; and when the Diſtance of the Sun is to that of the Moon as about 10000 to 46, and the Moon's Periodical Time leſs than 28 Days, the Periodical Time of the Sun wou'd be 242 Years, which all Experience atteſts to be one. To theſe ſome further Obſervations muſt be added: If the Earth's Motion of 210 Miles in a Minute is ſo vaſt, what wou'd the Motion be of the Stars on a Suppoſition that they mov'd and not the Earth: For ſince they are almoſt at an Infinite Diſtance from the Earth, and run thro' ſuch a vaſt Orbit, they muſt in a Minute's Time be whirl'd 100000 Miles, which reaches ſo near Infinity that it borders on Impoſſibility. If this Motion be aſcrib'd to the Earth, it continues ſtill in its Place: Nor is there any thing to be apprehended from its Swiftneſs becauſe 'tis carry'd round its own Axis. This Argument appears yet more ſtrong, if we compare the Vaſtneſs of the Cœleſtial Bodies with that of the Earth; for ſince the Sun is at leaſt 200 times bigger than the Earth, and the Fix'd Stars above 1000 times bigger, it ſeems much more probable that the Earth ſhou'd turn round its Axis with a Natural Motion, than that ſuch huge Bodies ſhou'd be mov'd from Place to Place with ſuch Incredible Swiftneſs: All the Cœleſtial Appearances, the Riſing and Setting of the Stars, and the Lengthning of the Days may be eaſily explain'd, if we allow the Earth to move, which cannot be done any other way ſo probably and reaſonably, many more Reaſons may be given for the Motion of the Earth; but it being a Syſtem generally receiv'd, we ſhall ſay no more to it.

Of the Heavenly Bodies.

Each Planet ſwims, as one may ſay, in a Tourbillon or Vortex of a Fluid Matter, like a ſort of Air which environs it, according to *Des Cartes*, which Opinion was greedily ſwallow'd by his Diſciples. This Vortex is ſuppos'd to have no void Interſtices or Vacuities between the Particles, and moving thus round, occaſions any Bodies that ſwim in its Subſtance, to move round as that do's, and that ſwifter or ſlower as they are farther off or nearer to the Center. By ſuch Vortices he endeavour'd to ſolve the Motion of the Heavenly Bodies round the Sun in the Center of the Vortex. But Sir *Iſaac Newton*, who ſeems deſtin'd to Triumph over all the Errors of the Ancient and Modern Philoſophers, has demonſtrated that the Planets cannot be carry'd round the Center by the Motion of any Corporeal Vortex, becauſe if they were, the Vortices themſelves muſt be carry'd round after the ſame manner as Aſtronomers have diſcover'd that the Planets perform their Revolutions. Dr. *Gregory* has at large confuted theſe pretended Vortices. Mr. *Keil* has done the ſame, and *Des Cartes*'s Authority will weigh nothing againſt Three Philoſophers, who were ſuch ſevere Followers of Reaſon and Obſervation.

For Tides we ſhall refer the Reader to what is ſaid in Natural Philoſophy by Captain *Halley* from Sir *Iſaac Newton*, which this *Admirable Mathematician* illuſtrates by Examples, and that for which an Ancient Philoſopher is ſaid to have been ſo puzzled about that he flung himſelf into the Sea, is brought very near Demonſtration by an *Engliſh* Philoſopher, who has ſearcht farther into the Wonders of Nature than any, if not all, of the Ancients ſo much boaſted.

Of Meteors,

Which, according to the *Carteſians*, are certain various Impreſſions made on the Elements, exhibiting them in different Forms. They are call'd Meteors from their Elevation, becauſe for the moſt part they appear to be high in the Air, and are either Fiery, Watry, or Airy. Fiery Meteors are ſuch as conſiſt of a Fat, Sulphurous, Kindled Smoak, of which there are ſeveral Kinds, as *Ignis Fatuus*, *Trabs*, *Ignis Pyramidalis*, *Draco Volans*, *Capra Saltans*, Thunder and Lightning. Airy Meteors are ſuch as conſiſt of Flatuous and Spirituous Exhalations, as Winds, *&c.* Watry Meteors conſiſt of Vapours or Watry Particles, by the Action of Heat ſeparated from each other, and variouſly modify'd, as Rain, Dew, *&c.*

Of

Of Wind.

Wind is defin'd to be the Stream or Current of the Air; and where ſuch Current is fix'd and perpetual in its Courſe, 'tis neceſſary that it proceed from a permanent and unintermitting Cauſe, wherefore ſome have been inclin'd to propoſe the Diurnal Rotation of the Earth upon its Axis; by which as the Globe turns Eaſtward, the loſe and fluid Particles of the Air being ſo very light as they be, are left behind; ſo that in reſpect of the Earth's Surface, they move Weſtwards, and become a conſtant Eaſterly Wind. This Opinion ſeems doubtful, for that theſe Winds are found only near the Equinoctial, in thoſe Parallels of Latitude where the Diurnal Motion is ſwifteſt; and the conſtant Calms in the Atlantick Sea near the Equator, *&c.* declare the inſufficiency of ſuch an Hypotheſis; inſtead of this Cauſe, another is ſubſtituted, as the Action of the Sun Beams on the Air and Water, as he paſſes every day over the Oceans, conſider'd together, with the Nature of the Soil, and Situation of the adjoyning Continents, which is back'd by many and weighty Arguments, too long to be inſerted here. And as to our Dew, Miſts, Milldews, Froſt, Ice, Clouds, Rain, Snow, Hail, *&c.* we ſhall not touch upon 'em here, as not being entirely Parts of the Subject in hand, as alſo Rainbows, *&c.* We have treated of thoſe Parts of Aſtronomy which Gentlemen will be moſt entertain'd with, and not enlarg'd on the Uſe of the Celeſtial Globes, nor put them on Aſtronomical Experiments, knowing we could but guide them very imperfectly in an Eſſay of this length, in which we have with all our Brevity, run out beyond the Bounds preſcrib'd.

ASTROLOGY.

THIS Noble Science, which has been in Vogue, as well as others, ſeems now to be in the hands of the Rabble: For who is there that has as much Learning as will let him know the difference between Geometrical and Aſtrological, but preſently abandons downright Mechanicks to caſt Figures and tell Fortunes? The unaccountable Curioſity of People to know Futurity, which if known would make 'em more miſerable than Mortality; the eaſineſs of acquiring the *Jargon*, and maſtering the Secret of this pretended Art; the Money got by it; the whole Crowd of Fools coming to the Market, and but a thin Company being fond of the Great Sciences has kept it up againſt common Senſe and Experience; and we ſhould have omitted it, had we not found it in the firſt Undertaking of this Kind.

Aſtrology is an Art which pretends to foretel future Things from the Motion of the heavenly Bodies, and their Aſpects to one another, as alſo from ſome imaginary Qualities, *Which*, ſays Dr. *Harris, the fooliſh Admirers of this Cheat will have to be in the Stars, as the Cauſes of great ſublunary Effects, tho' they have no tolerable grounds to prove there are any ſuch Things.* And where-ever a Philoſopher of this Rank ſets up for Mercenary Prediction, all the World may be ſure he's an Impoſtor, and ſo far from being able to gueſs well, which is a great help in the Trade of Fortune-telling, that if thoſe who apply to him are not greater Fools, they'll ſoon find all the Secret lies in a Nack of making them betray themſelves in ſome things got by Cuſtom and Impudence, and a few groundleſs Schemes of the heavenly Bodies: However, if any one has a mind to be as much a Conjurer as *Saffold, Gadbury,* &c. and perhaps *Lilly,* he need only get a little Aſtronomy, and ſome of the following Precepts among others.

We have already nam'd the Planets and Signs of the Zodiack, ſo there's no need of repeating them: But ſay the Aſtrologers

Aries ♈, Leo ♌, Sagittary ♐, are fiery, hot and dry, and therefore call'd the fiery Triplicity.

Taurus ♉, Virgo ♍, Capricorn ♑, are cold and dry, and call'd the earthly Triplicity.

Gemini ♊, Libra ♎, Aquarius ♒, are airy, hot and moiſt, and term'd the airy Triplicity.

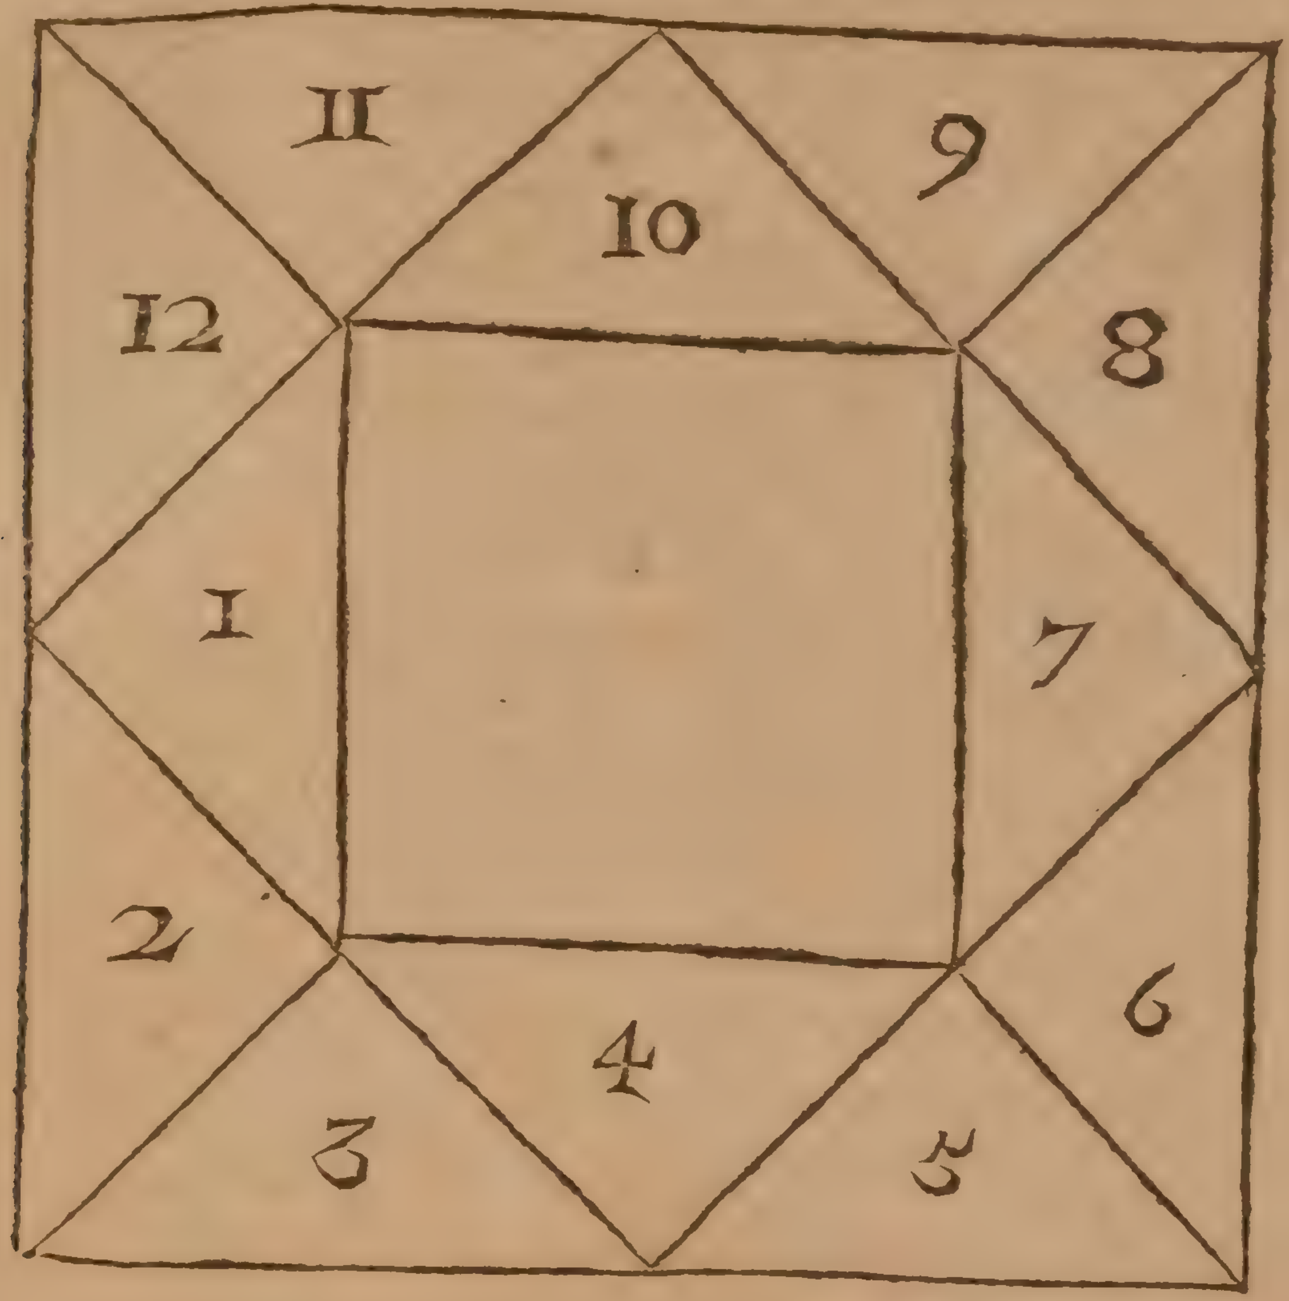
Cancer ♋, Scorpio ♏, Piſces ♓, are cold, moiſt and watry, and therefore nam'd the watry Triplicity. Signs are alſo Moveable, Fix'd, and Common.

The moveable Signs are ♈, ♋, ♎, ♑. The Fix'd, ♉, ♌, ♏, ♒. The Common, ♊, ♍, ♐, ♓. When the Sun enters the moveable Signs, the Weather changes. 'Tis fix'd when he's in the Fix'd, and various when in the Common. All the Stars and Planets have ſeveral Aſpects, with reſpect to one another. In Aſtronomy 5 only are reckon'd; 1. Sextile, when two Stars or Planets are 60 Degrees from one another; 2. Quartile, when 90 Degrees; 3. Trine, when 120 Degrees; 4. Oppoſition, when they are 180 Degrees; 5. Conjunction, when they are both in the ſame Degree. To which are added, for the uſe of Aſtrologers, Semi-Sextile, when Planets are diſtant 30 Degrees; Decile, 36 Degrees; Octile, 45 Degrees; Quintile, 72 Degrees; Terdecile, 108 Degrees; Seſquartile, 135 Degrees; Biquintile, 144 Degrees, and Quincieux, 150 Degrees. The laſt Aſpects were added by *Kepler.*

The whole Sphere of Heaven is divided by Aſtrologers into four equal Parts, or Quadrants, by the Meridian and Horizon. Theſe Quadrants are ſubdivided into three Parts, call'd Houſes. The firſt Quadrant extends, from the Angle of the Eaſt to Mid-Heaven, and contains the 12th, 11th, and 10th Houſes; 'tis call'd the *Oriental, Vernal, Aſcending, Maſculine, Sanguine, Infant Quarter.* The ſecond Quadrant, from the Cuſp of the Mid-Heaven, to the Cuſp of the 7th Houſe, contains the 9th, 8th, and 7th Houſes, and is call'd the *Meridian, Eſtival, Feminine, Youthful, Cholerick Quarter.* The third Quadrant, from the Cuſp of the 7th Houſe, to the Cuſp of the 4th Houſe, contains the 6th, 5th, and 4th Houſes, and is call'd the *Occidental, Autumnal, Maſculine, Melancholick, Manhood, Cold* and *Dry.* The fourth Quadrant, from the Cuſp of the 4th Houſe, or *Imum Cœli*, to the Cuſp of the 1ſt Houſe, contains the 3d, 2d, and 1ſt Houſes, and is call'd *Northern, Feminine, Old Age,* and *Phlegmatick.* The 1ſt, 7th, 10th, 4th Houſes are Powerful, the 11th, 5th, 2d, 8th next in Power, the 9th, 3d, 12th, 6th Weak. The 1ſt Houſe is preferable to the 10th, and the 10th to the 7th.

How to Erect a Figure.

Draw the following Figure; the 12 empty places are the 12 Houſes; the vacant place in the middle for the Earth, ſurrounded with the Heavens, in which write the *Year, Month, Day,* and *Hour,* when the Figure was made. Figure 1 is the Cuſp of the firſt Houſe, 2 the Cuſp of the ſecond, &c.



Your Figure drawn, ſeek the place in the **Ephemeris*; having found it, enter the Table of Houſes, and in the Column of the 10th Houſe find the Sign and Degree the Sun is in; if you don't find the juſt place of the Sun, take the neareſt to it; if the odd Minute be above 30, take the next whole Degree; if under 30, take the even Degree, and right againſt it, in the Column towards the left-hand, entitul'd, *Time from Noon*, you have the Time in Hours and Minutes of the Sun's Right Aſcenſion to be added to the Time of the Hour and Minute you make your Figure for. The Hours and Minutes thus added (if under 24 Hours) ſeek out in the Column of *Time from Noon*; but if they exceed 24 Hours, then caſt away 24 Hours, and ſeek out the Remainder in that Column right againſt it, in the ſame Line you have the *Signs*, *Degrees*, and *Minutes*, to be plac'd on the 10th, 11th, 12th, 1ſt, 2d, and 3d Houſes, ſo you have 6 of the Houſes, the other 6 are eaſily found by placing the ſame Degree and Minute of the oppoſite Sign on the oppoſite Houſe. If you cannot tell what Signs are oppoſite to each other, look at the beginning of the Tract, and you may ſee that *Aries* is oppoſite to *Libra*, &c. Take Example by that Figure at the beginning of the Ephemeris, when *Sol* enters *Aries*. Next learn to place the Planets right in the Figure, as you may ſee in the ſame Figure. Thus *Saturn* being more Degrees than the Cuſp of the 4th, is plac'd in the 4th; *Jupiter* being in fewer Degrees than the Cuſp of the Aſcendant, is plac'd above the Aſcendant. The like Rule obſerve in all the reſt. The next Thing we ſhould treat of, is, *How to reduce the Ephemeris and Sun's Declination*, and *Aſpect, to any Meridian*; but whoever has the Curioſity to go ſo far, muſt have recourſe to Authors who are greater Conjurers, and have more Paper to ſpare. For the Direction of ſuch as read Schemes, it muſt be noted, That Aſtronomers begin their Day at Noon, ſo that One a Clock in the Afternoon is their firſt Hour, Two the ſecond, &c. Six a Clock the next Morning the eighteenth, Eleven a Clock the twenty-third. We muſt now explain ſome Aſtrological Terms.

* *Books containing the daily Motion of the Planets.*

Application is when two Planets draw towards each other by *Body* or *Aſpects*.

By *Body* is Conjunction, by *Aſpect* is meant Beholding each other from ſeveral Signs.

Separation is when two Planets are departed 6 Minutes diſtance or farther.

Prohibition is when two Planets, ſignifying the effecting of any thing demanded, are apply'd by Conjunction or Aſpect, and before they can come to a true Aſpect, another Planet interpoſes his Body, by which the Matter propos'd is hinder'd.

Refranation is, when applying a Planet to another by Conjunction or Aſpect, before he comes to the other, he grows Retrograde, and refrains coming to a former Conjunction; if ſo, nothing ſignify'd by the former Sign, will, if the Aſtrologers can hinder it, be effected.

Tranſlation of Light and Nature, is when a Planet ſeparates from one more weighty, and applies to another more heavy, either by *Aſpect* or *Conjunction*.

Reception is when two Planets are in each others Dignities. Now, pray Reader, mind the *Jargon*: the uſe of it is much, for when the effecting the Matter is deny'd by the Aſpects, or when the Significators have no Aſpect to each other, &c. yet if mutual Reception happen between the Significators, the thing is brought to paſs without any great Trouble, to the Content of both Parties. Oh the ſweet Effects of the Stars!

Fruſtration is when a lighter Planet would come to Conjunction with another more weighty; and before they come to Conjunction, the more weighty Planet is joyn'd to another, and ſo the Conjunction of the firſt is Fruſtrate. The Conſequence of this, in a Queſtion, would be, If *Damon* and *Strephon* quarrel about *Cloe*, *Coridon* carries her away.

Perigrination is when a Planet has no eſſential Dignity in the Sign in which he is. 'Tis very material, ſays the Aſtrologer, with a grave Face, to know the Perigrine Planets, eſpecially in queſtions of Theft, as on the loſs of *Spoon* or *Bodkin*; for if you'll believe him, the Significator of the Thief is known by the Perigrine Planet, poſted in an Angle, or ſecond Houſe.

Cumbuſtion is when a Planet is not 8 Degrees, 30 Minutes diſtance from the Sun; and mighty is the Power of a Planet *Combuſt*, it ſhews the Quereſt is in great fear of *Loſing a Sweet-heart*, or over power'd by ſome great Man, as a Tenant by his Landlord. In change of Air it ſhews nothing if it does not ſhew high Winds and Storms.

Under the Sun-Beams, a Planet is ſaid to be ſo 'till 17 Degrees diſtant from the Sun.

Cazami is when a Planet is within 17 Degrees diſtance from the Sun.

Void of Courſe is when a Planet is ſeparated from another, and does not, while he is in that Sign, apply to any other. Aſtrologers keep a ſharp Eye on the Moon on this account; for if ſhe be *Void of Courſe*, ſays one of 'em, *You ſeldom ſee a Buſineſs go handſomly forward.* If a Planet is not within 12 Degrees of ſome Aſpect, he or ſhe is in thoſe whimſical Circumſtances.

Beſieging is when a Planet is between the Bodies of two Malevolents. This foretels ſuch things as, *Menin*, *Liſle*, Writs, Bailiffs, &c. for the Planets are ſo obliging, that they will anſwer for a *Pin-Cuſhion* as much as for an *Empire*.

Almuten is an Imperial Planet that bears chief Rule of any Sign in any Figure. He's a meer *Attila*.

Almuten of a Figure is that Planet which has moſt Dignities, or is moſt Powerful in the Scheme of Heaven. Thus it may be ſaid, that *Lewis* XIV. by ſeveral pretty ways of his, was 1684. the *Almuten* of Europe.

Haiz is when a Maſculine and Diurnal Planet is in the Day-time above the Earth, or a Feminine Nocturnal Planet in the Night-time under the Earth, and in a Feminine Sign. This, ſay the Learned, betokens Content.

Oriental is when a Planet riſes before the Sun.

Occidental when a Planet ſets after the Sun.

Direction is when a Planet moves forward in the Sign, as from 13 to 14 Degrees, *&c.*

Retrogradation, when he goes backward, as out of 14 into 13, *&c.*

Stationary is when a Planet moves not as the *Sun*, *Saturn*, *Jupiter*, and *Mars*, do not 3 or 4 days before they turn Retrograde.

Longitude of a Planet or Star is their diſtance from the beginning of *Aries*, number'd according to the Succeſſion of Signs.

Latitude of a Planet or Star is their diſtance from the Ecliptick.

Declination is their diſtance from the Equator.

Now we come to the diſtinguiſhing Signs and Tokens of the Stars and Planets, which, if Men could entirely truſt to, would be of great uſe in Humane Affairs; but alas, People are Incredulous, and having been deceiv'd 2 or 3000 Years, do not care to rely abſolutely

On the Faces of the Signs.

The firſt Face of Aries is the Face of Mars; and if it ſignifies any thing, 'tis *Boldneſs*, *Fortitude*, *Preferment*; and what ſeems very odd, *Impudence*. The Military Men are in the firſt Face of Aries.

The ſecond Face is the Face of the Sun, and ſignifies many excellent Things, as Places at Court, Commiſſions in the Peace, or Militia; or in more magnificent Terms, Nobility, Advancement, Rule, and Dominion.

The third Face is the Face of *Venus*. Its ſignification is Women, their Skill in *Sowing*, *Stitching*, *Starching*, &c. Trades belonging to the Sex, ſays my Author; as alſo Opera's, Farces, Dancing, and Merriment.

The firſt Face of *Taurus* is *Mercury's*, and a notable Face it is, if my Author does not abuſe it; for 'tis *Compleat in its Nature*, and good to *Plow*, *Sow*, and *Build*, to *Meaſure*, and divide *Land* by way of Purchaſe or Inheritance, I hope, to practice Geometry, to conſult the *Lawyer* or *Aſtrologer*.

The ſecond Face is belonging to the Moon, and betokens a Favourite's Fortune, *Power*, *Nobility*, and *Honour*; but unluckily, according to my Author, it ſignifies alſo *to ſpoil Towns and diſpeople them, and bring great Neceſſity on the People.*

The third Face is the Face of *Saturn*, an ugly Face with a witneſs, prognoſticating the preſent Fate of the French *Miſery*, *Bondage*, *Slavery*, *Neceſſity*, *Want*, and *Vileneſs*; and ſuch certainly is their Old *Saturn's* Face to them.

The firſt Face of *Gemini* is *Jupiter's*, and is *Compleat in its Nature*, as I am told, and it ſignifies *Writing*, *Caſting Accompt*, *receiving and paying Money*, as alſo *delivering Petitions*, *and exerciſing ſuch Feats of Wit, by which little Money is gotten.*

The ſecond is the Face of *Mars*, ſignifying *Oppreſſion*, *Labour*, *Care*, and *Difficulty*; and ſays my Guide very gravely, *If it ſignifies any at all, 'tis knaviſh Wit.* The firſt time that I ever believ'd an Aſtrologer.

The third is the Face of the Sun; and this may very properly be call'd the Gameſter's Face, becauſe it ſignifies *Forgetfulneſs*. The Gameſter forgets he wore a Livery, Diſdain; he ſcorns his Fellow-Footman, *Jeſting*; he drols with his *Grace* and *Playing*; he rides in his Coach and Six by it.

The firſt Face of *Cancer* is the Face of *Venus*; I'm afraid of this Face, and believe it as miſchievous as the ſecond Face of *Mars*, yet I'm aſſur'd 'tis *Compleat in its Nature*; and to uſe my Author's own Words, he being much more a Conjurer, it ſignifies *Strength* and *Senſibility*, *Community*, *Subtlety*, *and Favour of the Men they deſire.*

The ſecond is the Face of *Mercury*. This is indeed a pretty Face, if I can truſt my Teacher, for it ſignifies *Mirth*, *Jeſting*, *Playing with Women*, *Riches*, *and Fruitfulneſs*, which can hardly be ſaid of any Face beſides. My Aſtrologer not being willing to ſhew me any more of his Art, I ſhall leave it, and only tell the Reader what he told me, and ſo proportionably of the reſt, by which he will be as much enlighten'd as I am. But enough of this Unreaſonable, and conſequently Ungentleman-like *Recreation.*

GEOGRAPHY.

BEFORE we enter upon that Part of Geography, which is generally underſtood to be this Science, we mean the bare Deſcription of the Earth, we muſt premiſe, that the Maſters of this Art treat always firſt of the *Sphere*, which we have done in Coſmography, as alſo of the *Figure of the Earth*; Of its *Dimenſions and Magnitude*; *Of its Motion*; Of its *Situation*, *with reſpect to the Stars*; *Of Tides*; *Of Winds*, &c. as relating more to the General Syſtem, than the Particular Deſcription of the Globe, which is underſtood by Geography. Several other Authors have introduc'd Dew, Miſts, *&c.* as Monſieur *Bion* among others; but thoſe Things, as alſo Winds, Tides, *&c.* relate to *Phyſicks*, and we cannot but think 'tis to jumble Phyſicks, Coſmography, and Geography together, to handle the latter in that manner, at leaſt for us, who are confin'd in Room, it would be almoſt Impertinent, when the Reader expects an Account of the Globe on which he Treads and Travels, to carry him into the Air and Clouds to ſhew him Meteors, *&c.* ſo we ſhall come as faſt as we can to the Principal Matter.

The Terreſtrial Globe is compos'd of Earth and Water; the Art which concerns the Earth is call'd Geography, or a Deſcription of the Earth; and that which has relation to the Water, Hydrography, or a Deſcription of Water; both are comprehended in the general Term of Geography, for that Earth and Water are united in one Globe, of which the Earth is the moſt conſiderable Part. Geography conſider'd only with reſpect to the Earth, is divided into two Parts; Chorography, or the Deſcription of a particular Country, as *Great-Britain*, *Germany*, &c. and Topography, or the Deſcription of a particular Place, as a City, Caſtle, Village, &c. 'Tis very neceſſary that Learners ſhould be acquainted with the Celeſtial Globe, for the Terreſtrial makes uſe of its Circles, Lines, *&c.* and explains them before it deſcribes the Surface of the Earth and Waters. Before we proceed farther, 'twill not be improper to obſerve the *Meaſures* made uſe of in Geography by the moſt knowing People of the Modern World. The *Foot* is the moſt famous Meaſure, and *Snellius's* now us'd by Mathematicians, which he ſays is equal to

GEOGRAPHY.

to the Ancient *Roman* Foot. The Rod is 10 Feet. The Rod and Mile ariſe from the Multiplication of Feet. A Geometrical Pace is 5 Foot; a Fathom is 6 Foot; a Cubit 1 Foot. The *German* Mile contains $14000\frac{4}{13}$ Feet, or 4000 Paces. The *Italian* Mile is 1000 Paces. The *Engliſh* have two ſorts of Miles computed, and meaſur'd; of the firſt 50 make a Degree, of the laſt 60. 'Tis a common Opinion that 5 of our *Engliſh* Feet make a Geometrical Pace; 60000 of 'em in any great Circle, on the Spherical Surface of the Earth or Sea, a Degree. 'Tis generally allow'd that 60 *Italian* Miles, 20 *French* or *Dutch*, 15 *German* Leagues, $17\frac{1}{2}$ *Spaniſh* Leagues, and $56\frac{1}{2}$ *Engliſh* Miles make a Degree. But there is a great difference in Calculations; which for our uſual Reaſons we muſt not enlarge on here. The *Turkiſh* Miles are the ſame as the *Italian*. The *Indian* Miles are 100 to a Degree. The *Daniſh* and *Swediſh* Mile is to the *Italian* as 19 to 10. *Ruſſian* as 19 to 80; which is as much as can be allow'd us to ſay on this Head.

The Longitude of a Place is an Arch of the Equator intercepted between the Meridian of that Place, and the Firſt Meridian; or more truly the difference either *Eaſt* or *Weſt*, between the Meridians of any Two Places, counted on the Equator. As to the Firſt Meridian, Authors are not agreed about it. The *French* are oblig'd by an Edict to place the Firſt Meridian in the *Iſland* of *Fez*, the moſt Weſterly of all the *Canaries*; and the *French Geographers* have impos'd this Longitude on moſt of their Brethren. The *Dutch* make it the Pick of *Teneriffe*, Two Degrees more to the *Eaſt*, which is follow'd moſt univerſally.

The Latitude of a Place is an Arch of the Meridian of that Place intercepted between its Zenith and the Equator, or between the Pole and the Horizon; wherefore 'tis called the *Pole's Height*, &c. 'Tis known on the Globe thus; turn it about till the Place whoſe Latitude you want touch the Right Side of the Meridian. Obſerve the Figure upon the Meridian which the Place given touches, and you have its Degree of Latitude; one Half of the Meridian is above the Horizon, and the other Half below, which ſhews the ſame thing in that Hemiſphere.

Climate is a Space on the Terreſtrial Globe comprehended between Two Circles Parallel to the Equator, ſo that from the Beginning of the *Climate* to that of another next to it, there is Half an Hours difference in the longeſt Summers Day. Each *Climate* is divided into Half *Climates* by a Parallel Circle, which Half *Climate* is term'd a Parallel; wherefore theſe Parallels muſt differ from one another $\frac{1}{4}$ of our Hour. The *Climates* are reckon'd from the Equator to the Poles. *Geographers* have made 24 *Climates* between the Equator, and each of the Polar Circles; becauſe there are 24 Half Hours of difference between the Length of the Day under the Equator, and the longeſt Day under the Polar Circles. The Firſt *Climate* begins at the Equator. The Second where the longeſt Day is 12 Hours and a Half, and ſo on. We cannot particularize every *Climate* but only this,

That we in *England* are in the Ninth *Climate*; in which we find *London*, *Prague*, *Cracow*, *Roan*, *Franckfort*, &c. As there are 24 *Climates* in the Northern, ſo there are in the Southern Hemiſphere.

We ſhall now ſay ſomething of the Diverſity of Shadows with regard to the Points; of which when the Sun is in the Meridian, the Inhabitants of the Earth are thus diſtinguiſh'd. The *Aſcii* are thoſe who live between the Equator and the Tropicks; who ſome Days in the Year, when the Sun is in the Meridian, have no Shadow at all. Thoſe under the Equator, the Two Days of the Equinox, have no Shadow at Noon: No more have thoſe under the Tropick of *Cancer* when the Sun is under the Firſt Degree of that Sign. The Tropick of *Capricorn* the like. At other times under the Tropick of *Cancer*, the Shadow at Noon points to the North, under that of *Capricorn* to the South; whence they are call'd *Heteroſcii*. The *Periſcii* are thoſe whoſe Shadow in 24 Hours is carry'd round all the Points of the Compaſs: 'Tis thus with the Inhabitants of the *Frigid Zone*. The *Amphiſcii* have their Shadow at Noon; ſometimes towards the North, and ſometimes towards the South.

The People of the Earth, in reſpect to their Situation, are *Periæci*, *Antiæci* and *Antipodes*. The *Periæci* are thoſe who dwell in the ſame Parallel Circle of Latitude; but in oppoſite Points of the ſame, *viz.* in oppoſite Meridians. The *Antiæci* are thoſe who live under the ſame Meridian, but in oppoſite Parallel Circles of Latitude; and they are equally diſtant from the Equator. The *Antipodes* are the People who are diametrically oppoſite to one another, and different as to Days, Nights, Seaſons, &c. We ſhall now haſten to our particular Conſiderations of the Earth, having firſt treated a little of its Subſtance and Conſtitution.

Varenius holds that the Earth conſiſts of *Water, Oil of Sulphur, Salt, Earth, and a certain Spirit call'd Acid*; which he makes the firſt Five Simple Bodies. 'Tis divided into Dry and Liquid; and ſome add the Atmoſphere. The Dry Parts are Earth, Sand, Loam, Clay, Stones, Metals, Sulphur, Salts, Nitre, Herbs, &c. The Liquid are Ocean, and the Seas, Rivers, and freſh Water Lakes, and Marſhes, Mineral Waters, &c. The Atmoſphere has been ſpoken of in the former Chapter. The Height of the Atmoſphere is not aſcertain'd; ſome make it 7, ſome 8, ſome 50, and ſome many more Miles high. The Water being one of the Diviſions of the Earth, we ſhall treat of it Firſt.

Of the Diviſion of the Earth by the Ocean.

The Terraqueous Globe is divided into Earth cover'd by Water, into Earth ſtanding out of the Water, and Water itſelf. The Surface of the Earth, ſtanding out of the Sea, is divided into theſe four Parts by the Interflux of the Water.

I. Into great Continents, or great Iſlands; of which are reckon'd Four.

1. The Old World; whoſe Parts are *Europe*, *Aſia*, *Africa*. Bounded by
On the *North*, the *Northern*, *Frozen*, and *Tartarian Sea*.
On the *Eaſt*, the *Pacifick* and *Indian Sea*.
On the *South*, the *South Sea*.
On the *Weſt*, the *Atlantick*.

2. The New World, or *America*; whoſe Parts are *Northern*, *Southern*. Bounded by
   - On the *North*, *Davis's Streights.*
   - On the *Eaſt*, the *Atlantick Sea.*
   - On the *South*, the *Magellanick Streights.*
   - On the *Weſt*, the *Pacifick Sea.*
3. The Land of the *North Pole* or *Greenland*, is every where encompaſs'd by the *Sea* and *Streights.*
4. The *South* Land, or Land of *Magellan* not yet diſcover'd.

II. The Second Diviſion is *Peninſulas* or *Cherſoneſes*, which are Parts of theſe Continents join'd to them by narrow Necks of Land. They are divided into Round, Oblong, and into ſuch as have an affinity to *Peninſulas.*

The round ones; whoſe Latitude and Longitude are almoſt equal, are,
- *Africa.*
- The *Morea.* The *Cherſoneſus* of *Greece.*
- *Cherſoneſus Taurica.*
- *Cambaja.*

The Oblong are many in Number.
- 1. *Malacca*, adjoining to *India.*
- 2. *Jutland*, joining to *Holſtein.*
- 3. *Corea*, joining to *Tartary.*
- 4. 5. *North* and *South America.*
- 6. 7. 8. *California*, *Jucatan*, the *Cherſoneſus* of *Thrace.*
- 9. 10. New *France*, *Ionia.*

Thoſe which have an Affinity to *Peninſulas.* *Italy*, *Greece*, *Spain*, *Aſia minor*, *Arabia*, *Norway* with *Sweſden*, and *Lapland*; and *Beach* a Country of *Magellan*, *New Guiney*, *Indoſtan*, *Cochinchina*, *New England*, *Monomotapa* and *Cambaia.*

III. Diviſion, is Iſlands; of which there are,

Nine great ones. *Great Britain*, *Japan*, *Iceland*, *Canada*, *Sumatra*, *Madagaſcar*, *Borneo*, *Nova Zembla*, *California.*

Thirteen midling ones. *Ireland*, *Sicily*, *Hiſpaniola*, *Cuba*, *Java Major*, *Celebes*, *Crete*, *Euconia*, *Sardinia*, *Frieſland*, *Terra Nova*, *New France*, *Mindanao* and *Ceilan.*

Nine little ones. *Gilolo*, *Amboina*, *Timor Corſica*, *Majorca*, *Cyprus*, *Negropont*, in the *Mediterranean.* *Daniſh Zealand* and *Jamaica*, which lies in the Bay of *Mexico.*

Very ſmall ones.
- 1. Thoſe of moſt Note, which lye alone, as *Rhodes*, *Malta*, *Lemnos*, St. *Helens*, St. *Thomas*, *Madera*, &c.
- 2. Thoſe which lye together in great Numbers, very near one another, as the *Canary Iſlands*, the *Caribbe*, the *Heſperides*; thoſe in the Bay of *Mexico.* The *Maldive Iſlands*; thoſe about *Madagaſcar.* The *Mollucoes* and *Iſles* of *Banda*, the *Philippine Iſlands*; thoſe of *Japan.* The *Iſles* of *Thieves*; thoſe of the *Ægean Sea*; thoſe about *Great Britain*, and the *Iſlands* of *Solomon.*

IV. The Fourth Diviſion is *Iſthmus's*, or narrow Necks of Land; which are thoſe between *Ægypt* and *Arabia.* The *Corinthian Iſthmus.* The *Iſthmus* of *Darien*, that between *Jutland* and *Holſtein*, that between *Malacca* and *India.*

'Twill not be amiſs here to inſert a Word or Two

Of Maps, and the Uſe of 'em,

They being principal Parts of *Geography*, and Guides to all who inquire into the particular Branches of it. A Map is a Deſcription of the Earth, or ſome particular Part of it projected on a plain Superficies deſcribing the Form of Countries, Rivers, Situation of Cities, Hills, Woods, &c. Their Poſition as to *North*, *South*, *Eaſt* and *Weſt*, and their diſtance from other Places. The Advantage of Maps is this: They lay the Globe of the Earth before us at once. In all Maps the Places on the Right Hand lie *Eaſt*; thoſe on the Left *Weſt*. The Top of the Map is the *North*; and the Bottom the *South.* The Terreſtrial Globe moſt naturally ſhews the Situation of Places; the Motion of the Sun; the Difference of Climates; the Inequality of Days, &c. The difference between a Map and a Globe is much the ſame with that between a Picture and a Figure, in *Baſſo Relievo.* Maps are either General or Particular: The General Map ſhews us the whole Surface of the Earth; a Particular Map is that of a Particular Country. 'Tis difficult to find out the exact Longitude of a Place on a Map, becauſe of the Curvity of the Meridians and Parallels, unleſs the Place be under the Equator or ſome Meridian. 'Tis the ſame with the Latitude, unleſs it be under one of the Parallels, or under the firſt, and 180th Meridian. Before you ſearch the Latitude and Longitude on common Maps, it muſt be obſerv'd that the Lines divided by Degrees, and ſometimes by Minutes, at the two Sides of thoſe Maps, repreſent two Meridians, or at leaſt their Diviſion into Degrees, which are thoſe of Latitude, conſiſting of 20 Leagues. Further the Lines divided thus above and below repreſent the Degrees of Longitude, which are never 20 Leagues, unleſs when they repreſent the Equator.

To find the Longitude and Latitude of a Place on a Map

When the Equator is not on a Map, if you wou'd find the Longitude and Latitude of a Town, *&c.* you muſt draw a ſtreight Line from the Place propos'd to the Number of Degrees, equal to it above and below, which are the Longitude. If the Equator is on the Chart, you muſt make uſe of it inſtead of one of thoſe Lines, according to the Place where the Town ſhall be either above or below. If you deſire to know its Latitude, carry the ſame ſtreight Line fix'd on the Town in Parallel with the Lines above or below, and it will ſhew the Latitude on the Sides. By this means 'tis eaſie to comprehend how a Town may be found on a Map when you know the Longitude and Latitude; for by putting, as I have ſaid, two Lines, one on the Longitude, the other on the Latitude, the Interſection of them will point to the Town ſought after.

To find the Diſtance between Two Places.

'Tis as difficult to find the Diſtance of Two Places given on a Map where the Meridians and Parallels are repreſented by curv'd Lines, as to know the Longitude and Latitude, unleſs they are ſituated as I have already mention'd; but on the common Maps you may find it by the help of the Scale following this Method. If the Diſtance of the Places given is longer than the Scale, open your Compaſs to the Length of it, then put one of the Points in one of the Places, and carry it forwards in a ſtraight Line, as many times as is neceſſary, till you come to the Place you wanted. If the farther Point of your Compaſs does not fall directly upon it, cloſe your Compaſs till it does, and then meaſure the laſt Opening by the Scale, to know how many Leagues it contains; which you muſt add to the Number of the Lengths of the Scale you took before in a ſtreight Line. If the Diſtance is leſs than the Scale, meaſure it by your Compaſs, carry that meaſure to the Scale, and ſee how many Leagues or Miles it makes. If there's no Scale, you muſt meaſure the Diſtance by the Degrees on the Sides of the Map, reckoning 20 Leagues to a Degree. We ſhould be very well pleas'd to enlarge on the Uſe of the Terreſtrial Globe, or the Natural Hiſtory of the Earth, as Seas, Rivers, Mountains, *&c.* on the Ancient or Antediluvian World; on the ſeveral Diviſions of it by the Four Great Monarchies; but we do not think that has relation to *Geography*, ſo much as *Hiſtory* and *Phyſicks*. And for the ſame Reaſon we ſhall ſay nothing of the *Origin of Mankind*, *and Peopling of the World*; becauſe, however uſeful ſuch things may be in Works of great Length, they cannot be of any Uſe in ſuch an Eſſay where we cou'd ſay ſo little of any of 'em, and ſhou'd keep cloſe to *Geography*.

Of the ſeveral Parts of the Earth and Water.

Tho' we have already divided the Earth by the vaſt Ocean, we muſt again ſpeak of both the Dry and Liquid World, and bring both to Particulars. The Parts of the Earth or Land are *Continents, Empires, Kingdoms, Iſlands, Peninſula's, Iſthmus's, Coaſts, Capes, Mountains, Plains*, &c. Thoſe of the Water are the *Ocean, Seas, Guls, Streights, Rivers, Lakes*, &c. *The Continent* is a great Part of the Globe; which contains ſeveral Empires, Kingdoms and States together, as *Europe*, *Aſia* and *Africa*. An *Empire* or *Kingdom* is an extent of Country, containing ſeveral Provinces ſubject to an Emperor or King. An *Iſland* is a Part of the Earth ſurrounded entirely by Water. A *Peninſula* is a Part of the Land which is almoſt but not quite ſurrounded by Water. An *Iſthmus* is that Part or Neck of Land, which joins a *Peninſula* to the Continent. *Coaſts* are the Land that borders on the Sea. *A Cape* or *Promontory* is a Part of Land which runs out into the Sea, and is alſo call'd a Head or Point, *&c.* *Mountains* are high Parts of the Earth, diſtinguiſh'd from Hills only by being higher. A *Plain* is a great Extent of Land without Mountain or Hill. The *Ocean* is the Water which ſurrounds the Earth. It goes by ſeveral Names according to the ſeveral Countries it borders on, or other Accidents which has given 'em to it. *Seas* are great *Concourſes* of Water; of which the greateſt Part fall into the *Ocean*, for they do not all, ſome being like *Lakes*, as the *Caſpian* particularly. The Term *Sea* is more general than that of *Ocean*; for the *Ocean* can any where be call'd *Sea*, and a *Sea* no where be term'd *Ocean*. A *Sea* is ſaid to be bottomleſs when there's above 200 Fathom Water. A *Gulph* is a great Part of the *Sea* running into the Land; 'tis call'd a *Bay*. A *Port* or *Harbour* is a little *Gulph*. A *Road* is leſs than a *Port*; and only a Part of a *Coaſt* where Ships can ride ſhelter'd from the Wind. A *Streight* is an Arm of the *Sea* between Two Points of Land, but far diſtant from each other, by which Two *Seas* often join: 'Tis alſo call'd *Boſphorus*, *Channel, Faro*, &c. *Rivers* are diſtinguiſh'd by the *French* into *Fleuves* or great *Rivers*; and *Rivers* properly ſo call'd by us. A *Fleuve* is a Current of Water; which keeps its Name from its Source to the *Sea*. A *River* is a Current of Water which loſes its Name in ſome other *River* before it reaches the *Sea*. A *Lake* is a Maſs of Water leſs than a *Sea*; which ſometimes falls into it by a *River* or *Streight*. *Lakes* differ from *Marſhes*, in that the latter are not always full of Water. There are in the *Sea* Shelves, which are Rocks, above Water or under Water, and Banks of Sand, on which Ships are caſt away; Whirl-Pools, in which Ships are ſometimes ſwallow'd up. All theſe Parts are generally mark'd on the *Maps* only by the firſt Letter of their Names. Theſe Things as common as they ſeem will find ſome Readers that cou'd not have rightly diſtinguiſh'd them, and in mentioning them we follow *Bion, Robbè*, and others that have gone before us.

Of the general Diviſion of the Earth.

The Earth is divided into Three Principal Parts; The Old World; The New; and the *Terra Incognita*. The Firſt, which is the Continent of *Europe*, *Aſia* and *Africa*, is the Superior Hemiſphere; Superior with reſpect to us. The Second, which is *America*, is in the Inferior Hemiſphere; and the Third comprehending the Artick and Antartick Lands, is in both Hemiſpheres. The *Iſlands* are reckon'd appertaining to ſome Continent or other. We ſhall now proceed to the Particulars of this general Diviſion. And Firſt,

Of Europe.

As to the Ancient Geography of the World in General, or *Europe* in Particular, being ſo much confin'd as we are, it will not be look'd for from us that we ſhou'd enter on Diſſertations of that kind, ſo we ſhall come immediately to what we are more nearly concern'd in, Modern *Europe*. Tho' 'tis the leaſt it is the moſt valuable Part of the World; if we conſider it as to its Temperance, Fruitfulneſs, and the Number of its Inhabitants. 'Tis ſituate almoſt in the Temperate *Zone*, which gives it a great Advantage over any other Quarter of the Globe.

It retains its old Name from *Europa*; whoſe Fable with *Jupiter* is ſo well known. The *Aſiaticks* and *Africans* call us *Europeans* by ſeveral Names, as *Francks*, *Romæi* or *Cauri*, Infidels; which Compliment we do not fail to return to them. The *Æthiopians* term us *Alfrangues*, and others *Dzinzis*, *Pagans*. For tho' we have reaſon to believe they are Pagans and Infidels, ſo ſtrong is the Deluſion of Education, they fanſie we are ſo, and think they have Reaſon on their ſide.

Europe is bounded on the *North* by the *Frozen* or *Hyperborean Ocean*; on the *Weſt* by the *Atlantick*; on the *South* by the *Mediterranean*; on the *Eaſt* by 1. The *Archipelago*; 2. The *Helleſpont*; 3. The *Propontis*; 4. The *Thracian Boſphorus*; 5. The *Euxine*; 6. The *Cimmerian Boſphorus*; 7. The *Palus Mœotis*; 8. The *Tanais*; 9. A Line drawn from the Eaſterly turnings of that River to the *Obi*; 10. A Line from the *Obi* to the Northern *Ocean*, between the *Streights* of *Weigatz*, and the Mouth of that River. *Geographers* are divided as to the Length and Breadth of *Europe*. The Length is generally reckon'd from Cape St. *Vincent*, to the Mouth of the *Obi*; which according to *Sanſon* is 55 Degrees, or 3300 *Italian* Miles. The Breadth is by ſome computed from Cape *Matopan* in the *Morea*, to the North Cape in *Norway* 2200 *Italian* Miles. *Sanſon* makes the Breadth 2280 Miles.

As to its Quality. The Air is by its Situation Mild and Temperate. The Earth abounds in all ſorts of Grain, Wine, Fruit and Cattle. There are few Mines of Silver and Gold; its Commerce more than makes amends for that want. For whom are the Bowels of *America* torn up but for the *Europeans*? For whom do the *African* Rivers roll down their Golden Sands? For whom do the *Indian* Groves bear their Fragrant Spices but for the *Europeans*? Who has more than once been Miſtreſs of the other Parts of the Old World, and is now Empreſs of the New? The *Aſſyrian* and *Perſian* Monarchies were confin'd to *Aſia*, and not to all *Aſia*, with a ſmall Part of *Africk*. But the *Macedonian* and *Roman* Monarchies extended their Dominion to the *Indies*. We ſhall ſay ſomething further of its Fertility, when we come to ſpeak of the particular Countries.

The moſt remarkable Rivers in *Europe* are, The *Danube* in *Turkey*; The *Volga* and *Don* in *Muſcovy*; The *Nieper*, and the *Viſtula* in *Poland*; The *Oder*, the *Elbe*, and the *Rhine* in *Germany*; The *Loyre* in *France*; and, The *Thames* in *Great Britain*; to which may be added, The *Tagus* in *Spain*.

We now come to the manners of the Inhabitants, which differ according to the difference of the Countries. Their Valour, as has been hinted, twice ſubjected the whole World, at leaſt as much as was worth ſubjecting. *Brietius* tells us, The *Saracens* own Four remarkable Qualities in *Europe*; 1. That 'tis very Fruitful; 2. That it breeds Warlike Inhabitants; 3. That they are very Religious; 4. That they are fit to govern the reſt of the World; which coming from the Mouth of our Enemies will be a ſufficient Character.

Europe is lamented for the Diviſions in Religion among the Inhabitants, and true it is ſince the greateſt Part profeſs the Chriſtian which was preach'd by God Himſelf: 'Tis great pity they have not hit on one Standard. But are not all the other Parts of the World not only to be lamented for their Ignorance of this true Religion, but alſo for the Diviſions among them? And who will pretend to affirm that the Religions in *Aſia*, *Africa* and *America* are not infinitely more different from each other than the ſeveral Sects of Chriſtianity, who agree in the main Point, the Worſhip of one Holy Trinity. According to the preſent Diviſions, *Popery* and *Proteſtantiſm* are the chief. We ſhall not here attempt to make a Compariſon between the one and the other as to Strength or Riches, tho' 'tis not ſo eaſie as ſome imagine to prove the Papiſts have the Advantage in both of the Proteſtants; but we'll give Popery the Precedence out of civility to her Elderſhip as ſhe calls it, tho' indeed 'tis a Modern Religion; and the Reform'd as old as Chriſtianity itſelf. The Popiſh Religion prevails in *Italy*, *France*, *Spain*, *Portugal*, thoſe Parts of *Germany* belonging to the Houſe of *Auſtria*, the Electorate of *Bavaria*, the Three Eccleſiaſtical Electorates, and the *Spaniſh Netherland*, *Poland* and Part of *Hungary*; let the Papiſts make the moſt of them there's their Strength. The Reform'd Religion is profeſs'd in *Great Britain* and *Ireland*, which are firſt nam'd as being the Defenders of the Faith; in Part of the Imperial free Cities, the Electorates of *Brandenburgh*, *Saxony*, *Hanover*, the *Palatinate*, the *United Provinces*, *Swiſſerland*, the *Vallies* of *Piedmont*, in the Kingdoms of *Denmark*, *Norway* and *Sweden*; there's the moſt of it, let any one undertake the Parallel. The *Greek* Church is continu'd but with many Corruptions in *Greece*, Part of the neighbouring Iſlands, *Muſcovy*, and ſome Deſpoties in the *Eaſt*.

The *Mahometan* Religion is only profeſs'd in *Europe*, where the *Turks* are Maſters. The *Jewiſh* is a Vagabond Religion, and hated where ſuffer'd; which are not in many Parts of *Europe*, at leaſt not by Authority.

Europe, as to Government, is divided into Empires, Kingdoms, Republicks, and Principalities. The Empires are Three; *Germany*, *Muſcovy* and *Turkey*. The Kingdoms 10; *Great Britain* and *Ireland*, *Spain*, *France*, *Portugal*, *Hungary*, *Bohemia*, *Poland*, *Sweden*, *Denmark* and *Norway*, *Pruſſia*; which laſt ought to be added, that Monarch being much more powerful than ſome of thoſe who precede by Antiquity. The Common-Wealths are the *United Provinces*, *Swiſs Cantons*, *Venice*, *Genoa*, *Lucca* and the Diminutive *Republicks* of *Raguſa* and *San Marino*. The Principalities are what the Pope has uſurp'd by the Name of St. *Peter's* Patrimony. The Dukedoms of *Savoy*, *Tuſcany*, *Modena*, *Parma*, *Mantua*, *Mirandola*, *Moldavia*, *Wallachia*, *Malta*, *Lorain*, *Courland* and *Leſſer Tartary*. The Electorates ſome add, which are Nine; *Mentz*, *Cologne*, *Triers*, *Bohemia*, *Bavaria*, *Saxony*, *Brandenburgh*, *Palatine* of the *Rhine*, *Hanover*.

The chief Languages ſpoken in *Europe*, are the *Italian*, *Spaniſh*, *French*, *Engliſh*, *High Dutch*, *Low Dutch*, *Daniſh*, *Sclavonic*, *Modern Greek*, *Tartarian*, *Albanian*, *Finnick*, *Hungarian*, *Iriſh*, *Britiſh*, *Biſcaian* and *Arabic*, in Part of *Spain*. The Names of theſe Languages will ſhew where they are ſpoken.

The Geographical Diviſion of *Europe* is into 13 principal Parts; Five which run from Weſt to Eaſt, as *Spain*, *France*, *Germany*, *Poland* and *Moſcovy*; Four to the *South*, as *Italy*, *Hungary*, *Turkey* in *Europe* and *Greece*; Four to the *North*, the *Britannick Iſles*, *Denmark*, *Norway* and *Sweden*; of all which a few Words in their order, as taken from Monſ. *Bion*, which ſeems to be Natural enough.

Spain

Is the moſt Weſtern Kingdom of *Europe*, call'd *Iberia* by the *Romans*, and, ſays my Author, *Spaina Rare* by the *Chaldees*, *à cauſe qu il n'eſt querepeuple*, becauſe 'tis thin of People. 'Tis 660 Leagues long from Cape *Finis terra* in *Galicia* to Cape *Creuz* in *Catalonia*, and 510 broad from the *Straights* Mouth to Cape *Pennas* in *Eſturia*.

'Tis bounded on the Eaſt by the *Mediterranean Sea*, on the South by the ſame Sea and the *Straights* of *Gibraltar*, on the Weſt by the Ocean, on the North by the Ocean and the *Pyrænean* Hills.

The Air is hot, the Ground generally dry, and little Corn grows there, but Wine, Fruit and Olives in Abundance. Horſes call'd Gennets are numerous here, and famous all over the World for their Swiftneſs.

The Rivers are the *Ebro*, the *Guadalquavir*, the *Guadiana*, the *Tagus*, the *Douro*, the *Minho*, and the *Arga*, which gives Name to *Aragon*.

Its Government is Monarchical. The King do's what he pleaſes if the Grandees may do what they pleaſe. The Cortez or States have little more Power than the Parliament of *Paris*. The People are Proud and Lazy, they are Sober and the moſt Superſtitious of Mortals. The Country is ſo little Inhabited that 'tis ſaid, There never was an Army of 8000 Native *Spaniards*, of *Spaniſh* Origin, in the Field together. 'Tis divided into the following Kingdoms.

The Kingdom of *New Caſtile*, of which *Madrid* is the Capital, and of the *Spaniſh* Monarchy.

The Kingdom of *Old Caſtile*, of which *Burgos* is the Capital.

The Kingdom of *Leon*, the Capital *Leon*.

The Kingdom of *Galicia*, *Compoſtella* the Capital.

The Kingdom of *Navarre*, of which *Pampelona* is Capital.

The Kingdom of *Arragon*, of which *Saragoſſa* is Capital.

The Kingdom of *Valencia*, of which *Valencia* is Capital.

The Kingdom of *Granada*, of which *Granada* is Capital.

The Kingdom of *Murcia*, of which *Murcia* is Capital.

And the following Provinces *and* Iſlands.

The Provinces of *Eſtramadura* in *Caſtile*, the Capital *Badajox*.

The Province of *Aſturias*, the Capital *Oviedo*.

The Province of *Biſcay*, the Capital *Bilbao*.

The Province of *Alava*, the Capital *Vittoria*.

The Province of *Guipuſcoa*, the Capital St. *Sebaſtian*.

The Province of *Catalonia*, the Capital *Barcelona*.

The Province of *Andalouſia*, the Capital *Seville*.

Iſles,		
Majorca,	The Capitals	*Majorca*,
Minorca,		*Citadella*,
Ivica,		*Ivica*.

Of Portugal,

Reckon'd part of *Spain* in antient Times; 'twas by the *Romans* call'd *Luſitania*: It lies on the Weſtern Part of *Hiſpania*; 'tis 330 Miles long, and 150 broad, bounded on the *North* by *Galicia*; on the *Eaſt* by the Kingdom of *Leon*, the Two *Caſtiles* and *Andalouſia*, on the *South* and *Weſt* by the *Ocean*. The Air is not ſo hot as in *Spain*; the Country mountainous and barren of every thing but Wine and Fruit; its principal Rivers are the *Tagus*, *Guadiana*, *Douro*, *Minho*, *Lima*, *Mondego* and *Cadovo*. 'Tis divided into ſix Parts.

Eſtramadura the Capital; of which is *Lisbon* the Capital of the Kingdom.

Traloſmontes,	The Capital	*Bragantia*,
Entra Douro, and *Minho*,		*Braga*,
Beira,		*Coimbra*,
Alentejo,		*Evora*,
The Kingdom of *Algrava*,		*Silves*.

Of France.

It is a difficult Matter to give a tolerable Deſcription of ſo large a Country in the Compaſs of all this Eſſay; beſides, to deſcribe it as the *French* Geographers did 20 Years ago, we muſt make its Territories much larger than they now are, and probably they will be leſſen'd before theſe Sheets have paſt the Preſs.

'Twas anciently call'd *Gaul*, and receiv'd its preſent Name from the *Franks*, a *German* Nation, who overran it much about the Time that the *Saxons* invaded *England*; 'tis 540 Miles from the *Pyrenean* to *Calais* South and North, and 600 Miles from *Point Coquet* in *Britain*, to *Seralbe* in *Lorrain*. 'Tis bounded on the North by the *Britiſh Channel* and the *Low Countries*; on the Eaſt by *Germany*, *Swiſſerland*, *Savoy* and *Piemont*, from which 'tis divided by the *Alps*; on the South by the *Mediterranean Sea*, and the *Pyrenean* Hills which divide it from *Spain*; and on the Weſt by the *Ocean*. The Air is good, the Country Fruitful, and the People eſtimable for many good Qualities, did not their Vanity and Levity over-balance all of 'em; at leaſt, in much the major Part of the People of all Qualities. Its principal Rivers are the *Loyre*, the *Seine*, the *Garonne*, and the *Rhoſne*. Its Government is Monarchical. The preſent *French* King and his Father entirely deſtroy'd the Remains of the People's Liberty. There has been no Aſſembly of the States for near 100 Years, and none is there like to be. *France* was formerly divided into

Twelve Great Governments or Provinces.

Picardy,	Capital	*Amiens*,
Normandy,		*Roan*,
Iſle of France,		*Paris*, the Capital of the Kingdom.
Champagne,		*Troyes*,
Bretagne,		*Rennes*,
Orleannois,		*Orleans*,
Burgundy,		*Dijon*,

Lyonnois,

	Capital
Lyonnis,	*Lyons,*
Guyenne,	*Bourdeaux,*
Languedoc,	*Toulouſe,*
Dauphine,	*Grenoble,*
Provence,	*Aix,*

What follows, the preſent *French* King contrary to the moſt ſacred and ſolemn Oaths, ſeiz'd and added to *France*; they belong to *Spain* and *Germany*, and *Burgundy* is diſputable.

The *Franche Comté,*	*Dole,*
Flanders,	*Tournay,*
Luxemburgh,	*Luxemburgh,*
Hainault,	*Valenciences,*
Cambreſis,	*Cambray,*

Part of *Flanders* and *Alſace*, with all *Lorrain*; which is put in ſome late Accounts of *France*, he has loſt, and being ſtill loſing, 'tis to be hop'd a leſs Map will ſerve for him in a little time than ſerv'd for his Grand-father. There Great Governments are divided into Leſs; but we cannot particularize 'em.

Germany.

The difference amongſt Authors concerning the Etymology of the Name, hinders us from meddling with it all. 'Tis 720 Miles from Eaſt to Weſt, that is, from the Source of the *Viſtula* to *Beaurains* in *Artois*, and 600 Miles from South to North, from the *Lake de Locarn*, near the *Milaneſe* to the *Baltick Sea.* It is bounded on the North by the *Ocean*, *Denmark*, and the *Baltick*; on the Eaſt by *Poland* and *Hungary*; on the South by *Italy*; and, on the Weſt by *Savoy*, the *French* County and *Lorrain* which ſeparate it from *France*. The Soil is very fruitful, eſpecially in the South, about the *Danube*, where the Air is very temperate. In the North 'tis cold, and the Soil not ſo fertile; 'tis full of Great Cities, and the whole Country very populous. Many are the Rivers with which 'tis water'd; ſome of 'em very famous, as the *Danube*, the *Rhine*, the *Meuſe*, the *Weſer*, the *Elbe*, the *Oder*, the *Drave*, the *Save*, the *Inn*, the *Mein*, &c. Its Government is various; but the whole Empire owe a Homage to the Emperor, as well the Free Cities as the Soveraign Electorates, Dutchies, Principalities, &c. The People are Brave, Honeſt, Sincere, and want nothing but Politeneſs, which they rather deſpiſe than neglect. 'Tis divided into Ten Circles, as *Franconia*, *Bavaria*, *Auſtria*, *Suabia*, the *Upper Rhine*, the *Lower Rhine*, *Weſtphalia*, *Upper Saxony*, *Lower Saxony*, *Burgundy*.

The Latter Circle is not much concern'd in the Affairs of the Empire being almoſt entirely Subject to other Princes: But why may it not be again annex'd to it, at leaſt as much of it as is not under a better Government, that of the *States General.* This is the Old Diviſion of *Germany*; a more Modern and Natural One is as follows into

19 Principal Parts.

Towards the South.	*Auſtria*, and its Dependances, as	*Tyrol,* *Carinthia,* *Stiria,* *Carniola,* *Windiſmark.*
	Bavaria,	
	Suabia.	
In the Middle.	*Franconia,*	
	Heſſe,	
	Bohemia, with its Dependances, as	*Moravia,* *Sileſia.*
	Upper Saxony.	
On the North	*Brandenburgh,*	
	Pomerania,	
	Lower Saxony,	
	Weſtphalia.	
On the Weſt.	*Mentz,*	
	Triers,	
	Cologne,	
	Lower Palatinate,	
	Alſace,	
	Swiſſerland,	
	Cleves and *Juliers,*	
	Liege.	

There are in the Empire theſe following Sovereignties.

In *Bavaria*, Electorate of *Bavaria*, Capital *Munich*.

Dutchies,	Principalities,	Imp. Cities.	Forreſt Towns.
Newburgh.	*Saltsburgh,* *Augsburgh,* *Salsbach,* *Lutchlemburgh,* 3 Counts, 1 Provoſt Bertogaden.	*Ratisbonne,*	

In *Suabia*,

Wirtemburgh.	*Hohenzolleren,* *Furſtembergh,* *Burgaw,* Biſhop of *Dilling* or *Augsburgh,* Biſhop of *Conſtance,* 16 Abbots, 5 Abbeſſes, 8 Counts, 5 Barons, Grand Prior of *Maltha,* Provoſt of *Vetenhauſen.*	*Ausburgh,* *Ulm,* *Donawert,* *Weiſſemburgh,* *Nordlingen,* *Guemund,* *Hall,* *Rotweil,* *Retling,* *Hailbron,* *Eſling,* *Lindaw,* And 22 other Towns of leſs Note.	*Rheinfeldt,* *Sekingen,* *Sanfemburgh,* *Waldſhut.*

In *Franconia*.

Dutchies,	Principalities,	Imp. Towns.

Of Swiſſerland.

The *Swiſs Cantons* and their Allies have been Soveraigns of the Country that goes by this Name about 300 Years. We have not mention'd any Part of the Hiſtory, nor the Extent, nor the Boundaries of theſe Particular States, becauſe they are in our Diviſion of *Europe* included all in *Germany*, of which they were a Part long ſince *Charlemagne's* Time; and this we were oblig'd to omit for the ſame Reaſons that made us omit other Things. The *Swiſs* are a hardy Nation, War is a Trade with 'em, they having more Mouths than Bread, and more Men than Money; *France* and *Holland* buy the Latter with almoſt as mean a Traffick, with Reſpect to the *Swiſs*, as the *African* Kings deal with our *Weſt India* Merchants. The Latter Sell their Subjects to work for others, the *Swiſs* Sell theirs to Murder for others: Proteſtant Cantons Sell Soldiers to the *French* King to fight againſt Proteſtants; Popiſh Cantons are a little more reſerv'd, and ſeldom Sell their Men to any but Papiſts; 'tis a Poor Mountainous Country, having no Trade, no Manufactures, and almoſt no Corn. They live hard, and having little, little do's. There's many a Farmer in *England* that keeps a better Table than a *Swiſs Conſul*, and many a Town in *Holland* that cou'd buy a Canton; If ſuch Men cou'd not fight they muſt ſtarve; and their Bravery therefore is rather Neceſſity than Courage. Enough of them. The *Bernois* are the moſt Rich, Generous, Populous and Valuable State. *Swiſſerland* is divided into

13 Cantons.

Zurich,	Proteſtants. Their Capitals of the ſame Name.
Bern,	
Baſil,	
Schaffouſen,	

Theſe 4 are much ſtronger than all the reſt, *Bern* itſelf being a Match for the others.

Lucern,	Popiſh, Capital	*Lucern,*
Friburgh,		*Friburgh,*
Soleurre,		*Soleurre,*
Uri,		*Altorf,*
Schwitz, which gives Name to the reſt.		*Schwitz,*
Underwald,		*Stantz,*
Zug,		*Zug,*

Glaris,	Proteſtants and Papiſts, Capitals of the ſame Name.
Appenzell,	

The Swiſs Allies.

The *Griſons,*
The 10 *Communities,*
The *Vallteline,*
The Republick and Abbot of St. *Gall,*
The Biſhopricks of *Conſtance,*
of *Baſle,*
of *Coire,*
The Towns of *Mulhauſen,* Imp.
of *Rotwell,*
of *Neufchattel,*
of *Vallingen,*
Republick of *Biel,*
of *Geneva,*

Mendriſt,
Val Madie,
Bellinzone.

Thus we may ſee if they were United by Affection as well as Leagues, they wou'd be a Formidable Power.

Of

Of Poland.

This Kingdom was the *Sarmatia* of the Ancients. 'Tis in Length from the Frontiers of *Brandenburgh*, to the Frontiers of *Little Tartary*, 710 Miles without including *Courland*; which wou'd lengthen it to near 800 Miles. In Breadth from the Mountains of *Tranſilvania*, to the Dutchy of *Courland*, 600 Miles. 'Tis border'd on the North by the *Baltick*, *Livonia* and *Muſcovy*; on the Eaſt by *Muſcovy* and *Little Tartary*; on the South by *Moldavia*, *Tranſilvania* and *Hungary*; on the Weſt by *Germany*. The Air is different as muſt neceſſarily be in ſuch an Extent. The Country, eſpecially towards the North, abounds with Corn, which ſupplies great Part of *Europe*, from *Dantzick* in ſcarce Years; *Lithuania* is reckon'd unhealthy.

The principal Rivers are, the *Viſtula*, the *Wurt*, the *Bug*, the *Niemen*, the *Dune*, the *Nieper*, the *Nieſter* and the *Bog*.

'Tis divided into theſe *Palatinates* and *Provinces*.

The *Palatinate* of *Upper Poland*. The Capital *Cracow*.

Sendomir,

In *Mazovia*, the *Palatinate* of *Warſovia*.
In *Polachia*, the *Palatinate* of *Belsk*.
In *Poleſia*, the *Palatinate* of *Breſſici*.

Theſe *Palatinates* either take their Names from their Capitals, or they are ſuch Towns as Geographers have not thought fit to mention.

Samogitia is a Dependant of *Poland*. Its Capital *Medniki*.

The Dutchy of *Courland*, which includes *Semigallia*, tho' govern'd by a Sovereign Duke, is one of its Dependancies alſo.

The Capital of {*Courland*, *Semigallia*,} is {*Golding*, *Mittau*.

Of Muſcovy.

The *Sarmatiæ* inhabited this Country as well as *Lapland*. 'Tis honour'd with the Title of *Empire*, and the *Czar*, the Sovereign of it, looks on himſelf as Succeſſor to the Eaſtern Emperors, and with as much Reaſon as the Emperor of *Germany* calls himſelf the *Roman* or Weſtern Emperor; for after a Chaſm of 350 Years, in the Empire of the Weſt, it may very well be look'd upon as diſſolv'd, and the Pope's crowning *Charlemagne*, King of the *Franks*, gave him no more Title to the Empire of the *Romans*, than the pretended Donation of *Conſtantine* to *Silveſter*, gives the Pope to *Rome*, and the Territories of the Church. This is the moſt Eaſterly and moſt extenſive Part of *Europe*, and the *Czar* is Maſter alſo of ſome Kingdoms in *Aſia*, which we will mention here that the Reader may have a glance of his Dominions at once. The Empire of *Muſcovy*, including the *Czar's Aſiatick* Territories, is 3600 Miles long, and 1200 in breadth. 'Tis bounded on the North by the *Frozen Sea*; on the Eaſt by *Great Tartary*; on the South by the River *Don*, and *Little Tartary*; on the Weſt by *Poland*, *Sweden* and *Norway*. The Weſtern Parts are populous and fruitful; the Northern frozen and barren; the Eaſtern wild and woody; the Southern pretty populous and not unfruitful. The greateſt Rivers in *Europe*, if not in the World, flow thro' this Empire. The *Volga* runs 1800 Miles at leaſt; the *Don* is a very large River, as are the *Dwina*, the *Obi* and *Jeneſci*. 'Twou'd be endleſs if we ſhou'd pretend to mention all the ſmall Rivers. The People are much refin'd under the Government of the preſent *Czar*, who has taught 'em Military Diſcipline, and built Ships of War. In the Northern Parts his Subjects are brutal to horror, and Worſhip no God; but ſome Idol ſet up by their Fears. 'Tis divided into three Kingdoms and 36 Principalities.

Having gone thro' the Eaſtern Diviſion of *Europe*, we come now to the Southern, where firſt we meet with

Italy.

'Tis ſo well known that this was the Seat of the *Roman* Empire, and the ancient Inhabitants the *Romans*; that there's no King in all this Part of *Europe*; that the *Italians* are divided into ſeveral Dukedoms and Principalities; that the Pope is Maſter of *Rome*, and ſeveral Provinces; that the *Italians* are all Papiſts except a few Poor People Subjects to the *Swiſs*, and the Duke of *Savoy*; that they are Poor and Slaves, and tho' in poſſeſſion of the fineſt Spot of Ground upon Earth, the moſt Miſerable Nation. That they have nothing to boaſt of but the Ruins of old *Rome*; their Painting, Muſick and Architecture. In ſhort, that there's no Country in Chriſtendom ſo much travell'd thro' on the Account of the Latter, nor more particularly deſcrib'd, ſo we ſhall ſay nothing of all thoſe things but proceed.

Italy is in Length from *Lauſet*, in the Principalities of *Barcelonetta* to *Otranto*, in *Calabria*, 720 Miles; its Breadth is ſo irregular that 'tis not to be determin'd. 'Tis bounded on the Weſt and South by the *Mediterranean*; on the North by the *Alps*, dividing it from the Territories of the Houſe of *Auſtria* in *Germany*, and on the Weſt by the ſame Mountains, and the River *Var* which ſeparate it from *France* and *Savoy*.

Its principal Rivers are the *Po*, the *Adige*, the *Adda*, the *Teſin*, the *Arno*, and the *Tiber*. It is full of Lakes and Rivulets; Wine and Fruit are plenty beyond belief. 'Tis divided as follows.

The Capital *Rome*.

The State of the Church.	
Dukedom of *Tuſcany*.	*Florence*.
Kingdom of *Naples*.	*Naples*, ſubject to *Spain*.
Republick of *Venice*.	*Venice*.
Biſhoprick of *Trent*.	*Trent*.
Dutchy of *Milan*.	*Milan*, ſubject to *Spain* and *Savoy*.
Dukedom of *Savoy*.	*Chambery*, ſubject to the Duke of *Savoy*.
Principality of *Piemont*.	*Turin*,
Dukedom of *Montferrat*.	*Cazall*,
Dukedom of *Mantua*.	*Mantua*.
Dukedom of *Modena*.	*Modena*.
Dukedom of *Parma*.	*Parma*.
Republick of *Genoa*.	*Genoa*.
Republick of *Lucca*.	*Lucca*.
Republick of St. *Marino*.	St. *Marino*.

To which may be added ſome ſmall Principalities depending on the Emperor, King of *Spain*, or the Pope.

In *Modena*, Dukedom of *Mirandola*, *Nogara*.
In *Mantua*, Dukedom of *Guaſtalla*, Principalities of *Caſtiglione delle Stevero*, *Sabionetta*, *Bozzolo*.
In *Parma*, Dukedom of *Maſſa*, Principalities of *Carrara*, *Fordinouvo*,
Principalities of *Monaco*, *Piombino*.
Principality of *Meſſaran* in *Piedmont*.
Marquiſates of *Maleſpine*, *Torriglia*.
Porto Hercole, *Porto Longono*, on the Coaſts of *Tuſcany*, ſubject to *Spain*.

To *Italy* is generally annex'd the Iſland of

Sicily;

Which by ſome is imagin'd to have been divided from the Continent by a natural Irruption. It is 210 Miles in Length, and 150 in Breadth. 'Tis a fruitful pleaſant Iſland, ſubject to Earthquakes and Vulcano's. Its chief Rivers are the *Salſo*, *Dataino*, *Terinſeri*, *Betice*, *Platani*, *Traina* and *Catara*. 'Tis ſubject to the King of *Spain*, and divided into three Parts.

Val Di Mazara,	Capital	*Palermo,*
Val Di Demona,		*Meſſina,*
Val Di Noto,		*Syracuſa,*

There are ſome other Iſlands which lying off the Coaſts of *Italy*, are properly mention'd after that Part of the Continent; as,

Sardinia,

Subject to *Spain*. 'Tis 168 Miles long, and 90 broad. There are few Rivers in this Iſle; thoſe that are are ſmall, and the Water bad. The moſt remarkable are the *Thyrſo* and *Coquino's*. The Air is reckon'd unhealthy; but the Soil produces great Quantities of Corn, excellent White Wine and Oyl. The Corn is tranſported to thoſe Parts of *Spain*, where 'tis ſcarce and dear. 'Tis divided into two Parts, *Capo di Cagliari*, the Capital of that Diviſion, and the whole Iſland *Cagliari*, and *Capo di Logudori*; the Capital *Saſſari*.

Corſica

Is an Iſland belonging to the *Genoeſe*, to the North of *Sardinia*, from which 'tis ſeparated by a ſmall Paſſage of an Hour over. 'Tis 114 Miles from South to North, and 51 from Eaſt to Weſt. The Air is bad, and the Iſle very thin of People. The chief Rivers are the *Liamon*, the *Tavignian* and the *Golo*; the Capital is *Baſtia* a Biſhoprick. There are three or four other Epiſcopal Sees; but the Cities are in Ruins.

Maltha

Belongs to the Knights, from it term'd Knights of *Maltha*. The Ancients call'd it *Ogygia*, and it lies ſo near *Africa*, that it ſhou'd have been plac'd in that Diviſion of the World; but we were willing to rank it among Chriſtian Countries, as Geographers have taught us. 'Tis 21 Miles long, and 7 broad. The Air tho' hot is not unhealthy. It abounds moſt in Cotton and Honey. The Capital is divided into four Parts, which has each its particular Name, but it generally goes by that of *Valetta* the Chief of 'em; which Name it owes to the Houſe of *Valette* in *France*, One of which was great Maſter of this Iſle, and defended it reſolutely againſt the *Turks*.

Beſides theſe are the Iſles of *Lipari*; the Capital of which is a Biſhoprick of the ſame Name. There are ſeveral other ſmall Iſlands, not worth mentioning in ſuch a ſhort Eſſay, on the Coaſts of *Italy*.

Hungary

Is a large Kingdom, ſo call'd from the Ancient *Huns*: It has been ſubject to the Houſe of *Auſtria* ever ſince the Year 1527, when *Louis* the laſt King was ſtifled in a Bog after he had been routed by the *Turks*. And *Ferdinand*, Brother to the Emperor *Charles* V. was elected King; but the Infidels have almoſt ever ſince been at War with the Chriſtians for this Kingdom; of which they have been poſſeſs'd of more or leſs according as their Arms prevail'd or were unſucceſsful. *Hungary* is 300 Miles long, and 240 broad. 'Tis bounded on the Weſt by the Territories of *Auſtria*; on the North by thoſe of *Bohemia*; on the Eaſt by *Tranſylvania*; on the South by *Servia* and *Boſnia*. The Air is unhealthy; but the Soil fruitful. The principal Rivers after the *Danube* are the *Drave*, and *Save*, *Thyeſſe*, the *Mariſch*, the *Raab*, the *Vag*, the *Gran*, &c. 'Tis divided into *Upper Hungary* and *Lower Hungary*, as well as into Chriſtian and Turkiſh. The Capital of *Upper Hungary* is *Presburgh*; of *Lower Hungary Buda*. The *Turks* are now poſſeſs'd of very little of *Hungary*. The Treaty of *Carlowitz*, *Anno* 1698. ſhut 'em up in very narrow Limits on this ſide. Their Capital is *Warraden*, in *Upper Hungary*. As a Part of this Kingdom are by ſome reckon'd,

Eſclavonia,	Capital	*Zagrab,*
Croatia,		*Sigeb,*
Morlachia,		*Zegna.*

The *Turks* divide theſe Provinces with the Chriſtians; ſo we ſhall be oblig'd to ſpeak of 'em again.

Turkey in *Europe*.

The Name ſhews that 'tis that Part of it which is ſubject to the *Ottoman* or *Turkiſh Empire*; and it has been ſo ever ſince the Deſtruction of the *Greek Empire*. 'Tis 870 Miles from South to North without including *Tartary* or the Iſle of *Candia*, and 750 from Eaſt to Weſt. 'Tis bounded on the North by *Poland* and *Hungary*; on the Eaſt by the *Palus Mæotis*, the *Black Sea*, the Sea of *Marmara*, and the *Archipelago*; on the South by the *Mediterranean*; and, on the Weſt by the *Gulph* of *Venice*. The Air is mild and temperate, and the Soil tho' various, generally fruitful in every thing neceſſary for Life. The principal Rivers are thoſe mention'd in *Hungary*; which Water alſo the *Turkiſh European Empire*. The Capital of which is *Conſtantinople* in *Romania*. This *Empire* may be divided into 12 principal Parts.

2. Towards the South	*Romania* and	Capital	*Conſtantinople,*
	Greece,		*Salonike,*
4. In the Middle	*Bulgaria,*	Capital	*Sopia,*
	Servia,		*Semandria*
	Boſnia,		*Boſnia Serayo,*
	Part of *Eſclavonia,* with		*Poſega,*
	Part of *Croatia* and *Dalmatia,*		*Bigion,* *Scardona.*

4. To the North, now reduc'd by the Christians	Part of *Hungary*,	Capital	*Waradin*,
	Tranſylvania,		*Hermanſtadt*,
Deſpots Tributaries only	*Wallachia*,		*Tergowisk*,
	Moldavia,		*Sockzow.*

To theſe are added *Tartary*, and the Iſles of *Candia*, &c.

Tartary the *Leſs* is 744 Miles long, and 360 broad, including the *Krimee*. The *Cham* or *Emperor* is Tributary to the *Turk*. The Capital is *Kerim*, in the *Krimee*. 'Tis ſeparated from *Muſcovy* by the *Nieper* and *Don*, and from *Poland* by the *Nieper* and vaſt Mountains. *Aſoph*, the beſt City in this Dominion is now in the Hands of the *Muſcovites*.

Greece.

Under the *Turk*.

Romania or *Thrace*,	Capital	*Conſtantinople*,
Macedonia,		*Salonike*,
Theſſaly,		*Lariſſa*,
Achaya,		*Atines*,
Albama,		*Aleſſia*,
The Iſle of *Candia*,		*Candia.*

And the Iſles of the *Archipelago*.

Under the *Venetians*.

Epirus,	Capital	*Preveza*,
Poloponneſus, or the *Morea*,		*Modon*,
Iſle of *Negropont*,		*Negropont*,

The Republick of *Venice* poſſeſs alſo the Coaſts of *Dalmatia*, the Capital *Zora*, and ſeveral Iſlands, as *Corfou*, *Ceſalonia*, *Zant*, Capitals of the ſame Name.

The Republick of *Raguſa* on the Coaſt of *Dalmatia* is under the Protection of the *Turks*. We muſt now ſay a Word or Two of the Northern Diviſion of *Europe*. The principal Kingdom of which are,

The Iſle of Great Britain, *and the Iſles ſubject to it.*

England, and *Scotland*, } united in *Great Britain.*

No body will be contented with ſo ſhort an Account of our own Country as we have been oblig'd to give of others; ſo we ſhall refer the Reader to the Geography of it at large, and only take notice that *England* the greateſt of the Iſles, ſubject to the Britiſh Empire, is in Length 386 Miles, in Breadth 279, and is divided into 40 Counties or Shires. *London* is the Capital of this Kingdom and the Britiſh Empire, and for Extent, Beauty and Riches, may very well be eſteem'd the Capital of Chriſtendom. *Wales*, a Principality, annex'd to this Kingdom, is divided into 13 Counties, *Carmarthen* is reckon'd the beſt Town; but the Biſhop's Sees will not ſuffer it to aſſume that Name. *Scotland* is as long as *England*, but not ſo broad: It contains 35 Shires, the Capital *Edinburgh*. *Ireland*, ſubject to the Crown of *Great Britain*, is 300 Miles long, and 150 broad; *Dublin* the Capital. As to the Fertility of *Great Britain*, the Happineſs of the People in their mild Air and Government, their Trade and Wealth, their Learning and Arts, their Glory in War, and their Plenty and Peace; 'tis enough to ſay, They are the Terror and Envy of their Foes, and almoſt the Jealouſie of their Friends. The Rivers of *England* have not room to flow to as great a Length as others; but where is there one ſo well known as the *Thames*, the Queen of all her Streams. Where a finer one than the *Severn*, which Waters ſome of the moſt fruitful Valleys in the World. The *Trent*, the *Avon*, &c. in South *Britain*. The *Tay*, the *Tweed*, the *Spey*, &c. in North *Britain* or *Scotland*. The *Shanon*, the *Boyne*, the *Liffy*, &c. in *Ireland*, are Rivers which viſit as many great and populous Towns, and Water as fertile and pleaſant Countries as thoſe that wander hundreds of Leagues thro' many Parts of the Continent. We cou'd dwell with Pleaſure on ſo inviting a Subject; but muſt wait for a fairer Occaſion. There are ſeveral Iſlands belonging to *Great Britain* in the *Britiſh Channel*, the *Iriſh* and *Northern Seas*; which we wou'd have ſpoken of more particularly had we been leſs confin'd.

Of Denmark.

In this Part of *Europe* the ancient *Cimbres* dwelt, a barbarous People, who more than once made themſelves terrible to the *Romans*. The Kingdom properly call'd *Denmark*, is 270 Miles from South to North, and 150 from Eaſt to Weſt. 'Tis bounded on the North and Eaſt by the Sea, which parts it from *Sweden*, and by the *Baltick*; on the South by *Germany*, and on the Weſt by the *Ocean*. Tho' the Air is extremely cold, the Soil is fruitful, and the Paſturage plentiful and good. There are no Rivers of any note in *Denmark*; and but one ſpacious Lake which is in North *Jutland*. The *Danes* as to their Manners imitate the *Swedes* and *Germans*; but are reckon'd more Proud and Crafty. They are induſtrious and good Husbands. They love the Sciences; but ſays my Author, They love Wine and good Chear much better. The Kingdom is generally divided into South *Jutland*, North *Jutland* and *Zealand*, and the Iſles. *Holſtein* is in South *Jutland*; *Rypen* is the Capital of North *Jutland*, and *Copenhagen* of *Zealand*; which is alſo the Capital of this Monarchy. The leſs Iſles are about 16 in Number, and the principal next to *Zealand* is *Funen*.

Norway

Is a Kingdom ſubject to the King of *Danmark*. 'Tis 700 Miles long where longeſt, and 150 broad where broadeſt. 'Tis bounded on the North, Weſt and South by the *Ocean*, and Eaſt by ſome Lakes and a Ridge of Mountains, which divide it from *Sweden*; to which Kingdom one of the Five Governments into which *Norway* is divided belongs.

The *Norwegians* are a poor honeſt ſimple People. The Soil is barren, and Nature ſeems to have been in no good Humour when ſhe produc'd this Nation and their Neighbour of

Lapland,

The Capital of which is not eaſily determin'd, they having no Cities, and their Chief Towns reſemble rather the Tents at ſome of our Wells than the Habitation of *Europeans*. We cannot call 'em Chriſtians, for a great Part of 'em are Pagans. *Lapland* is partly ſubject to the *Danes*, partly to the *Swedes*, and partly to the *Muſcovites*. *Wardhius*, one of the 5 Governments of *Norway*, includes the *Daniſh Lapland*.

Berghen in the Government of *Bergenhus*, is the Capital of *Norway*; *Drontheim* was formerly.

Sweden

Is call'd *Scandinavia* by *Pliny* and *Solinus*. This Kingdom and *Denmark* are generally call'd the Two Northern Crowns. The Dominions of the King of *Sweden* are reckon'd 840 Miles long, and 480 broad, but therein Geographers are not agreed; and this Extent is very unequal. 'Tis bounded on the North by the *Daniſh* and *Muſcovite Lapland*, on the Eaſt by *Muſcovy*, on the South by *Muſcovy*, *Poland* and the *Baltick*, on the Weſt by the Sea which ſeparates it from *Denmark* and Mountains which divide it from *Norway*. The Air is very Cold but Pure and Healthy; and we are told that 'tis not uncommon for the Inhabitants to live 110 and 120 Years; tho' Ice is to be met with from *October* to *April*, yet the Soil produces good Quantities of Corn. It abounds with Lakes and Rivers, whoſe Names are not worth remembring any more than the Country. The *Swedes* are counted leaſt barbarous of all the Nations of the North: They are Strong and Hardy, but love Wine and Feaſting inordinately; they are great Lovers of Arts and Sciences, and good Proficients in them. My Author tells me they are Lazy, or their Country wou'd not be over-run with Foreſts as it is. His other Reaſons we'll omit, and rather take him at his Word. 'Tis divided into the following Provinces.

In *Sweden*,

Upland, the Capital of which is Capital of the *Swediſh* Monarchy, *Stockholm*.

Sudermania,	Capital	*Nikoping*,
Weſtmania,		*Waſteras*,
Nericia,		*Oerebro*,
Geſtricia,		*Gevalia*,
Dalecarlie,		*Jera*,
Helſingia,		*Dilsbo*,
Medelpadia,		*Judal*,
Angermania,		*Nortmaling*,
Jemptia,		*Reſſund*,
Bothnia,		*Thorn*.

In *Gothland*,

Haland,	Capital	*Helmſtad*,
Smaland,		*Calmar*,
Bleking,		*Chriſtianſtadt*,
Schonen,		*Lunden*,
Weſter-Gothia,		*Gottenburgh*,
Dalia,		*Daleburgh*,
Wermeland.		*Carolſtadt*,
Oſtro-Gothia,		*Nortkoping*.

Lapland,	Capital	
Finland,		*Cajaneburgh*,
Livonia,		*Riga*,
Pomerania,		*Stetin*,
Bremen,		*Bremen*.

Lordſhip of *Wiſmar*. The Iſles, as *Rugen*, &c.

Thus we have gone over *Europe*, according to the Diviſion laid down by us in the foregoing Pages; and ſhall run over the other Parts of the World, but with all poſſible Brevity; and inſtead of Provinces, divide each Part only into Empires and Kingdoms.

Of ASIA.

NOT to enter into the Ancient or Modern Hiſtories of it, we ſhall paſs immediately to the preſent Geography. 'Tis, according to the Lateſt Accounts of it 6450 Miles from Eaſt to Weſt, and 4200 from South to North. It takes up a great Part of the Torrid Zone, all the Northern Temperate Zone, and advances 5 Degrees in the Frozen. The Jeſuits, who made their Obſervations on its Latitude, affirm 'tis not ſo long by 1200 Miles. The *Faiſeurs des Cartes*, as the *French man* is pleas'd to call the Makers of the Maps by way of Contempt, being ſo far miſtaken according to theſe Fathers; we have neither Room nor Inclination to engage in ſuch Diſputes, and leave 'em to the Reader's Diſcretion. 'Tis bounded on the North by the Northern and *Scythian* Ocean, on the Eaſt by the Sea of the *Kaimachites*, and that of *China*, on the South by the *Indian* and *Arabian* Seas, on the Weſt by the *Red Sea*, the *Archipelago*, the *Black Sea*, the Sea of *Marmara*, of *Zabache*, Part of the River *Don*, and the Eaſtern Bounds of *Europe*. 'Tis impoſſible to give any tolerable Account of the Quality of ſuch a Vaſt Extent of the Globe in ſo ſmall a Compaſs. It varies according to the Climates, and the Manners of the Inhabitants are no leſs different: They are Soft and Effeminate, and have very little Reſemblance to the Ancient *Aſiaticks*, who, under the *Aſſyrians* and *Perſians*, were Founders of the Two Firſt Great Monarchies. The Impoſtor *Mahomet* ſettled his Extravagant Religion here, and 'tis under ſeveral Sects ſpread over all *Aſia*; where are alſo to be met with ſome *Chriſtians*, *Jews*, &c. and in the moſt Barbarous Part of it *Pagans* and *Idolaters*. The Chief Rivers are the *Tigris*, *Euphrates*, *Ganges*, and *Indus*. We ſhall follow *Robbe's* Diviſion of

Aſia into 6 Principal Parts.

Turkey in *Aſia*,
Perſia,
India,
China,
Great Tartary, and
The *Iſles*.

We can but juſt mention them.

Turkey in *Aſia*

Is 975 Miles from South to North, and above 1350 Miles from Eaſt to Weſt. 'Tis bounded on the North by the *Black Sea* and *Georgia*, on the Eaſt by *Perſia* and the Gulph of *Ormus*, on the South by *Arabia*, on the Weſt by the *Red Sea*, the *Mediterranean*, the *Archipelago*, &c. 'Tis not eaſy to aſcertain any Capital to this Part of the *Turkiſh*

Empire, ſo many of the Provinces having Great Cities in them, and the Capital being in *Europe.* The Provinces are as follow.

Natolia,	Capital	*Chintaye,*
Caramania,		*Cogni,*
Amaſia,		*Amaſia,*
Aladulia,		*Maraz,*
Syria,		*Aleppo,*
Phœnicia,		*Damaſcus,*
Paleſtine,		*Jeruſalem.*
Turcomania,	Capital	*Erzurin,*
Imirella in *Georgia,*		*Colatis,*
Mingrelia,		*Rucks,*
Guriel,		*Ozurgheti,*
Abcaſſia,		*Danders,*
Circaſſia,		*Temrock.*
Diarbeck,	Capital	*Cara-Emid,*
Curdiſtan,		*Van,*
Chaldee,		*Bagdad,*
Arabia Fœlix,		*Mecha,*
Arabia Deſert,		*Anna,*
Arabia Petræa,		*Aerach.*

The *Iſles,*

Cyprus,	Capital	*Nicoſia,*
Rhodes,		*Rhodes,*
Metelin,		*Metelin,*
Schio, and others in the *Archipelago.*		*Schio,* &c.

Perſia

Is 1500 Miles from Eaſt to Weſt, and 900 from South to North, bounded on the Eaſt by the Territories of the *Great Mogul* and the *Grand Tartary,* on the North by the River *Oxus,* which divides it from *Great Tartary* and the *Caſpian Sea,* on the Weſt by the *Turks* Dominions, and on the South by the Gulph of *Balſora,* the *Perſian* and *Indian Seas.* The Capital of this Monarchy is *Iſpahan,* which paſſes for one of the Largeſt, Faireſt and Richeſt Cities in the World. The Chriſtians exerciſe their Religion publickly in the Suburbs call'd *Zulfa,* and the *Engliſh* have a Factory there with great Privileges. The Chriſtian Kingdom of *Georgia* is now Part of *Perſia*; It has a Patriarch at *Teflis.* The other Provinces of *Perſia* are

Airach,
Farſiſtan,
Siſtan,
Chuſiſtan,
Kheirman,
Sobleſtan,
Candahar,
Aderbejan,
Scirvan,
Mackeran,
Choraſan,
Erwan,
Dagheſtan in *Tartary.*
Mozanderan,
Ghilan,

India

Contains ſeveral Spacious Kingdoms, of which one Word or two muſt be ſaid, for more we have not Space. *India* was formerly reckon'd to be all that Part of *Aſia* on the other Side of the *Ganges*; but ſince the *Indian* Princes have extended their Conqueſts on this Side, Part of that Diviſion of *Aſia* is alſo ſo call'd; and here we firſt meet with

The Empire of the Great Mogul,

Which is 1950 Miles from Eaſt to Weſt, and 1320 from South to North, on which Side 'tis bounded by *Tartary,* on the Eaſt by the Territories of the King of *Ava,* formerly *Brama,* on the South by the River *Guenga,* &c. on the Weſt by *Perſia.* *Agra* is the Chief Province of this Empire, and the City of that Name the Capital of it. There are ſo many Fables told us of the Riches of this Monarch, that 'tis well we are abridg'd in our Relation; for both Hiſtorical and Geographical Accounts are not much to be rely'd on, excepting in what concerns the Coaſts which are very well known by Commerce with *Europeans,* who have ſome Settlements near them, particularly the *Engliſh.* *Surat* is very much frequented by the Merchants of *Europe.* The Empire of the *Great Mogul* is divided into 40 Governments call'd *Raja's,* ſome of whom are rather Tributary than Subject to him. We do not think the Reader will expect ſo many Barbarous Names in ſo ſhort an Eſſay; ſo we proceed to the

Peninſula on this Side the *Ganges,*

Which is 780 Miles from South to North, and 690 from Eaſt to Weſt, containing

The Kingdom of *Golconda,* the Capital *Heider Abad,*
The Kingdom of *Biſnagar,*
The Principality of *Gingi,*
of *Tonjaur,*
of *Kerhatack,*
of *Maduras,*
on the Coaſt of *Coromondel* in the Principality of *Maduras,* is for the Sage the Chief Factory of the *Engliſh* in *India.*

The Kingdom of *Viſapur,*
Principality of *Kirmalack,*
of *Comara.*

The Kingdoms of *Calecut* and *Cochin,* In *Malabar.*

India on the other Side of the *Ganges,*

Which is from Eaſt to Weſt 960 Miles in ſome Places, and 1920 from South to North, containing

The Kingdom of *Ava,* Capital of the ſame Name.

To which are Tributary

The Kingdoms of
Pegu,
Arracan,
Tipra,
Brema,
Camarana, &c.

The Kingdom of *Siam,* the Capital *Odia.*
The Kingdom of *Tonquin,* the Capital *Keccio.*
The Kingdom of *Cochinchina,* the Capital *Caccian.*

China,

Is about 1400 Miles from South to North, and 1650 from Eaſt to Weſt; but neither Longitude nor Latitude is well Settled. 'Tis bounded on the North by the Famous Wall of 1000 Miles long, and 45 Foot high, which ſeparates it from the Kingdom of *Tunquin* and *Niuche* on the Eaſt by the Oriental Ocean or the *Chineſe Sea,* on the South by the ſame Ocean and the Kingdom of *Tunquin,* on the Weſt by the *Damaſian* Mountains, which divide it from the Territories of the King of *Ava.* 'Tis now united under one Prince with *Great Tartary.* The Capital of *China* is *Peking,* ſaid to be of an

Incredible Length, which is not ſo certain as that the Streets are not pav'd nor the Houſes Contiguous. The Chriſtian Religion, if the *Romiſh* deſerves that Sacred Name, is profeſt by great Numbers of *Chineſe*, but mix'd with *Idolatry* and *Mahometaniſm*, which the Popiſh Miſſionaries have allow'd of, and are now under the Diſpleaſure of the Court of *Rome* about it. *China* is divided into the following Provinces.

Peking,
Leaotong,
Iſle and Kingdom of *Coree*,
Zantung,
Nanking,
Chekiang,
Fokien,
Quantung,
Kiangſi,
Quangſi,
Queichu,
Huquang,
Hopan,
Xanſi,
Xenſi,
Suchuen,
Junnan,
The Iſle of *Hainan*.

The Iſles.
Formoſa,
Chewxan,
Changye.

Great Tartary,

The Greateſt Empire in the World; It is 4500 Miles from Eaſt to Weſt, and 2280 from South to North, bounded on the Eaſt by the Sea of the *Kaimachites* and the Straights of *Jeſſo*, on the South by *China*, the *Indies*, and *Perſia*; on the Weſt by the Main Sea and the Territories of the Czar of *Muſcovy*; and on the North by the Northern or Frozen Sea. If we add *China* to this Empire, 'tis very eaſie to Calculate that it muſt contain $\frac{1}{4}$ Part of the Habitable World; 'tis ſubject with *China* to one Emperor, who is call'd the *Khan*, but has ſeveral Kings under him. *Tartary* is divided into 5 Parts.

Kathaye, the Capital of that and all *Tartary*, *Munoncheu*.
Turkeſtan,
Usbeck, and
The Two moſt Northerly *Hordes*, or Parts call'd by the *Arabians*, *Kaimach*, *Mongul*.
The Capitals very little known.

As indeed is all this vaſt Empire, except what borders on *China* on the Eaſt and *Muſcovy* on the Weſt, where the *Muſcovites* poſſeſs *Aſtracan*, and other Kingdoms reckon'd Part of *Great Tartary*.

Of the Iſles of Aſia.

The Iſles of *Japan*, *Niphon*, *Bungo*, *Tonſo*, and 20 more.

The *Philippine* Iſles, *Lucon*, *Manitha*, *Mindanao*, *Paragoia*, *Mindora*, and about 18 more.

The *Molucca* Iſles, *Celebes*, *Papous*, *Gilolo*, *Ceiram*, *Timor*, *Flores*, and ſeveral others.

The Iſles of the *Sound*, *Sumatra*, *Java*, *Borneo*, and others of leſs Note.

The Iſle of *Ceylon* is near 700 Miles in Circumference, the Capital *Candy*.

The *Maldives* Iſles and the Iſles of *Thieves*, with others not worth naming, are in the Number of the Iſles of *Aſia*.

Of AFRICA.

WHether *Aſer* gave Name to *Africa*, and was the Son of *Aſia*, let the Antiquaries decide, 'tis ſufficient for us in this Place to enquire into its Extent, &c. 'Tis 4800 Miles long and 4200 Miles broad, where broadeſt and longeſt; bounded on the North by the *Mediterranean* Sea; on the Eaſt by the *Red* Sea and the Eaſtern Ocean; on the South by the *Ethiopian* Sea, and on the Weſt by the *Atlantick*. Two Thirds of it is in the Torrid Zone, which renders it inſupportably hot in many Places, and eſpecially on the Coaſts of *Guinea*; to make amends for which it has Plenty of Gold, Ivory and Drugs. The Inhabitants are for the moſt part Barbarous and Idolaters, except where by their Commerce with *Europeans*, they are Civiliz'd a little. *Mahometaniſm* is the Religion of the leaſt Barbarous Nations. As to Chriſtianity, whether it has liv'd in *Abyſſenia* ever ſince the Apoſtles Days or not, does not ſeem to be a Geographical Controverſy, ſo we ſhall not inſiſt upon it. The River *Nile*, ſo famous in Story, waters a great Part of it, as do's alſo the *Niger*, whoſe Courſe is much longer, no leſs than 2400 Miles, according to ſome Authors, which is, we fear, too great a Length. *Africa* is divided into Eight Principal Parts,

Egypt,
Barbary,
Biledulgerid,
Zaara,
Nigritia,
Guinea,
Ethiopia,
Nubia,

Egypt

Is 300 Miles from Eaſt to Weſt, and 570 from South to North. 'Tis Part of the *Turkiſh* Empire, the Capital *Grand Cairo*, which we ſeldom hear of but for Plagues. Some pretend it is the biggeſt City in the World, but we don't believe 'em; *Alexandria* was the Capital in the Reign of the *Ptolomies*. 'Tis divided into *Upper* and *Lower Egypt*, and Subdivided into 14 Begles or Governments.

Barbary

Runs along no leſs than 2700 Miles in Length, and is not above 240 Miles over where broadeſt. 'Tis bounded on the Eaſt by *Egypt*, on the North by the *Mediterranean Sea*, on the Weſt by the *Atlantick*, and on the South by *Biledulgerid*. 'Tis the moſt conſiderable Part of *Africa*, the beſt Inhabited and Richeſt, as well as moſt Civiliz'd. The *Romans* were Maſters of the greateſt Part of this *Diviſion* 'till the *Saracens* expell'd 'em. 'Tis now ſubject to ſeveral Princes, the Chiefeſt of whom is the Emperor of *Morocco*, whoſe

Kingdoms of *Fez* and *Morocco*, have Capitals of the ſame Names.

The Kingdoms of *Algiers*, *Tunis*, *Tripoly*, Governments under the Protection of the *Turks*.

The Kingdom of *Barca* and ſeveral Iſles, too many and too inſignificant to name.

Biledulgerid

Is the Ancient *Numidia*; in Length 3000 Miles where longeſt, in ſome Places near 500 Miles broad, in others not a hundred. 'Tis bounded on the Eaſt by *Egypt*, on the North by *Barbary*, on the Weſt by the Ocean, on the South by *Zaara*, or the Deſart; the Air is very hot but healthy; the Soil in moſt Places Sandy, Uncultivated, and the Country thin of People. 'Tis Govern'd partly by ſome Kings or Lords Tributary to the Turks of *Algiers*, *Tunis* and *Tripoly*; partly by ſome little Republicks; and in other Places the People have neither Laws nor Government. It is divided into Eight Principal Provinces, each of which has a Capital; but there is not one appointed to *Biledulgerid* in General.

Zaara,

Or the Deſart, is 2800 Miles in Length, and from 750 to 120 Miles in Breadth, bounded on the North by *Biledulgerid*, on the Eaſt by *Nubia*, on the South by *Nigritia*, and on the Weſt by the Ocean. This Diviſion is ſtill leſs Cultivated and Inhabited than *Biledulgerid*, and may well be call'd the Deſart; for 'tis ſaid one may travel there 300 Miles without finding a drop of Water, in a Country where the Sun darts his burning Rays with the greateſt Violence. 'Tis divided into Seven Provinces, each of which has its Capital, wretched ones without Queſtion. The Inhabitants may well be term'd *African* Monſters, being in many Parts of this Diviſion Strangers to Government and Laws. Some Kings there are call'd *Xeques*; ſome have a ſort of Religion bordering on *Mahometaniſm*, ſome none at all: An Accurs'd Corner of the Earth, from which we are willing to haſten as faſt as we can, though we ſhall hardly meet with any thing better 'till we get out of *Africa*.

Nigritia,

Or the Country of *Negroes*, is 2400 Miles long, and 900 broad where broadeſt, bounded on the North and Eaſt by *Zaara*, on the South by *Guinea*, and on the Weſt by the *Atlantick*. The Air, tho' hot, is healthy, and the Soil fertile, in Compariſon with the other Parts of *Africa*. 'Tis divided into Sixteen Kingdoms.

Geneboa,
Galata,
Tombut,
Agades,
Cano,
Caſſena,
Gangara,
Zenegal,
Gambia,
The *Jecloffes*,
The *Caſanges*,
The *Bijagos*,
The *Biaſares*,
Melli,
Zegzeg,
Lanfara,

Which are Subdivided into other Kingdoms. Indeed Monarchy is no where in ſo mean a Condition as in theſe Parts of *Africa*, where a King is Powerful when his Dominions extend as far as a ſmall Hundred in *England*. There are ſome Towns in this Diviſion. *Tombut* is pretty large, as is alſo *Cano*. The *French* have a Settlement at *Senegal*; the *Negroes* are either *Mahometans* or *Idolaters*.

Guinea

Is 1650 Miles long and 420 broad, where broadeſt; in ſome Parts of it not 200. 'Tis bounded on the Eaſt by the Kingdom of *Biafara*, on the North by the *Negro-Country* or *Nigritia*; on the Weſt by the Kingdom of *Sierra, Leona*; and on the South by the Sea which bears its Name. There's hardly a hotter Climate upon Earth; 'tis a Low Country, and the Air not much wholſomer than that of a Peſt-Houſe; yet hither do *Engliſh*, *Dutch*, *Danes*, *Swedes* and *Portugueſe* reſort; here do they ſettle and build Houſes and Forts; here do they broil for 10 or 20 Years, if by Chance they Survive or lay their Burnt Carcaſſes in theſe Glowing Sands. And why all this Force upon Nature? Why do they leave the former Climes, at leaſt the Cold Mountains of the North for the Burning Regions of *Guinea?* The Reaſon is plain; There's Gold, and what is there Men will not do for Gold. *Guinea* is divided into Three Principal Parts: The Kingdom of *Guinea*, properly ſo call'd, which is in the Middle; the Kingdom of *Benin* to the Eaſt, and the Province of *Malaguetta* to the Weſt. Theſe Kingdoms are ſubdivided into others, ſome of which are Conſiderable, as thoſe of *Sabou*, *Foetu*, *Accara* and *Arda*. The King of the Laſt Kingdom, about 40 Years ago, ſent an Ambaſſador to his Brother of *France*. The Reader muſt know, that under theſe and ſome others, there are Kings of ſuch Conſideration, that a File of Muſqueteers wou'd be as dreadful to their Kingdoms, as the Duke of *Marlborough* and Prince *Eugene*'s Army is to the Kingdom of *France*; and we have heard of a Monarch who has been Enthron'd not far from the River of *Gambia* by the Aſſiſtance of ſuch a Number of *Engliſh* Auxiliaries. *Guinea* is again divided into the Gold Coaſt and Ivory Coaſt, the former of which is the Eaſtern Part, and the latter the Weſtern. The Coaſts on the Province of *Malaguetta* have *European* Settlements as well as the Gold Coaſt. *Sierra Leona* is by ſome plac'd in *Guinea*, we have a Factory there; but theſe Things wou'd require more Sheets than we can allow Lines, ſo we muſt go on to

Ethiopia,

Which includes *Abyſſinia* and *Nubia* in the Common Acceptation; but we ſhall treat firſt of *Abyſſinia*, which is 2100 Miles from North to South, and near 1500 from Eaſt to Weſt. 'Tis bounded on the North by *Nubia*; on the Eaſt by the Coaſts of *Abex*, *Ajan*, and *Zanguebar*; on the South by the Empire of *Mono-emugi*; and on the Weſt by *Congo* and *Biafara*. We are told that the Supream Lord of this Country, which ſome call *Preſter Joha*, as well as his Subjects are Chriſtians; and that they pretend to have been ſo from the Primitive Times, which is no great matter to us whether they were or were not. As to the Capital of this Empire Authors vary; ſome make it, *Dombea*, others *Godigna*, &c. but we believe none of 'em knew much of either the one or the other. There are 12 Kings of Large Kingdoms Tributary to this Emperor.

Nubia

Is 1100 Miles long and 570 broad, where broadeſt and longeſt. 'Tis bounded on the North by the Deſart of *Barka* and *Egypt*; on the Eaſt by the Kingdom of *Barnagey*, and the Iſle *Gueguere*; on the South by the *Abyſſinian* Deſarts; and on the Weſt by the Deſarts of *Borno* and *Gaoga*. The Natives of this Country are very black; they are Stout and Laborious; their King very Powerful; their Religion, if any, has more of Chriſtianity than any other in it. The Capital is *Nuabia*, about the 19 Degr. of Latitude.

Between *Nigritia* and *Congo* are ſeveral Kingdoms, which ſome place together with *Guinea*, in the Country of *Negroes*, as

Biafara,
Gabon,
Bungo,

The King of *Congo* has 6 Princes or Kings under him: To theſe muſt be added,

The Kingdoms of *Medra*,
– of the *Anzicains*,
Anyac,
Angola,
Loango,
and the Republick, or rather Anarchy of *Geaques*,

The Empire of *Monomotapa* is 1050 Miles long, and 450 broad.

The Empire of *Monoemugi* is ſo unknown, that its Extent is not determin'd with any Certitude. Then come

The *Cafres*, the Kingdoms of *Sofala* and *Mataman*, the Kingdoms on the Coaſts of *Zanguebar*, *Ajan*, and *Abex*; the latter is pretended to be the Country from whence the Queen of *Sheba* came to viſit *Salomon*. We wou'd not have it lye upon us to prove it.

Of the Iſlands of Africa.

Madagaſcar lying off the Coaſts of *Zanguebar* and *Cafres*, is one of the largeſt in the World, being 1050 Miles long, and 360 broad. 'Tis ſaid to be divided into Five or Six Kingdoms. The *Europeans* have ſome Settlements on the Coaſts. The other Iſlands are,

Zocotora,
The Iſles of *Comorra*,
St. *Thomas*,
The Iſles of *Cape Verd*,
The *Canary Iſles*,
Madera,
The *Azores*.

All which except *Zocotora* and *Comorra*, are in the Poſſeſſion of the *Spaniards* and *Portugueſe*.

America

Or the New World; it being intirely unknown to the Ancients unleſs out of Complaiſance to Antiquity, you allow *Plato's Atlantick* Iſland to be our *America*; but we are not ſo fond of their Gueſſes as to think it was reveal'd to 'em by Inſpiration, and how they cou'd get thither without the Compaſs, or how get back again, is what we do not comprehend, and therefore believe that the *Biſcain* Fiſhermen were the firſt who diſcover'd the Bank of *Newfoundland*, and, perhaps, that Part of North *America*; and *Columbus* the firſt who landed on the Continent, in the Year 1493. But *Americus Veſpuſius* had the Honour, though a later Diſcoverer, to give Name to this Diviſion of the Globe, which is much bigger than the biggeſt of the other Three, if not as big as all of 'em. It extends from 63 Degrees of North Latitude to 54 of South, from *Hudſon's Streights*, to thoſe of *Magellan*, and from *Agu. be la del Galo* above the Iſle of *California*, under the 240 Degrees of Longitude, to the fartheſt Part of *Braſil* under 348; on the North 'tis bounded by the Sea which divides it from *Greenland* by *Hudſon's Streights*, and the Sea of *Chriſtiana*; on the Eaſt by the *Atlantick Ocean*; on the South by the *Streights* of *Magellan*, which divide it from *Terra del Fuego*; and on the Weſt by the *Pacifick* Sea. It's Situation is in Three different *Zones*, ſo that the Air and Soil muſt conſequently be very different. The greateſt Rivers are that of the *Amazons*, that of *Plata* in South *America*, and that of St. *Laurence* in North. Having mention'd this Diviſion, we ſhall keep to it, and only take notice that *America* is poſſeſt chiefly by the *Spaniards*. The *Engliſh* next to theſe have moſt Poſſeſſions in this Part of the World. Then the *Portugueſe*, *Dutch*, *French*, *Danes* and *Brandenburghers*; for as to the Natives they are all ſubject to the *Europeans* wherever the latter have been pleas'd to ſettle. The *Spaniards* are in Poſſeſſion of the Silver Mines which this New World was ſo much coveted for. The *Engliſh* and *Portugueſe* have the Sugar Trade not much leſs Advantageous. The *Engliſh* alone that of Tobacco, a Traffick which with due Encouragement might be made ſo Advantageous, as to render us above envying the Mines of *Peru* and *Mexico*. The *French* have alſo their Sugar Iſlands; and other Nations other Acquiſitions and Trades which cannot be enlarg'd on here. So we proceed to the Geographical Deſcription, and begin with

South America;

Which forms a great Peninſula of 3990 Miles in Length, 3420 in Breadth, and near 15000 in Circuit. 'Tis bounded on the North and Eaſt by the Northern Sea; on the South by the *Magellanick* Sea; and on the Weſt by the *Pacifick* or South Sea. 'Tis divided into Seven principal Parts.

Peru,
Paraguay,
Tucuman,
Chili,
Terra Firma,
Braſil, and the Country bordering on the River of the *Amazons*.

Peru is about 780 Miles long, and has near 2000 Miles on the Coaſts. Its bounds on the Eaſt are *Paraguay*, and the Country of the *Amazons*; on the North *Terra Firma*; and on the South *Paraguay*, *Tucuman* and *Chili*. The City of *Lima* is the Capital, and the Mines of *Potoſi* make this Province the moſt deſirable Jewel in the *American* Crown. 'Tis ſubject to the *Spaniards*; for the Natives who are not reduc'd are ſo few in Number or Power that the former rather deſpiſe than fear them. The Viceroy of *Peru* has ſeveral Governours under him. *Paraguay* is ſometimes reckon'd a Part of *Braſil*; but Geographers lately make a particular County of it. 'Tis about 1500 Miles long and broad, bounded on the Eaſt by the Northern Ocean; on the North by *Brazil*, and the Country of the *Amazons*; on the Weſt by *Peru*, *Tucuman*, *&c.* and on the South by the Ocean. 'Tis almoſt entirely ſubject to the *Spaniards*, the City of *Aſſumptio* is its Capital and the Reſidence of the Governour, who is under the Viceroy of *Peru*.

Tucuman is ſometimes reckon'd Part of *Peru*, and ſometimes Part of *Paraguay*; but being in a great Meaſure in the Hands of the Natives we place it by itſelf. 'Tis 840 Miles from South to North, and above 600 from Eaſt to Weſt; bounded on the Eaſt by *Paraguay*, on the South by the *Patagons*, on the Weſt by *Chilie* and by *Peru*, on the North. That Part of it ſubject to *Spain*, has the City of *San Jago del Eſtero* for its Capital. The Government is dependant on that of *Paraguay*.

Chili is 1260 Miles long, and 450 broad where broadeſt; bounded on the North by *Peru*, on the Eaſt by *Tucuman*, and the Lands of *Magellan*, and on the South by the *Patagons*. The Government of this Province, whoſe Capital is *San Jago*, depends alſo on the Viceroy of *Peru*; but the Natives under their Caciques are not entirely ſubdu'd. The Lands of *Magellan* are divided into ſeveral *Indian* Kingdoms or Nations. The *Spaniards* not having been at the trouble to conquer them, they built Two Cities on the *Streights* to ſecure their Trade; but they are now in Barns. The Inhabitants are call'd *Patagons*; and the Country being little known, Geographers and Travellers take the liberty to tell us 'tis inhabited by a Race of Gyants, the Men being 10 or 14 Foot high; which we can believe as eaſily as that one of 'em will *eat up a Basket of Bisket, drink up a Pail of Wine at a Draught*, &c. We are aſham'd of ſuch Stories told by grave Authors. *Terra Firma*, or *Caſtille del Or*, advances farther towards the North than any Part of South *America*. 'Tis above 2000 Miles long, and 600 broad, ſubject to the *Spaniards*, who have a Governour reſiding here at St. *Fe de Bogota Panama*, &c. This Country has been moſt viſited by the *Buccaneers* of any Part of *America*, and the Names of its principal Cities *Panama*, *Porto belo*, *Nombre de Dios*, *Rio de la Hacha* are very well known by ſuch as know the *Buccaneer Hiſtory*, and the Adventures of Sir *Henry Morgan*, &c. Thus we ſee that the *Spaniards* are poſſeſt of a prodigious Extent of Ground in South *America*, containing many large Cities, Three *Archbiſhopricks*, and 16 *Biſhopricks*, &c.

Braſil

Is a vaſt Tract of Land in South *America*, diſcover'd by and ſubject to the *Portugueſe*, running along 2400 Miles on the Coaſt. 'Tis bounded on the North and Eaſt by the Northern Ocean; on the South by *Paraguay*; on the Weſt by the ſame Country, and that of the *Amazons*. The *Portugueſe* have ſeveral Cities here, One Archbiſhoprick, and Three Biſhopricks. The Viceroy reſides at *San Salvador* the Capital. However, the *Braſilians* ſtill poſſeſs the far greateſt Part of the Country, and indeed almoſt all the Inland Parts.

North America.

The *Dutch* make it above 6000 Miles long from the *Streight* of *Anian* to the *Iſthmus* of *Panama*, and about 3800 broad; but this and its Bounds are very uncertain. We only know that *Hudſon's Streights*, and the Sea of *Chriſtiana*, divide it from the Artick Regions; that it has the Northern Ocean on the Eaſt, and the South Sea on the South and Weſt. It may be divided into *Spaniſh* and *Engliſh*. For the *French* who have neſted in *Canada*, have no more legal pretence to that Part of *America* than to *Peru* or *Mexico*, Part of which they are now in Poſſeſſion of under pretence of keeping it for the *Spaniards*. It is to be hop'd they will be driven off this Continent in a little time; for there's nothing of more Conſequence to ſecure our Northern Colonies.

To the Spaniards *belong*

Mexico; which extends 1800 Miles from the River of *Chagre*, in the *Iſthmus* of *Panama*, to the River of the North, in the Sea call'd *La Mer Vermeille*, the *Vermillion Sea* by *French* Geographers. The Sea of *Mexico* bounds it on the Eaſt; the *Gulph Florida* and *New Mexico* on the North, and the South Sea on the Weſt and South. *Mexico* is the Capital, the Reſidence of the Viceroy, and the Seat of the Archbiſhop, under whom are 12 Biſhopricks.

Mexico, Archbiſhop.
Mechoacan, Biſhoprick.
Los Angeles,
Antequera,
Menda,
Guadalajara,
Duremgo,

J. de Gualius, Biſhop.
Cuidad Reale,
Vallodolid,
Santa Fe,
Vera Paz,
Leon.

In the Provinces of *New Spain*, *viz. Mexico*, *New Mexico*, *New Galicia*, *New Biſcay*, *Guatamela*, *Honderas*, *Vera Paz*, *Nicaragua*, &c.

To the Engliſh *belong*

From St. *Matheo* in *Florida*, to the River of St. *Laurence* in *New France*, including *Nova Scotia*, which belongs to the *Engliſh* by all the Title and Pretence that one Nation can have to a new diſcover'd Country more than another. Thus the *Engliſh* Acquiſitions run along on the Coaſt 13 or 1400 Miles, and in Breadth is unequal or rather uncertain; for they may extend 'em as far as they pleaſe. They contain the following Governments. That of

Carolina,	Capital	*Charles*'s Town.
Virginia,		*James*'s City.
Maryland,		St. *Maries*.
Penſylvania,		*Philadelphia*.
The *Jerſeys*,		*Shrewsbury*.
New York,		*New York*.
New England,		*Boſton*.
New Scotland,		*Port Royal*.

In which Extent of Ground are more European Inhabitants than perhaps in any Part of *America* of twice its Length and Breadth. It being computed there are near 300000 *Engliſh* Souls, and 50000 Fighting Men at leaſt, and that they employ 500 Sail of Ships to *Europe*, and other Parts of *America*, &c. The *French*, who are the moſt Inſolent People on the Globe, call all that Country *New France*, which reaches from *Florida* to *Hudſons Streights*, and take in all the Queen of *England*'s Dominions on the Continent of *America*; but we muſt drive 'em up to

Canada,

Where they are ſettled between the Barbarians of *New Scotland*, and *Hudſon's Bay*, and have a Biſhop of *Quebec*, who has been ſeveral Years a Priſoner in *England*. You wou'd think by their

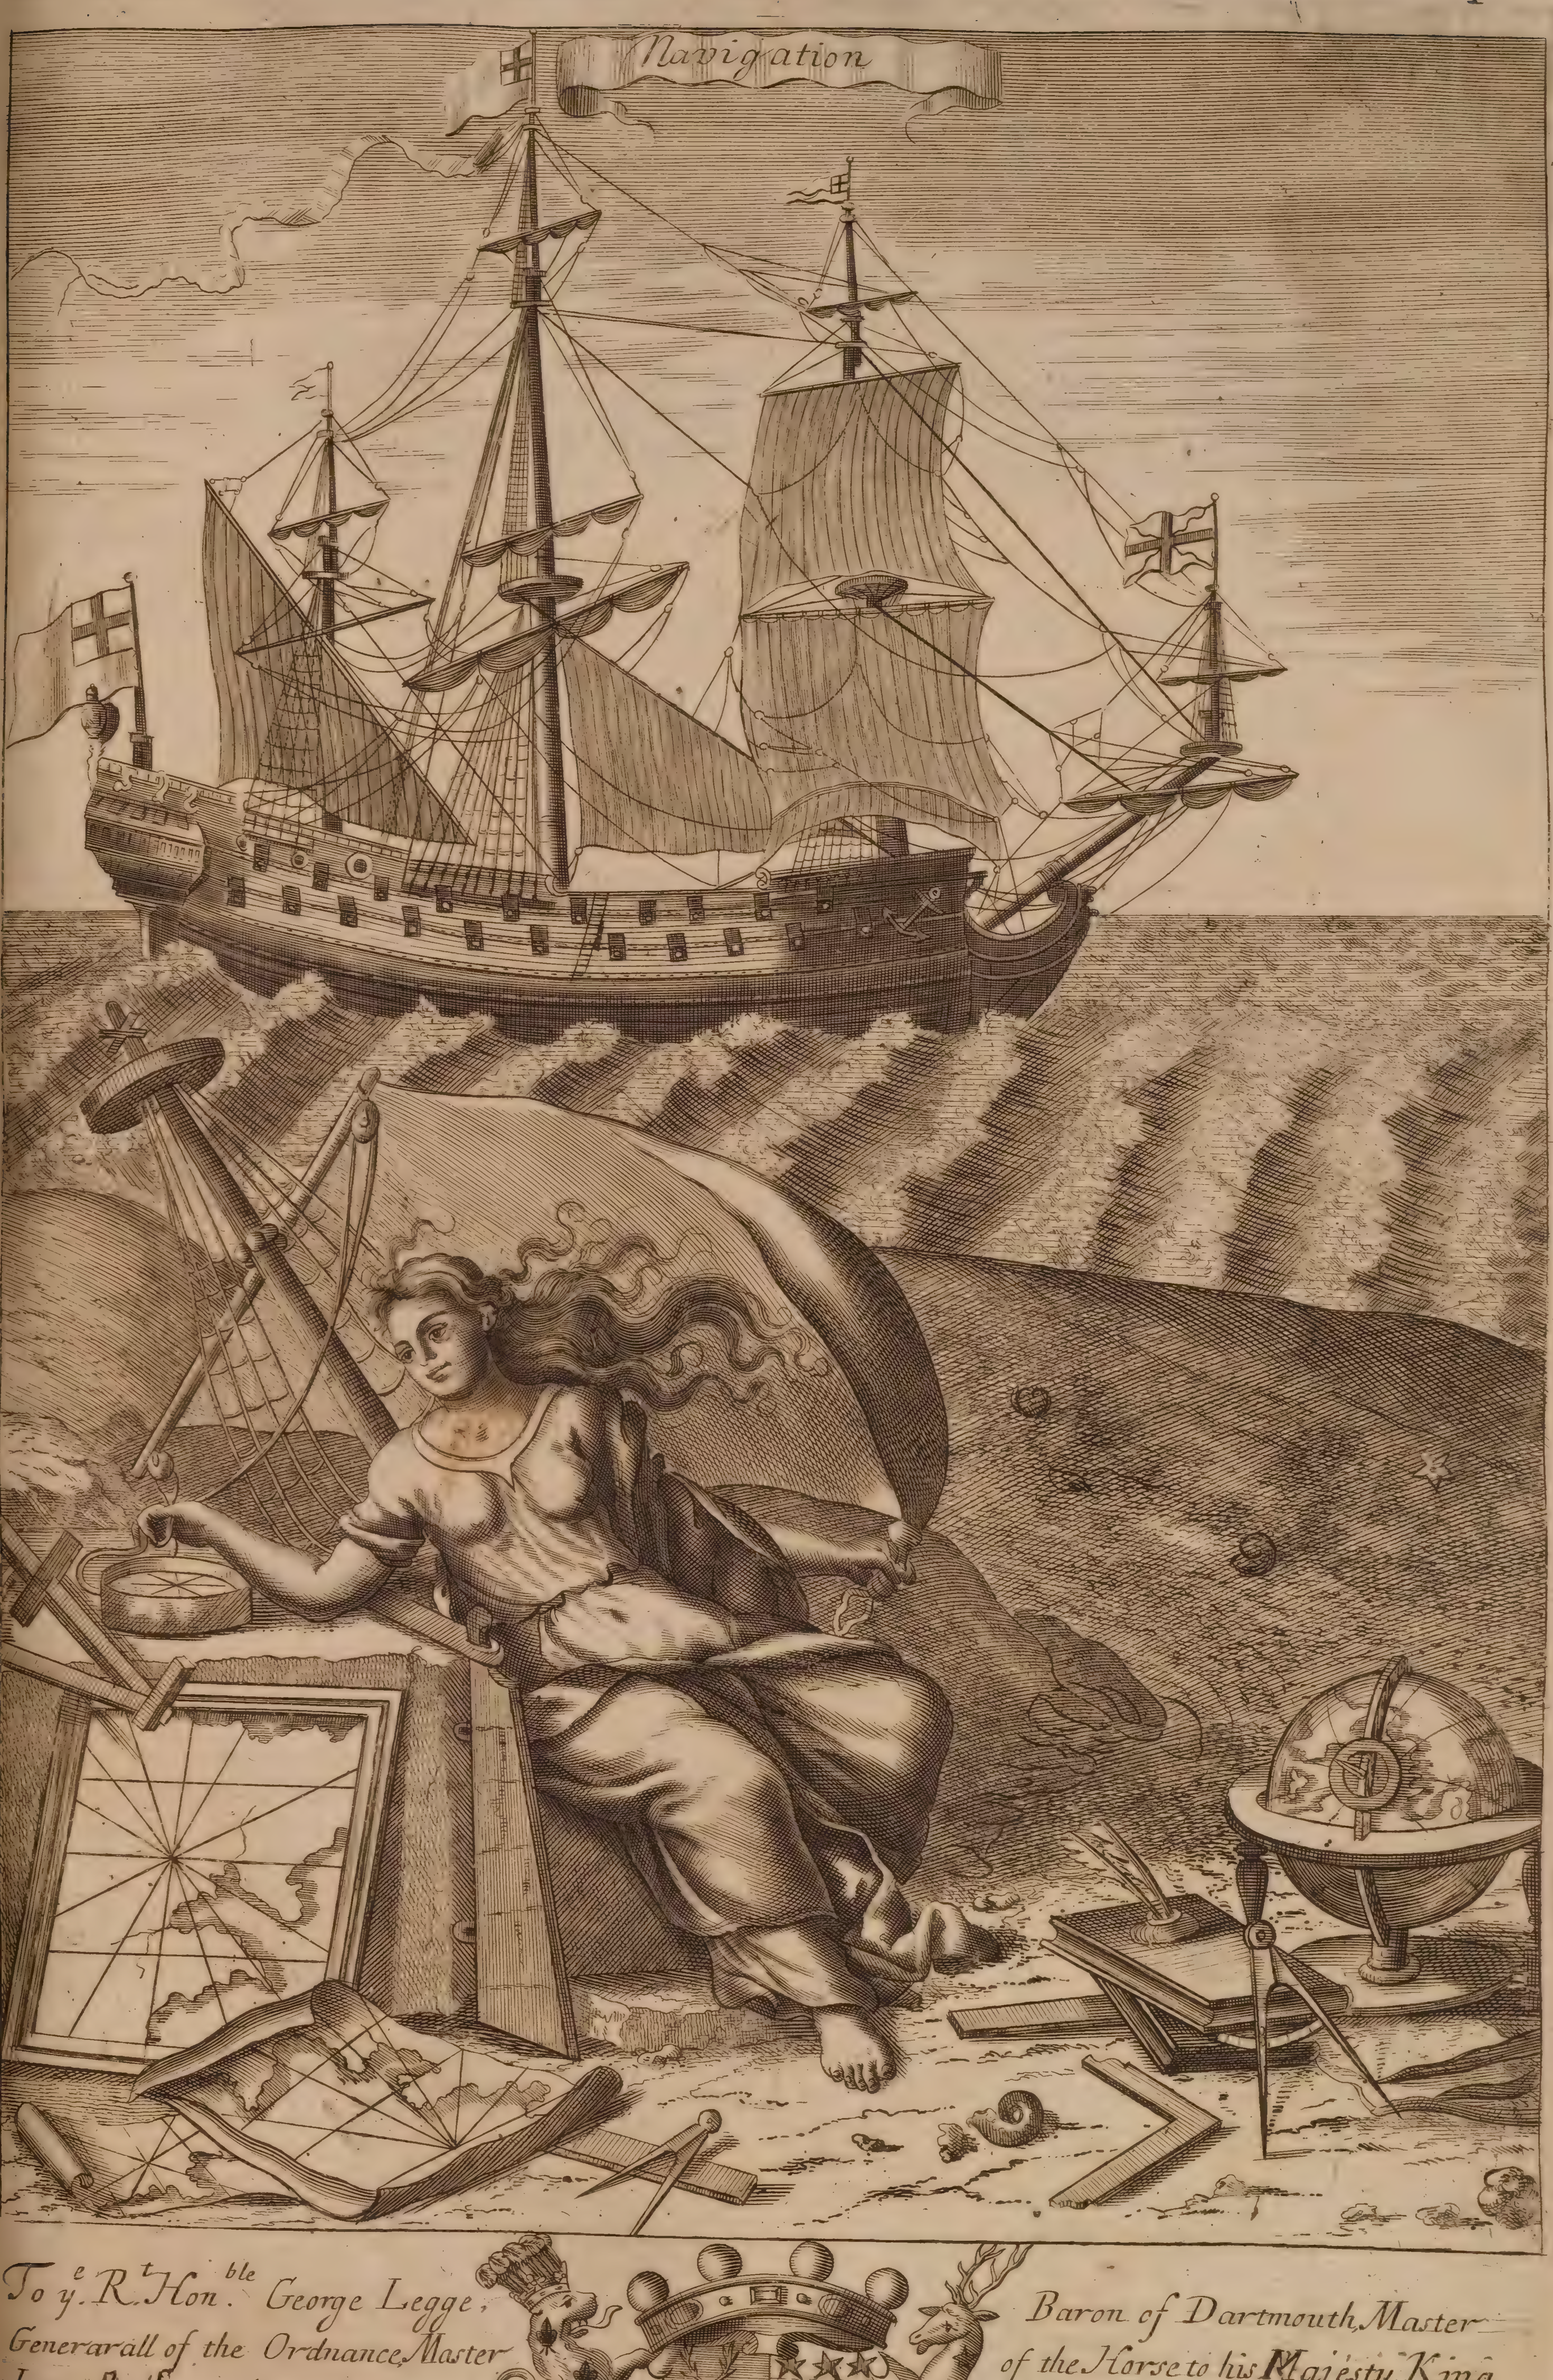
To ye Honble Arthur Herbert Esq.
Admirall and comander in
cheife of his Majestyes
fleet in ye Mediterra-
nean and one of ye
Comiſsioners
of the Admiralty
&c.
This Plate
is Humbly
dedicated by
Ric: Blome

Navigation Conſiſts of three parts viz.

- the makeing, or building Ships, wherein muſt be conſidered
  - the Materialls as the; Timber, Maſts, Yards, Sayles, Cordage, Anchors &c. of wch not only ye matter, figure, & coherency, but alſoe the weight, and Magnitude ought to be coſidered.
  - the Figure, or Shape, and the Magnitude, that is moſt apt for a quick motion; and ſuch may be defended againſt Storms & Tempeſts.
    - The knowledge of all ye Parts, & materialls of a Shipp, with ye proper names for the ſame, and their vſe.
    - The ſkill to prevent a Breach, Leake or other defect in a Shipp.
- The Ladeing of Ships, where reſpect muſt be had to theſe things
  - That there is not impoſed ſo great a Burthen that its weight taken may be equall with ye weight of ye Shipp, or greater then the Moles of the water, which is equall to the Solidity of ye Shipp but leſser though not much.
  - That if ye matter to Lade ye Shipp be to light, the burthen muſt be augmented with Ballaſt.
  - That ye depth of the water muſt be conſidered through wch the Shipp is to Sayle.
  - By how much ye weight of ye Shipp Laded is greater, by ſoe much ye leſs it is toſsed with Stormes, & Tempeſts.
- The Art of Guiding, or Navigateing a Shipp, wch may be conſidered in theſe parts
  - how to guide, or Stear a Shipp to any Place propoſed without danger, wch requires the knowledge of
    - ye Scituation of Places, as ye Procurrences of Angles. ye bending of ye Shoars. ye Aſpect of Promontories, Mountains, Bayes, depth of waters, Rocks, Sands, ſight of Islands, Coaſt of Lands, &c. all wch are known by Speciall Geography, and ſea Charts.
    - The motions of the Seas.
    - ye knowledge of ye winds both generall, and ſpeciall.
  - To find out the Latitude, and Longitude of Places.
  - The finding out of a place in the Mapps, to which the voyage being performed one arives at a certaine tyme.
  - To caſt vp a Voyage made vpon ye Rhombe, to meaſure it at ye given time, from ye given place
  - The knowledge of places, viz in every place to know ye North, South, East, & West, & ye intermediall Quarters.
    - This requires the Knowledge of nauticall Inſtruments, and the Mariners Compaſs
  - ye Vſe of ye magneticall Needle.
  - ye Hiſtiodrome, or Line of the courſe of a Shipp.



To ye Rt Honble George Legge, Baron of Dartmouth, Master
Generarall of the Ordnance, Master of the Horse to his Majesty King
James the Second, Leiutenant of Alceholt & Wolmer fforest in
Hantshire, Admirall of his Maties fleet of Ships in ye Mediterranian,
Captaine Generall of his late Maties forces in Affrica, & Governour of
Tangier, & one of the Lds of his Maties most Honble Privy Councell Anno 1685
This Plate is humbly dedicated by R. Blome

Gaudet Tentamine Virtus

Deſcription of their Territories here that they were a formidable People, whereas had not their King been at a prodigious Expence to fortifie them with good Forts and Caſtles to protect 'em in their little Trade, hardly worth the Expence, ſince that of Furs has ſunk ſo, they wou'd not deſerve mentioning with the other Nations on this Continent.

Northward of this is *Hudſon's Bay*, and ſome other Places very little known to Geographers; ſo we ſhall leave 'em, and ſay ſomething of the *American Iſles*, which are moſt in Poſſeſſion of the *Engliſh*, or were ſo before the War with *France.*

1. *New Foundland* 360 Miles long, 300 broad. } *Engliſh*, the Capital, ſuch as it is, St. *John's*.
French, the Capital *Placentia*.

2. The *Antilles*, { *Cuba*, 660 Miles long, 180 broad, where broadeſt, *Spaniſh*, St. *Jago* the Capital.
Hiſpaniola, 450 Miles long, 180 broad, *Spaniſh* and *French*, Capital St. *Domingo*.
Jamaica, 170 Miles long, 80 broad, *Engliſh*, Capital St. *Jago*, or *Spaniſh Town*.
St. *Jean Porto Rico*, 130 Miles long, 60 broad, *Spaniſh*, Capital of the ſame Name.

3. The *Lucayes*, *Spaniſh*.

4. The *Bahama* or *Barbuda* Iſlands, *Engliſh Providence* the Chief, *Naſſau* the Capital.

5. The *Charibees*, { *Barbadoes*, the Chief of the *Engliſh*, the Capital *Bridge-Town*.
Martinico, the Chief of the *French*.
Tobago, Dutch.

There are many of theſe Iſlands, and the *Engliſh* drive a Vaſt Trade thither, their Settlements being much more Populous than the *French*, it being computed that there are 60000 *Engliſh* in their *Charibe Iſlands*, and not 20000 *French*, who do not employ a $\frac{1}{4}$ Part of the Shipping.

There remains only to ſay a Word or two

Of the Terra Incognita, *and* Artick Regions.

The Latter are bounded on our Hemiſphere by the *Frozen Sea*, which divide 'em from *Muſcovy*; and in the other by the *South Sea*, the Sea of *Chriſtiana*, and *Hudſon's Streights*, which ſeparate them from *America*. To belong to theſe are reckon'd

Iſland, an Iſland belonging to the King of *Denmark*.

Greenland, not Inhabited.

Spitsberg, the moſt Northerly of all theſe Artick Countries.

Nova Zembla, to the North of *Muſcovy* from which 'tis parted by the Streights of *Weigatz*, by which 'tis thought the Seas of *Muſcovy* and *Tartary* have Communication. Thoſe that can prove and paſs it, may go to the *Indies* without weathering the Cape of *Good Hope*.

The Land of *Jeſſo*, Situated, as 'tis ſaid, between *Aſia* and *America*: If ſo, 'tis without Doubt the Way the Ancients travell'd by to their *Atlantick* Iſland.

The Streights of *Jeſſo* ſeparate it from *Great Tartary*, and of *Anian* from *America*. We are told Part of this Country is ſubject to the Emperor of *Japan*.

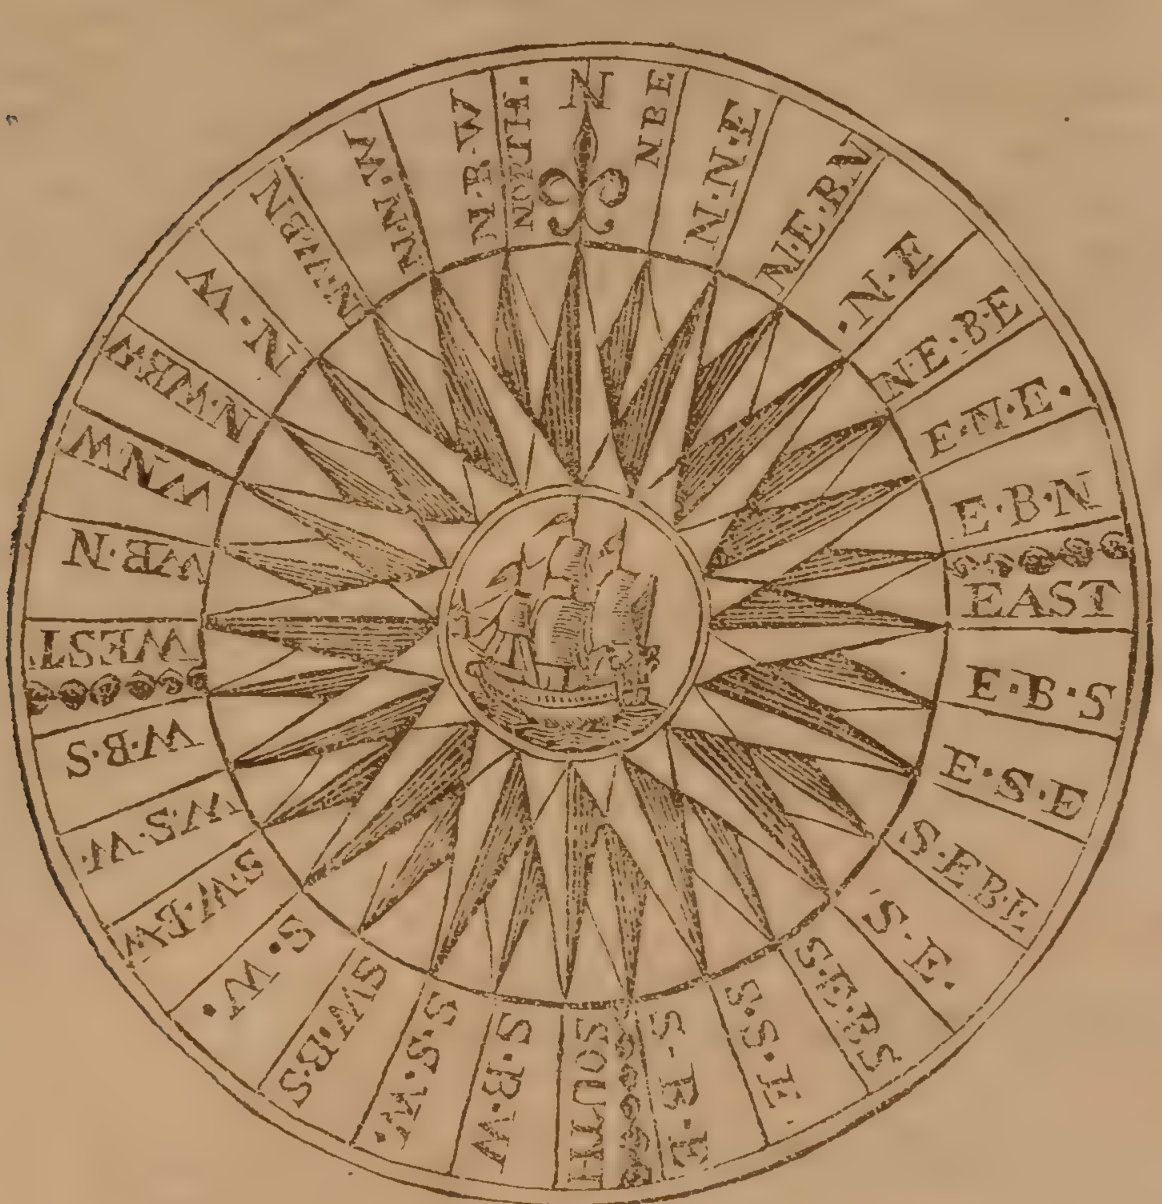
The *Antartick Regions* or *Terra Incognita*, are towards the South Pole, and was diſcover'd by *Magellan*. Their Name of *Terra Incognita* is ſufficient to excuſe us from enlarging upon 'em; and indeed Authors ſeem to make this Vaſt Country, the Inhabitants, &c. what they pleaſe.

NAVIGATION.

WHatever is pretended by the Idolizers of Antiquity, of the Superiority of the Ancients over us as to the other Arts, this, we hope, will be allow'd us entirely, and with it one of the moſt Uſeful *Sciences* that ever was produc'd by the Invention of Man. The Ancients knew no more of it than a *Coaſter* that brings Coals from *Newcaſtle* to *London*. What are their *Mediterranean Voyages* to *Drake's*, *Magellan's*, *Dampier's*, and thoſe Illuſtrious *Navigators* whom the Circumference of the Globe cou'd only confine.

Navigation is the Art of *Sailing*, by which a *Mariner* is inſtructed how to guide a Ship from one Part to another, the ſhorteſt and ſafeſt way, and in the ſhorteſt time. It is either *Improper* or *Proper*: *Improper* is call'd *Coaſting*; as when the Places are no great Diſtance one from another; when the Ship Sails uſually in Sight of Land, and is within *Soundings*; for the Performance of which is requir'd a good Knowledge of the Lands; the Uſe of the *Compaſs*, *Lead*, or *Sounding-Line*, &c. *Navigation Proper* is when the Voyage is perform'd in the Vaſt Ocean, out of Sight of all Land; and here 'tis neceſſary, not only to have ſufficient Knowledge of the *Lead*, *Compaſs*, &c. but the Maſter muſt be a *Thorough Artiſt*, and underſtand *Mercator's Charts*, *Azimuth* and *Amplitude*, *Compaſs*, *Log-Line*, and all good Inſtruments for Cœleſtial Obſervations that can be us'd at Sea. We muſt now explain what theſe Inſtruments are.

The *Compaſs* is a Circle divided into 4 Quadrants, repreſenting the Four Cardinal Winds or Principal Points, Eaſt, Weſt, North, and South; and each Quarter Subdivided into 8 other equal Parts, making in all 32 Rhombs or Points of the Compaſs, as by the Figure.



This Circle thus graduated, being drawn on a *Chard* or *Paſt-board*, has a touch'd Needle or Wire plac'd under it, and in its Center a Braſs Conical Hollow, by which means it hangs *Horizontally* on an Erect Pin, and keeps its *Lilly* or *North Point* always to the *North*, by which the Man at *Helm* knows how to keep the Ship to her *Courſe*.

Mercator's Chart is a Projection of the Face of the Earth in *Plano*, by which the Degrees on the *Meridian* increaſe towards the *Poles* in the ſame Proportion that the *Parallel Circles* decreaſe towards them.

An *Azimuth Compaſs* is an Inſtrument made in a Large Box, with *Jambols* and a broad Limb having 90 Degrees Diagonally divided, with an Index and Thread to take the *Sun's Amplitude* or *Azimuth*, in order to find the Difference between the *Magnetical Meridian* and the *Sun's Meridian*, which ſhews the Variation of the *Compaſs*.

Log-Line is wound about a *Reel* for that purpoſe, fix'd in the Gallery of the Ship. This Line for about 10 Fathom from the *Log* has no Knots, becauſe ſo much ſhould be allow'd for the *Log's* being Clear out of the *Eddy* of the Ship's *Wake* before the *Glaſs* is turn'd up. But then the Knots or Diviſions begin, and ought to be 50 Foot long from one another, tho' the Common Erroneous Practice at Sea is to have them but at 7 Fathom or 42 Foot Diſtance.

The *Croſs-Staff* is to take the *Meridian Altitude* of the *Sun* or *Stars*, in order to find the *Latitude*.

The *Aſtrolabe* is an Inſtrument to take the Height of the *Sun* or *Stars*. It conſiſts of an entire Circle, whoſe Limb is divided into Degrees and Decimal Parts of a Degree, with a moveable *Ruler* which turns upon the Center and carries two Sights. At the *Zenith* is a Ring to hang it by in time of Obſervation, and then you need only turn it to the *Sun*, that the Rays may paſs freely thro' both the Sights, and the Edge of the *Ruler* cut the *Altitude* in the Limb. This Inſtrument is not now much in Uſe at Sea.

The *Quadrant* is a very Uſeful Inſtrument; the Limb is divided into 60 Degrees, and as many Parts of a Degree as the Bigneſs of the Inſtrument will bear; and this, by means of a String and Plummet, gives you the *Sun's Altitude*, or that of any Star or other Object above the *Horizon*, reckon'd from that Edge of the *Quadrant* where the Sights are not plac'd. In *Collins's Quadrant* this Limb is alſo divided into Time and number'd accordingly, and then it ſerves very readily to find the *Sun's* Right Aſcenſion either in Degrees or Time.

We omit the *Calendar* which is plac'd next, and below it is the *Projection*, which is a fourth Part of *Stoffler's Aſtrolabe*. The *Quadrant of Altitude* relates to the Artificial Globe.

We now proceed to the Method of *Sailing*, and Firſt of the Uſe of the

Log-Board, which, with the *Line* is to keep an Account of the Ship's *Way*; for as many *Knots* as run out in half a Minute (meaſur'd by a half Minute Glaſs) ſo many Miles do they count the Ship Sails in leſs than an Hour, or ſo many Leagues and Miles in a *Watch*. As if there be veer'd out 4 Knots in half a Minute the Ship runs 4 Miles an Hour, or 5 Leagues and 1 Mile in a Watch. The Way of heaving the *Log* is; Firſt to let it down into the Water, then let it run away ſo far as to be out of the Eddy of the Ship's *Wake*; and then one having an half Minute-Glaſs in his Hand, turns it up juſt when the firſt Knot runs off the *Reel*. The Line running eaſily off, when the Glaſs is out he cries *Stop*, another ſtops the *Reel*, and then they count the *Knots* run out; and if they can be ſo exact as to count the odd Feet which the *Line* ſhall run out above any Knot, they ought to account 5 Feet for a Tenth Part of a Mile more. This Invention is follow'd by the *Engliſh* only; and whatever Foreigners pretend to the Advantage of their own Practice, is the ſureſt Method of meaſuring a Ship's *Way*: For there's none of theirs but is liable to more Objections. In the *Steerage* or ſome other Part of the Ship, hangs up a Board call'd the *Log-Board*; a Table divided into 5 Columns, and ought to be of the following Form. This *Log Board's* Account ſhou'd every Day at Noon (when an Obſervation of the Latitude if poſſible ought to be made) be enter'd into the *Log-Book* or *Traverſe Book*, Rul'd and Column'd as the *Log-Board*, from whence it may be tranſcrib'd into the Journals, and how much Way the Ship has gain'd in her *Courſe* daily Eſtimated.

The LOG-BOARD.

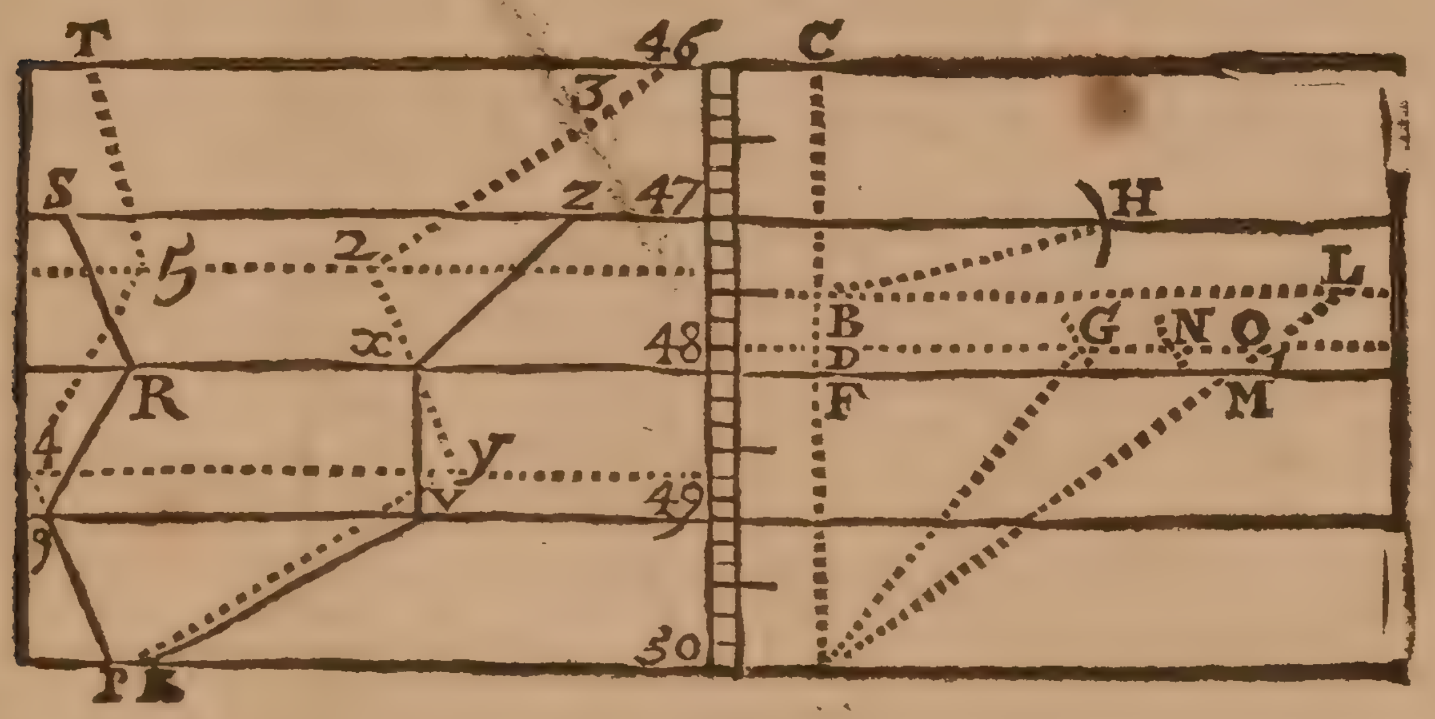
Dead Reckoning is that *Eſtimation* which the *Seamen* make of a Place, where a Ship is by keeping an Account of her *way* by the *Log*, by knowing the Courſe they have ſteer'd by the *Compaſs*, and by rectifying all with allowance for *Drift*, *Lee* and *Way*, *&c.* according to the Ship's Trim; ſo that his *Reckoning* is without any Obſervation of the *Sun*, *Moon* and *Stars*, and is to be rectify'd as often as any good Obſervation can be made. There are ſeveral ways of correcting the *Dead Reckoning.* When the *Dead Latitude* differs from the *Obſerv'd Latitude*, you muſt correct your *Dead Latitude* as your Courſe has been. For if *North* and *South*, and by Reckoning you find your *Latitude* leſs than by Obſervation, the Ship's Place in the ſame *Meridian* muſt be corrected, and is the *Obſerv'd Parallel.* As for inſtance; Suppoſe you depart from A, C taken notice of in the following Figure, in the 50th Parallel or Latitude of 50 Degrees, and that you Sail directly South 50 Leagues 'twill appear by your *Reckoning* that the Ship is at B, in the Latitude of 47 Degrees, 30 Minutes; but by your *Obſervation* the Ship is in the Latitude of 47 Degrees. Therefore to correct your *Dead Reckoning*, prick your Point in C under the ſame Meridian, and in the 47 Parallel according to your *Obſervation.*



If in Sailing *North* or *South*, the *Obſerv'd Latitude* is leſs than the *Latitude* by *Reckoning*, you muſt ſhorten your Diſtance in the ſame *Meridian* according to your *Obſerv'd Latitude.* As for Example,

Suppoſe you depart from A C in the Latitude of 50 Deg. and Sail South 43 Leagues, which is 2 Deg. 10 Minutes Difference by your *Reckoning*, it will appear you are arriv'd at D in the Latitude of 47 Deg. 50 Minutes; but if by your *obſerv'd* Latitude you find you are but arriv'd in the Parallel of 48 Deg. Prick your Point in F and not in D, becauſe your *Obſervation* ſhews an Error in your *Reckoning.* To Correct the *Dead* Latitude by your *Obſerv'd* Latitude when you Sail *Eaſt* or *Weſt* this Example will do. Admit that departing from B in the Parallel of 37 Deg. 37 Min. after having Sail'd 43 Leagues Weſt, you find by *Obſervation* you are in the Latitude of 47 Deg. To Correct your Courſe, take with your Compaſs on the *Meridian* the 43 Leagues Sail'd, and ſetting one Foot in B with the other, deſcribe an Arch which will cut the 47 Parallel, and the Point of *Interſection* at B will mark the Place of your Ship.

We cannot avoid ſaying a Word or two of *Sailing*, both *Plain* and *Mercator's.*

Plain Sailing is the Art of finding all the *Varieties* of a Ship's Motion on a *Plain* where all the *Meridians* are made *Parallel*, and the *Parallels* of *Right Angles* with the *Meridians*, and the *Degrees* of each *Parallel* equal to that of the *Equinoctial*, which, tho' notoriouſly falſe in itſelf, as ſuppoſing the *Earth* and *Sea* to be a Plain flat and each *Parallel* equal to the *Equinoctial*; yet by laying down Places accordingly, and breaking a long Voyage into many ſhort ones, a Voyage may pretty well be perform'd by it.

The *Chart* moſt in uſe among common *Navigators* is the *Plain Chart*, whoſe Degrees of Longitude and Latitude are made of the ſame Length; which, tho' it be very eaſie and uſeful in ſhort Voyages and will ſerve in the longeſt Voyages, if you Sail home in or near the oppoſite *Rhumb* you went by, yet becauſe few Places or indeed none but ſuch as lye under the ſame *Meridian* or under the *Equinoctial*, can be expreſs'd in it according to their true Situation and Diſtance, the Difference of Longitude will be falſe. If they be laid down by that Courſe and Difference of Longitude, then will the Diſtance and Difference be more than it ſhou'd be, and if they be laid down by their Diſtance and Difference of Longitude (which in many caſes is impoſſible) then the Difference of Latitude will always be too little, and the *Rhumb* too wide from the *Meridian.* And if they be laid down by their *Latitude* and *Separation*, then the *Courſe* will be *wide*, and the *Diſtance* too much, *&c.* and ſince Places, in particular *Charts*, being laid down in ſome one way, and in others another, and theſe Pieces many times tack'd together without due Conſideration of the differing Methods places have been laid down by. The *Geography* and *Hydrography* of the World, is ſo corrupted, that too many Deſcriptions of the whole or of the large Parts of it are enormouſly Erroneous, and the Shape of the Land much diſtorted. It were to be wiſh'd therefore, ſays my Author, that the World wou'd not put over much value on, but wean itſelf from the Uſe of the *Plain Chart*, and by making the true *Chart* eaſie and familiar, bring it in Reſpect and Uſe.

'Twas the great Study of our Predeceſſors to contrive ſuch a *Chart in Plane with* ſtrait Lines, on which all or any Part of the World might be truly ſet down according to their *Longitudes*, *Latitudes*, *Bearings* or *Diſtances.* A way was hinted for this near 2000 Years ago by *Ptolemy*, and a general *Map* according thereto, made in the preceding Age by one *Mercator*; but the Thing Demonſtrated, and a ready way ſhew'd of Deſcribing it was not known till Mr. *Wright* taught to enlarge the *Meridian Line* by the continual Addition of *Secants*, ſo that all the Degrees of *Longitudes* might be proportional to thoſe of *Latitude* as on the *Globe*; which he has done after ſuch an excellent manner, that in many reſpects 'tis far more convenient, for the *Navigator's* Uſe than the *Globe* itſelf, and will better ſhew the *Courſe* and *Diſtance* from *Place* to *Place* which way a Ship ſails or returns. This is call'd *Mercator's* Sailing, and is the Art of finding on a Plane the Motion of a Ship upon any aſſign'd Courſe true in Longitude, Latitude and Diſtance. The *Meridians* being all *Parallel*, and the *Parallels* of Latitude ſtraight Lines.

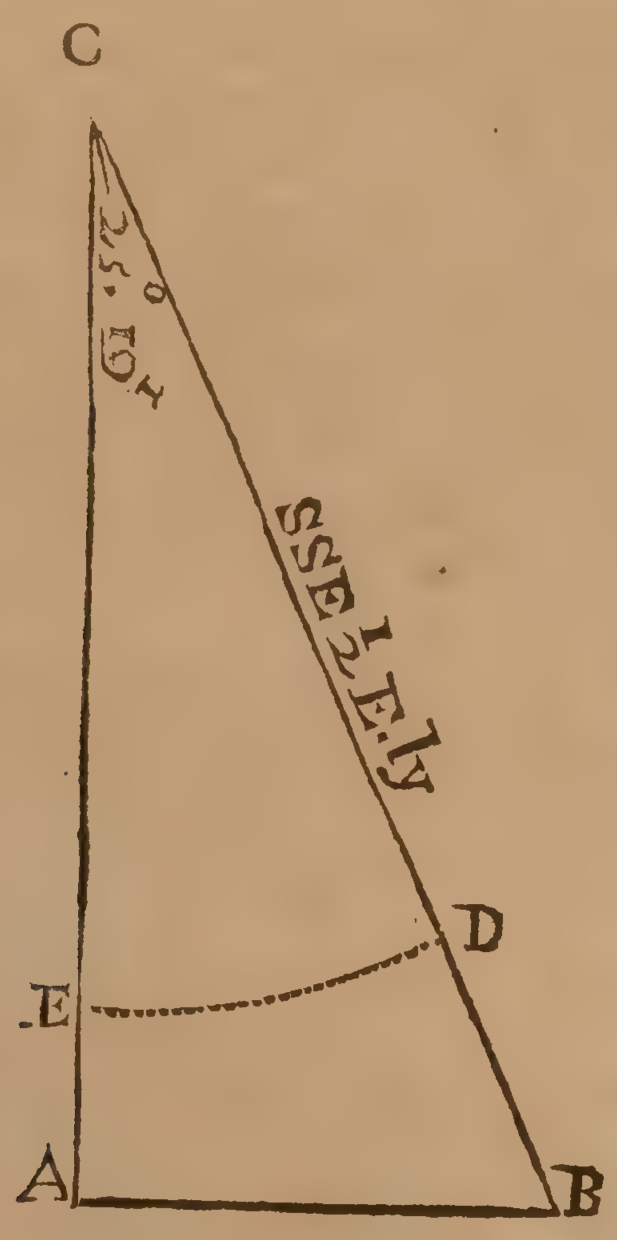
The Rumb or Courſe of a Ship is the Angle which ſhe makes in her Sailing with the *Meridian* of the Place where ſhe is. The *Complement* of the *Rhumb* is the Angle made with any Parallel to the Equator by the Line of the Ship's run. A *Rhumb* is alſo one Point of the Compaſs, or $11\frac{1}{4}$ Degrees, *viz.* the $\frac{1}{32}$ Part of the Circumference of the *Horizon* or *Compaſs Card*; which is the *Repreſentative* of the *Horizon.* A *Rhumb Line* is a Line deſcrib'd by the Ship's Motion on the Surface of the Sea, ſteer'd by the *Compaſs* making the ſame or equal

Angles with every *Meridian*. *Rhumbs* are Heliſpherical or Spiral Lines proceeding from the Point where we ſtand winding about the Globe of the Earth, till they come to the Pole, where at laſt they loſe themſelves; but in the *Plain* and *Mercator's* Charts they are repreſented by ſtraight Lines. Their Uſe is to ſhew the bearing of any Two Places one from another, that is upon what Point of the Compaſs any Shoar or Land lies from another. Having premis'd theſe Things, we will proceed to ſome Caſes in *Plain Sailing*, and *Mercator's*, refering the Reader to what has been ſaid before of both the one and the other.

In *Plain Sailing* it is imagin'd that by the *Rhumb Line*, *Meridian* and *Parallel* of Latitude, there will always be form'd a *Right Angled Triangle*, and that ſo poſited as that the Perpendicular may repreſent Part of the Meridian or North Line, South Line containing the *Difference* of *Latitude*. The *Baſe* of the *Triangle* repreſents the Departure, and the *Hypotheenuſe* the *Diſtance Sail'd*. The *Angle* at the Top is the Courſe, and the *Angle* at the Baſe the *Complement of the Courſe*, any Two of which with the *Right Angle* being given; the *Triangle* may be protracted, and the other Three Parts found. As

Suppoſe, *The Courſe and Diſtance given to find the Difference of Latitude and Departure from the Meridian.*

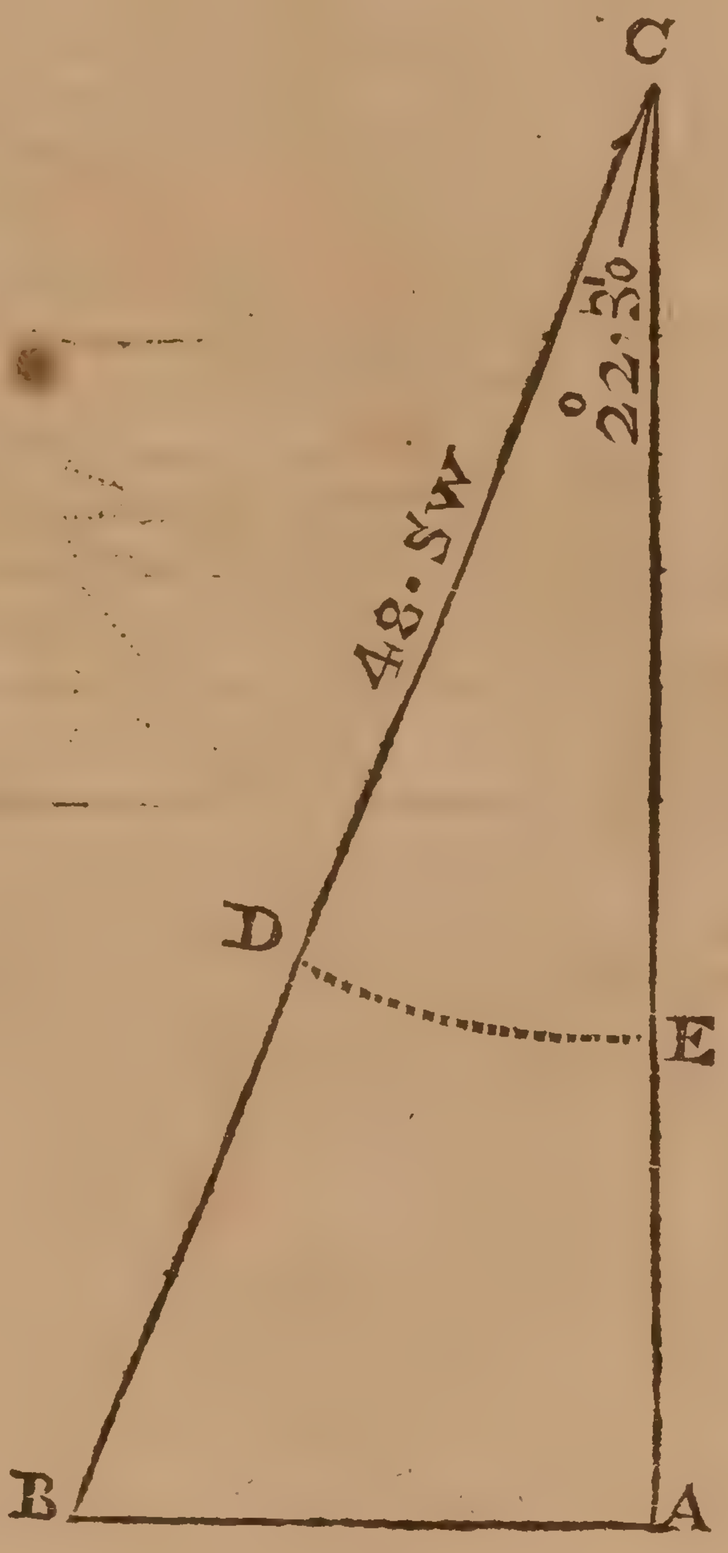
Admit a Ship from the Latitude 50°, 10′ North, Sails S S W 48, 5 Miles. I require the Latitude ſhe is in, and her Departure or Separation.



Draw A C the South and North Line, and with 60 Degrees from the Line of Chords (a Chord in Geometry is a Right Line connecting the Extremities of any Arch of a Circle) from C (becauſe the Ship Sails Southward) deſcribe D, E, which make equal to 22 Degrees 30 Minutes the Courſe, and draw C, B, which make alſo equal to 48. 5 from any Line of equal Parts. Then let fall from B, B A Perpendicular to the Meredian, ſo is the Triangle compleated, and the Lines C A B A may be meaſur'd from the ſame Scale. This is to be done alſo by *Logarythms* and *Gunter's* Scale. *Logarythms*, as defin'd by Captain *Halley*, are *Indexes* of the *Ratio* of Numbers one to another. They were firſt invented by the Lord *Nepper*, a *Scotch* Baron, and compleated by Mr. *Henry Briggs*, Savilian Profeſſor of Geometry at *Oxford*. They are a Series of Artificial Numbers, invented for the Eaſe and Expedition of Calculation, proceeding in an Arithmetical Proportion as the Numbers they anſwer to do in a Geometrical one; but we rather Deſign to ſhew a Gentleman what he is to learn towards acquiring this Science than pretend to teach it him; the ſame we do by the others, our limits being too confin'd to expatiate on Things ſo much as is neceſſary for compleat Inſtruction. *Gunter's* Scale, call'd by the common Seamen the *Gunter*; is a large *Plain Scale* with the Lines of Artificial Signs and Tangents, fitted ſo to a Line of Numbers, that they can by the Compaſſes work all Queſtions in *Navigation* and *Dialling*, &c. with tolerable Exactneſs if the Scale be large and good. To return to our *Plain Sailing*,

2. *The Courſe and Difference of Latitude being given to find the Departure and Diſtance ſail'd.*

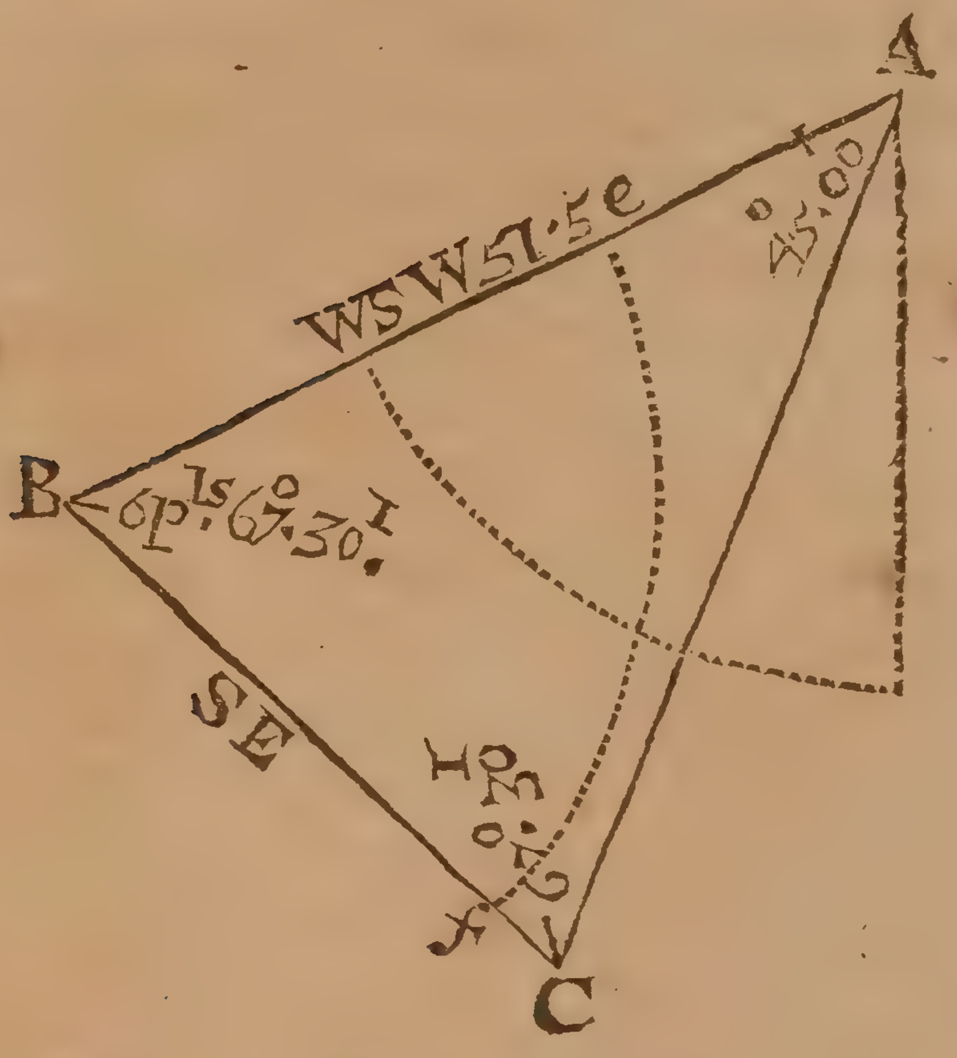
Admit a Ship to Sail from Latitude 48 Degrees 30 Minutes S S E ¼ Eaſterly till ſhe be in Latitude 47 Degrees 21 Minutes. I demand the Departure and Diſtance ſail'd.



Draw the North and South Line C A, and ſubſtracting the Latitudes one from another, it leaves 69 Minutes for their Difference, make C A equal to 69 from the Line of equal Parts; from C with 60 Degrees from the Line of Chords deſcribe D E which make equal to 25 Degrees 19 Minutes, draw C D, and raiſe the Perpendicular A B which compleats the Triangle B A C, whoſe requir'd Parts may be meaſur'd by the Scale. We cannot give more Examples in theſe Caſes; but ſhall only repeat ſome Heads. 3. *The Difference of Latitude and Diſtance ſail'd, given to find the Courſe and Departure.* 4. *The Diſtance run, and Departure from the Meridian given to find the Courſe and Difference of Latitude.* 5. *The Difference of Latitude and Departure, from the Meridian given to find the Courſe and Diſtance.* 6. *The Courſe and Departure given to find the Diſtance and Difference of Latitude.* Theſe are the uſual Caſes of Plain Sailing; which are all to be perform'd by the Knowledge of *Rectangled Plain Trigonometry*.

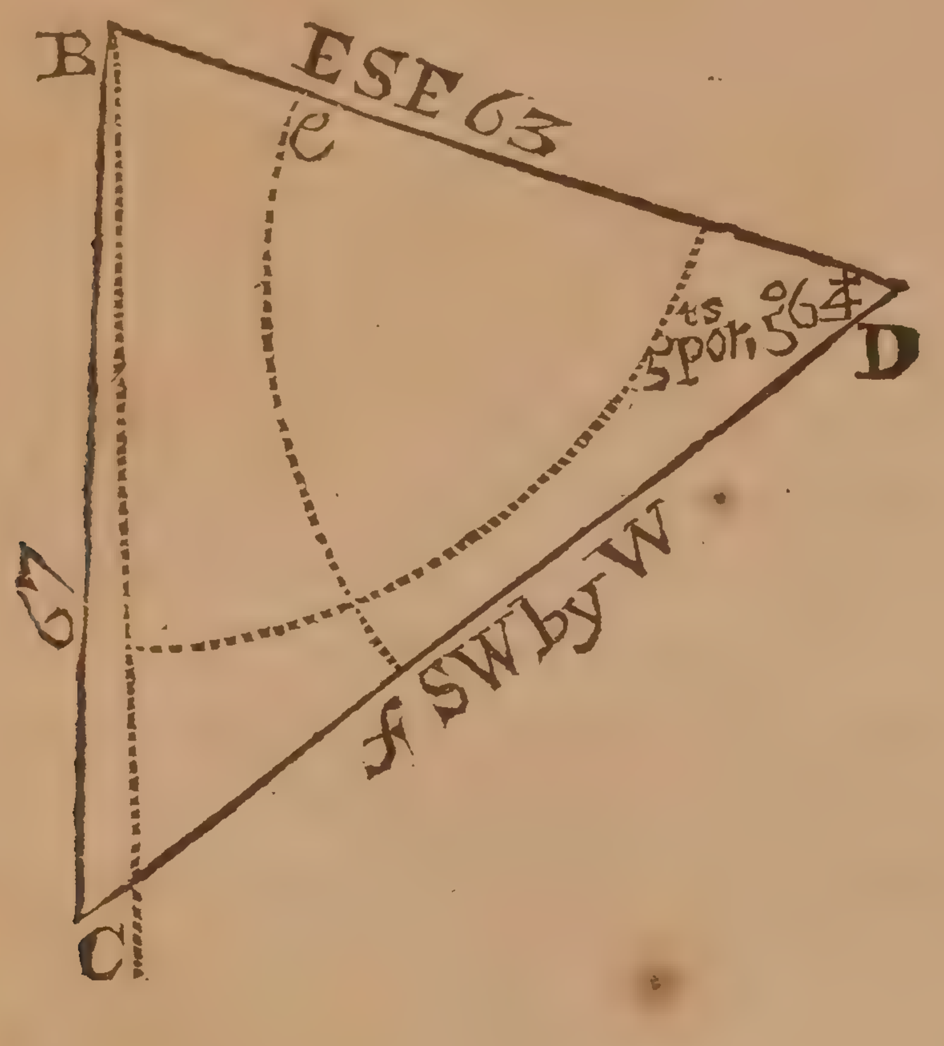
The Doctrine of *Oblique Plain Triangles* is not of ſuch neceſſary Uſe in *Sailing* as that of Right Angled ones is. However we ſhall inſert Two or Three of the moſt uſeful Caſes of it.

Coaſting along the Shoar I ſee an Headland C bearing off me S. S. W. and Sail W. S. W. 51, 5 Miles to B, and then the Headland C bears S. E. from me. I demand my ſeveral Diſtances to the Headland.



From A draw a S. S. W. Line as A C, and a W. S. W. Line as A B, and make A B = 51. 5 Miles, then from B with 60 Degrees of the Chords deſcribe e f, which make equal to 6 Points and draw B f.

A Ship in the Parallel of 46 Degrees North at B, deſcries a Headland at C, diſtant from her 67 Miles; ſhe Sails E. S. E. 63 Miles to D, and then the Headland at C bears S. W. by W. from her. How did the Headland bear from the Ship when ſhe was at B, and how far is it diſtant from her now ſhe's at D?



From B draw an E. S. E. Line B D, which make equal to 63, and from D with 60 of the Chords decribe e f, which make equal to 56° 15′ draw D f e, then from B with 67 Miles croſs D C in C, and draw B C.

We are in the next Place to add ſomething of *Mercator's* Sailing.

To find the Meridional Miles anſwering to any Difference of Latitude. Firſt, By the Table of *Meridional Parts*, which are Printed in moſt Books of Navigation, find the Degrees of either Latitude over-head, and the Minutes in the Left-hand Column downwards, and in the Angle of Meeting are the Parts for that Latitude. Thus alſo are found out the Parts for the other. Then if both Latitudes be of the ſame Name, that is both *North* or both *South*, ſubſtract theſe one from the other, and that Remainder contains the Meridional Miles ſought: If of different Names add them together. As in Example.

Example I.

Requir'd to find the Meridional Miles between Latitude 43°, 15′ North, and 50°, 20′ North.

$$\begin{array}{l}\text{Lat. } 50^\circ, 20' \text{ North} \text{———} \\ \text{Lat. } 43, 15 \text{ North} \text{———}\end{array}\left.\begin{array}{r}35057\\ \underline{28837}\end{array}\right\}\text{Merid. Part.}$$

$$\text{Merid. difference of Lat.} — 6220$$

Example II.

$$\begin{array}{r}\text{Let one Lat. be } 20^\circ, 19' \text{ S.} — \\ \text{The other } 18, 53 \text{ N.} —\end{array}\left.\begin{array}{r}12423\\ \underline{11541}\end{array}\right\}\text{Mer. Part.}$$

$$\text{Merid. Difference of Lat.} \text{——} 23964$$

The Latitudes and Differences of Longitudes of two Places given to find the Courſe and Diſtance between them.

Admit the Courſe and Diſtance between the *Lizard* in Latitude 50°, 10′ North, and *Antego* in Latitude 17°, 25 North, whoſe Difference of Longitude is 50°, 15′ Weſt, requir'd.

$$\left.\begin{array}{l}\text{From } 50^\circ, 10'\\ \text{Subſt.} \underline{17, 25}\end{array}\right\}\text{N. L.}\left\{\begin{array}{l}\textit{Liz.}\\ \textit{Ant.}\end{array}\right\}\text{M. P.}\left\{\begin{array}{l}3490\\ \underline{1060}\end{array}\right.$$

$$\begin{array}{lr}32, 45 & \\ \underline{60} & 2439 = \text{to M. D. L.}\end{array}$$

$$1965 = \text{Diſt. La. Diſt. Lo.} = 54^\circ, 15' = 3255 \text{ M. W.}$$

The Latitude and Courſe given. The Diſtance, Difference of Longitude and Departure requir'd.

Example.

Sailing from the *Lizard* Latitude 50° 10′ North, and the Courſe being 53°, 16′ Weſterly, (Variation and Leeward Way, *&c.* allow'd for) or S. W. 3/4 W. near, and finding by Obſervation the Ship to be in Latitude 17°, 25′ North, What's the Diſtance run, Departure and Difference of Longitude

$$\left.\begin{array}{l}\text{From } 50^\circ, 10'\\ \text{Subſt.} \underline{17, 25}\end{array}\right\}\text{N. Lat.}\left\{\begin{array}{l}\textit{Lyzard}\\ \textit{Obſerv'd,}\end{array}\right\}\text{M. Part.}\left\{\begin{array}{l}3490\\ \underline{1060}\end{array}\right.$$

$$\text{Rem. } 32, 45 = 1965 \text{ Diſt. Lat. M. Diſt. Lat. } 2439$$

Diſtance what,

As the Sine of the Courſe? Rad. Dif. Lat. Diſt. and 36°, 44′ : S. 90°, 00 :: 1965. 3285.

Departure what,

Rad. Mer. Diſt. Lat. :: T. Courſe Diſt. Long. T 45 : 2439 Min. :: T. 53°, 16′, 3255 Min.

Having touch'd upon *Plain Sailing* and *Mercator's Sailing*, we muſt now ſpeak of *Traverſe* in Navigation, which is the Variation and Alteration of the Ship's Courſe upon the Shifting of Winds, *&c.* It muſt be noted, that in Sailing, in reſpect of the Wind, is either *before a Wind*, *by a Wind*, or *Largeing.* If a Ship Sail by or againſt a Wind, there ought to be an Allowance for the *Lee-Way*, and that more or leſs according to the Growth and Surge of the Sea, Mould of the Ship, and Sail ſhe bears, *&c.*

Example.

A Ship being bound to the Eaſtward, and finding the Wind variable, a ſmall Gale and ſmooth Water, plies upon theſe ſeveral Courſes with the Diſtances on each Courſe, as follows:

The Larboard tack on board, Wind from S. S. W. to S. and ſo to S. S. E. and E.

	Miles.
South-Eaſt and by Eaſt, half Eaſterly	5
Eaſt-South-Eaſt	4
Eaſt-by-South	7
Eaſt, half Northerly	3

The Starboard tack on board, the Wind S. E. E. S. E. E, *&c.*

	Miles.
South-South-Weſt	5
South-by-Weſt	6
South	4
South-South-Eaſt	7
South-Eaſt-by-South	3

The direct Courſe and Diſtance from the Firſt Place of Departure is requir'd.

The Work by Traverſe Table.

Courſe.	Points.	Diſtance.	North.	South.	Eaſt.	Weſt.
S. E. by E. ½ Eaſterly.	5½	5		2.36	4.41	
E. S. E.	6	4		1.53	3.70	
E. by S.	7	7		1.37	6.86	
E. ½ Northerly.	7½	3	29		2.98	
S. S. W.	2	5		4.62		1.91°
S. by W.	1	6		5.88		1.17
S.	0	4		4.00		00.0
S. S. E.	2	7		6.47	2. 8	
S. E. by S.	3	3		2.49	1.67	
			29	28.72	21.70	
				29	3.08	
Summ				28.43	18.62	

Having ſet down the ſeveral Courſes and Diſtances, then in the *Traverſe Table* find the Courſe in the Head of the Table, if under Four Points, but at the Bottom if above Four Points; and look the Diſtance in the Left-hand Column, and in the *Square* Meeting will be the Difference of Latitude and Departure under the reſpective Titles. Thus above 5½ Points, and right againſt 5 M. I find over Title Dif. Lat. 2,36 M. in the Difference of Latitude, and over Dep. 4.14. the Departure in the Firſt Courſe, which being plac'd in their Proper Columns, according as they are *Northing* or *Southing*, &c. Proceed in the ſame manner with all the other Courſes or Diſtances, Entring and Correſponding Differences of Latitude and Departures in their Columns; then add up the Columns of Difference of Latitude and Departure, Subſtracting the leſs Difference of Latitude from the greater, and the leſs Departure from the greater, and the Remainders are the whole Difference, Latitude and Departure ſhe has made from the Place of her Departure: So in this Example ſhe's 28° 43′ to the South of the Place of her Departure, and 18° 62′ M. Eaſt, by which I find her Courſe is S.E.by S. Southerly, and Diſtance 34° 5′ M.

It will not be look'd for from us to qualifie a Gentleman in ſuch a ſhort Eſſay to Commence Captain of an *India Man*; and if we cou'd teach him much more, he wou'd hardly truſt himſelf over the *Humber* with his Science. Before we proceed further, we ſhall treat of the Ship's Fabrick. A Ship ought to be built of Wood that will long endure the Water, and whoſe uſeleſs Moiſture is conſum'd with Fire, Pitch'd and defended from Corruption. It muſt be ſo ſhap'd as to be apt for a Quick Motion, and to be mov'd with a ſmall Power. There are ſeveral ſorts, as

Men of War, call'd by the *Spaniards*, *Galleons*, by the *Portugueſe*, *Carracks.*

Theſe are of all Burthens, from 2000 to 200 Tuns. The leſs ſort are term'd alſo

Frigats, and ſo are Merchant Ships Square Stern'd.

Fly-boats differ from theſe in being built rounder and bellying out a-Stern with a narrow Top.

Flutes are large *Fly-boats.*

Caraveles are little *Fly-boats* with 4 Triangular Sails very much us'd on the *Mediterranean.*

A *Hoy* is a ſmall Ship or Bark whoſe Yards are not a Croſs nor the Sails Square, but like a Mizen, and ſo ſhe can lie nearer the Wind than a Veſſel with Croſs Sails.

A *Ketch* is a ſmaller Veſſel of this Kind.

Galleys are flat and very long, with 20 or 30 Oars of a Side, and 4 Men to an Oar. *Galeaſſes* have 50 Oars of a Side, and are moſt us'd by *Spaniards.*

Shallop is a Small light Veſſel with only a ſmall Mainmaſt and Foremaſt, and *Lugg* Sails to hale and let down upon occaſion. They commonly are good Sailors, eſpecially the *French Shallops*, and are often us'd as *Tenders* on *Men of War.*

As to *Pinnaces*, *Long Boats* and the ſmaller *Craft*, we ſuppoſe they are too well known to need any further Explanation. Something might be ſaid of *Ship-Tackling* and *Sea-Terms*, but the *Sea-Dictionaries* are ſo Copious and Perfect in this Matter, that 'twould be in vain for us to pretend to refine upon them or to abridge them in our Compaſs. We might here Treat of the Lading of Ships and their Drawing Water, which for our wonted Reaſon muſt be omitted.

We ſhall add a few things which are not ſo difficult, relating more to the *Theory* than the Practice of Navigation; and herein ſpeak of the Winds, not *Phyſically* but *Nautically*, If we may be allow'd the Expreſſion. The Ancients had no Notion of any Wind's being fair for a Ship, but what was in her Stern, or at leaſt very little contrary; and we read in Hiſtory that the Famous *Genoeſe* Admiral *Andrew Doria* was thought a Conjurer by the Mariners of the *Black Sea*, when they ſaw him Sailing towards them with a Wind almoſt in his *Teeth*. The *Rhumbs* or 32 Points of the Compaſs, are of admirable Uſe in this; for a Ship may Sail towards the ſame Place with 20 or 21 of them. And 'twou'd be aſtoniſhing

ing to think that a Wind which is quite contrary to a Ship, ſhall not hinder her advancing, if we did not know that ſhe can ſhift her Courſe ſometimes to one ſide ſometimes to another, to take hold of the faireſt *Rhumb*. By this means a Weſterly Wind makes a Ship's Way Northerly or Southerly, as well as an Eaſterly; and Ships are every Day in the *Streights* ſeen on contrary Courſes with the ſame Wind. A Mariner may, as has been hinted, make uſe of 21 Winds out of the 32 to follow the ſame Courſe. If he wou'd Sail Northwards all Winds are fair for him from South Eaſt ¼ Eaſt to South Weſt Quarter Weſt. People generally think the Wind that's full a-Stern is the faireſt; but Sailors prefer a Side Wind to it, as if a Ship was bound to the South, a North Eaſt or North Weſt Wind wou'd do better than one full North, which wou'd be full a-Stern. The Reaſon is, ſhe can then hardly make uſe of any but her *Main-Sail*, whereas with a Side Wind all the Sails are uſeful which do not hinder one another. In Stormy Weather *ſhifting a Rhumb* is not Practicable, becauſe the *Sails* are furl'd and the Ship lies by. There are Certain Regular Winds call'd *Trade-Winds* by ſome, Winds which blow always, or almoſt always, one Way. In the *Torrid Zone* the Wind is almoſt always Eaſterly, for which Reaſon when the *Spaniards* Sail for *America* they go to the *Canaries*, and deſcend far into the *Torrid Zone* to take in the Eaſterly Wind. They do the ſame when they Sail from *Peru* to the *Philippine Iſlands*; they touch at *Aquapulco* on the Coaſts of *New Spain*, where the Wind is fair to carry them to the *Iſles of Thieves*, to the Eaſt of the *Philippines*, where they arrive with the ſame Wind. When they return they aſcend higher than the *Iſles* of *Japan*, towards 40 Degrees Latitude, from whence they Sail towards the *Coaſts* of *Mexico*; for commonly they meet with a North Weſt Wind which carries 'em to *California*, and from thence they return to *Aquapulca*. Between the *Molucca Iſlands* and the *Peninſula* of the *Ganges* in the *Indian Sea* the Wind is generally Eaſt from *June* to *October*, and all the reſt of the Year 'tis moſt commonly Weſterly. There are certain Regular Winds which the *Indians* call *Manſons*, and we *Monſoons*. Whether they took it firſt from us or we from them, is not much to our Purpoſe. Theſe *Monſoons* reign between *Java* and *China*, blowing between the South-Eaſt and the North-Eaſt from the Beginning of *September* to the End of *March*. The reſt of the Year they are Weſt or South Weſt towards the Streights of *Molucca*. The *Monſoon* is Northerly from *November* to *April*, and Southerly from *May* to *Auguſt*. On the Coaſt of *New England*, &c. the North-Eaſt Wind begins about the End of *November* and laſts to the End of *March*; then the South-Eaſt ſucceeds during the Spring and Summer, and ſometimes the North-Weſt, but does not ſtay long. On the *Mediterranean* an Eaſterly Wind blows generally from Morning to Noon, and then a Weſterly commonly ſucceeds it.

The Seamen in their Navigation have ſeveral Preſages of *high Winds, Rain and Storms*. When they ſee a *Whitiſh Circle* round the *Sun* they expect foul Weather; When they obſerve a *Red Cloud* in the Horizon when the *Sun* Riſes or Sets, the Wind, if their Prognoſtick is good, will be in that Corner. When the Rays of the Sun are Red when it Riſes, 'tis a Sign of Wind; if a Blemiſh or Black Cloud encircles the Sun when it Sets, they look upon it as an infallible Sign of a Storm. When the *Sun* looks Pale at its Riſing it betokens Rain; if at its Setting, Wind. When 'tis Red all over at its Setting, High Winds are to be fear'd for ſeveral Days. When it Riſes Clouded, and darts its Rays below the Cloud, it preſages Rain; if thro' the Middle, Storms with Rain. When the Clouds gather from all Parts about the Sun, 'tis a Sign of a Storm. The Fifth Day of the Moon is thought by them to be more Subject to Storms than any other. When a *Spot* is in her upper Horn, they ſay 'tis a Sign of Rain; If ſhe do's not appear the Fourth Day, and the Wind is Southerly, they expect bad Weather all that Moon; when ſhe has a Whitiſh Circle round her it Prognoſticates Rain; when there are ſeveral, and her Body appears *Reddiſh*, 'tis a Token of a Storm. They expect a Terrible Tempeſt when the Sea looks blackiſh; and if the Water bubbles, and the Waves ſwell on a ſudden 'twill be a long one; when Porpoiſes and other Sea-Fiſh play above Water, it foretells a Storm; when Swallows fly low it preſages Wind and Rain. My Author has not been pleas'd to give me one Reaſon on which any of theſe Prognoſticks are grounded but the laſt, and that he ſays is, becauſe the Wind drives down the Flyes on which the Swallows live, and forces 'em to come to the Surface of the Water.

All the reſt depend on the Arbitrary Judgment of the Rude Sailor: However, ſince Experience in theſe Caſes qualifies Perſons to Judge, as well as all the Knowledge of *Phyſicks* wou'd do, we cannot think theſe Preſages are not to be minded, or that they may not be of Uſe at Land, if the Places have ſufficient Communication with the Sea.

We ſhall in the next Place diſcourſe of the *Currents* to be met with in the Sea, of which Navigators ſhould be very well inform'd. We do not intend to treat of 'em as they are a Branch of Natural Philoſophy, having treated of Tides already. Mariners tell us there's a General Current that runs from the *Poles* to the *Torrid Zone*. They alſo affirm there's a General Current from Eaſt to Weſt in the Torrid Zone, and judge of it by the vaſt way they make in 24 Hours, which ſome attribute to the Wind. But it has been obſerv'd often, that in Sailing from *Peru* to the *Molucca's* with a good Wind, has taken up but 3 Months, whereas it has requir'd 5 or 6 to return the ſame way with as good a Wind. 'Twou'd be very uſeful if Mariners kept Journals of the Currents they meet with in the Sea, with Remarks of the Circumſtances attending them. We have read of the following: In the Sea of *Petzora* to the North of *Muſcovy*, are Currents that go Eaſt ¼ North, from the Iſle of *Kolgoy* by the Streight of *Weigatz* to the Mouth of the River of *Oby* in the Gulph between *Tartary* and *Nova Zembla*. In this Gulph are Great Iſlands of Ice, very dangerous to Navigators who ought to avoid 'em carefully. There's another from the North Cape which comes from the North-Weſt all along the Coaſts of *Muſcovite Lapland* to the Mouth of the *White Sea*. There are Rapid Currents along the Coaſts of *Arabia* in the Ocean, and towards the End of *September* you meet with Great Tides and Eaſterly Winds beating in on the *Red Sea*, at which time Ships cannot eaſily get out of the Gulph.

In an *India Voyage* a Ship ſhou'd not come within 100 Leagues of the *Maldives* Iſle, for the Currents are very ſtrong and the Sea full of Rocks the nearer you approach them. To the North-Weſt of *Gilolo* are extraordinary Currents, particularly in the Streight of *Caldera*: They run ſometimes Northward, ſometimes Southward, and with ſuch Violence that they have broken a Cable of 27 Inches about, of a Ship lying at Anchor. On the Coaſt of *Guinea* the Current always runs Eaſt-North-Eaſt in the Gulph of *Benin*, ſo that if you wou'd go to the Gold Coaſt you can't keep too much to the South. To the North of *Madagaſcar* you meet with a Current which carries you Northward to the Cape of *Guardafuy* on the Coaſts of *Ajan*. And from the Bay of St. *Auſtin* in the Southern Part of that Iſle, there's another Current which runs from North-Weſt to South Weſt as far as the Cape of *Good Hope*, which is the Reaſon that *Europeans* are ſo hard put to it to double this *Cape*. There's a ſtrong Current in the *Mediterranean* from the Streights of *Gibraltar* all along the *Barbary* Shoar to the Bottom of the Gulph of *Lajazzo* in *Aſia*. Our Author having carry'd us thus far wou'd ſtop us with an Account of the Diſeaſes to which Mariners are Subject, but he tells us nothing new; what we call *Sea Sickneſs* and *Scurvy* are ſo well known, that he might have ſpar'd himſelf the Pains of treating of them as we ſhall do.

Of all the Sciences we treat of, tho' this is of the Laſt Importance to the Publick Good in advancing of Commerce; yet Gentlemen generally preferring *Freſh Water* to *Salt*, and ſeldom venturing themſelves farther than Fiſhermen, we ſhall ſay no more of it. Thoſe who are deſirous to be Maſters of it are referr'd to *Hodgſon's* Navigation, and the *Gentleman's Dictionary* will interpret all the Sea-Terms to Satisfaction.

DYALLING.

SINCE theſe *Eſſays* are intended for the Entertainment of Gentlemen, it will not be improper to give them a ſhort Hiſtorical Account of an *Art* which is little known or ſtudy'd. The Firſt *Sun-Dial* that was ſet up in *Rome* was by *Papyrius Curſor*, about the Year of the City 447; before which, *Pliny* tells us, there's no mention of any Account of Time, but of the *Sun's* Setting and Riſing. This *Dial* was erected in the Temple of *Quirinus*, more for Ornament and Novelty than Uſe, for it did not go Right. About 30 Years after this, as we are inform'd by *Varro*, M. *Valerius Meſſola* being Conſul, brought out of *Sicily*, from the taking of *Catana*, another *Dial* which he ſet up in a Pillar near the *Roſtrum*, but for want of its being made for that particular Latitude it cou'd not go true; however it was us'd 11 Years. And then *Martius Philippius*, who was Cenſor with *L. Paulus*, ſet up another that was more exact. The *Greeks* were a long time without *Clocks* or *Dials*; ſome attribute the Invention of *Sun-Dials* to *Anaximenes Mileſius*, and ſome to *Thales*. *Vitruvius* mentions many kinds of *Dials*, as one invented by *Beroſus* the *Chaldæan*, which was in a *reclining Plane*, Parallel almoſt to the Equinoctial; on this was an half Circle, and then 'twas call'd *Kemicyclus*. *Ariſtarchus Samius* found out the Hemiſphere Dial, and there were ſome Spherical ones with a Needle for a *Gnonon*. The *Diſcus* of *Ariſtarchus* was an Horizontal Dial with its Line rais'd up all around to prevent the Shadow from extending itſelf too far. Having ſaid thus much in favour of Antiquity we muſt do ſo much Juſtice to the Moderns as to ſay, that whatever they knew of this *Art* was very imperfect in Compariſon of the Progreſs lately made in it, now it is reduc'd to Rules, and defin'd to be

The Art of Deſcribing Hour Lines truly on any given Plane, ſo as thereby to ſhew the Hour of the Day when the Sun ſhines.

The *Art* of *Dyalling* is founded on this Suppoſition, That the whole Earth is but a Point in Compariſon of the *Magnus Orbis*, or the Sphere of the Sun's Motion round it (or of it round the Sun) and therefore the *Hour Lines* drawn on any *Plane* are in effect the ſame with theſe *Right Lines* produc'd by the mutual Interſection of a great *Circle* of the *Sphere* Parallel to the *Plane* of the *Dial*, and to the *Planes* of the ſeveral *Hour Circles*. For the *Plane* of every *Dial* is *Parallel* to ſome greater *Circle* of the *Sphere* which is as far from the *Plane* of the *Dial* as is the Point aſſign'd from the *Apex* or *Point* of the *Stile*. The Situation therefore of the *Plane* is the firſt Thing to be conſider'd, and this properly ſpeaking is only in reſpect of the *Horizon* or the *Meridian*.

In reference to the Horizon, if a Plane be exactly Parallel to it, it is call'd an *Horizontal Plane*; and the *Dial* drawn on it an *Horizontal Dial*. If the Plane be perpendicular to the Horizon, as all thoſe of Walls are ſuppos'd to be, the *Dial* deſcrib'd on it is call'd a *Direct Mural Dial*. If the *Plane* be *Oblique* to the *Horizon*, it either hangs over towards you making an *Acute Angle* with it, and then it is call'd an *Inclining Plane*, or elſe it falls of backward from it, making an *Obtuſe Angle* with it, and then 'tis call'd a *Reclining Plane*; and if it reclines back equal to the *Complement of the Latitude* off that Place, it lies in the *Plane* of the *Equinoctial*, and is therefore call'd an *Equinoctial Dial*.

In reſpect of the *Meridian*, a Plane is either *Direct* or *Declining*. The Plane of a Dial is *Direct* when it reſpects one of the Four Cardinal Points directly, or when 'tis either Parallel to the *Meridian* as are all *Direct Eaſt* or *Weſt Dials* (which therefore are properly call'd *Meridional*) or Perpendicular to it, as are all *Direct*, *Erect North* and *South Dyals*; which becauſe they lie in the Plane of the *Prime Vertical Circle* are rightly call'd *Vertical Dyals* by moſt Authors.

The *Plane* of a *Dial* is declining when it is not directly oppoſite to any of the Four Cardinal Points, but declines or deviates ſome way from the *Meridian* or the prime *Vertical* Circle.

The Fundamental Scheme for *Dyalling* is the Projection of the Sphere on the Plane of any particular Horizon. This Projection of the Sphere is a true *Geometrical* Delineation of the Circles of the Sphere, or any aſſign'd Parts of 'em on the Plane of ſome one Circle as on the *Horizon*, *Meridian*, *Equator*, *Tropick*, *&c.*

Dial Planes are Plane Superficies on which the *Hour Lines* are drawn in any Latitude, and may be diſtinguiſh'd into Parallel, Perpendicular and Oblique according to their Poſition with reſpect to the Horizon of the Place, where they are.

Parallel Planes or *Dials* are ſuch as lie level with the *Horizon*; of which we have ſpoken before.

A Dyalling Globe is an Inſtrument made of Braſs or Wood with a Plane fitted to the *Horizon*, and an *Index* particularly contriv'd to draw all ſorts of *Dials*, and give a clear Demonſtration of that Art.

HOROLOGY, or DYALLING

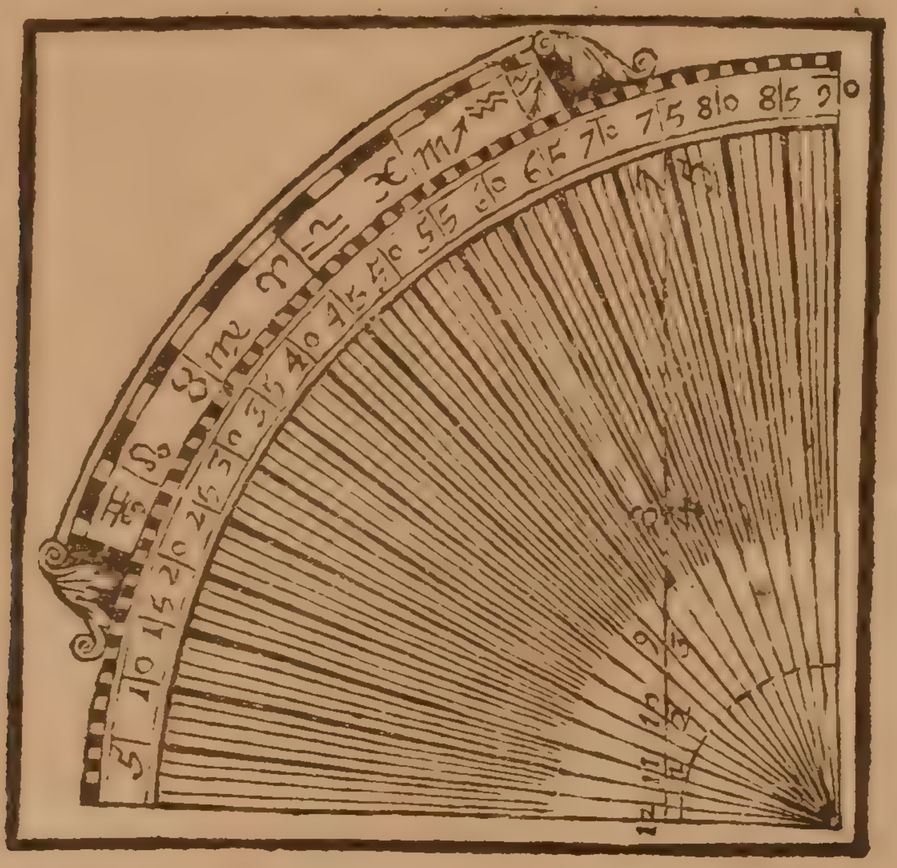
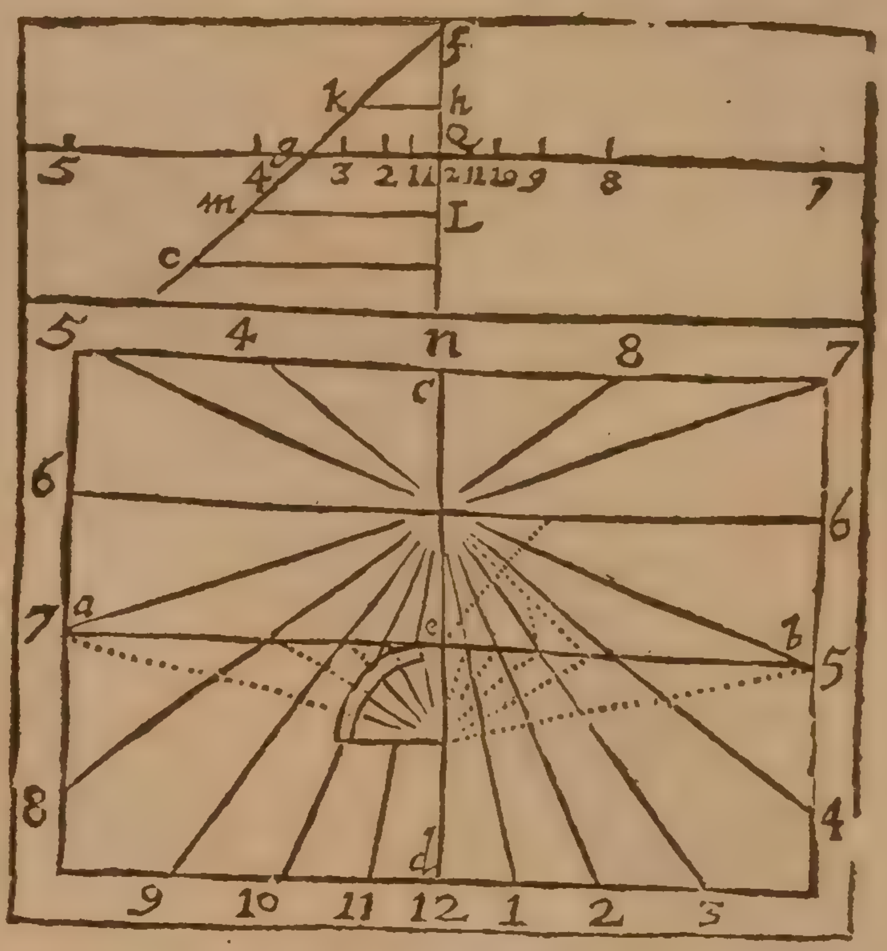
A *Dyalling Sphere* is an Inſtrument made of Braſs, with ſeveral *Semi-Circles* ſtanding over one another on a moving *Horizon*, to demonſtrate the Nature of the *Doctrine* of *Spherical Triangles*, and give a true Idea of *Drawing Dyals* on all manner of *Planes*.

Such as wou'd go ſo far into this Art as to erect a Dyal muſt firſt underſtand the *Elevation of the Pole*, or *the Height of Degrees*, that the Pole in any Latitude appears above the Horizon by which he is to determine of the *Center* of the *Hours* and the *Altitude* of the *Style*, which is the Line whoſe Shadow on the Plane of the Dial ſhews the true *Hour Line.* This is always ſuppos'd to be a Part of the *Axis* of the *Earth*, and therefore muſt be ſo plac'd as that with its Two Extream Points it ſhall reſpect the Two *Poles* of the *World*, and with its upper End the *Elevated Pole.* This Line is the upper End of the *Cock*, *Gnomon* or *Index*. He muſt alſo know how to find out the *Meridian Line* to place the *Dyals Meridian Line* exactly under the *Meridian* of the Place aſſign'd. We have mention'd this *Meridian* already in *Aſtronomy*. He muſt have a Rule and Compaſs, and an *Aſtronomical Quadrant* where the Degrees are exactly and accurately divided by the Help of a Screw on the Edge of the Line fitted with Teleſcopes, and either apply'd to a Wall in the Meridian, or on a ſtrong *Axis* or Pedeſtal with Two Semi-Circles plac'd at *Right Angles* on Two endleſs Screws; which readily directs the Inſtrument to take Obſervations of the Sun, Moon or Stars. This Quadrant muſt be rightly divided into 90 Degrees, and the Horary Line and Points deſcrib'd according to the Scheme.



For the Deſcription of the *Hours*, there are commonly preſuppos'd Two *Right Lines* cutting each other croſs ways to *Right Angles*; of which the one is the *Meridian Line* or Line of the 12th Hour, the other the *Occult Line* which cuts the firſt croſs ways to *Right Angles.* This is call'd by ſome the *Line* of *Hours*; others the *Equinoctial Line*.

All Aſtronomical Hours are diſtinguiſh'd proportionably among themſelves by an Interval of 15 Degrees; becauſe in the ſpace of Five of theſe Hours the Sun runs 15 Meridians. A *Plain Line* is neceſſary in the right placing of the *Dyal* to examine whether it be Parallel to the Horizon or Perpendicularly Vertical, when the Horary Points are to be firſt deſign'd; for which this Scheme will be an Example.



Draw the Line *a*, *b*, which is to be the *Meridian* Line, and that *Obſcure Line c*, *d*, which is to be the *Equinoctial*, and expung'd as ſoon as the *Dyal* is finiſh'd, transfer the Horary Points from the Aſtronomical Quadrant by the Help of the Compaſs to the Equinoctial Line. The *Morning-Hours* are drawn to the Right Hand. In the Equinoctial Line are only found of the *Morning-Hours*, 11, 10, 9, 8, 7; of the *Evening* only, 1, 2, 3, 4, 5. This is call'd an *Horizontal Dyal*, or one whoſe *Plane* lies Parallel to the *Horizon* of the Place; and there are ſeveral Methods of them. As the following, which is taken from a Modern Author of the beſt Authority. You muſt always have the Heighth of the Pole given which is equal to the Heighth of the *Style*, by the Help of which you may find the Hour's Diſtance from the Meridian by the following Propoſition.

As the Radius is to the Line of the *Style's Height*, ſo is the Tangent of the Hour (or Angle at the Pole) to the Tangent of the Hour's Diſtance from 12 (or the Hour Arch).

Example.

Suppoſe an Horizontal Dyal was to be drawn for the Latitude of 51 Degrees 32 Minutes. Firſt find the Diſtance of the Hours 1 and 11 from the Meridian according to the preceding *Canon*.

Thus,

To the S. of the Style's Height 51°,32—9,893745
Add the Tangent of the Hour 15.00—9,428052

Sum Rad. = T of the Hour Arc. 11°,50'—19321797

Which is the Diſtance of 1 and 11 from the Meridian Line. In the ſame manner find the reſt of the Hour's Diſtances, and place 'em in a Table.

'Tis ſuppos'd that the Reader before he will go upon ſuch Experiments is very well acquainted with Logarithms without which this Scheme cannot be operated.

The Table.

Lat.	32 Deg. 51.		Min. N.	
Hours	Ang. at Pole.		Hour Arches.	
	G.	M.	G.	M.
12	00	00	00.	00
11. 1	15	00	11.	50
10. 2	30	00	24.	20
9. 3	45	00	38.	3
8. 4	60	00	53.	35
7. 5	75	00	71.	6
6	90	00	90.	00

For the *Stile* make the Angle B, C, A = to the Latitude of the Place.

So ſhall B, C, A, be the *Style* or *Cock*; which muſt ſtand perpendicular on C 12, and point due North. If you wou'd calculate for every half Quarter you muſt ſay,

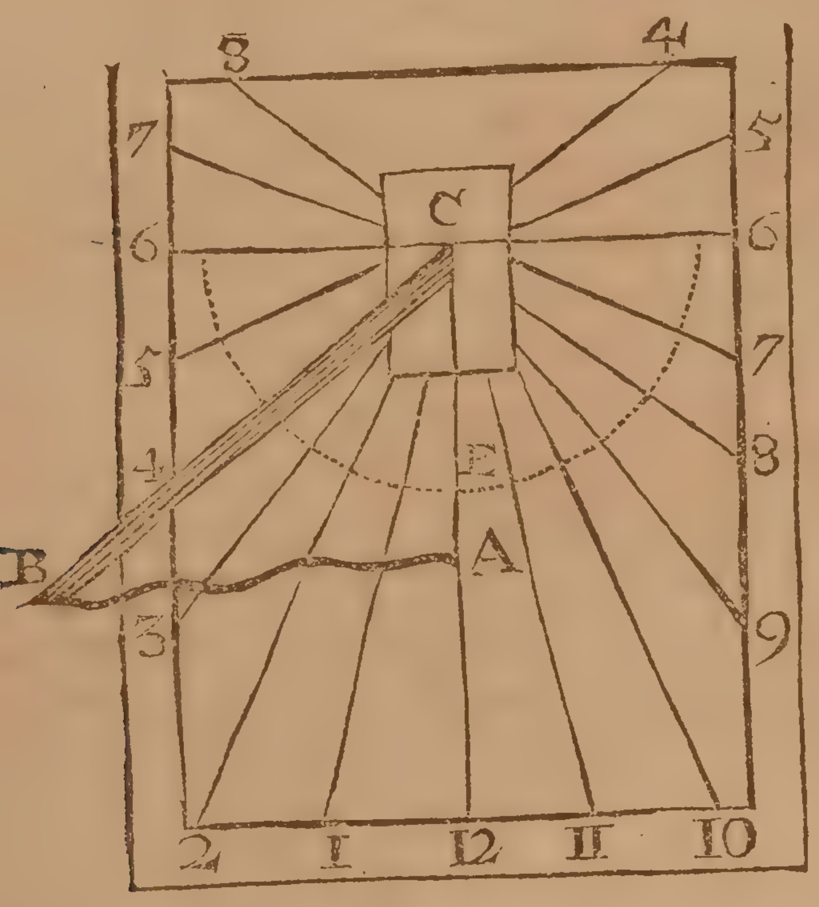
As Rad. S. Lat. : : T, 1 Degree 52 Minutes,

To the Tangent of the firſt half Quarter's Diſtance from the Meridian : :

So T, 3 Degrees 45 Minutes : To T of the firſt Quarter of an Hour's Diſtance : :

So T, 5 Degrees 37 Minutes : To a Quarter and half Quarter's Diſtance : :

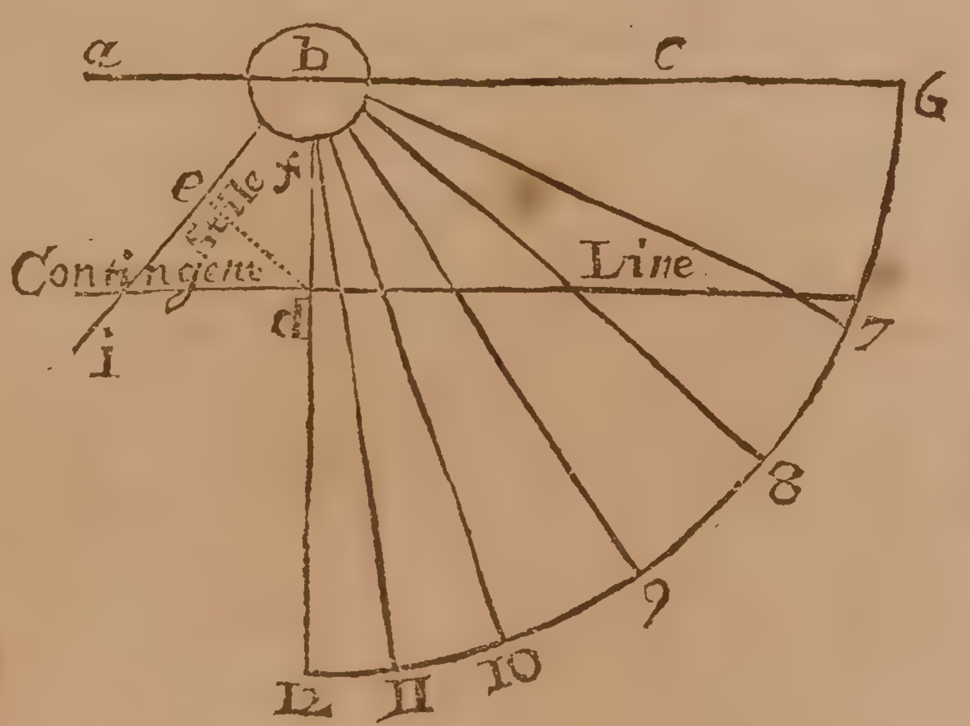
So T, 7 Degrees 30 Minutes : To the Half Hour's Diſtance, &c.



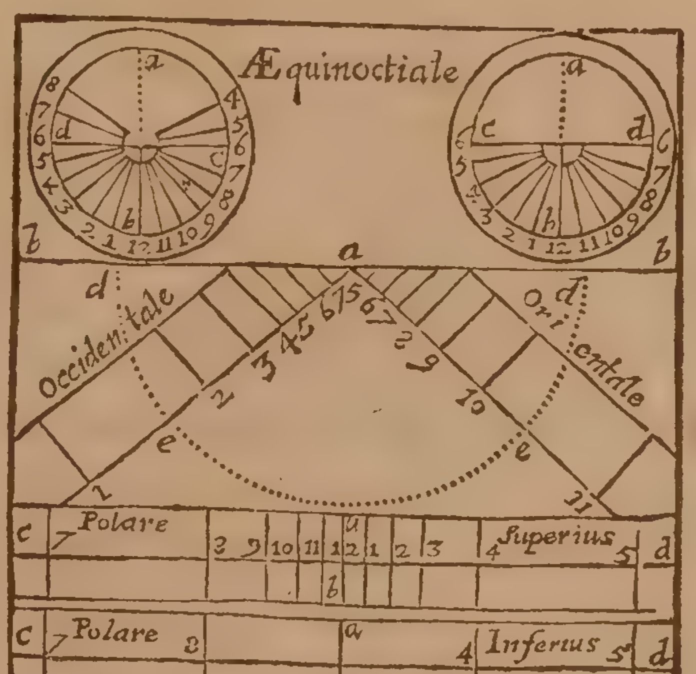
To deſcribe the *Dyal*, reſpect muſt be had to the Bigneſs of the *Plane*, and the Place for the Center C determin'd; and then thro' C draw C 12 for the Meridian (which will be the Subſtylar Line and Hour Line of 12) and at *Right Angles* to it 6, C 6 for the Hour Line of 6, then on C with a Line of *Chords*; whoſe Radius is proper for the Largeneſs of the Dyal. Draw a Circle, and from E both ways ſet the ſeveral Diſtances of the Hour Arks, found by Calculation in the Circumference of that Circle: Then lay a *Rule* to C, and draw Lines from thence thro' all thoſe Diviſions, they will be the true *Hour Lines* on the Plane of the *Dial*.

You muſt note this Practice ſerves to draw an *Erect Vertical Dyal*; only in Calculation, you muſt uſe the *Complement of the Latitude* inſtead of the Latitude, and the Hours muſt be number'd differently.

If you wou'd draw an *Horizontal Dyal* Geometrically, let Two Lines be drawn ſquare wiſe, *viz.* b d for the Hour of 12, and b c for the Hour of 6, draw the *Stile* b c ſo, that the Angle e b d may be equal to the *Elevation of the Pole*; take (where you pleaſe) any Point in the Meridian Line ſuppoſe d, from which into the *Style* let fall a Perpendicular as d e, and transfer it into the Meridian in d f: Then draw i d Perpendicular to the Meridian in d for a Line of *Contingence*. From f, as a Center, deſcribe a *Circle* repreſenting the *Equinoctial* at any conſiderable Diſtance (the bigger the better) and divide it into 24 Parts for Hours, and 48 Parts for half Hours: But 'tis enough for an *Horizontal Dyal*, if one Quadrant between the Hours of 12 and 6 be divided into 6 Parts or 12. Make Points in the *Contingent*, where it ſhall be cut by a Ruler apply'd to the Center, and every Diviſion in the *Equinoctial*. Draw the Hour Lines from the Center b, and every Correſpondent Point in the Contingent erecting the *Stile* over the Meridian according to the Angle i b d.



When you find the *Center* of the *Dyal* or of the Hour, chief regard is to be had to the *Elevation* of the *Pole*; for not any *Dyal* of this ſort will declare the Hours in any Place, but only under that Elevation which belongs to the Region, for which the *Dyal's* made. Suppoſe in this Region the *Pole* be elevated in 49 Degrees which is 41; then place the Foot of the Compaſs in the Center of the Inſtrument, and extend the other Foot from thence to the *Equinoctial Line* deſcrib'd in that Inſtrument, in which part the 41 Degree is cut by the *Radius* numbring from the Line of the 12th Hour. This Extention of the Compaſs transfer upon the Dial, fix one Foot in the Concourſe of the *Meridian* and *Equinoctial Line*, *viz.* e, the other fix in a Part of the *Meridian Line* which is in f, and determine that Point to be the Center of the Hours; for from thence and thro' each Point mark'd in the *Equinoctial Line* are all the Lines to be drawn which are term'd *Hour Arches*. The Reader will perceive this is a New Scheme which has no relation to the former.



Draw thro' that Center of *Hours* a Line Parallel to the *Equinoctial*, which is to be the Line of the 6th Hour both for Morning and Evening. The Lines of the 4th and 5th Hours in the Evening are to be drawn out beyond the Center of Hours; for the Hours 4 and 5 in the Morning (as well as the Lines of the Hours 7 and 8 in the Morning) are to be drawn further out to deſign the Hours 7 and 8 in the Evening. This Scheme is not recommended for this Uſe ſo much as the Two former. It relates alſo to the manner of framing a Meridional Dyal either to Eaſt or Weſt. And Firſt of the Meridian Eaſt Dyal. Draw the Line *a*, *b*, Parallel to the Horizon by *a*; draw a ſlight Circle at any Opening of the Compaſſes beginning from the *Horizontal Line b*, and then towards the Right Side where the Oriental Dyal is to be drawn. Imagine in the Inſtrument the like Arch at the ſame Opening of the Compaſs; then in that Arch cut off the *Complement of the Pole's Elevation*, and transfer that Interval to the Circle drawn from the Point *a*, and let the Arch be cut off in the Point *e*; through which Point *e*, and the Extremity of the Horizontal Line *a*, *b*, draw the Line *e*, *a*, which will be in the Head of an Equinoctial Line, becauſe the Horary Points are to be deſign'd in it. Before you mark 'em draw another Parallel to that Equinoctial; and about the upper Part of the latter mark at Pleaſure the Hour 6, and alſo the like Point in the oppoſite Parallel, ſo as that between theſe Points the Line of the Hour 6 be made at Right Angles. 6 in theſe Dyals are the Beginning of the Hours, and the Style is plac'd in it in the upper Part of that Line where it goes under within the *Horizontal*. From the Horizontal Dyal transfer hither the Intervals of the Hours. The Diſtance of the Hour 1 from 12, which is form'd in the Horizontal, will be in this Place the Interval of the Hour 5 on the one Side, and on the other of the Hour 8, &c. The Firſt Hour of the Sun which appears in this ſort of *Dyal*, is 5, and ſo forwards to 2 incluſive: for 12 cannot well appear. The *Style* in this *Dyal* is a Right Index of a Determin'd Altitude, and is fetch'd from an Interval found between the Point of the Hour 6, and the Point of the Hour 9. The Meridian Weſt Dyal differs little from the Meridian Eaſt Dyal, except that the Occult Arch which is for diſtinguiſhing the Point of the Equinoctial Line, is drawn from the Left Side, and that in the Weſt Meridian the Evening Hours are to be drawn beginning from the 1ſt to the 7th incluſively, with the like Intervals as in the Eaſt Meridian; but the Firſt is in the Lower Place, and ſo the reſt in Order. The Hour 6 is the Place of the *Style* here as in the Eaſt Meridian, and has the ſame Altitude. To deſcribe the Arches of the Signs in this ſort of Dyal: From the Point in which the Stile is Erected, draw a Right Line to cut all the Lines of the Hours to Right Angles, and this will be the Equinoctial Line, in which all the Middle Hours muſt be mark'd, as in the *Horizontal Dyal*; then from the Point in which the Line of the Hour 3 from the Equinoctial is cut, Extend the Compaſs at Pleaſure to deſcribe an Arch, in which the Solar Declinations may be deſign'd in the ſame manner as in the Horizontal Dyal. The Rule is to be apply'd as well to the Points of thoſe Declinations, as to the Point in which the Line of Hour 3 is cut by the Equinoctial, and at the ſame time the Points are to be obſerv'd in which the Line of the Stile is cut as well beneath as above the Style itſelf. By applying the Rule to thoſe Points, as alſo to each Point of the Middle deſign'd in the Equinoctial, it may be obſerv'd in what Part Hour-Lines will be reach'd, ſo as that through thoſe Points the Arches of the *Signs* may be drawn.

The *Equinoctial Dyal* is that whoſe Plain lies Parallel to the Equinoctial. To make this Dyal you need no more than 60 Degrees of your Line of Chords to deſcribe a Circle, in which draw Two Diameters croſſing each other at Right Angles; then divide this Circle into 24 Equal Parts or Hours, which ſubdivide as you pleaſe, every Hour being 15 Degrees, therefore the Half Hour will be 7 Degrees and 30 Minutes, and the Quarter 3 Degrees 45 Minutes. This being done, ſet up a Straight Pin perpendicular to the Plane in the Center of the Circle, and place the Plane Parallel to the Equinoctial, the Meridian Line true North and South, and the Dyal is fitted. Theſe Dyals are commonly ſet up in a Frame to be Elevated to any Latitude.

The next we ſhall treat of are *Polar Dyals*, which are thoſe whoſe Planes are Parallel to ſome Great Circle that paſſes thro' the Poles, or Parallel to ſome one of the Hours, ſo that the Pole is neither Elevated above nor depreſs'd below the Plane, therefore the *Dyal* can have no Center, and conſequently its *Style*, *Subſtyle*, and *Hour-Lines* are *Parallel*; This therefore will be an *Horizontal Dyal* to thoſe who live under the *Equator*. The Style may be either a ſtraight Pin ſet upright, or a Wyre made to lie Parallel to the *Plane*, and muſt ſtand over the Hour-Line of 12. In a *Direct Polar Dyal* the Hour-Lines muſt be drawn all Parallel to the Hour-Line of 12; the Length of the Plane may be taken in any Inches, reckoning the Inch to be divided into 10 or 100 Equal Parts.

'Twill be neceſſary that ſuch as wou'd Erect theſe Dyals be Vers'd in Logarithms as before hinted, becauſe the Operations are moſt eaſily perform'd by them. We have already made ſome Mention of them, and regret the want of Room, that we can't give the Reader here a larger Inſight into them, without referring him to others. Theſe Logarithms are drawn in Tables, which are to be met with in moſt Books of *Trigonometry*, *Navigation*, &c. The *Common*, contriv'd by Mr. *Briggs* before mention'd, is Publiſh'd in Sir *Jonas Moor's Mathematicks*. Having a ſufficient Knowledge of this Table, and the Way of Working it; *For the Height of the Polar Style, ſay:* As the Tangent of the Hour-Line 4 or 5 is to the Logarithm of their Diſtance from the Meridian in Inches and Parts, ſo is the Radius to the Height of the Style in Inches and Parts. *For the Hour-Lines ſay*; As the Radius is to the Logarithms of the Style's Height in Parts of Inches, ſo is the Tangent of any *Hour-Line* to the Logarithm of its Diſtance from the Meridian Line. *As for Inſtance:* Suppoſe your Polar Plane be 12 Inches long, and it be requir'd to put on all the Hour-Lines from 7 in the Morning to 5 in the Afternoon Here you have 5 Hours and 6 Inches on either Side of the Meridian; and before you work the Operation, the Hours and Inches muſt be reduc'd into Degrees and Parts allowing for every Hour or Inch 15 Degrees, ſo you will have 75 Degrees and 600 Parts. *Then for the Style's Height.*

To the Ar. Co. of the Tangent 75° (= 5 Hours } 9,428053
Add the Logarithm of the Diſtance from the Meridian, 600 Poles, } 2,778151

Sum=The Logarithms of the Style's Height, 161 Parts; That is, 1 Inch and 61 Parts of an Inch. } 2,206204

For the Hour's Diſtance from the Meridian.

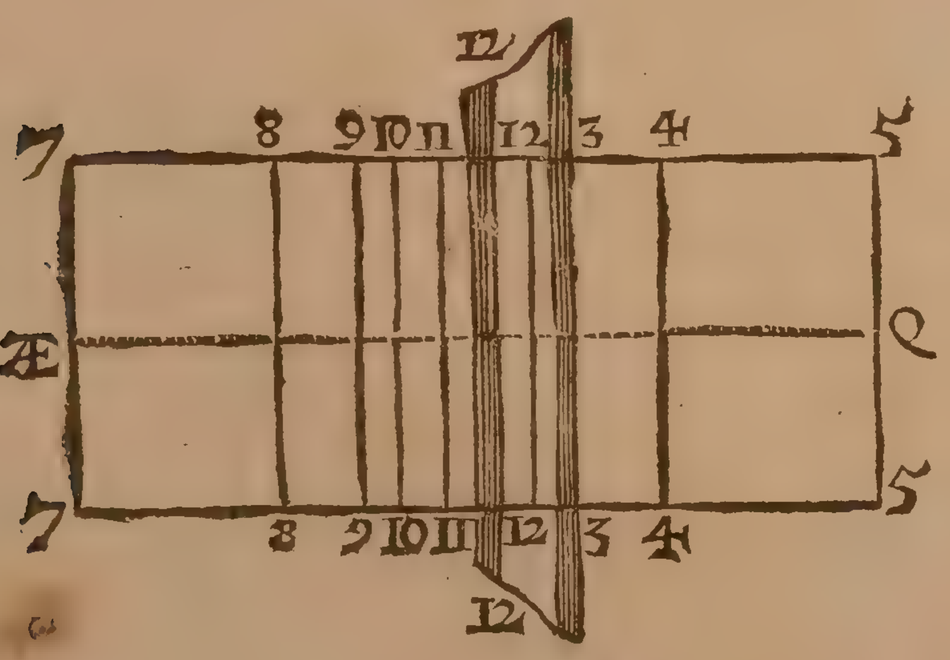
To the Logarithm of the Style's Height, 161 Parts, } 2,206204
Add the Tangent 15° (for the 1ſt Hour) 9,428053

Sum=Radius=Logarithms of the Hour's Diſtance=43 Parts. } 1,634256

After the ſame manner you may find the other *Hour's Diſtance from the Meridian*; then draw them in a Table thus.

Hours.		*Angles at the Poles.*		*Tangents.*	
H.	H.	G.	M.	Inch	Parts.
12.		00	00	00	00
11.	1	15.	00	00	43
10.	2	30.	00	00	63
9.	3	45.	00	1	61
8.	4	60.	00	2	79
7.	5	75.	00	6	00
6.	6	90.	00	*Infinite.*	

To Project the Dyal. Firſt draw on the *Plane* the Meridian Line A B, which croſs at Right Angles with ÆQ the Æquator; then from C the Interſection of the Meridian and the Æquator, ſet off thoſe Parts from the Table both Ways, and thro' theſe Points draw Lines Parallel to A B (or the Hour-Line of 12) thoſe ſhall be the *Hour-Line* requir'd.



Now to Erect Declining Dyals, which are thoſe whoſe Planes are directly oppoſite to one of the Four Cardinal Points, but decline from the Meridian, or *Prime Vertical Circle.* For the drawing of the *Hour-Lines* on theſe *Dyals* there is given the Latitude of the Place and the Declination of the Plane in Order. 1. *The Height of the Style above that Plane.* 2. *The Diſtance of the Subſtyle from the Meridian.* 3. *The Inclination of the Meridians or Difference of the Meridian.*

To find the Style's Height above the Plane, ſay, *As the Radius is to the Co-ſine of the Plane's Declination: So is the Co ſine of the Elevation of the Pole to the Sine of the Style's Height.* To find the Subſtyle's Diſtance from the Meridian, ſay, *As the Radius is to the Sine of the Plane's Declination: So is the Co-Tangent of the Elevation of the Pole to the Tangent of the Subſtyle's Diſtance.* To find the Inclination of the Meridians, ſay, *As the Radius is to the Co-Tangent of the Declination: So is the Sine of the Elevation of the Pole to the Co-Tangent of the Inclination of the Meridians.* Theſe being found, then with a Line and Plummet, let fall a Perpendicular to the Horizon, and that ſhall be the Meridian or Hour-Line of 12.

Then if your Plane decline Weſtward or Eaſtward, place the Sub-Style's Diſtance (and from the Line of Chords) to the Right or Left Hand of the Meridian.

Having found *the Inclination of the Meridian*, find what Angle each Hour makes at the Pole with the Sub-Style, by ſubſtracting 15 Degrees for each Hour that is between the Sub-Style and Meridian, as long as it can be done from the Inclination of the Meridians, and by adding 15 Degrees for the other Hours. And with the *Hour Angles* at the Pole, find the *Hour Arches* by this Proportion, *as the Radius is to the Sine of the Stile's Height*, *ſo is the Tangent of the Hour Angle to the Tangent of the Hour Arch.* Of theſe Hour Angles and Hour Arches frame a Table, as was ſhewn in making an *Horizontal Dyal.*

Example.

A South Erect Dyal declining Eaſtward 45 Degrees, 00 Minutes, Latitude 51°, 31′.

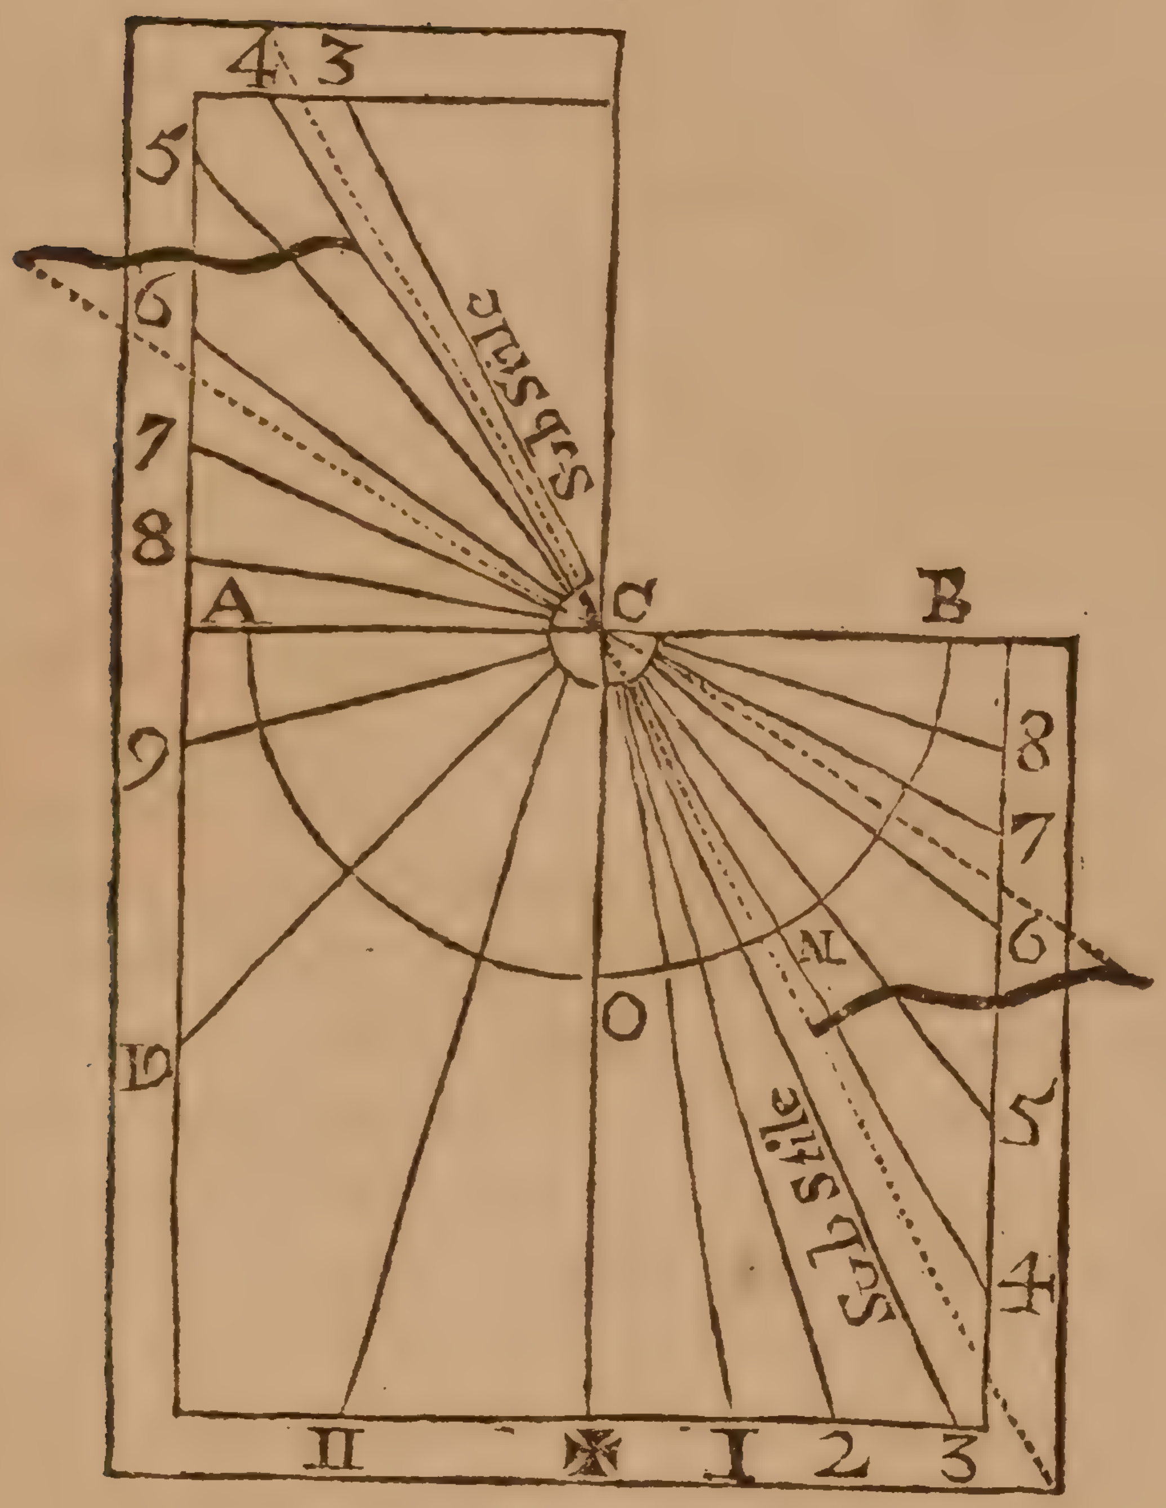
The Requiſites may be found by the preceding Canons, *viz.*

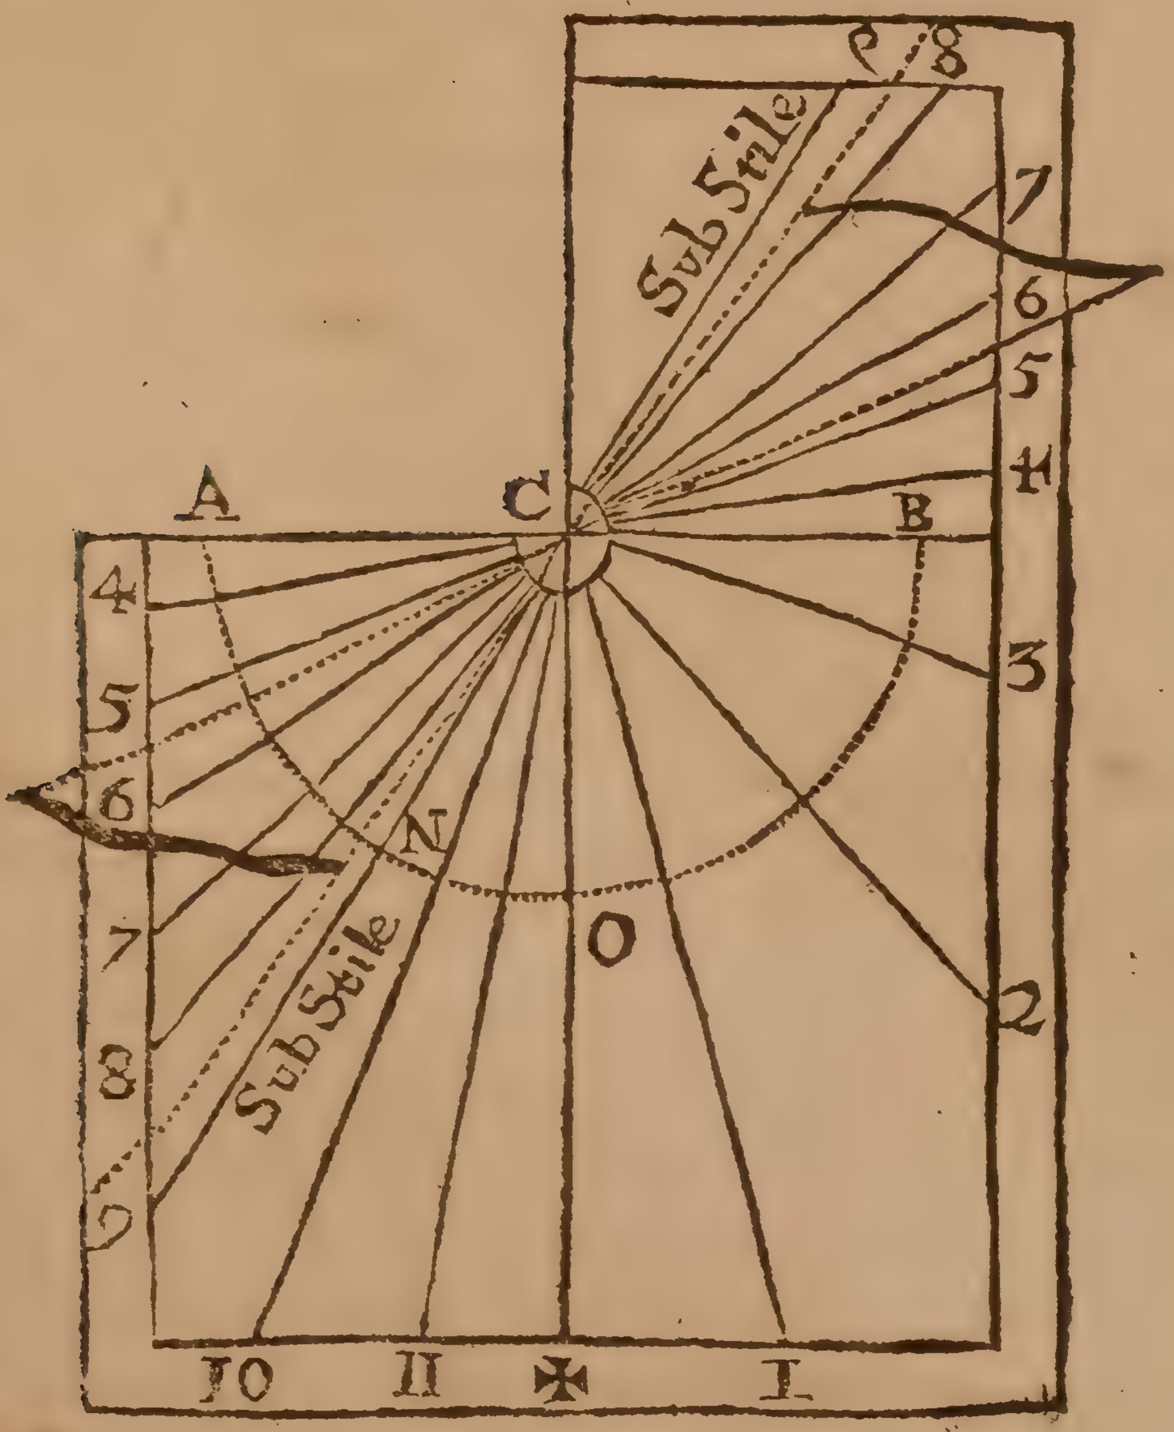
The Height of the Style	26 : 6
Sub Style's Diſtance	00 : 00
From the Meridian	29 : 21
Inclinations of Meridians	51 : 57

Now ſince the *Inclinations of Meridians* is leſs than 60 Degrees, and greater than 45 Degrees; 'tis certain the Sub-Style muſt be between 8 and 9 of the Clock. Then the *Hour Angles* at the Pole are alſo found by *ſubducting* 15 Degrees from the Inclination of Meridians (ſuppos'd to be ſet againſt 12) the Remainder will be for the Hour 11 and from that Angle againſt 11 ſubſtract 15 Degrees, the Remainder ſet againſt 10, and from that Remainder ſubduct 15 Degrees, the Reſidue ſet againſt 9, and that becauſe 'tis leſs than 15 Degrees, take the difference to 15 Degrees, which ſet againſt 8, then by continual Addition of 15 Degrees you'll have the Numbers againſt the remaining Hours.

Find the Hour Arches by the continual Addition of the Sine of the *Style's Height* 26 Degrees 6 Minutes to the Tangent of every Hour's Diſtance from the Sub-Style, and that will give new Tangents of the *Hour Arches.*

	Eaſt Decliner.	
Hours.	Angles at Pole	Hour Arches.
	D. M.	D. M.
3	83. 3	74. 31
4	68. 3	47 31
5	53. 3	30. 20
6	38. 3	19. 1
7	23. 3	10. 37
8	8. 3	3. 24
Subſtyle	*Subſtyle*	*Subſtyle*
9	6 57	2. 26
10	11. 57	10. 3
11	36. 57	18. 19
12	51. 57	29. 21
1	66. 57	45 58
2	81 57	72. 27





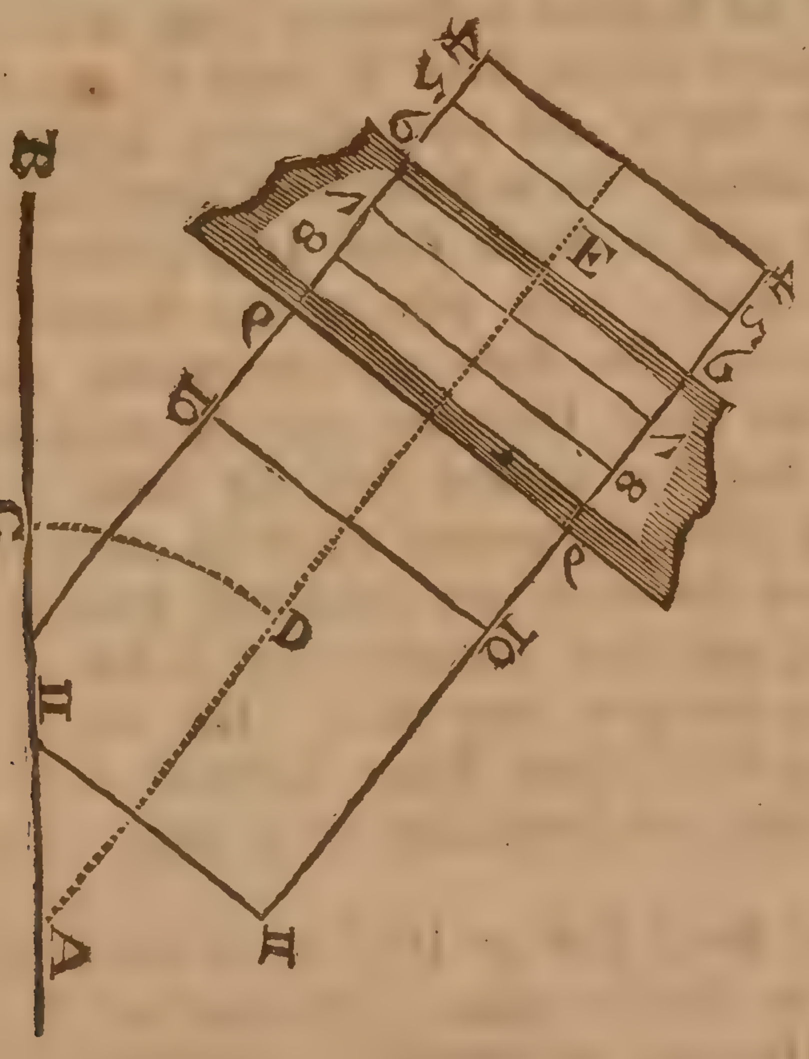
To deſcribe the Dyal.

Firſt draw the Horizontal Line A, C, B, and at Right Angles to it the Meridian C O 12, then with 60 Degrees of your Lines of Chords from C, deſcribe the Semi-Circle A, O, B, and ſet off 29 Degrees 21 Minutes (the *Diſtance of that Sub-Style from the Meridian)* from O to N, on the Weſt ſide of the Meridian, becauſe the Plane declines Eaſt. Set off alſo the ſeveral Hour Arches, as 10 Degrees 37 Minutes for 7 and 5 a Clock, 18 Degrees 19 Minutes for 11 and 1 a Clock, &c. both ways from the Sub-Style on the Circle N R O, and draw Lines from the Center C thro' theſe ſeveral Points, ſo you'll have the *True Hour Lines* deſir'd. Then from your *Chords* ſet off the Style's Height 26 Degrees 6 Minutes from N to R, and a Right Line drawn thro' R from C, repreſents the Axis or Style, and your Dyal is finiſh'd; as alſo Three others, *viz. a South Erect Dyal declining Weſt as much,* and *a North Erect Dyal declining Eaſt and Weſt as much*, only placing the Numbers of the Hours, and the *Style* repreſentatively upon each *Plane*; an *Erect Declining* may be made Geometrically, but we cannot here ſay how. 'Twill be obſerv'd that the greater Parts of *Arithmetick, Algebra* and *Geometry,* are abſolutely neceſſary in the Sciences, and that without them a Learner cannot make an entrance into them. He, whoſe Patience has gone thro' theſe Three Sciences, will find the others eaſie, as depending in a great Meaſure on them.

Direct Erect Eaſt or Weſt Dyals are thoſe whoſe Planes lie directly open to the Eaſt or Weſt Points of the Heavens, or Parallel to the Meridian of the Plane. To draw this Dyal, the Stile's Height may be form'd according to the Bigneſs of the *Plane*, and the Diſtance of the *Hour Lines* from each other by the Direction given under *Polar Dyals*, making of them a Table as in the following one for the Latitude 51 Degrees 32 Minutes.

Hours.	Angles at Pole.	Tangent.	Hours.
Eaſt.	D. M.	Inch P.	Weſt.
4	30. 00	5. 77	8
5	15. 00	2. 68	7
6	*Subſtyle*	00. 00	6
7	15. 00	2. 68	5
8	30. 00	5. 77	4
9	45. 00	10. 00	3
10	60. 00	17. 32	2
11	75. 00	37. 32	1
12	Infin.	Infin.	

Then to deſcribe the Dyal, draw the Horizontal Line A B, and with 60 Degrees from your Chords deſcribe the prick'd Arch C D, whereon ſet the Latitude of the Place from C D. From A thro' D, draw A D E repreſenting the *Equator* of the *Dyal*; then chuſe a Point in this Line to be the Hour of 6 as at E D r a a, 6 e 6 at *Right Angles* with the *Equator*; and from Æ ſet off the ſeveral *Tangents* as you find them in the Table, and thoſe ſhall be the ſeveral *Points* for the *Hours*; thro' each Point draw the *Hour Lines* Parallel to the *Equator* C e 6. The *Style* may be a Streight Pin, equal in Height to the Right Line 6, 9 in either Dyal or a Rod of Iron ſupported by Two Legs of the ſame Height.



The Weſt Dyal is made after the ſame manner, only ſet and number'd a contrary way. *Direct South or North Inclining or Reclining Dyals* are thoſe whoſe Planes incline to the Horizon, and recline from the Zenith, and lie directly open to the South and North.

Theſe Dyals are deſcrib'd after the ſame manner with *Direct South Dyals* only obſerving this Rule in placing the *Style*. In *South Incliners*, the difference of the Angle of *Inclination*, and the Height of the Pole is the Height of the *Style* above the Plane. If the Pole's Height be greater or leſs than the Angle of Inclination, then the North or South Pole is elevated, and the Center is below or above.

In *Direct North Incliners*, the Sum of the Angles of Inclination and Elevation of the Pole is the Height of the Style above the Plane. *Reclining Dyals* are made after the ſame manner. For *South Incliners* are *North Recliners*, and *North Recliners South Incliners*; the one being the Back-ſide of the other.

Declining, Inclining or Reclining Dyals are thoſe whoſe Planes neither face directly any of the Four Cardinal Points, nor are they either Perpendicular or Parallel to the Horizon. For the deſcribing of theſe Dials. Firſt make an Erect one for the given *Declination* according to the Direction in *Erect Declining Dyals*, then let the *Height* of the *Style* above the *Sub-Style* be the

Difference between } the Co-Latitude and { Inclination,
the Sum of } the Co-Latitude and { Declination.

Prime Vertical Dyals, or *Direct Erect North* or *South Dyals* are thoſe whoſe *Planes* are *Parallel* to the *Prime Vertical Circle*; but ſince that Pole is rais'd or depreſs'd on every Plane which lies Eaſt to it, therefore this Plane, if a Direct South, has the South Pole Elevated, and conſequently the *Style* (whoſe Height muſt be the *Complement* of the *Latitude* of the Place) will point downwards. The Proportion to find the Hour's Diſtance on this Plane is; *As the Radius is to the Sine of the Style's Height, or Co-Latitude: So is the Tangent of the Hour, or Angle at the Pole, To the Tangent of the ſeveral Hour's Diſtance from the Meridian*, By this Canon the Hours requiſite for the Plane, as alſo the Half-hours, Quarters, &c. being calculated and ſet in a Table, the *Dyal* is deſcrib'd after the ſame manner as the *Horizontal Dyal*. A *North, Direct Erect Dyal* is but the Backſide of the *South*, becauſe lying in the ſame *Azimuth* with it, therefore 'tis no more but turning the South Dyal upſide down and leaving out the Superfluous Hours between 5 and 7, and 4 and 8, and the *North Dyal* is made. The *Style* muſt point upwards towards the *North Pole*.

We might enlarge on this Science as well as others, but this will give the Reader, who is prepar'd, a good Idea of it, and for the Practice he will probably have recourſe to Authors that write purpoſely on it, ſo we ſhall draw towards a Concluſion of this Article; but muſt firſt obſerve what the *Declination of a Wall or Plane for Dyals* is. 'Tis an Arch of the Horizon comprehended either between the *Plane* and the *Prime Vertical Circle*, if you account it from Eaſt or Weſt; or elſe between the Meridian and the Plane, if you account it from North to South. The beſt way to find this *Declination* is, to get on a large Square Piece of Braſs or Wood, a Limb accurately divided into 360 Degrees, and if it can be, every 5 Minutes; on the Center of which moves an *Horizontal Dyal* purpoſely made for the Latitude of the Place, and which has a ſmall bit of fine Braſs fix'd on its Meridian Line like a *Fiducial* Edge, to cut the Degrees in the *Limb*, the Uſe of which is very eaſy; for at any Time when the Sun ſhines, you need only apply that Side of the Square to the *Plane* where are 60 Degrees on the Limb, and then ſetting it as nearly as you can Horizontally, turn the Dyal about 'till it ſhews exactly the true Hour of the Day (which before muſt be rightly found, and a Watch ſet to it) and then will the *Fiducial* Edge cut the Degrees of the Plane's Declination, and which way to account will be eaſily ſeen, becauſe the *Dyal* pointing true North gives you an Idea of all the Points of the Compaſs. This Method will be of great Uſe to ſuch as make many *Dyals* in or near the ſame Latitude.

A Word or two muſt be added how to find out the *Hour* of the Night by the Rays of the Moon. Suppoſe an *Horizontal* Fixt or Moveable Sun-Dyal at hand, to which joyn what is call'd by ſome a Moon Dyal, made of Two *Concentrick Circles*, in one of which are ſet down the Days of the *Moon's* Age by a *Globule* apply'd to the Number 30. The Age of the Moon muſt be firſt known by the *Epact*, or ſome other way; and then apply a Sun-Dyal to the Lunar Beams in the ſame manner as apply'd to thoſe of the Sun, See what Hour the Moon's Shadow points to, as for Example, the Eighth; then place the Globule to that Hour ſet down in the Horary Circle. And

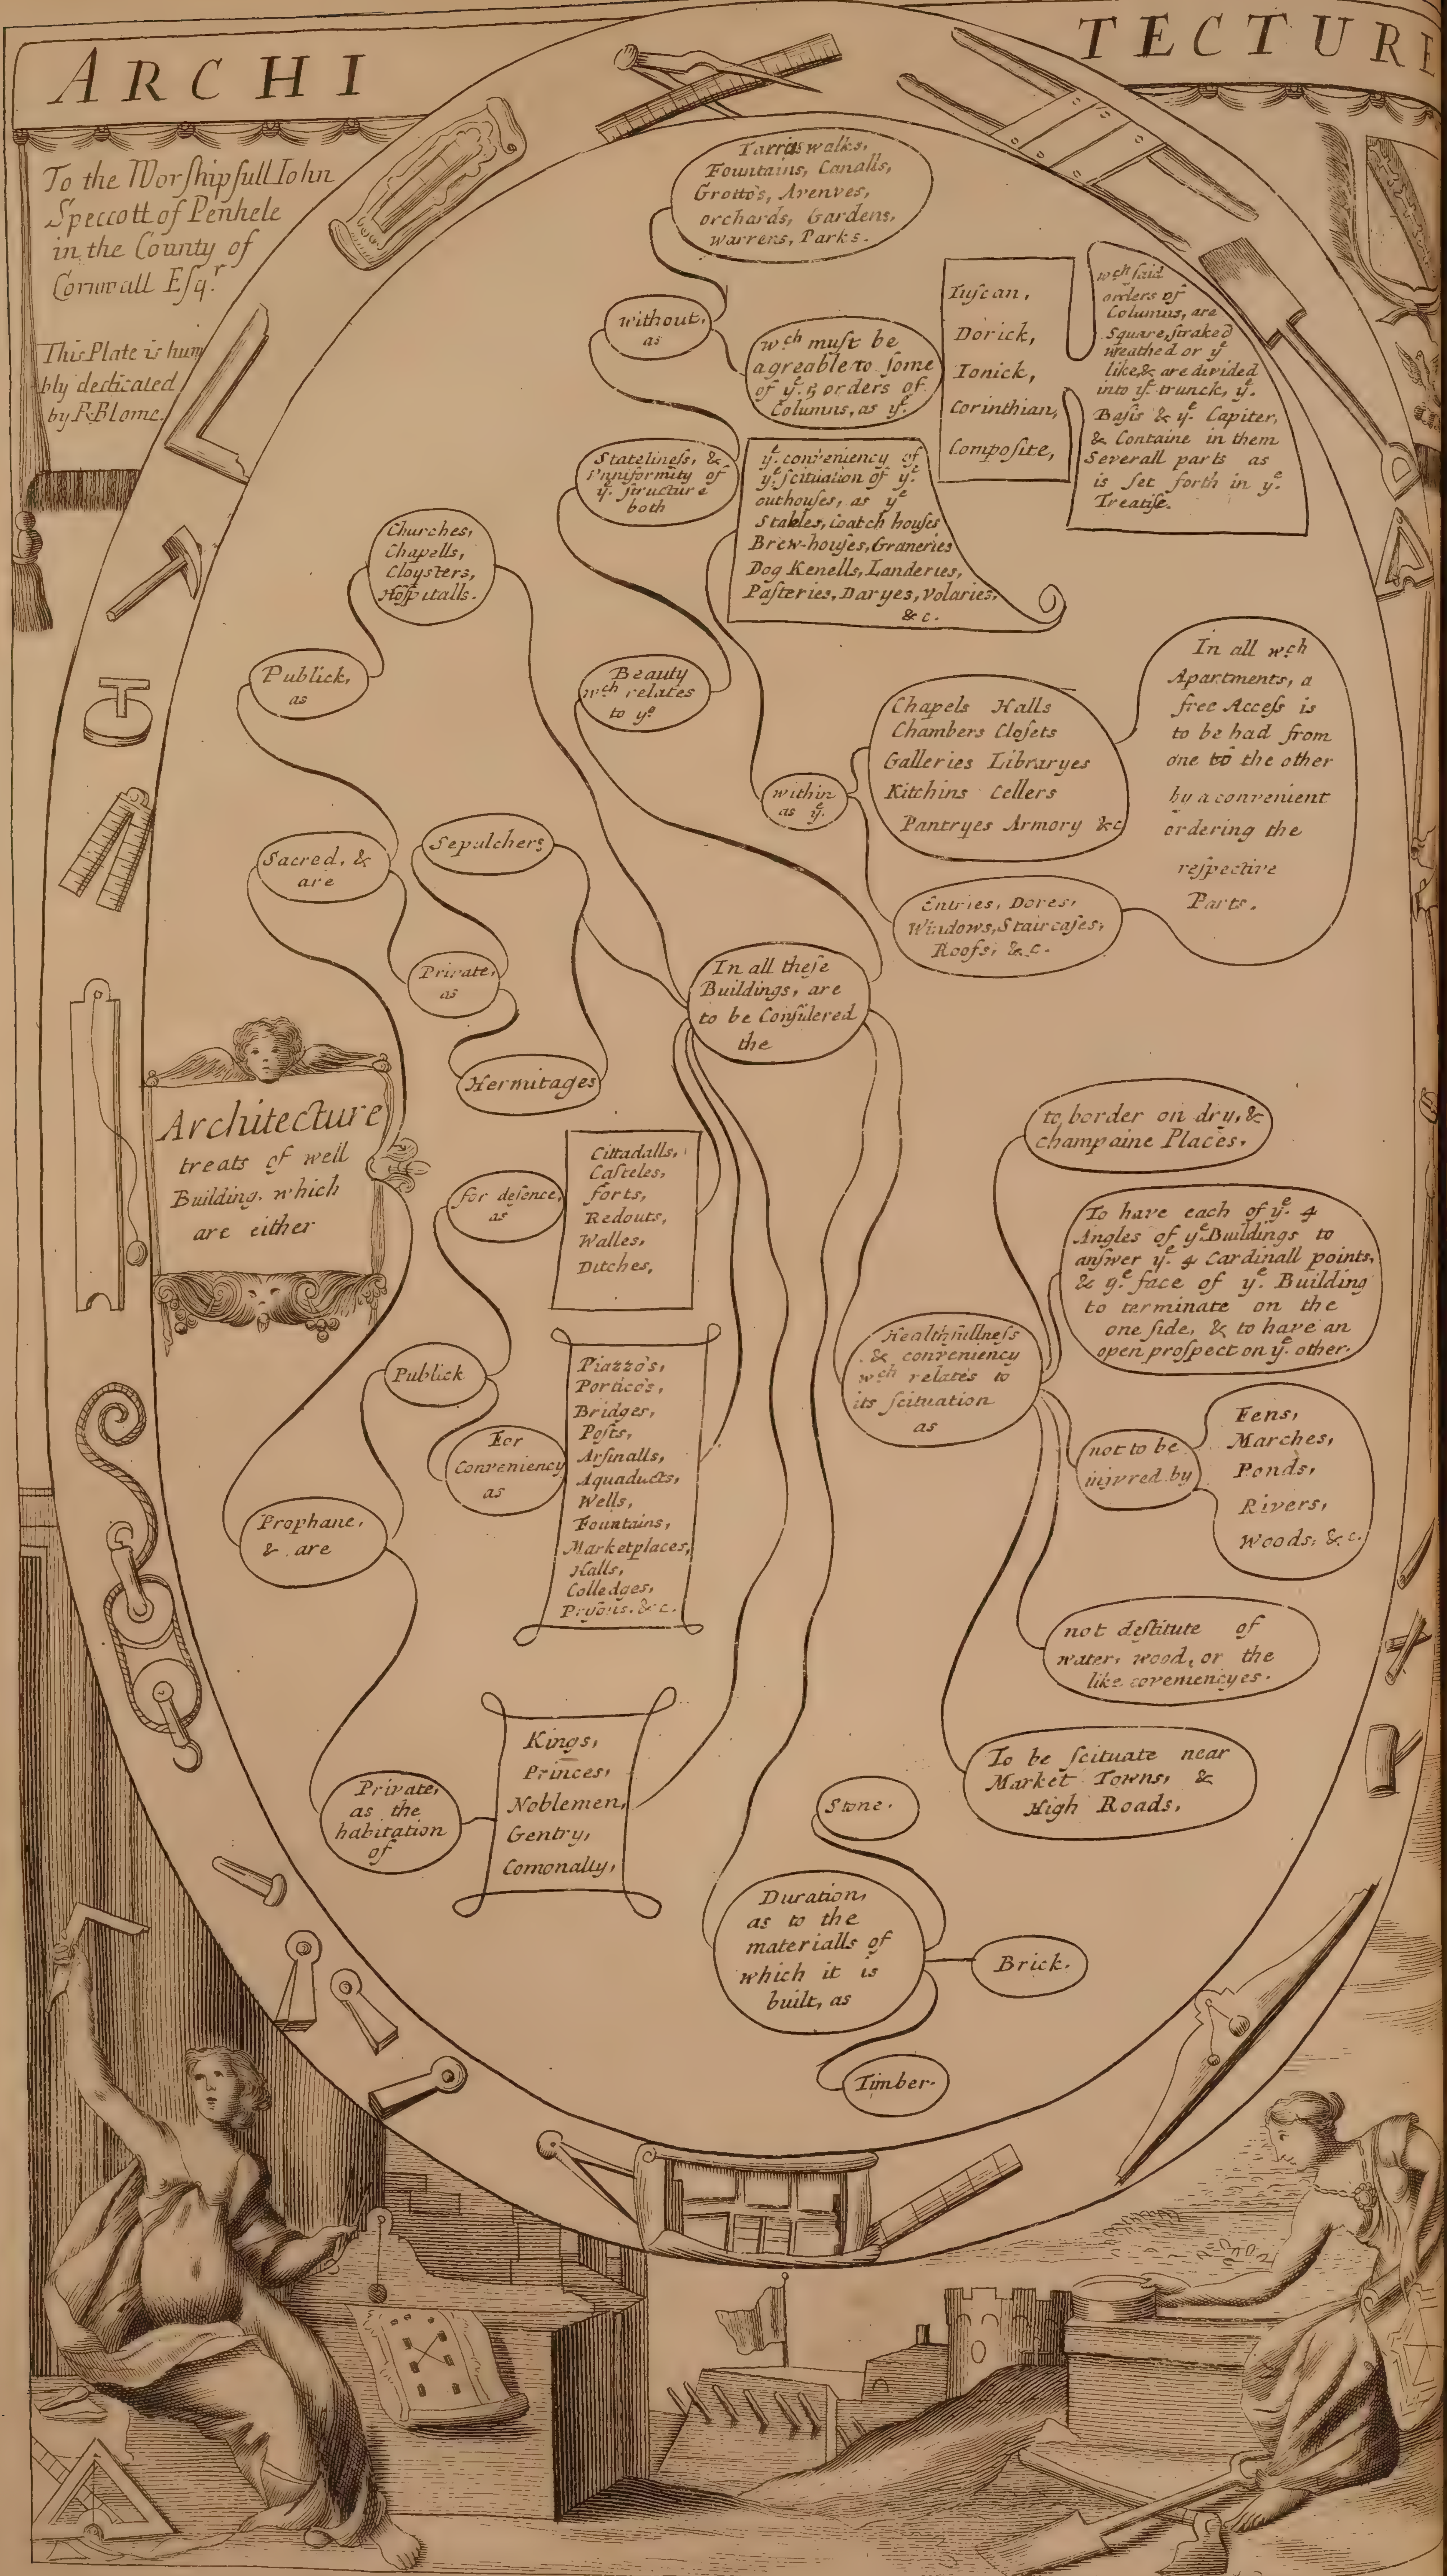
Laſtly have recourſe to the Age of the Moon, and that will give the Hour ſought. For Example; If it be the 12th Day of the Moon's Age, 'twill declare the Hour to be about $5\frac{1}{2}$. But if, as it often happens, a Lunar Dyal be made of 3 Concentrick Circles, of which the laſt and biggeſt is that of the Lunary Days; the Second is the Horary Circle, the innermoſt the Index: Apply that Index to the Day of the Moon; then in the Circle of the Index ſeek the Number of the Hour mark'd by the Lunary Shadow in the *Sun-Dyal*, which is the Hour ſought for. The *Periodick Motion of the Sea may be found on a Lunar Dyal.* Thus; If you wou'd know at what Hour it will be full Sea in any given Place, you muſt know at what Hour it happens at that Place when the Moon is at the Full. Thus place the Globule fix'd at the Moveable Wheel of the Lunary Days at that Hour in which theſe Tides happen in that Place at that time, as for Inſtance, 10 a Clock; then ſeek the Moon's Age for the Given Day. As ſuppoſe the 9th of the Moon, obſerve to what Hour the Number 9 is oppoſite, and that is the Hour ſought.

To ſuch as are acquainted with the Three Fundamental Sciences above-nam'd, this *Eſſay* on *Dyalling* will be ſerviceable in ſome Degree; to others it will ſerve only to give them a ſlight Idea of it, which indeed is as much as cou'd be pretended in 5 or 6 Pages. Maſters affect to conceal this Art by Terms and Operations as much out of the way as is poſſible not to fall into downright Nonſenſe and Confuſion. And as it cannot be ſuppos'd the *Compiler* of theſe Eſſays is a Maſter of each Science, or indeed of the Quarter Part of them; ſo he has truſted entirely to thoſe who are generally eſteem'd to underſtand them to Perfection, making uſe of no Authority which is not Sovereign in theſe Caſes, as will be mention'd in the Preface. And as the Praiſe will therefore redound chiefly to them where Praiſe is due; ſo 'tis but reaſonable the Cenſure ſhould lie alſo at their door where 'tis deſerv'd. All due Care has been taken to keep cloſe to the Text; however, when Authors were not ſo Eloquent as might have been wiſh'd; and in *Algebra*, *Geometry*, *Navigation*, *Dyalling*, &c. Eloquence was no neceſſary Ingredient in the Compoſition of the Science, the Style has been ſoften'd and made more agreeable to a Gentleman's Ear.

ARCHI TECTURE

To the Worſhipfull John Speccott of Penhele in the County of Cornwall Eſqr

This Plate is humbly dedicated by R. Blome.



Architecture treats of well Building. which are either
Sacred, & are
Publick, as
Churches, Chapells, Cloysters, Hoſpitalls.
Private, as
Sepulchers
Hermitages
Prophane, & are
Publick
for defence, as
Cittadalls, Caſteles, forts, Redouts, Walles, Ditches,
For Conveniency as
Piazzo's, Portico's, Bridges, Poſts, Arſinalls, Aquaducts, Wells, Fountains, Marketplaces, Halls, Colledges, Prisons. &c.
Private, as the habitation of
Kings, Princes, Noblemen, Gentry, Comonalty,
In all theſe Buildings, are to be Conſidered the
Beauty wch relates to ye
Statelineſs, & Unniformity of ye Structure both
without, as
Tarras walks, Fountains, Canalls, Grotto's, Avenves, orchards, Gardens, warrens, Parks.
wch muſt be agreable to ſome of ye 5 orders of Columns, as ye
Tuſcan, Dorick, Ionick, Corinthian, Compoſite,
wch ſaid orders of Columns, are Square, ſtraked weathed or ye like, & are divided into ye trunck, ye Baſis & ye Capiter, & Containe in them Severall parts as is ſet forth in ye Treatiſe.
ye conveniency of ye ſcituation of ye outhouſes, as ye Stables, Coatch houſes Brew-houſes, Graneries Dog Kenells, Landeries, Paſteries, Daryes, Volaries, &c.
within as ye
Chapels Halls Chambers Cloſets Galleries Librar yes Kitchins Cellers Pantryes Armory &c
Entries, Dores, Windows, Staircaſes, Roofs, &c.
In all wch Apartments, a free Acceſs is to be had from one to the other by a convenient ordering the reſpective Parts.
Healthfullneſs & conveniency wch relates to its ſcituation as
to border on dry, & champaine Places,
To have each of ye 4 Angles of ye Buildings to anſwer ye 4 Cardinall points, & ye face of ye Building to terminate on the one ſide, & to have an open proſpect on ye other,
not to be injured by
Fens, Marches, Ponds, Rivers, Woods, &c.
not deſtitute of water, wood, or the like conveniencyes.
To be ſcituate near Market Towns, & High Roads,
Duration, as to the materialls of which it is built, as
Stone.
Brick.
Timber.

ARCHITECTURE.

Of Architecture *in General.*

THO' Building is look'd upon as one of the firſt Works of Man, yet Architecture is not one of the moſt Ancient Arts. Her Beginnings, like thoſe of other Arts, were weak; and ſhe grew perfect only by long Practice. Houſes were at firſt made for neceſſity; and as the firſt Men often chang'd their Dwellings, ſo they did not trouble themſelves to make their Habitations either Laſting or Beautiful. But afterwards, when every Man ſought for a Settlement in a particular Country, they began all to build Houſes that were more ſolid, to reſiſt the Injuries of the Weather. At laſt Luxury being ſpread up and down amongſt the moſt wealthy and powerful Nations, Men were for adding *Beauty* and *Magnificence* to their Buildings; and in obſerving what contributed moſt to the Solidity, Conveniency and Beauty of them, *Rules* were made, and an Art form'd to teach good Building, which is call'd *Architecture*; and thoſe who are perfect Maſters of it, *Architects*.

The Name of *Architecture* is ſometimes apply'd to the Work itſelf, as well as to the Art of Building. Thus we ſay, Such a One has made a fine Piece of Architecture.

Architecture, according to *Vitruvius*'s Idea of it, ſhould comprehend a general Notion of every thing neceſſary to the Perfection of an Edifice. The Architect ought eminently to poſſeſs the Theory of all the other Arts that have any relation to *Architecture*, not only for the forming Deſigns of Things to be Executed, but alſo to judge of the Goodneſs of the Materials, to Chuſe them well, and Overſee all the Workmen, as an abſolute Maſter of the whole Work, which the Name of *Architect* implies.

The Ancients had two Sorts of Architecture, as well as we; one which is call'd *Civil*, and the other *Military*. The firſt that they practis'd is the ſame we follow at this Day, and contains all the Rules of publick and private *Edifices*. The other, which regards the Fortification of Places of War, has been chang'd, according to the different manners of Attacking and Defending in different Times. In both one and the other the Solidity of the Work ought principally to be conſider'd. But as to the *Rules* which concern the Symmetry and outward Form, they differ from one another, as Peace and War do, to which theſe two manners of Building have relation.

The firſt Thing to be obſerv'd in Building, is the Situation of the Place, that is, to chuſe one in a fine Expoſition, Healthy, and Commodious for Water, and every Thing neceſſary to Life; which made *Alexander* reflect very wiſely on *Dimocrates*, who propos'd to that Prince to make of all Mount *Athos* the Figure of a Man, who ſhould hold a great City in his Left-hand, and in his Right a Cup, that ſhould receive all the Waters from all the Rivers that flow'd from that Mountain, from whence they ſhould be pour'd into the Sea. For *Alexander* having been wonderfully pleas'd with the Novelty of this Invention, demanded, if there would be Fields enough about that City for the Subſiſtance of the Inhabitants; and underſtanding all their Proviſions muſt be brought them by Sea, he only commended the Beauty of the Deſign, but diſapprov'd the Architect's Choice of the Place, where he pretended to Execute it.

After the Place is choſen, Materials muſt be gather'd together, either in the ſame Country, or brought from elſewhere. For there are certain Places where Stone, Sand and Wood are better and properer for Building than in others.

'Tis probable, that Mankind at firſt, building their *Houſes* for meer neceſſity, they were, properly ſpeaking, nothing but *Hutts*; till at laſt the *Carpenter*'s Art, which is much more ancient than the *Maſon*'s, began to give them ſome Form. For we ſee that all the Members of Architecture are nothing but the Repreſentation of ſuch Pieces of Wood as are neceſſary for the Structure of an Edifice. And the moſt that Learn'd Architects have done to Eſtabliſh a certain manner of good Building, has been chiefly to give Proportion to all the Parts of a Houſe; as alſo Strength and Solidity, according to its Bigneſs, ſo to diſpoſe the Inſide and Outſide with ſo much Convenience and Symmetry, that there ſhall be an Agreement and juſt Proportion between the one and the other, as well for the Commodiouſneſs of the particular Lodgings, as for the exterior Beauty and Grace of the whole Edifice. Tho' to enrich their Works, they make uſe of the ſame *Saillies* or Bearings out, the ſame *Mouldings*, and abundance of other Members of the Body of *Architecture*, the greateſt Part of which are neceſſary in *Carpenter*'s Work, yet they very often ſerve only for the *Embelliſhment* of thoſe that are made of *Stone*.

The Occaſion there has been of making ſeveral ſorts of *Buildings*, caus'd the *Builders* to eſtabliſh different Proportions, that they might have ſome which would agree with all ſorts of *Edifices*, according to the Grandeur, Strength, Delicacy and Beauty they would ſhew in them. And from theſe different Proportions they compos'd different Orders.

The Orders which the Ancients invented at ſeveral Times, and on ſeveral Occaſions, are the *Tuſcan*, the *Dorick*, *Ionick*, the *Corinthian* and the *Compoſite*. Each of theſe different Orders is form'd by the Pillar or Column, with its Baſe and Capitol, and Entableture, or the Architrave, Frieſe and Cornice; ſo that 'tis only thoſe Parts of a Column which makes what we call an *Order* in

Building. And all the Orders are different from one another, only in the Proportion of the Parts, and in the Figure of the *Capitols* of the *Pillars*.

When ſeveral Orders are made uſe of in an Edifice, they ought to be diſpos'd of in ſuch a manner, that the moſt *Delicate* ſhould always be plac'd on the moſt *Strong* and the moſt *Solid*. Thus the *Dorick* is put on the *Ionick*, the *Corinthian* on the *Ionick*, and the *Compoſite* on the *Corinthian*; the *Corinthian* and the *Compoſite* may alſo be put on the *Dorick*. For all the Art and Care in it are to place the Lighteſt a top. Nevertheleſs in the *Beautiful* Buildings of the *Ancients*, we ſee the *Architects* have plac'd the *Ionick* between the *Dorick* and the *Corinthian*, and the *Corinthian* on the *Ionick*. Each Order has its particular Meaſures.

Vitruvius is the moſt ancient of all the *Architects*, whoſe Writings are left us. He flouriſh'd in the Reign of *Auguſtus*, and had ſeen all the ſtately Edifices that were then in *Greece* and *Italy*. All that have work'd in *Architecture*, and the laſt Ages, ſince that Art has been reſtor'd with the other Arts that were deſtroy'd by the Wars and the Invaſion of the Barbarians, who overran *Greece* and *Italy*; All theſe, I ſay, have follow'd *Vitruvius*'s Leſſons, and the Examples they have met with in the *Antiques* that remain. But becauſe they have found a great deal of Difference between the Meaſures which this ancient Author gives to the ſeveral Members of all the Orders, and thoſe of the Buildings they have ſeen, theſe Moderns have differ'd very much from one another, and have not the ſame Meaſure. The Occaſion of their going ſo far from each other, is probably their not comprehending right, that *Vitruvius* lays down in each Order one Meaſure only, which will produce the only Beauty that every one ſeeks after, but is never found in Works of this Nature, excepting where the Workman underſtands by the Force of his Genius, and the Light of his Judgment, how to conduct all the Parts of a Building according to its Bigneſs, Situation and Place, or the Diſtance from which it may be ſeen. For ſuch as have written upon *Architecture*, have made particular Rules, each according to his *Genius* and *Skill*, ſupporting them by the Examples of *Antique* Edifices, which they have ſeen, and of which however we obſerve very often they have not taken the true Meaſures, but have written very differently. This is what Monſieur *de Chambray* has taken notice of, in ſpeaking of the *Compoſite* Order, of which *Phil. de Lorme* and *Serlio* ſay the *Coloſſus* was, and have drawn ſeveral Deſigns of it. Yet *Scamozzi*, and all thoſe who have examin'd the Remains of that great Work, have found out that it was two *Corinthian* Orders, one upon the other. *Palladio*, who has one of the beſt Characters among the Moderns, is ſo much deceiv'd in what he ſays of the Temple of *Diana*, in *Languedoc*, and not in *Provence*, as he affirms, that if he is not more exact in other Things, there is no depending on any thing he ſays of *Antique* Pieces. What oblig'd me to ſay this, are the juſt Meaſures of that Temple, which Monſieur *Mignard*, Architect to the King, carefully took by the expreſs Order of Monſieur *Colbert*, Superintendant of the *Buildings*. He deſign'd it with ſuch Nicety, that we cannot in the leaſt doubt his Fidelity. We ſee, by what he has done, that *Palladio* was not ſo careful, and that he truſted to ſome one or other, who did not diſcharge himſelf well in his Office, as it often happens in theſe ſort of Things. For, as to what he himſelf meaſur'd at *Rome*, perhaps he is more to be depended on. 'Tis plain therefore, that we cannot always rely on thoſe who quote *Antique* Examples, eſpecially when we know they did not ſpare Time enough to meaſure them well, nor could be at the Charge that ſuch a Work requires; and we frequently find Examples in their Writings contrary to Reaſon, and the moſt Eſſential Principles which *Vitruvius* has ſo well Eſtabliſh'd.

'Tis true, this Author ſeems Obſcure in ſeveral Parts of his Book, and even Contrary, in certain Places, to many Excellent *Romans* of Antiquity, which are to be ſeen. But perhaps when we have ſtudy'd him well, and carefully examin'd thoſe, and the Reaſons the Authors might have for what they did, we ſhall not find ſuch a vaſt Difference. Add to this; The *Architects*, who have work'd ſince, have very much vary'd from thoſe who went before them, as is eaſily obſerv'd. *Vitruvius* condemn'd himſelf the Works of ſeveral *Architects*, living at the Time of his Writing his Book.

The Tranſlation Monſieur *Perrault* has given us of him, is ſo Exact and ſo Learn'd, and the Notes ſo Curious, 'tis to be hop'd the Publick will reap great Advantage by it; and that after there have been ſo much Pains taken about him, nothing will be wanting for the good Underſtanding of an Author, which ſo many Learn'd Men have endeavour'd to Explain, but Monſieur *Perrault* only has render'd Clear and Eaſy in all thoſe Places; where, till now, we could ſee nothing but Difficulties and an impenetrable Darkneſs.

This Eſſay on Architecture in general, was taken from Monſieur *Felibien*; and what is in his Treatiſe of Architecture, which is not in the Firſt Edition of this Work, will be added in their proper Places.

Of the TUSCAN *Order.*

THE *Tuſcan* Order, as is the common Opinion, came Originally from *Tuſcany* in *Italy*: 'Tis the moſt Simple, and leaſt Ornamental of all the Orders; and is even ſo Rude, that it is ſeldom made uſe of, unleſs for ſome Ruſtick Building, where there's occaſion for but one Order; or ſome great *Edifice*, as an *Amphtiheater*, or ſuch-like Works.

Monſieur *de Chambray*, in his excellent Book of a *Compariſon between the Ancient and Modern Architecture*, divides the *Tuſcan* and *Compoſite*; which, he ſays, were origininally of *Italy*, from the other Orders. He is of Opinion, that the *Tuſcan* Pillar, without any *Architrave*, is the only Piece of Work which deſerves to be wrought, and which can recommend this Order to *Architects*. On this account, he deſcribes *Trajan*'s Pillar, ſhews the Excellence of it; and ſays, It was the Model of the *Antonine Column*; and another that was rais'd at *Conſtantinople*, to the Honour of the Emperor *Theodoſius*, after his Victory over the *Scythians.*

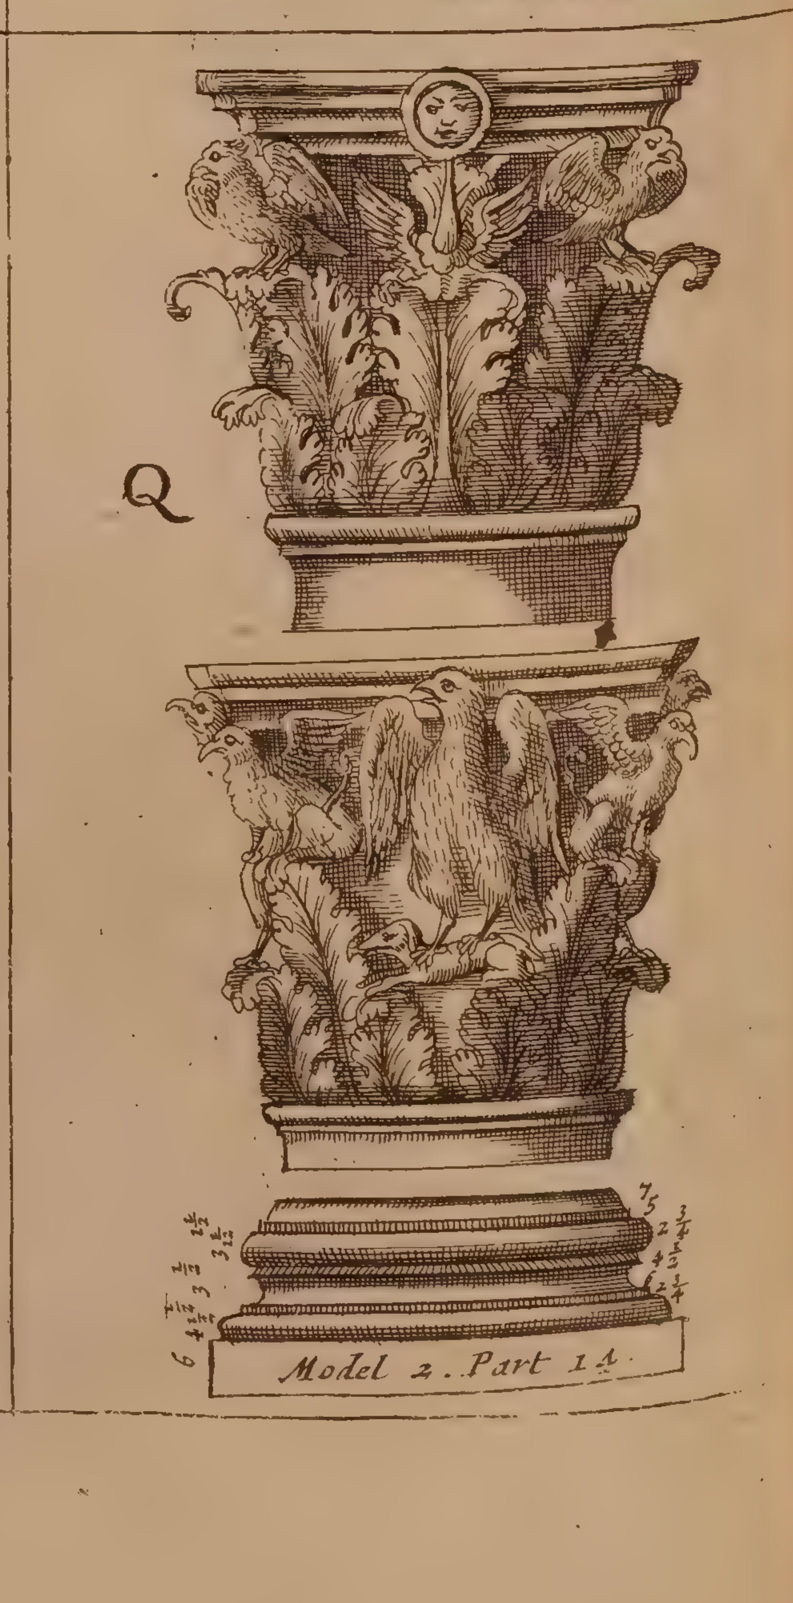
To the Right Worſhipfull S.r Thomas Fitch, of Eltham and Mount=Maſcall in Kent Knight and Baronet, Deſcended from the Antient Family of the Fitches of Fitches Caſtle in the North. Theſe Plates of the five Orders is humbly dedicated by Richard Blome.



Q
Model 2. Part 14

ans. However, 'tis probable, that the *Trajan* Column was not the firſt that was Erected to the Honour of Great Men. 'Tis not long ago, that there was a little *Tuſcan* Pillar to be ſeen at *Rome*, on which was the Figure of a *Crow*, with this Word above it, *Corvin*; ſhewing, in all likelihood, that the Column was erected to the Honour of *Valerius Maximus*, after the Action he did in ſight of the *Gauliſh* and *Romiſh* Armies; for being Military Tribune in the Conſolate of *Furius* and *Appius*, in the Year 415, from the building of the City, he fought a Gigantick *Gaul* in ſingle Combat; and it was obſerv'd, a *Crow* flew on the Barbarian, and aſſiſted the *Roman*; as may be ſeen at large in *Aulus Gellius*; by this aſſiſtance, *Valerius* overcame the *Gaul*, aſſum'd the Sirname of *Corvinus*; and his Memory was ſo venerated afterwards, that *Auguſtus* put his Statue in the *Forum*: Now, whether it was placed on the Column before mention'd or not, or the latter was Erected in *Valerius*'s Life-time. We may however ſee by it, that *Trajan*'s Column was not the firſt the *Romans* rais'd to commemorate ſome Glorious Action. And, if the *Tuſcan* Order was made uſe of by *Valerius*, 'twas on account of its Solidity.

l. 9. *c.* 11.

The *Tuſcan* Pllar with its Baſe and Capitol, is commonly Seven times as High as it is Thick, meaſuring at the Baſe, the height to be leſſen'd one quarter part of its Diameter. The *Pedeſtal* is very plain, and but one *Module*, or *Diameter* in height. The *Baſe*, which is half the Diameter of the Height, is divided into two Parts, one for the Plinth: The other is divided into four Parts; three for the Tores, and the fourth for the Liſt; which only in this Order makes a part of the *Baſe*; for in the other Orders 'tis a part of the Body, or part of the Column. The *Capitol* is alſo half the Diameter of the thickneſs of the Pillar, narrow at the Baſe, and divided into three Parts; one for the Abacus, the other for the Ovum; and the other is divided into ſeven Parts; of which, one makes the *Liſtel*, and the other ſix are for the *Colarin*, or Frieſe of the Capitol.

Felib.

Tho' the *Tuſcan* Order ſeldom has a *Pedeſtal*, yet it is made here for *Example* ſake, as in the Figure mark'd *B*; where *A* repreſents the Body of the *Column*. *B*, the neather *Band* or *Swathe*. *E*, the *Liſt*. *F*, the *Gula*, or Throat revers'd in the *Pedeſtal*. *G*, the *Body* of the *Column*, &c.

The Figure *A*, ſhews the *Capitol*, *Architrave*, *Frieſe*, and *Cornice* of the *Tuſcan* Order; and the Figure *B*, the *Baſe*, and *Pedeſtal*.

The Names of the ſeveral Parts, or Members of the Column, according to the Figure mark'd A.

THat mark'd *A*, is call'd the *Ovum*, or *Ovolo*. *B*, the *Tondino*, or Round. *C*, the *Liſt*, or Rule. *D*. the *Crown*. *E*, the *Liſt*. *F*, the *Gula*, or Throat revers'd. *G*, the *Frieſe*. *H*, the *Liſt* of the *Architrave*. *I*, the *Architrave*. *K*, the *Liſt* of the *Abacus*. *L*, the *Abacus*, or *Cimatium*. *M*, the *Ovum*, or *Ovolo*. *N*, the *Frieſe* of the *Capitol*. *P*, the Neck of the *Column*. *Q*, the hanging over the *Capitol*. And *R*, the *Body* of the *Column*.

Of the Dorick *Order.*

THe *Dorick* Order was Invented by the *Dorians*, a People of *Greece*. *Palladio* Writes, That when the *Dorick Column* ſerves for a *Portico*, it ought to be Seven times as much in *Length* as in *Thickneſs*; but if fix'd in Walls, it ought to be Eight times as long as thick, and often more taking in the Baſe and Capitol. The *Dorick* Capitol is in height half the Diameter of the Column: It conſiſts of the following Parts; The *Abacus*, the *Ovum*, the *Rings* and the *Frieſe*; the *Aſtragai*, and the *Cincture*, which are below the Capitol, are reckon'd part of the Fuſt of the Column.

Fel.

The *Entableture*, or Architrave, Frieſe, and Cornice, are heavier and higher in this, than in other Orders: For in this, as well as in the *Tuſcan* Column, 'tis commonly a fourth Part as much in Height as the Column itſelf; and the others do not exceed a Fifth.

The height of the *Architrave*, is half the *Diameter* of the *Column*: 'Tis compos'd of one only *Faſcie*, and one *Swathe* or *Band*, which Crowns it; and has for particular Ornaments certain *Gutta*, or Drops, below the *Triglyphes*. Some Modern *Architects* put two *Faſcies* in the *Dorick* Architrave, in Imitation of ſome Remainders of Buildings, which are not of the greateſt Antiquity nor the beſt *Gout*.

The *Frieſe*, with its Liſt; which is the flat Band, that ſeparates it from the Cornice, ſhould be three quarters of the Diameter in Height. Its Ornaments, are *Triglyphes* and *Metopes*, but 'tis very difficult to diſpoſe of them well. Read *Vitruvius*, l. 4. c. 5.

The height of the Cornice, is equal with that of the *Frieſe*, when the *Column* is above Seven times its Diameter in Height: The *Frieſe* and *Architrave*, keep always their ſetled Meaſure; one of half, and the other of three quarters. The Diameter and the Surplus, which makes the Fourth Part of the Column, is thrown back on the Cornice.

If that Column is Fluted, it has generally no Liſt, or plain Space between each Flute, as is obſerv'd in the other Orders; and beſides, the Flutes are not ſo deep; they ought to be Twenty in Number.

As for the *Pedeſtal*, *Palladio* aſſigns it in Height two Diameters, and a third of the Column taken at the Bottom, and makes uſe of the *Attick* Baſe. For by what remains to us of the Antient Buildings, it appears, that the *Dorick* Order has no *Baſe*. Thus far Monſ. *Felibien* goes, in his Treatiſe of the *Dorick* Pillar. The Figure will give the *Engliſh* Reader a further Light; and it may be thus deſcrib'd in particular.

The Figure mark'd *C*, repreſents the *Dorick* Order, whoſe Parts are thus mark'd; *A*, the *Grove*, or hollowing of the upper *Liſt*. *B*, the *Dentils*, or Teeth. *C*, the *Capitol* of the *Triglyph*. *D*, the *Triglyph*, in which thoſe Parts that are fram'd inwards, are call'd *Flutes*, or *Hollows*: And the ſquare Place of the *Frieſe* between the *Triglyphs*, is called a *Metops*. *E*, the Props, or little *Bells*. *F*, the *Cimatium*. And *G*, the *Amulets*, *Bands*, or *Liſts*.

Of

Of the Ionick Order.

THE *Ionick* Order derives its Name from *Ionia*, a Province of *Aſia*. The Pillar, with its *Capitol* and *Baſe*, ſhould be in *Height* nine times the *Diameter* of the *Column* taken at the Bottom. It was not thus, when this *Order* was firſt invented; for it then conſiſted of but Eight Modules, or *Diameters* in Height. But the Ancients intending to make it more agreeable than the *Dorick*, encreas'd the height of the *Column*, by adding a *Baſe*, which is not us'd in the *Dorick* Order.

The *Entableture* takes up a *Fifth* Part of the Height of the *Column*, of which the *Baſe* is half the *Diameter*, and the *Capitol* a little more than a *Third*. The Capitol is chiefly compos'd of *Voluta's*, which renders this Order different from all the others. There are ſeveral Ways of making theſe *Voluta's*, as may be ſeen in *lib. 5. c. 27.* Monſieur *Perrault*'s Notes upon *Vitruvius*. *Phil. de Lorme* ſays, he firſt diſcover'd thoſe which are now moſt commonly put in Practice; and ſeems to complain, that ſome one elſe had aſſum'd the Honour of that Diſcovery, becauſe *Palladio* and *Serlio* had ſpoken of it before him. *Michael Angelo* alſo invented a particular ſort of *Voluta*'s. The *Ionick* Pillar is generally fluted with twenty four Flutes. There are ſome which are not concave, till above the third Part of the height of the Column, the Flutes of which third Part are fill'd with round Baſtons. 'Tis true, in the Ancient Buildings, almoſt all the Great *Columns* that are fluted, have Flutes from the Top to the Bottom, which was an Invention of the *Architects*, to imitate the *Folds* of Womens Robes, for they pretended this Order had the ſame Proportions.

The Height of the Pedeſtal of the *Ionick* Pillar, ought to be two, and two Thirds, or thereabouts, of the Diameter.

There are ſeveral Things to be obſerv'd in all the Parts of this Order, to give it that Beauty and Elegance which it requires, as may be learn'd in the beſt Authors, and particularly *Vitruvius*.

This is *Felibien*'s Account of the *Ionick* Order: To which may be added the following Particulars.

The Figure mark'd *D*, repreſents the *Ionick* Order, whoſe Parts are thus mark'd. *A*, the *Scotia*, or upper Hollowing. *B*, the *Aſtragals*, or Rounds. *C*, the *Scotia*, or neathermoſt Hollowing. Alſo, the Figures mark'd *E*, *F*, and *G*, are parts of the *Ionick* Order; the latter of which is the *Voluta*, or Scroll.

The Figure *D*, ſhews the *Baſe* and *Pedeſtal* of the ſaid Order. *E*, the *Capitol*, *Architrave*, *Frieſe*, and *Cornice*. *F*, the *Baſe* and *Pedeſtal*. And *G*, the manner of deſigning the *Voluta* of the *Capitol*.

To make a *Voluta*, a Line is to be drawn level from beneath the *Doucine*, and to be prolong'd as far as the Line, which form the upper Abord of the *Baſton*; the point of Interſection of theſe two Lines, will be the *Center* of the *Eye* of the *Voluta*: Then from the *Center*, trace every one of the four Lines of one part of the *Model*, and draw through their Extremities other *Lines*, you will make a Square cut the ſides into two equal Parts; draw two Lines through the oppoſite Diviſions, which will paſs from the *Center*; divide each one into ſix equal Parts, and you will have twelve Points mark'd 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12. which will ſerve for *Centers* to twelve Fourths of *Circles* that compoſe the *Voluta*, which conſequently will have three entire Revolutions, and will end in a Point, as it began at the lower ſide of the *Doucine*: But from the upper ſide of the *Abacus*, there is to be begun another *Voluta*, which will end at the firſt, and whoſe twelve Parts of the *Circle* will have the ſame *Centers* as the firſt; and the *Eye* of the *Voluta* is the *Circle* deſcrib'd from the Interſection of the two firſt *Lines*, as *Center* of the overture of one part of the *Model*.

Obſerve, That the *Abacus* having left off Projection, then its upper *Liſt* will make the *Creux* of the *Voluta*: And the ſame *Liſt* which is compriz'd of the two Lines of the *Voluta*, will be the Part Projecting.

Of the Corinthian Order.

THIS Order was invented at *Corinth*; its Meaſures are the ſame with the *Ionick*: The greateſt Difference between them, is in their Capitols.

The *Corinthian* Column, with its Baſe and Capitol, is generally ten times in Height, to what it is in Diameter; tho' *Palladio*, and ſome others, aſſign it but nine Diameters and a half. If it is fluted, it ought to have almoſt twenty four Flutes, the depth of which ſhould be half of their breadth: The *Liſt*, or plain Space that ſeparates one Flute from another, ought to be one third as broad as the width of the Flutes: There may be twenty eight, or thirty two of them, according to the bigneſs of the Pillars, and the Place where they are put; becauſe, if there's occaſion to make it look bigger, you need only multiply the number of the Flutes.

The greateſt part of the Modern Authors aſſign only to the *Entableture*, or *Architrave* Frieſe and Cornice, a fifth Part of the height of the entire Pillar, including the *Baſe* and *Capitol*: But if we wou'd take the beſt Remains of Antiquity at *Rome*, particularly the *Rotunda*, for an Example, the *Entableture will allow* of greater Height: 'Tis true, regard muſt be had to the bigneſs of the Edifice, according to which, the upper Parts ought to be more Powerful.

The Height of the *Capitol* ſhould be one *Diameter* of the *Abacus*, a ſixth or ſeventh Part of the Diameter of the Pillar taken at the Bottom: The reſt is divided into three Parts; one for the firſt Range of Leafs, and another for the ſecond: As for the third, 'tis again divided into that which joins the *Abacus*, in form of *Voluta*'s, and that which makes the *Colicoles*.

Thus far *Felibien*. To which may be added what another Author ſays of the Capitol. ' The reſt of it has the Figure of a Bell reverſt, whoſe Side (which is under the *Abacus*) has two Parts of Largeneſs, and four of Projecture. 'Tis divided into four equal Parts, and each of them again into twelve, for the Foliages, which ſerve for Ornament to the Column; theſe *Foliages* conſiſt of Olive-branches, which are to hang down about four Parts; but their Projecture is ‘to be determin'd by a Line drawn from the Extremity of the *Cimatium*, to the *Roundel* under the *Capitol*. Some are of Opinion, that the *Foliage* may paſs a little beyond this Line; and the Angles of the *Cimatium* are carry'd by *Rollers*, which others call *Tigats*, beſides two other Rollers, which are turn'd one towards the other, ſo far as to touch under the Flower, which is moſt commonly a Roſe: This Roſe ought to be in breadth one quarter of the Diameter of the Column taken at the Bottom.

The *Pedeſtal*, according to the ſame *Felibien*, ſhould be a fourth Part of the Column. 'Tis divided into eight Parts, one for the *Cimatium*, two for the Baſe, and the reſt for the *Dye*. As to the Figures of this Column, thoſe mark'd *H*, *I*, *K*, *L*, and *M*, repreſent the *Corinthian* Order. In that mark'd *K*, the Letter *A*, ſhews the upper *Torus*, or *Swathe*; and *B*, the neather *Torus*, or *Swathe*. In that mark'd *L*, the Letters *A*, *B*, together, are call'd the *Abaces* of the *Capitol*; but for Diſtinction, *A* is taken for the *Cimatium* of the *Abacus*; the *Stalks*, *B*, *C*, *D*, the leſs *Leaves*; and *G*, the *Flowers*. The Figure *H*, ſhews the manner of deſigning the *Capitol*. That of *I*, the *Capitol*, *Architrave*, *Frieſe*, and *Cornice*. That of *K*, the *Baſe*, and *Pedeſtal*. That of *L*, an Example of the *Pillars*. And that of *M*, of *Pilaſters*.

Of the Compoſite *Order.*

THE *Compoſite* Order was added to the other Four by the *Romans*, who place it above the *Corinthian*, to ſhew, (as ſome Authors tell us) that they were Maſters of all other People: And that 'twas not Invented, till after *Auguſtus* had given Peace to all the World.

'Tis compos'd of the *Ionick* and *Corinthian*, but is ſtill more Ornamental than the *Corinthian*, to which it is like in all the Meaſures and Numbers, excepting that the Capitol has but four Voluta's, which take up the Space that in the *Corinthian* is fill'd with Voluta's and Colicoles: The Capitol has a *Cimatium* like the *Corinthian*, a little Space of two Parts; whence ſpring the Voluta's, and then an Ovum, or Baſton, and a Liſt like thoſe that are in the lowermoſt Part of the *Ionick* Capitol. The Voluta is the ſame as the *Ionick*, having as much of the Front as the Corners of the *Corinthian Abacus*; that is, four Parts, or a little more: It ſprings from the Foot of the Flower, and its Eye is terminated by the upper ſide of the *Baſton* or *Roundel*. The Capitol from the *Abacus*, is divided into three Parts, the uppermoſt is allow'd to the *Voluta*; and the other Ornaments taken from the *Ionick* Order; and the lowermoſt to the *Foliages*. *Felibien* ſays, We may believe by ſeveral Ancient and Modern Buildings, that there are other ſorts of *Capitols*, which agree with no other Order but this. He continues, The *Compoſite* Column, like the *Corinthian*, is ten times as High as it is Thick. *Phil. de Lorme*, who believ'd that thoſe Pillars of which the laſt Order was form'd, were *Compoſites*, writes, That they were as big at the *Capitol*, as at the *Baſe*; which however, is not obſerv'd in the ancient Edifices, where the *Entableture* is alſo a Fourth Part of the Column. But *Palladio* allows only a Fifth Part to it, as well as to the *Corinthian* Order. He alſo aſſigns to the *Compoſite* an *Attick* Baſe; or a Baſe compos'd of the *Attick* and *Ionick*, as he does to the *Corinthian* Order. As for the *Pedeſtal*, its Height ought to be a Third Part of the Pillar.

Nevertheleſs, all the Meaſures are not ſo well ſetled, but they vary according to the Bigneſs of the Building. *Vitruvius* ſhews how the Members of an Order ought to be made, according to its Height; for the Members of an Edifice ſhould be Encreas'd, or Diminiſh'd, as is convenient for the Beauty of the Work. So true is this, that among the Antiquities in *Provence*, there's a Tomb, which Monſieur *Mignard* the Architect, Deſign'd very lately, with more than ordinary Exactneſs: the Columns of which, have alſo have no ſetled Meaſure: There are ten pretty high of the *Compoſite* Order, which ſupport a little Dome; and becauſe they are all Iſolees, each ſtanding by itſelf, and the Light paſſes by the ſides of them, they are ſo big, that they are not above eight Modules in Height, and yet they have an admirable Effect.

Regard muſt be alſo had to the Number of *Pillars*, and a Difference be made between ſuch as are not above four in Number, and ſuch as are ſix or eight in a Row; thoſe that ſtand againſt a certain Body, and thoſe that ſtand by themſelves, muſt be conſider'd; as alſo ſuch as are the Extremities or Angles of a Building; which ought always to be greater than others, becauſe the Air encompaſſing them, takes off part of their Bigneſs in View, and makes 'em look Leſs.

As for thoſe *Pillars* which are not Entire, but the half or third Part of their Bigneſs is loſt in the thickneſs of a Wall, other Meaſures muſt be obſerv'd, different from thoſe that are quite Round. The former was not only Invented for the Decoration of Walls, but alſo to ſtrengthen them, and ſerves for *Jambes* to Gates and Doors; alſo for Counter-Pillars, the better to ſupport the Vaults of Edifices. Ornaments may be added on certain Occaſions, to *Pillars* and *Pilaſters*, as *Phil. de Lorme* has done in the Palace of the *Tuilleries*.

This is what Monſieur *Felibien* writes of the *Compoſite* Order.

The Figures mark'd *N*, *O*, *P*, *Q*, repreſent the ſeveral parts of this Order, viz. *N*, the manner of Deſigning the *Capitol*. *O*, the *Capitol*, *Architrave*, *Frieſe*, and *Cornice*. *P*, the *Baſe* and *Pedeſtal*. And *Q*, an Example of the *Capitol*, with *Birds* and *Beaſts*.

This Order has as great a Fame as the *Corinthian*. Its principal Parts are compos'd of the ſame Ornaments, and divided in the ſame manner: And indeed, there is no material Difference to be found, except in its *Capitols* and *Pedeſtals*.

The *Pedeſtal* of this Order, differs not from that of the *Corinthian*, except in ſome parts of the upper and lower *Cimatium*.

Among the Antiquities of *Rome*, has been found a very great number of *Capitols*, which not belonging to any of the Four *Orders*, are to be attributed to the *Compoſite*, becauſe they have almoſt all the principal Meaſures of that which is compos'd of the *Ionick* and *Corinthian* Orders here deſcrib'd. In the place of the *Voluta*'s, *Rollers*, and *Tigats*, there are *Eagles*, *Griffons*, and other Animals; and in the place of a *Flower*, there are *Faces* and other Things.

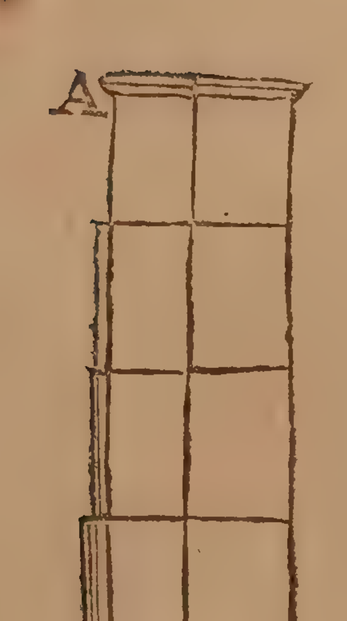
What follows, is taken entirely from Monſieur Felebien's *Treatiſe of Architecture.*

Of Pilaſters and Wreath'd Columns.

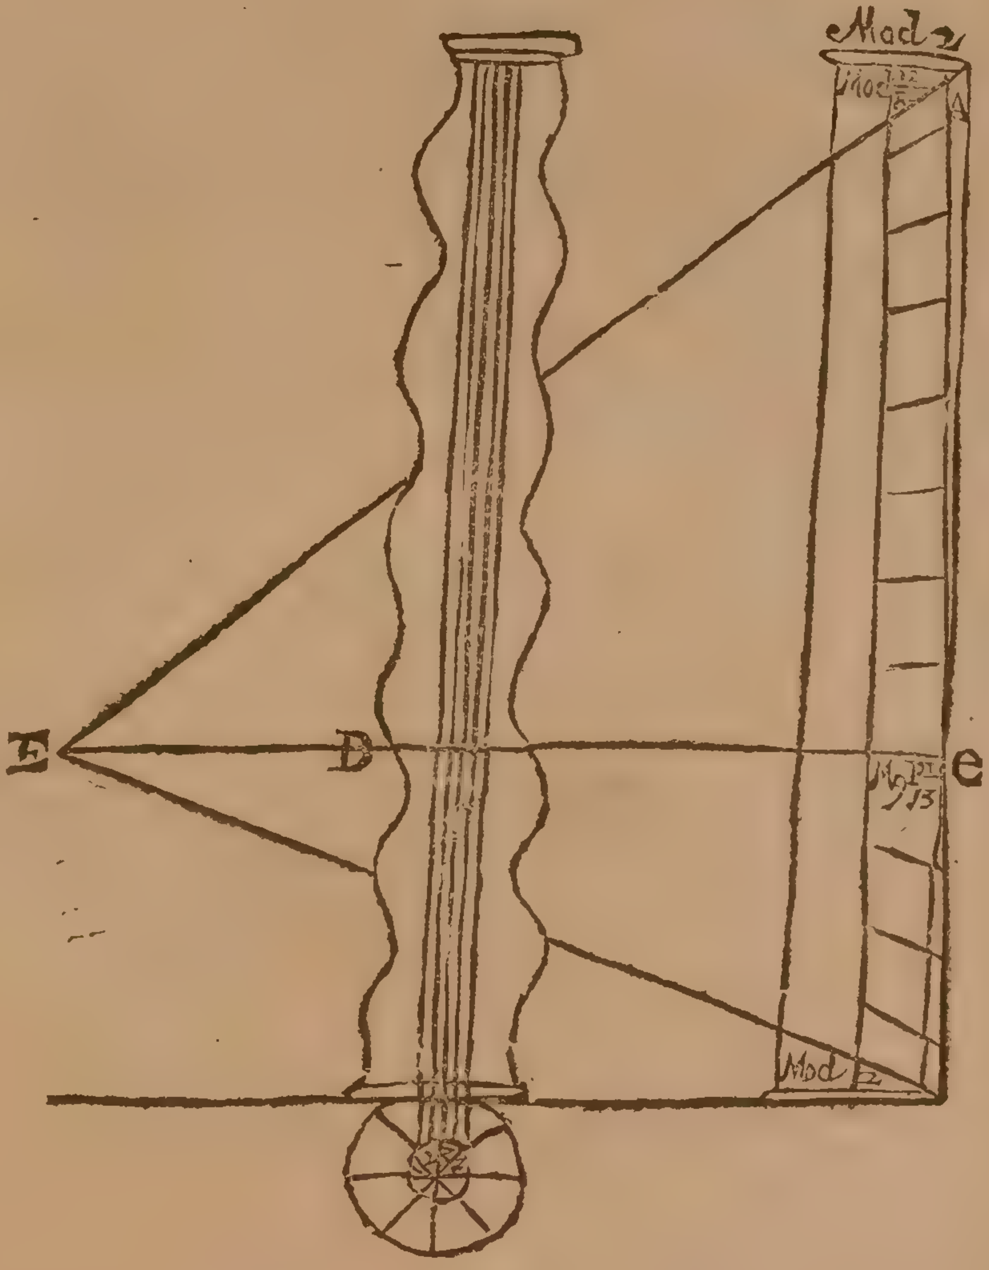
THere are Square Columns, which are call'd *Pilaſters*, and are thought to be the ſame ſort of Pillars, which in Ancient Authors are term'd *Atticurges*: They are proper to all the Orders, and ſuſceptible of the ſame Ornaments. Some of them may be ſeen at the Corners of the *Portico* of the Church of the *Four Nations.*

Wreath'd Colums, ſuch are now in Uſe, are a Modern Invention; and the Ancients, who were above all Things careful to make their *Buildings* firm, never would have *Wreath'd* Pillars, tho' they had been for Ornament only: They deſir'd, that Nature and Veriſimility ſhould appear in all their Works, which are not to be met with in thoſe ſort of Columns, they having neither Force nor Figure to ſuſtain a great Burden: Neither were they much us'd till lately, that the Great *Braſs* Columns in St. *Peter*'s Church at *Rome*, were made. Workmen think one Example of Novelty ſufficient to authorize their Imitation, and juſtifie their taking all manner of Licenſe, very often *mala propos*, and againſt Reaſon; as ſeveral have done with reſpect to Cartridges, with which they may be ſaid to have disfigur'd Architecture, ſince they ſaw *Michael Angelo* make uſe of them. By this we ſee, that ſuch as do not throughly underſtand their Art, and are indeed nothing but *Copyiſts* and *Apes* of others, almoſt never Imitate them, except in thoſe Things in which they did ill. For, 'twas not in his Cartridges that *Michael Angelo* ſhew'd himſelf an excellent Architect; he was Maſter of thoſe other Parts of his Art, that may very deſervedly be imitated. But as to thoſe heavy and ridiculous Ornaments, they are not to be found in any *Antique* Edifices, no more than *Wreath'd* Columns. *Palladio* only ſays, He had obſerv'd in a little Temple near *Trevi*, ſome Pillars of the *Corinthian* Order with Flutes twiſted about the *Fuſt*; but the Trunk of the Column was not Twiſted, as is done now a-days. *Vignole* has deſcrib'd the true Figure of it, and ſet down the manner of making it.

Of the Diminution and Enfleurs of Columns.



THE *Diminution* of *Columns* is made ſeveral ways: But it will be ſufficient to give Examples of the two chief of them. For the Firſt. Let the Column *A,B*, be divided from a Third Part upward. Let the *Semi-Circle E, D, C*, be made at the Point *E*, and from *A*, the point of *Diminution.* Let the Line *A, G*, be let down perpendicularly; then let the Point *E, G*, be divided into as many equal Parts as you pleaſe: For Example, into ſix; and let *E, A*, be alſo divided into other equal Parts; and when the *Perpendicular* and *Horizontal* Lines ſhall cut each other, draw the Line *E, H, I, K*, which will give the *Diminution* deſir'd: And the ſame way may be made uſe of in the *Tuſcan* and *Dorick* Orders.



This other way, tho' it be leſs common, yet is eaſie to be conceiv'd by the *Lines*. The Meaſure of the *Columns* being agreed on, a *Line* is to be drawn *ad finitum*, beginning at *C*, and continuing through *D.* Afterwards bring back the Meaſure *C, D*, to the Point *A*, till it cut the *Perpendicular* at the Point *B*; and *A, B*, being continu'd to *E*, from thence there may be drawn as many *Lines* as you pleaſe; which parting from the *Perpendicular*, will tend directly to the Circumference of the *Column*; upon which, applying to the Meaſure *C, D*, you will there have the *Enfleur* of the *Column*, as well above as beneath. And this way may be apply'd to the *Ionick*, *Corinthian*, and *Compoſite* Orders.

But if it be thought fit to make theſe *Columns* Wreath'd, after the manner of thoſe which are at St. *Peter*'s at *Rome*, there muſt be a *Plane*, as is here mark'd; and that little *Circle* in the middle, ſhews how it is to be Wreath'd; which being divided into eight Parts, and four *Lines* being drawn qarallel to the *Perpendicular*, the whole *Column* is to be divided into 48 Parts; and the *Spiral Line* form'd through the Middle, ſerves for a *Center* to the *Column*, upon which is to be ſet forth the bigneſs of the *Column Strait-Line* by *Line*, as it is here repreſented. But 'tis to be obſerv'd, That the four Numbers, 1, 2, 3, 4, mark'd upon the *Plane*, are only to ſerve as far as the firſt Half-Story, in regard the beginning Parts from the *Center*, muſt be continu'd from thence upward about the little *Circle*, to the laſt Half-Story above; where alſo the four Points below are to be made uſe of.

REMARKS.

THE *Roundels*, or *Baſtons*, are deſign'd by a *Demy-Circle.* The *Ovum*, or quarter of a *Round*, by a quarter of a *Circle.* The *Gueul* Revers'd, or *Doucine*, by the Sixth part of a *Circle*, deſcrib'd with the *Equilateral Triangles*, in ſuch ſort, that the *Crooking* from below be inward, and the *Crooking* from above be outward. The *Strait Gueul*, or *Demi-Doucine*, is deſign'd as the *Doucine* itſelf, only with this Difference, that the bending from below

low is outward, and that from above inward. The *Abacus* is deſign'd by an *Arch*, deſcrib'd with an *Equilateral Triangle*, in the ſame manner as the *Scotia's*, and the Imbelliſhment of the *Trunk* of the *Column* towards its *Cincture* or *Collar*.

Of the Order of the Cariatides, *and the* Perſick Order.

BEſides the Five Orders, of which mention has been already made, there are ſome Writers who put Two more after them, as the Order of the *Cariatides*, and the *Perſick* Order. The Firſt is nothing elſe but the *Ionick* Order, without any Alteration, except that inſtead of *Pillars*, the *Entablement* is ſupported by the Figures of *Women*. *Vitruvius* attributes the Origin of this Order to the Ruin of the Inhabitants of *Caria*, a City of *Peloponneſus*. He ſays, That being united with the *Perſians* in the War againſt the *Greeks*, their own Country-men; the latter, after they had routed the *Perſians*, laid Siege to the City of *Caria*, and having taken it by Storm, reduc'd it to Aſhes, and put all the Men to the Sword, carrying away the Women and Children into Captivity. But to leave ſome Tokens of their Vengeance to Poſterity, they repreſented in all the Publick Edifices they built afterwards, the Image of thoſe miſerable Captives, making them ſerve for Columns to ſupport a heavy Burthen, which was the Puniſhment they had deſerv'd for the Crime of their Husbands.

'Twas another ſuch Accident that gave riſe to the *Perſick* Order; for *Pauſanias* having defeated the *Perſians*, the *Lacedemonians*, in Token of their Victory, erected Trophies with the Arms of their Enemies, whom they afterwards repreſented under the Figure of Slaves, bearing the *Entabletures* of their Houſes. And as the *Ionick* Order was choſen for the *Cariatides*, as moſt agreeable to the Figure of Women; ſo the Architects choſe the *Dorick* Order to repreſent the *Perſians*.

Theſe two Examples have been the occaſion of making uſe of ſeveral ſorts of *Figures* in *Architecture*, to bear up Cornices, Corbels and Compartiments. Several of theſe ſorts of Figures are to be ſeen in the *Gothick* Buildings, with as much Exceſs as without Order and Reaſon. 'Tis probable the *Greeks* alſo made ſuch Figures as theſe, after different Manners. For in the *Antiquities* near *Athens*, there are *Figures* of Women carrying Baskets on their Heads, which ſerve inſtead of *Cariatides*. They alſo put Human Figures under Compartiments and Corbels, calling them *Atlas's*. According to *Vitruvius*, the *Romans* term'd them *Telamones*. The *Greeks* had ſome Reaſon to call them *Atlas*, the Poets feigning that he bore up Heaven with his Shoulders, but we can't imagin why the *Romans* gave 'em the Name of *Telamones*, *Vitruvius* himſelf ſaying nothing of it.

Baldus, in his Dictionary on *Vitruvius*, ſeems to have hit upon the Thing well enough, when he ſays, 'tis likely he who made uſe of that Word to expreſs Figures ſupporting a Burthen, did not write it *Telamones*, but Τλήμονας; which Word in the *Greek* ſignifies *Wretches* who are condemn'd to hard Labour, and this agrees perfectly well with the Figures that ſuſtain Cornices and Corbels, as is to be ſeen commonly in ſome ancient Churches, where the Figures of Saints and ſome other Illuſtrious Perſons ſerve for Pillars.

Of the Ornaments of Architecture.

AS to the Ornaments of an Edifice, it may be ſaid of them, that they ſerve only to embelliſh the ſeveral Parts by the different Pieces of Sculpture that are put there.

Vitruvius calls the *Entabletures* of each Order *Ornaments*, as the *Architrave*, *Freiſe* and *Cornice*, the *Metops*, *Tryglyphes* and the *Guttæ*. Other Things that are met with in Architecture, were invented to imitate the Beams, Girders, and other Pieces of Timber made uſe of in Building; and the Ancients imitating not only what Nature ſhew'd them, but aſſiſting themſelves by the Art and Invention of other Workmen, made ſeveral Parts of Sculpture in Cornices and Capitols of Pillars. Read *Vitruvius* on this Head.

The *Ornaments* that generally are cut on the Mouldings, are Foliage, Flutes, Rubans wound upon Sticks or otherwiſe, *Chaplets*, *Shells*, *Roſes*, *Flowers*, and divers other Things, according to the Place and Part to be adorn'd. Certain Parts may be enrich'd with *Baſſo Believo's*, as *Freiſes*, *Pedeſtals*, and other flat Places, as may be ſeen in the *Antiques* that are left us.

The Ancients did not take ſo much Care to finiſh the Ornaments of great *Edifices*, as *Amphitheatres*, and the like; but in thoſe of their little *Buildings* they were very exact. The former would have taken up too much Time, and been too great an Expence.

In ſome Parts of Architecture Sculpture is Eſſential, as *Vitruvius* obſerves, in the 3d. Chapter of his Fourth Book; ſuch are *Corinthian* and *Ionick* Capitols and Trygliphes, *&c.* In others 'tis not abſolutely neceſſary, as in the Oval of great Cornices, the Dantilles of *Corinthian* Cornices; the *Corinthian* and *Ionick* Freizes, the Cornices, the Metops of the *Dorick* Order.

Of ſeveral Sorts of Edifices.

THERE are three ſorts of Buildings in Architecture. 1. Sacred Edifices, as the ancient Temples, and our Churches and Chappels. 2. Publick Edifices, as Courts of Juſtice, Tombs, Theatres, Amphitheatres, and other Buildings, which ſerve for *Shews* and *Feſtivals*; and *Triumphal Arches*, *Gates*, *Bridges*, *Aqueducts* and *Priſons*. 3. Palaces and Private Houſes.

The Ancients had two ſorts of *Temples*; ſome built after the *Greek*, and ſome after the *Tuſcan* Manner, as may be ſeen in *Vitruvius*,

They aim'd at making their Temples have a particular Agreement with their *Deities*, not only with reſpect to the *Situation*, but alſo to the Form of their Structure. Thoſe that were Dedicated to the *Sun*, were of a *round* Figure; as were alſo thoſe Dedicated to *Luna* and *Veſta*; ſuch a one is that built by *Numa*, which is to be ſeen at *Tivoli*. Thoſe Dedicated to *Minerva*, were *open* in the Middle; thoſe to *Minerva*, *Mars* and *Hercules*, were of the *Dorick* Order; thoſe to *Venus*, *Flora*, the *Muſes* and *Nymphs*, of the *Corinthian*; thoſe to *Juno*, *Diana*, *Bacchus*, and other the like Divinities of the *Ionick* Order. And all theſe Temples were enrich'd with Ornaments ſuitable to each Divinity.

They were for the moſt part of White Stone, or Marble; and when of Braſs, or any other Matter, whiten'd within-ſide; for of all Colours the *White* is that which agrees beſt with a Temple, becauſe it repreſents that *Purity* with which the Divinity that is there Worſhip'd ought to be Ador'd.

As for Publick *Edifices*, either Courts of Juſtice, or Places for *Shews* and *Feſtivals*, or for the Advantage and Decoration of a City, 'tis certain the *Greeks* and *Romans* ſurpaſt all other Nations in the Grandeur and Magnificence of their Buildings. There's very little of the *Greek* Edifices remaining; but what is to be ſeen in ſeveral Parts of *Italy*, ſufficiently ſhews what the *Roman* Building was. They had three ſorts of Priſons; the one for looſe, debauch'd People; the other for Bankrupts and inſolvable Debtors; and the third for ſuch as had been guilty of Capital Crimes. Among the moſt conſiderable of Publick Edifices, may be reckon'd *Stone-Bridges*, on account of the Difficulty of carrying on Maſon's Work in the Water. There are five Things to be obſerv'd in Building them. 1. The Buttings of the Borders. 2. The Piles, whoſe Foundation is in the Water. 3. The Arches. 4. The Supporters. 5. The Pavement.

The Piles ought to be equal in Number from one End of the Bridge to the other. Their Thickneſs ought not to be leſs than a *Sixth* of the Void of the Arch, nor more than a *Fourth*. Their *Front* is generally *Angular*, and ſometimes alſo *Semicircular*. But in the ancient Bridges, the *Angles* of Defence, or *Spars*, oppos'd to the Current of the Water, are almoſt always *Right*, thoſe ſort of Angles being ſtronger than *acute*, and leſs liable to Deſtruction.

The ſtrongeſt Arches are thoſe whoſe Vault is an entire Semicircle.

As for the Supporters, the Height and Ornaments, they are left to the Diſcretion of the Builder.

The Pavement ſhould be of good Stone; and as People are to paſs to and fro moſt upon the Bridge, ſo the Paving muſt be manag'd accordingly.

Palaces ſhould be built according to the Grandeur and Magnificence of the Princes or Great Lords to whom they belong; and the Houſes of Private Men alſo according to their Employments and Eſtates.

Solidity, Convenience and Beauty are the three principal Things to be minded in *Building*. As to the Ornaments, they muſt be ſuited to the Diſpoſition of the Place, and the Expence propos'd as the *Builder* thinks fit.

Of Things Neceſſary in Building.

THE principal Materials in building are *Timber*, *Sand*, *Stones* and *Earth*. For of Earth *Bricks* are made, as alſo *Pantiles*; and of Stone *Lime*.

The beſt Lime is made of Marble, or of the hardeſt Stone; for the harder the *lib.* 11. *c.* 5. Stone, the fatter and more gluttinous will the Lime be. *Vitruvius* ſays, Lime made of the hardeſt Stone is beſt for Maſon's Work, and that made of ſpungy Stone propereſt for Plaiſtering.

In all Work under Water you muſt make uſe of Lime burning hot and juſt taken out of the Kiln, with the Flints and Sand of the River, or a Cument made of broken Tiles; for this Mortar will ſo conglutinate with Lime, that all the Stone-work will be one ſolid Maſs. *Phil. de Lorme* writes, that Lime is known to be good when 'tis very heavy, and ſounds like an empty Pitcher when 'tis ſtruck; or being *wetted*, its Vapour and Smoak are very thick, and preſently riſe high, and in tempering it, it ſticks to the Beater.

According to this *Architect*, the beſt Way to make excellent Mortar, *lib.* 1. *c.* 17, is to heap it together as ſoon as it comes out of the Kiln, in what Quantity you pleaſe, in a ſmooth Place two or three Foot deep.

It muſt afterwards be cover'd all over equally with good Sand about a Foot or two deep; then throw Water upon it, and that in a great Quantity every where to moiſten the Sand ſo well, that the Lime which is under it may infuſe and diſſolve without Burning. If the Sand cleaves in any Place, and makes way for the Smoak, that Place muſt be immediately cover'd with new Sand, to hinder the Vapours breaking thro' it; for the Sand being thus moiſten'd, and the Lime well cover'd, it turns to a Maſs of fat Subſtance, which, when it is broken open, two, three, or ten Years afterwards, will reſemble a Cream-Cheeſe. This Matter will be ſo fat and gluttinous, that the Workman will be hardly able to ſtir it with his Beater; and having eaten up a good quantity of Sand, will make an excellent Mortar for Cruſting and Plaiſtering of Walls, for Stuck and Painting in Freſko. For the Colour keeps better upon Mortar made after this manner, than on that made of new Lime, which makes the Plaiſter cleave and chap, and changes the Beauty of the Colours.

As to Sands there are ſeveral Sorts of different Natures and Goodneſs. Some of them are more profitable, and bind better with Lime than others. And ſome are ſo fat and excellent, that one may put five, nay ſeven Parts to one Part of Lime. Others are ſo bad and dry, that there muſt be almoſt as much Lime as Sand. The one is proper for Walls above Ground, the other for Foundations; ſome for Plaiſtering; ſome for Pottery; as particularly a very brown Sand, work'd up for that uſe at *Rome*, which does wonderfully well: 'Tis call'd *Pouzzolan*, from the Pits where 'tis dug. It hardens ſo when 'tis work'd, and grows to ſuch a ſolid Body, and knits itſelf ſo admirably together, that 'tis of itſelf capable of forming Vaults.

In many Parts of *France*, the beſt Sand is the Terrene, which is there call'd *Sable de Cave*, Cellar-Sand, becauſe 'tis dug up in the Earth, and has a Grain almoſt as big as *Pebbles*, making a noiſe when 'tis handled. That which brings Earth up with it, is not of ſuch uſe. There's Sand of divers Colours, as White, Yellow, Red, and Black. You may know the Goodneſs of them, by putting them on Cloth; and if it does not dirt it, nor ſtick to it, as Earth commonly does, then the Sand is good. *Vitruvius*, and *Phil. de Lorme*, have treated of this more amply.

It muſt be obſerv'd, that all ſorts of Water is not good to temper Lime and make Mortar. That which is temper'd with Sea-water, is worth nothing; for when it is work'd, 'tis not dry'd, but with great difficulty, nor conglutinates, nor binds itſelf with the Stone. The Water of Lakes and Marſhes, are as bad, being two foul; River-Water, Rain-Water, Spring-Water, are the propereſt for this Uſe.

When any Stone-work is done in the Water, a Cement made of broken Bricks, or Tiles, with Lime juſt taken out of the *Kiln*, is beſt, as I have already obſerv'd: You firſt put Piles of good Oak, the Bark taken off, which muſt be driven down as deep as you can, with a void Space as big as that which is fill'd. The Void is fill'd with Coal, and above the Piles are plac'd Beams, of eight or nine Inches, which are nail'd down on the Piles, cut to an equal Height: On the Beams are plac'd Planks of five Inches thick, and this makes the Platform, or Floor. In ſome Countries Wool is put between the Piles and Planks. *Pliny* ſays, the Foundations of the Temple of *Epheſus*, were good Piles with Coal and Wool. On this Platform the Work is carry'd on with hard Stone, according to its Nature and Quality.

Lib. 86. 14.

The Walls of Buildings are made after different Manners; ſome with great Free-Stones; others with Rubbiſh; others with Flint; others with Bricks, diſpos'd Chequer-wiſe, in Angles, or as the Builder's Fancy directs him.

The Ancients made a ſort of Coffers with Planks of the thickneſs they would have their Walls to be, and fill'd them with Mortar and all ſorts of Stones. This way is proper for raiſing of *Dikes* and Works under Water: Little Stones, too hard, and too ſmooth, are not proper to receive the Mortar. Some are of Opinion, that the *Grez* is the worſt, and ſhould not be made uſe of by Maſons, in Flint or Rubbiſh-work. As to great Squares of *Grez*, they are to be ſeen in abundance of Buildings, and are very Beautiful and good; but then the Stone muſt be Peak'd and made rugged; otherwiſe 'tis too ſlippery. In great Edifices, the greateſt and hardeſt Stones ſhould be us'd, to render them the more Beautiful and more Solid. The *Greeks* and *Romans*, who aim'd as much to make their Buildings Durable, as Fine and Magnificent, in their Publick Works us'd the hardeſt Stone, and in great pieces; as may be ſeen by the remains of Buildings, which were of Marble, and other as rich and ſolid Stone in *Greece* and *Italy*.

A greety ſort of Free-Stone.

Of all Stone, Porphyry, which the *Greeks* call *Porphyrites*, is the hardeſt: 'Tis of a browniſh Red, and full of little white Spots: 'Twas brought from *Ægypt* to *Rome*. 'Tis thought to be more tender in the Quarry, and that it hardens in the Air, the Sun and Froſt; for when 'tis expos'd to the Weather, tis much more difficult to cut.

There are ſeveral pieces of *Porphyry* at *Rome*, ſome of which were work'd with the Chizel, ſome with the Saw, and others by little and little, with the Emerald. One of the moſt conſiderable Pieces, is the Tomb; which is ſaid to be that of *Conſtantia*, the Emperor *Conſtantine*'s Daughter, in St. *Agnes* Church, without the Walls of *Rome*. 'Twas formerly a Temple dedicated to *Bacchus*; on which account this Tomb is commonly call'd *Bacchus*'s Tomb; as alſo for its being adorn'd with ſevreal Children, mingled among the Vine-Leaves and Bunches of Grapes, all of *Baiſſe Taille*, and wrought with a great deal of Labour on ſuch a hard Stone. In the Church of St. *Denis* in *France*, is the Font which King *Degobert* brought from *Poictiers*, and is ſaid to have been the ſame in which S. *Martin* was Baptiz'd. There are alſo in the Palace of the *Tuilleries*, among the Kings and Antiquities, a Palace, and the Buſts of twelve *Roman* Emperors in *Porpyhry*.

'Tis a long time ſince the Art of working in *Porphyry* with the ſame Facility and Perfection which the Ancients did, has been loſt, Workmen not knowing how to temper their Tools as they did, nor even what Tools were made uſe of in ſuch difficult Work. When the *Italian Sculptors* would work up ſome old pieces of Pillars that are now found out, they uſe only a Copper Saw without Teeth, and with Emerod Duſt and Water, which they pour upon it, they at laſt cut it with great Patience. 'Tis true, ſeveral Excellent Artiſts have from Time to Time, endeavour'd to diſcover how the Ancients work'd in *Porphyry*, but almoſt without any Succeſs. *Leo Baptiſt Albert* made the moſt Trials, and carefully ſought after a Temper for his Tools: And tho', as he ſaid, he found that Goat's Blood was the beſt of all his Experiments, yet that Temper was not of any long duration; for tho' it takes away ſomething of the Stone in working, yet it was ſo hard, but that the *Chizel* rather ſtrikes out *Sparkles of Fire*, than *Splinters of Stone*, which made other Workmen try other Ways to work it, ſome with Wheels and Emerod, others with great Hammers, with Diamond Points of good Steel, and temper'd with Goat's Blood. By ſtriking on the Porphyry with theſe, by ſmall Strokes, they made it at laſt Round or Flat, tho' not without much Pains and Difficulty; and they could not for a long time reach ſo far as to form any Figure of it.

In the Year 1555. Duke *Coſmo* of *Medicis* having found ſome Pieces of *Porphyry* Stone among ſome old Marble, had a great Mind to have a Baſon for a Fountain made of it; and to make the Work the eaſier to the Perſon he choſe for it, he diſtill'd certain Herbs, and extracted from them a Water, which temper'd the Tools that it gave them an extraordinary Hardneſs. By this means, one *Franciſco Tadda* made a Baſon for a Fountain, of two Fathom and a half Diameter; and cut alſo a Foot to his Baſon. Finding the Secret the Duke communicated to him was a rare Invention, he try'd it on other Works; in which he ſucceeded ſo well, that he made three Ovals; in one of which, he repreſented a *Head of Chriſt in a Demi-Relievo*; and in the other two, *Duke Coſmo of Mecicis, and the Dutcheſs his Wife*. He perform'd it ſo well, that the Hair of the Head, in which 'tis very difficult to ſucceed, were manag'd ſo Artfully, that nothing better is to be met with among the Works of the Ancients. This *Tadda* did ſeveral other Pieces afterwards; but 'tis probable the

Secret dy'd with the Duke and him; for in our Times, there are none who work in Porphyry. There has lately been found out in *France*, the Secret of cutting it with an Iron Saw, without Teeth, and with wet *Grez*, after the ſame manner as Marble is cut; and with the ſame Saw to make Mouldings: Nay, thoſe that found out this Contrivance, pretend by Rounding, to cut the whole Circumference of a Porphyry Pillar. 'Tis true, we cannot now make many Eſſays in this ſort of Stone; for the *Quarries* being loſt, there remain only ſuch *Antique* Pieces, as are diſcover'd among the Ruins. 'Tis not amiſs to obſerve, that the *Porphyry*, which has endur'd the Fire, breaks and ſplinters eaſily when 'tis Wrought; and tho' it has not loſt all its Natural Colour, 'tis nevertheleſs very much diminiſh'd, having not that Vivacity, nor ſuch a ſhining and beautiful Brightneſs, as when it has not been in the Fire: Not that the Fire makes it the ſofter; for if you put a piece of it into a *Kiln*, it does not only not Melt, but grows even the harder for it, and hinders, in ſome meaſure, the melting of the other Stones that are about it.

After the *Porphyry* Stone, comes the *Serpentine*, which the *Italians* call *Serpentino*, and the *Greeks* *Ophis*. 'Tis of a dark Green Colour, with yellow Streaks, which run along the whole length of the Stone. Tho' it is little leſs hard than *Porpyhry*, yet it breaks more eaſily, and is not ſo difficult to be Wrought. It comes from *Ægypt* and *Greece*, but no great pieces of it are found, for there is no piece of Work above three Fathom length, to be met with; ſome Columns of leſs Bigneſs are to be ſeen; as alſo Tables, and pieces of Pavement, ſome Heads, but no entire Figure. 'Tis wrought in the ſame manner as Porphyry. *Boot* pretends the Ancients give the Name of *Ophis* to all ſorts of Marble, and even Alabaſter, let 'em be of whatever Colour they would, provided they had any Spots or Streaks, diſpos'd and mark'd like the Skin of a Serpent: That 'twas not the particular Colour of the Stone which caus'd the Name of *Ophis* to be given to it, but the diſpoſition of the Streaks and Spots that's obſerv'd in it. He adds, *Diaſcorides*, as well as *Pliny*, holds there are ſeveral ſorts of Stones call'd *Ophites*.

Lib. 2. *ch.* 227.

There's a ſort of them in *Germany*, which the ſame Author terms *Zeblicius Ophites*, and of which he tells a great many Wonders. Vaſes are made of it, but 'tis not more durable than common Alabaſter, which being of no uſe in the *Structure* of Buildings, ought not to have a Place among the other Marbles, of which I treat.

There's a ſort of Stone, that in Colour is not unlike the *Ophis*, only the Green is more lively, and a little Yellowiſh, with ſome black Spots of a ſquare Figure, and different Sizes, and ſome a little White. The *Italiians* call this ſort of Stone *Cipollacio*, perhaps, becauſe its Green Colour is ſomewhat like that of a *Leek*. 'Tis not ſo hard as the *Ophis*, and is dug in many Places: Great Pillars, and other ſuch Works, are met with in it, but no Statues. This Stone is Sawn and Wrought, and Poliſh'd like the *Porphyry* and *Ophis*. In the Garden of the *Vatican* at *Rome*, is a Nitch of this kind of Stone, Deſign'd by *Michael Angelo*. 'Tis probable, that 'twas ſome of it, which being found in *Ægypt*, in the Reign of *Auguſtus* and *Tiberius*, was, for that Reaſon, differently call'd by the Name of thoſe two Emperors *Auguſtum*, and *Tiberium Marmor*.

There's alſo another hard Stone in the Mountains of *Verona*, *Carrara*, and ſeveral other Places in the Dominions of the Great Duke. The *Italians* call it *Miſchio*, becauſe 'tis the mixture of ſeveral Stones, which are as it were, congeal'd together, and by the Water and Weather, extreamly Cold, turn'd into One. This Stone takes a fine Luſtre, and is dug in great Pieces: Its Colour enclines a little to the Purple, with white and yellowiſh Veins: Nay, there's an Infinity of Colours in it; for it ſeems as if Nature delighted to vary this ſort of Stone in all Places where 'tis found, even in the ſame Quarry. Thoſe that come from *Ægypt* are more hard, and their Colour is more lively than thoſe that come from *Italy*. 'Twas of this kind of Stone that the Inhabitants of *Chio* built the Walls of their City, whoſe Beauty was admir'd by all the World: On which *Cicero* ſaid, They " would have been much more worthy, had they " been built of *Travertin* Stone, it being no great " Wonder they ſhould be built with the Stones of " their own Country.

There's a very hard and rugged Stone with black and white, and ſometimes yellow Spots, like that which is call'd *Syenites*, on account of the *Syenis* of the *Thebaides*; or as others Read in *Pliny*, *Stignites*, becauſe of the little black Spots, with which it is mark'd. The *Italians* term it *Granito*, and Stones of it are dug in *Ægypt* to a prodigious Bigneſs. Of this Stone are the Obeliſks, Spires, and a vaſt Numbers of Columns and other Works, ſtill to be ſeen in *Rome*, the Hardneſs of which, have reſiſted the Fire, and other Injuries of Time. 'Twas for this Reaſon the *Ægyptians* made uſe of it, to eternize the Memory of their Great Men; noting their Actions by Characters, which they Engrav'd on Edifices, or Pyramids, with which they Adorn'd their Tombs.

Several have thought, that theſe huge Maſſes at *Rome*, were contriv'd with wonderful Art, and form'd of Marble Splinters, melted and mingled together, not being able to comprehend how they were able to bring them by Sea from the diſtant Provinces; and 'twas plain they were not cut in *Italy*, where there are no Stones of that Nature. But to clear this Matter, you need only ſee what *Pliuy* Writes, *Lib.* 7. *c.* 9.

Another ſort of *Granito* was brought from *Ægypt*, of a Greyiſh Colour, inclining to Green, ſpotted with little black and white Spots, and very hard. This *Granit* is met with in ſeveral Parts of *Italy*, but the greateſt Pieces have been dug in the Iſle of *Elbe*, where the *Romans* had continually Men at Work in the *Quarries*. From thence were taken the Columns of the *Portico* of the *Rotunda*, which are very fine, and of an extraordinary Bigneſs. When this Stone is wrought in the *Quarry*, 'tis much more Tender and eaſie to be Cut, than after 'tis taken out, tho' it is almoſt always neceſſary to make uſe of the *Pecker*, the Point of which muſt be the ſame as of that for working in *Porphyry*, and the Teeth very Cutting.

'Tis alſo from *Ægypt* and *Greece* that is brought a ſort of Stone very black, call'd now a-days *Parangon*. The Ancients, according to *Pliny*, term'd it *Baſſalles*; and *Ba-*

l. 57. *c.* 7.

ſanus, from Βακανίζω, that is, *diligenter Examino*, becauſe Gold and Silver are try'd by rubbing them on this Stone. There are other Kinds of it, the Grain of which is different, and the Black not ſo deep. Perhaps they are thoſe which are call'd *Lapis Lydius*, and *Lapis Obſidianus*. The Ancients made Statues of *Sphynxes*, and other Animals in them, as is to be ſeen at *Rome*. This ſort of Stone is very hard to cut; but when wrought is very Beautiful, and of an admirable Luſtre. 'Tis dug at *Carrara*, in the Great Duke's Territories, and in *Flanders*.

Boot. de Gan. Lap. lib. 2. *c.* 27.

In *Greece*, and almoſt all over the *Eaſt*, is found a ſort of White Marble, a little Yellowiſh. 'Tis very Tranſparent, and was in ancient Times made uſe of, inſtead of Glaſs, for the Windows of Baths, Stoves, and other Places, where the Wind and Rain ſhould not enter. *Vaſari* writes, that in his Time there was a Church at *Florence*, the Windows of which were fill'd with it, inſtead of Glaſs, and yet the Church was very Light. By this means the Ancients defended themſelves againſt the Cold, and gave Light to their Chambers. There are alſo other ſorts of Tranſparent Stone, and of all Colours. They are call'd *Lapides Speculares & Selenites*.

Plin. lib. 6. *c.* 22. *Boot. l.* 2. *c.* 225.

In the ſame *Quarries* where this White Marble is dug, there is another ſort without any Vein, but of the ſame Colour; the Thread and Grain of which are very Fine. Of this formerly were the fineſt Statues made, and all the Ornaments of Edifices; ſeveral Pieces of it, perfectly Fine, have been diſcover'd, as thoſe great Statues and Houſes that are ſtill at *Montecavallo*, and ſeveral other Figures, which are known to be *Greek*, both by the Grain of the Marble, and the Manner of the Work.

The Faireſt of all White Marble, is that call'd *Parium Marmor*, either becauſe 'twas dug in the Iſle of *Paros*, or becauſe the Sculptor, *Agoracritos*, was a Native of this Iſle, who firſt cut the Statue of *Venus* in White Marble. The Ancients call'd the fine White Marble *Lichnitis*; for that, according to *Varro*, 'twas hewn in the Quarry by the Light of Lamps. This, and the Like ſort of Marble, are cut with the common Tools.

Boot. lib. 1. *c.* 267. *de lap. & Gem.*

There are ſtill ſeveral other ſorts of Marble dug in the Mountains of *Carrara*, ſome Black, others inclining to Grey, others mixt with Red, others that have grey Veins, and thus of divers Kinds. There's one ſort which the *Italians* term *Cipollini*, and others *Saligni Campanini & Miſchiati*. The greateſt Plenty is of a very White Marble, of the Colour of Milk, which is excellent for Figures. There's a certain Place, which the *Italians* call *Le Cava del Polvacio*, where the Marble has leſs Spots, of what we call *Emeril*, and of thoſe Kinds which they term *Noccioli*, and which commonly are found in very great Pieces. Beſides, that theſe Knots give a great deal of Trouble to the Workmen, they cauſe a great deal of Deformity in the Statues, when finiſh'd. But that which is taken out of *Pietra Sancta*, where was the Wood of the *Feroman* Goddeſs, according to *Ptolemy*; or, according to others, the Temple of *Hercules*, has more Firmneſs, yeilds more to the Chizel, having what the *Italians* call *Marbidezza*, and the Poliſhing of it is finer than that of any other Marble. 'Tis true, in ſome of them we meet with thoſe Veins of *Emeril*, which often break the Tools.

The Marble which the *Italians* call *Cipollini*, has another ſort of Grain; the Colour inclines to Green; the *Veins* are greater in Number, but not ſo ſtrong. It is not proper for *Statues*, but ſerves for *Pilaſters* for great *Tables*, and other Pieces of Work, as may be ſeen in the Hall of *Antiques* at *Louvre*. 'Tis dug up in other Places beſides *Carrara*.

The Marble which the Workmen call *Saligni*, reſembles Congelations; for 'tis a little leſs Tranſparent, and has a certain Brillant, like that which appears in Salt. 'Tis hard enough to make Figures of it, becauſe its Grain is very great and rough; and in wet Weather it gives, and Water drops from it like a kind of Sweat.

As for the Marble call'd *Campanini*, it takes its Name from its tinkling lik a Bell, when 'tis wrought. It has a very ſharp Sound, is naturally hard, and ſplits more eaſily than the reſt; 'tis found at *Pietra Sancta*. There's alſo a Black Marble, with large Yellow Veins; they call it *Portoro*, becauſe its Veins reſemble Gold. Several different ſorts of Marble are taken up in ſeveral Places of the Appenine Mountains.

In *Spain* alſo is dug a Marble, the Ground of which is Yellow. They give it the Name of *Brocatelle*. 'Tis eaſy to work, and takes fine Poliſhing.

Since Monſieur *Colbert* was made Superintendant of the Buildings, there have been diſcover'd in *France*, by his Care and Order, ſeveral ſorts of *Marble* of different Colours, eſpecially near the *Pyrenees*. 'Tis likely the *Romans* heretofore dug up Marble hereabouts; for we may perceive in the Quarries that Stones have been taken thence; and ſince they are not to be met with in *France*, they muſt have been tranſported elſewhere. There's a Place near St. *Beat*, on the Borders of the *Pyrenees*, a League from *Catalonia*, whence a Piece of Marble was dug up, fourſcore and ten Foot long, as may be gueſs'd by the manner of the cutting of the Mountain: And yet none has thought of ſearching for Marble in theſe Parts. Some private Men have brought away ſome little Pieces of various Kinds; but the Sieur *de Fromont* was the firſt that dug up one that was conſiderable. He diſcover'd the beſt Quarries in the Year 1664. and took up, by Order of Monſieur *Colbert*, Columns of twenty Foot high, the Stone very hard, and the Colour admirable. An infinite Number of other Pieces have been already wrought at the *Louvre*, the *Tuilleries* and at *Verſailles*, which are ſo much the more to be eſteem'd, by how much the Colours are Lively and Extraordinary.

The chief Places where theſe Marble Stones are dug, are near St. *Beat*. There's one Quarry call'd St. *Martin*, where the greateſt Pieces are found. The Marble is a ſort of a Fleſh Colour, with Red Veins and White Spots. 'Tis eaſy to work; and we might get there, with Eaſe, Pieces of what Bigneſs we pleas'd. Out of the other *Quarries*, in the ſame place, is dug *White Marble*, which comes near that of *Genoa*; and were it not, that what the Workmen call its *Pouf* is too hard, and that 'tis a difficult Thing to make Figures of it, it would be preferrable to the Marble of *Genoa*; for whatever Figures were made of it, would be more Beautiful than thoſe made of the *Genoeſe* Marble. In the Valley near the Town of *Campan*, is another Quarry, where great Pieces of *Green* Marble are taken up, as alſo *White*, *Red* and *Fleſh* Colour. Of this Marble are part of the Works I have mention'd to be at *Louvre*, and at the *Tuilleries*, and the Pillars of 20 Foot that are in the King's Magazine; the Workmen call it *Campan Marble.* There are ſeveral other *Quarries* in the ſame Valley; but as the Marble is not ſo fine as what I have ſpoken of, ſo People have not been at the Pains to dig it.

In the *Golden Vale* near *Serancolin*, there's a *Quarry* of *Marble* of an *Iſabella* Red Colour, as alſo of an *Agat.* 'Tis call'd *Serancolin.* Pieces of 9 and 10 Foot long have been dug there; the Beauty and Luſtre of which were extraordinary, as may be ſeen by that in the Chimneys of the *Tuilleries.* Greater Pieces might be taken up, if the Mountain was not ſo difficult of Acceſs, and Men could come at it ſo as to dig the Marble in its Center. A League from this *Quarry*, near the Village of *Echet*, which is farther in *France*, is another Quarry of *Black* and *White* Marble, which does not give place to the fineſt *Antique* Marbles. The King has had Pieces from thence of 20 Foot long for Pillars.

Three Leagues from St. *Beat*, near the Village of *Barbaſan*, is a *Quarry* of Marble of different Colours; the Ground Black, with White Veins and Spots mingled with Yellow Veins, reſembling ſeveral Flint Stones congeal'd and joyn'd together. The Artificers call it *Breche* and *Sauveterre*, becauſe 'tis found near the Village of *Sauveterre*. Pieces of above 20 Foot in Length have been brought from thence to make Pillars. This Marble is very hard, and the Poliſhing wonderfully Fine.

In *Languedoc*, near the Town of *Coſne*, is a White and Carnatian Marble, of which ſome Pieces dug up there for Columns, have been 20 Foot long. And near this Quarry are ſeveral other Quarries of different ſorts of Marble.

Near *Roquebrue*, 6 Leagues from *Bezieres*, is another Quarry of Red and White Marble, of great Hardneſs and fine Luſtre. Pieces of 30 Foot long might be taken up there.

A League from *Roquebrue* is a Quarry of Marble, of a Colour equal to that of *Agat*, of which Tables are made; but 'tis difficult to be met with, lying among the Rocks, and only certain Veins of it are now and then diſcover'd. The Sieur *de Fromont* before-mention'd, by Order of Monſieur *Colbert*, ſent Monſieur *Miſſon* to ſearch after ſome *new Quarries* in the *Pyrenean* Hills, and in *Languedoc*. He diſcover'd one near *Narbon*, the Ground of which is of a Violet Colour, having great Yellow Spots mingled with other little White Spots. 'Tis very hard, and looks Beautiful, when Poliſh'd. This Marble varies in Colour; for in ſome Veins the three Colours are mingled differently one with the other, the ſtrongeſt with the weakeſt.

Near St. *Baume*, in *Provence*, there's a ſort of *Marble* that does not fall ſhort of the *Brocatel* of *Spain*. And near *Moulins*, in the *Bourbonnois*, is found Yellow, Red and Blue Marble, of which great Pieces may be got. 'Tis hard to work, and its Poliſhing is very Fine.

The Marble that's dug in *Flanders* comes from about *Namur* or *Dinant.* The latter is the Beſt. 'Tis very Black, and Finer than that of *Italy*. Three Leagues from *Dinant*, near *Charlemont*, are alſo *Quarries* of *White* and *Red*, and *Black* and *White* Marble. Near *Avennes*, at a Village nam'd *Rance*, is dug Black and Red Marble; and Black and White not far off, near *Barbancon.*

A Bold Marble is that whoſe Grain is very Fine, and which ſplits eaſily. Its Tenderneſs is a Sign of its good Quality, and that 'twill take a fine Luſtre; not but that there's ſome hard Marble, which takes alſo a beautiful Poliſhing; however the greateſt Part of it does not poliſh ſo well.

The Way of digging Marble in *Italy*, and cutting it from the Mountain, is to hew out all about the Piece by main Force, with Tools made ſharp at the Point. But now a-days, we in *France* ſaw off the Piece in the Quarry, and in the Rock, of what Bigneſs we would have it. Some of theſe Saws are 23 Foot long. 'Twas thus the Sieur *Miſſon*, who had the Secret of ſawing off Pieces of Marble in the Rock with great Saws, made to turn as he pleas'd, by his Induſtry dug out the Marble at *Sarancolin* in as great Pieces as he thought fit; whereas before one could have it only in Bits, becauſe of the Delicacy of that Marble, and its Difficulty to get it from the Mountains.

There's a certain Toughneſs in the White Marble, which proceeds from a Mixture of Copper, or ſome other Metal. Theſe are what is call'd the *Emeril*, and what makes the little black Spots in ſome Parts of the Stone. Other tough Places, like Knots found in Timber, are alſo met with in this and other ſorts of Marble. Theſe Knots are not eaſier to cut than Porphyry, and cannot be faſhion'd without a Pecker. Our Artificers call 'em *Clouds*.

All Marble is almoſt of an equal Weight, which is about 200 pound a Cubical Foot. But it muſt be obſerv'd, that the Boldeſt Marble, and that whoſe Grain, as I have ſaid, is Fineſt, is lighter than the other, and there will be above 10 pound a Foot difference in the Weight of it, tho' it ſeems to be moſt ſmooth, and moſt cloſe, and that there are even void Spaces and Openings in the other Marble.

When this bold Marble is working, 'tis very apt to ſplit and crack, unleſs when 'tis loaden you put a Matter leſs hard, ſuch as a ſoft Stone upon it. But thoſe who would put other Marble on it, without placing a Plate of Lead, or ſome Mortar between, will be in Danger of ſpoiling the Marble; for the Pillar that's undermoſt runs a great Riſque of Cracking. It being the Nature of Marble to break, or whatſoever touches it above or below will crack, unleſs ſomething is plac'd between.

The ordinary Stones made uſe of in Building are different, according to different Countries. In *Italy*, particularly at *Rome*, they employ a great deal of *Trevertin*. The beſt of this Kind is found on the Banks of the *Terveron*, and near *Tivoli*. 'Tis very hard; and of this Stone the Ancient *Romans* built their greateſt Edifices, as the *Coliſee*, and ſeveral other Buildings, the Remainders of which are to be ſeen at this Day.

The *Italians* have another ſort of blackiſh Stone, which they term *Piperno*, or *Preperigno*: 'Tis dug in the Neighbourhood of *Rome*.

There's a white Stone very much us'd at *Venice*; 'tis eaſie to cut. That call'd *Serena*, is very common and much us'd at *Florence*, but it does not hold well in the Water; it ſhould be put in dry Places, and cover'd from the Wet. They have another ſort, call'd *del Fiſſato*, which is hard, and a good Defence againſt the Weather; as is alſo that Nam'd *Pietra forte*, very difficult to Hew, on account of its extraordinary Toughneſs. There's alſo a blackiſh Stone dug in the Quarries at *Lavagna*, on the Coaſt of *Genoa*; 'tis proper only for Pavements, and to cover Houſes as we do with Slate.

If we in *France*, ſays *Felibien*, have not ſo much Marble to adorn our Edifices with as they in *Italy*, to make amends for it, we have a vaſt number of different Stones, much finer, and more proper for Building, than thoſe I have before mention'd: There is hardly a Province but excellent Stone is found in it, particularly in the Neighbourhood of *Paris*: It ſeems as if Nature had from the Beginning, deſign'd to provide for the Occaſions of that Great City, ſince every thing neceſſary for Building is to be met with on the Spot, or is brought thither ſo conveniently, that there is no Place in the World where all ſorts of Materials for Edifices are more eaſily to be had; all the Sand and the greateſt Stones that were employ'd in the Foundations of the *Louvre*, were brought no further than from St. *Cloud* and *Meudon*, five Leagues from *Paris*.

There are three ſorts of *Quarries* near *Paris*, thoſe of *Cliquart*, *Boubanc*, and *de Liais*; the laſt is the beſt and hardeſt, and defends itſelf againſt the Injuries of the Weather, and is therefore propereſt to be made uſe of without Doors. The *Cliquart* is alſo proper to be plac'd in the Out-ſide, provided it has any thing to cover it. The *Boubanc* is hard, but ſhould lie in Cover as much as poſſible.

The *Liais Ferault* does not burn in the Fire, and is therefore made uſe of for Hearths, Chimneys, and Furnaces.

There are good *Quarries* of *Free-Stone* from behind the *Chartreux* to *Vaugirard*. The Stone call'd *Liais*, is not ſo good for Building as that behind the *Chartreux*, but its *Rubble* is better.

The *Liais* at the *Chartreux* is drawn up at a Hole ſix Foot broad, and fourteen Fathom deep: The Vaults of the Quarry is ſix Foot high; and from this Bed of *Liais*, all the preſent Works at the *Louvre* are ſupply'd. 'Tis a very hard white Stone, and comes near Marble; for which reaſon it receives a ſort of Poliſhing with *Grez*, particularly that of *Senlis*, which neither Froſt, nor any other bad Weather, can ſpoil.

Beſides theſe *Quarries*, which furniſh the greateſt part of *Paris* with Stone, there are thoſe of *Arcueil*, *Ivry*, of the Vale of *Facon*, of St. *Maur*, of *Paſſy*, of *Charenton*, of *Cloud*, of *Monteſſon*, of *Leu*, of *Seran*, of *Troſſy*, of St. *Maximin*, of *Cæſar*'s *Camp* and *Senlis*. *Free-ſtone* is generally ſold at *Paris* by the Load, each Load conſiſting of five Squares, that is, of about fifteen Foot of Stone: 'Tis alſo bought by the Foot only. Formerly 'twas ſold by the Cart-load, carrying ten Squares.

Libage Stone, is when there's ſix or ſeven to a Load: Quarter Load is one or two Stones; theſe ſorts are us'd for the Foundations of Great Houſes; as for Little, they make uſe of *Rubble* only, which is meaſur'd by the Cubical Fathom, containing two hundred and ſixteen Foot.

The Stone of St. *Leu* and *Vergele*, is ſold by the Ton, containing fourteen Cubical Feet. The Ton was formerly two Meaſures, and every Meaſure ſeven Cubical Feet.

That of *Leu*, is ſoft to the Chizel, but it grows hard in the Air. That of *Vergele* is harder, and does not Poliſh ſo well. The *Vergele* Stone is that which is taken up above the Vaults of the *Quarries* at St. *Leu*, and thereabouts: They are ſometimes thrown down, and often fall down by Accident. They ſerve commonly for Kays on Rivers and Vaults of Bridges and Caves, and other ſubterranean Places.

That of *Senlis*, which is made uſe of at the *Louvre*, comes from a Quarry that's pretty Extraordinary: 'Tis about a Mile from the Town. There's but one Bed of about ſixteen or eighteen Inches high: The Quarry is very deep; the Height of it from the Area to the Vault, is but two Foot and a half. Thus, 'tis very difficult to enter it, 'tis ſo low: And, as the Nature of the Stone is ſo very hard, the Quarry-men are forc'd to Work lying along. This Stone is not eaſie to come at.

The Stone of St. *Cloud* affords very large Pieces: Some of thoſe us'd at the *Louvre*, weigh 20000 pound Weight: They are dug up at a *Quarry*, call'd the *Quarry of the Grez*. On the Left Hand, going from St. *Cloud* to *Verſailles*, its Vault is ſix, ſeven, ten and twelve Foot high. The Stone of the White Bed, is only employ'd on great Buildings; Stones of eighteen Foot long, and three broad, or more, if one would, may be taken from thence.

The two Great Stones with which the *Fronton* of the *Louvre* was cover'd laſt Year, were dug up below *Meudon*, and were but one Stone in the Quarry, which was cut in two, each of them making fifty two Foot in Length, eight Foot in Breadth, and eighteen Inches in Thickneſs. Theſe Stones are very hard, and very much of the ſame Nature of the *Liais*.

Sept. 1674.

The Stone of *Monteſſon* is dug out of a Quarry lately Diſcover'd, at the Village of *Monteſſon*, three Leagues from *Paris*. 'Tis very Hard and White, the Colour falling very little ſhort of that of Marble: The Baluſters of the Stair-caſe at the *Tuilleries* are made of it.

There's alſo a Stone call'd *Plaſter-Stone*, which is not good to Build with, but ſerves to fill up the Foundations of Ordinary Houſes: In Great Edifices 'tis never made uſe of; it rather Softens than Hardens; but when 'tis Melted, every one knows how uſeful it is in all ſorts of *Architecture* and *Maſonry*.

The ſorts of Stones that are made uſe of at *Paris*, have *Layes* in them, which are not met with in other Places, nor in all ſorts of Stone; for this Reaſon, care muſt be taken that they are not put in Front, nor the *Layes* in Joint, unleſs it be in

Entabletures, which are not uncover'd: *Layes* ſhould not be put in theſe Stones, being of that Nature, that they ſeem to be compos'd of ſeveral *Plates* or *Leafs* of a Book. Thus they loſe their Strength, when they are not put one upon another; and theſe Leaves are flat and downwards; for when they are upright, they cannot ſo well reſiſt the Weather, and will be apt to ſcale, excepting however the *Liais* of *Senlis* and *Paris*, that never ſcale.

It muſt be further obſerv'd, That if the greateſt part of the Stones I have ſpoken of, be not plac'd Flat-ways, and wrought ſo as they grow and are found in the *Quarry*, they are apt to Cleave, and one of them wrong put, is enough to endamage a whole Building. 'Tis for this Reaſon, all ordinary Stone, even the hardeſt, cannot defend itſelf againſt the Injuries of the Weather, like *Marble*, which has no *Lay*, or *Leaf*; eſpecially if the former lies expos'd, and put in the form of a Pyramid, for Rain and bad Weather will then ſoon ſpoil it: Nevertheleſs, it keeps very well in Buildings, when 'tis cover'd with Cornices.

Notwithſtanding this, there are ſome Places, as I have already hinted, where the Stone has no *Lay* nor *Leaf*, and are almoſt as hard as Marble. The Church at *Chartres*, which is one of the Largeſt and Oldeſt in *France*, is Built of that ſort of Stone, on which the *Saw* has no effect, but it is always cut with the Mallet and Chizel. 'Twas dug for the moſt part, in a Quarry two Leagues from the City, near a Village call'd *Berchere l' Everque*. There are alſo other Quarries at *Var*, and at *Praſville*, the former a League; the latter four Leagues from *Chartres*. The Stone is as hard as that at *Berchere*, but plainer; the Grain more ſmooth, and the Colour a little more Brown. There's Stone alſo near *Caen*, which takes a fine Poliſhing. That at *Vernon* is very hard, and the Grain fine: Its only Fault is, that 'tis Flinty and Stringy. The Caſtle of *Gaillop* was built with it. The Stone dug at *Tonerre* is extreamly White and Fair, and eaſie to Cut. That of which the Church of *Amiens* is built, is Excellent; and indeed all over *France* there are as good Materials for Building, as in any Country of the World.

The *Work-men*, who work under the Direction of the *Architect*, are Firſt, Thoſe that belong to the *Maſonry*: And of theſe, the *Maſons* are the Chief; their Employment is to make Mortar, to raiſe Walls from the Foundation to the Top; to form Vaults, and put the Stones to the Uſes deſign'd by thoſe that have the Management of the Building. When great Stones are made uſe of, there are Artificers call'd *Appareilleurs*, Preparers, who Mark them according to their Deſigns, and give them to the Stone-cutters. The Ornaments of *Sculpture*, are made by the *Sculptors*, as directed by the *Architects*.

In Great Yards, as at the *Louvre*, beſides Maſons, Preparers, and Stone-cutters, there are Layers, who lay the Stone, Labourers, who carry *Leavers* to help unload the Stones from the Cart, and put them on the *Gauntry* to be Cut; Bardeurs, who haul the Stones along on little Cars; Labourers that wait upon the Maſons and bring them Gravel; Goujats, Boys, that carry Mortar on Trays; Prickers, whoſe Buſineſs is to ſee the Work-men mind their Work, to keep an exact Liſt of their Names, and prick down ſuch as do not come at the Hour; Drivers, Fellows that drive the Cart, &c. drawn by Cattle; Craners, thoſe that make Holes in the Stones, and place the Hooks to Crane them up when they are wanted.

The Tools neceſſary for *Stone-cutters* and *Preparers*, are a Tray, a Trowel, a Rule, a Compaſs, a Bevel; ſeveral ſorts of Plains, Chizels, Mallets, Saws, Martlets, and the like.

The *Sculptors* in Stone make uſe of the ſame Inſtruments as the *Sculptors* in Marble, or Wood, of which I ſhall ſpeak hereafter.

Beſides theſe Tools and Hand-Inſtruments us'd in Building, there are others to raiſe Burdens of heavy Things, and guide great Pieces; without which, it would be impoſſible to go through with any conſiderable Undertaking.

In *Mechanicks* there are five Principal Inſtruments, that may be term'd Regular; the Strength of which is very well known; as the *Leaver*, the *Ballance*, the *Wheel* with its Axis, the *Pully*, the *Wedge* and *Vize*; the two laſt being reckon'd as one.

Beſides theſe *Machines*, there are in *Architecture* mighty Engines, to Strike, to Lift, to Drive; as the Ram, the Mallet, and the like. Other Movers are alſo employ'd; as Men, Cattle, Wind and Water, Weights and Wheels; and indeed every thing that acts by Percuſſion.

The *Leaver* is ſo common an Inſtrument, and of ſuch great uſe, that every one knows what it is. Under the word *Leaver* is comprehended the Croe, and other ſorts of Leavers made of Iron Bars, to move any Weight. The *Leaver* ought to be conſider'd as a Right Line with three Principal Points, That on on which the Thing to be mov'd is plac'd; that which keeps it up; and the Hand or Power, that moves the *Leaver*. The different Diſpoſition of theſe three Points is what gives ſtrength to the *Leaver*, and cauſes the moving a greater or leſs Weight, with more or leſs Facility.

As for Example; If the Diſtance between the Hand that holds the *Leaver*, and the Place that keeps up the the ſaid *Leaver*, be ten times as great as the Diſtance between that Place and the Weight to be rais'd, Ten Pound of Strength will ſuſtain One hundred Pound of Weight: As the Strength augments, or the Weight diminiſhes, the Burden is mov'd; for the Leaver is like a Balance, the Center of which is in the Beam. Thus the Inequality of the Diſtances, is what gives more or leſs force to the Power, and cauſes the Burden to be mov'd with more or leſs Facility. The ſame Reaſon that gives force to the *Leaver*, gives Motion and Weight to the Balance, which is of different Make, according to the different Uſes that 'tis put to. And tho' it very often goes under different Names; as *Statera*, *Libra*, &c. yet the turning on an Axis is what gives the Weight. That which the *Latins* call *Platera*, had but one Scale: That which they call *Libra*, had two.

As for Wheels, Pullies, Wedges, Vizes, and the like, they are ſo Common, that we ſhall leave the French *Author in his Deſcription of them, and ſhould have done the ſame as to the* Leaver *and* Balance, *but that there's ſomething more Curious in what he ſays of them, than in what he has ſaid of the reſt of theſe Tools and Machines.*

Cuſtom has prevail'd ſo far in the late War, that almoſt all the Terms of Military Architecture us'd by us, *are borrow'd; for the* French *and the* Engliſh *have lately had ſo much occaſion to make uſe of 'em, and meet with 'em ſo often in the Publick Prints, that 'twill not be improper to Explain them; as alſo to Treat a little of Military Architecture in General. Tho' the* French *cannot reaſonably pretend to be a Match for us in the Buſineſs uf the Field; yet in Fortification a long Experience has given them the Advantage, and 'tis no Shame for us to confeſs it. Let our Enemies have the Glory of knowing how to hide themſelves better than we: And let us learn from them, as much as may be for our Purpoſe, to defend ſmaller Numbers againſt greater, and to know how to reach them behind a thouſand Fortifications. We ſhall therefore proceed with the before-mention'd Author, Monſieur* Felibien, *and Tranſlate as much of him on this Subject, as may ſerve to give the Reader ſufficient Light into it.*

Of Military Architecture: *Or*, Fortification.

THE Principal End of *Architecture* in General, being to Regulate and Direct, as we have already obſerv'd, every thing relating to the Structure of Publick Edifices, ſuch as Temples, Palaces, Halls of Juſtice, Private Houſes, Streets, Squares, and other ſuch Places; it cannot be queſtion'd but that Fortification is not only a very uſeful, but one of the moſt important Parts of this Art, ſince its Deſign is the Preſervation of a State, in reſiſting mighty Armies, and a powerful Enemy, with a ſmall number of Men.

When we conſider *Fortification* as a part of Architecture in General, we call it *Military Architecture*; and the Difference between this and the *Civil* conſiſts, in that the latter tends only to the Ornaments of Building; whereas the former has nothing in view, but to make Walls ſtrong, and able to reſiſt the Injuries of the Weather, the Shot of Cannon, and diſpoſe them in ſuch a manner, with reſpect to all their Parts, that there ſhall be no Place in the whole Circumference of the Walls, but what ſhall be ſeen, be well Flank'd, and well Defended.

Tho' Men began in Immemorial Times to encompaſs Cities with Walls, with ſtrong Towers, yet the Word *Fortification*, and the Art which it ſignifies, are not old. It was not very much practis'd, till after the uſe of Cannon, the terrible Effects of which oblig'd Men to alter and add ſeveral Things to the ancient Structure of the *Walls* of *Cities*. Theſe Alterations were thought ſufficient to form a new Art, call'd *Fortification*, becauſe of the great Force with which it ſupplys thoſe that are in a Town, to defend themſelves againſt their Enemies.

The Architects who apply themſelves particularly to this ſort of Architecture, are term'd *Ingeniers*. The firſt of them, who wrote upon Fortification, conſider'd as an Art by itſelf, were two *Italians*, *Rameli* and *Cateneo*. The next was *Iean Erard*, Ingenier to *Henry* the *Great*, and *Lewis* XIII. *Simon Steven*, Ingenier to the Prince of *Orange*, *Marolois*, the Chevalier *de Ville*, *Lorini*, the Count *de Pagan*, and ſeveral others more Modern, have contributed very much to augment this Art, and bring it to its preſent Perfection.

Of all theſe Authors the Count *de Pagan* has made the fineſt Diſcoveries in *Fortification*, and laid out the moſt ſolid Rules; I ſhall touch lightly upon them, my Deſign being only to give a Sketch of the Arts of which I treat.

All *Fortifications* are directed by Lines and Angles, to which different Names are given, according to their different Uſes. I ſhall not trouble myſelf with the Etymology of each Term, but explain it by its uſe.

Places fortify'd *a La Modern*, conſiſt only of Baſtions and Courtains, and ſometimes Half-Baſtions, according to the Ground; Cavaliers, Falſe Brays, Ditches, Horn-works, Crown-works, Glacis, Redans, Counter-guards and Tenailles.

There are other acceſſary and moveable Parts, which will be added in the following Definitions, as alſo the Subdiviſions of the Parts I have mention'd.

A Baſtion is compos'd of *Faces* of ſimple Flanks, after the *French* and *Dutch* Manner; of cover'd Flanks, after that of Count *Pagan*, and the *Italians*; of Caſemats, Orillons, of a Flankt Angle, Centre du Baſtion, the Angle of the Shoulder, Capital Line, Gorge, *&c.*

The principal Angles are the Angle of the Figure, the Angle of the Center, the Flanking Angle, the Flankt Angle, the Angle *de L' Epaule*, the Angle of the Flank and the Diminiſh'd Angle. All theſe Angles are Saillans or Rentrans, Viſible or Inviſible. The *Saillans* Angles are thoſe that advance towards the Country, the *Rentrans* thoſe that retire towards the Town or Fort.

The Flankt Angles, the Angles *de L' Epaule*, and thoſe of the Baſtion, are Viſible, as well as thoſe of the Half-Moons, the Angles of the Figure, of the Center. The flanking and diminiſh'd Angles are Inviſible, and ſerve only for the Structure.

A Definition of all the Parts of a Fortify'd Place, and firſt of the Lines that Compoſe it.

A *Fortify'd Place* is a Place well flank'd, and well cover'd.

A Citadel is a little Fortreſs that commands a great City, and has no Inhabitants, but its Garriſon of Soldiers.

Fortins, or *Forts de Campagne*, or *Sconſes*, are Forts rais'd in the open Country, and disjoynt from any Town. They are made uſe of only on certain Occaſions for a Time; and as they are generally ſmall, the Outſides of the Polygone are leſs than a 100 Fathom, that is, leſs than the Diſtance from one Baſtion to another.

Caſtle is a Place fortify'd, *a l' Antique*, after the ancient Manner, encompaſs'd only with Walls, Ditches and Towers, without any *Rampart*.

Donjon is the Name of an Antique Fortreſs, to which our Citadels ſucceeded. 'Tis commonly a great Tower or Platform in a Caſtle for the Garriſon to make their laſt Retreat to.

Reduit is any Advantagious or Entrench'd Place in a Fort, Caſtle or Town, againſt the Sedition of the People, or Enemies of the State.

A Cloſe Town is a City encompaſs'd with Walls.

A Regular Place is one whoſe Sides and Angles are equal.

An Irregular Place is one whoſe Sides are unequal, in Part or in Whole.

Every Figure takes its Name from the Number of its Angles; from whence come the *Greek* Words *Trigon*, *Tetragon*, *Pentagon*, *Exagon*, *Eptagon*, *Octogon*, *Enneagon*, *Decagon*, *Endecagon*, *Dedecagon*, *Polygone*; which is the ſame thing as to ſay, 3,4,5,6,7,8,9,10,11,12, or ſeveral Angles or Baſtions.

Baſtions are great Bodies of rais'd Earth, ſupported by Walls of Turf diſpos'd Point-wiſe, and advanc'd by Saillant Angles from the Body of the Place, the Parts of which are two Faces, and two Flanks.

Courtain is a Line or Wall between the Baſtions.

Faces of a Baſtion are two Lines, which form the ſaillant or flank'd Angle from the ſaillant Angle to that of the Shoulder.

Simple Flanks are Lines that run from the Angle of the Shoulder to the *Courtin*, and are the chief Defence of the *Ditch* and the Place.

Open Flanks are thoſe which are Viſible.

Retir'd Flanks, or *Covert Flanks*, is that exterior Part of 'em which advances to ſecure the innermoſt Parts; or rather Platforms of the Caſemat, which lie hid in the Baſtion.

Orillon is a ſmall Rounding of Earth, lin'd with a Wall rais'd on the Shoulder of thoſe Baſtions, which have Caſemats to cover the Cannon in the Retir'd Flank, and prevent their being diſmounted by the Enemy. There are alſo other ſorts of *Orillons*, properly call'd *Shoulderings*, which are almoſt of a ſquare Figure, and term'd *Epaulements*.

Caſemats are Vaulted Batteries, made one upon another in that part of the Flank of a Baſtion which is next the Curtin. The Cannon is lodg'd there. But, ſays *Felibien*, they are little us'd now, the Batteries of the Beſieges often burying the Artillery of theſe Caſemats in the Ruins of the Vaults; beſides the Smoak is very Troubleſome.

Places High, Middle and Low, are Retir'd Flanks in the Form of Steps, one behind another.

Flank Raſant is the Point from whence the Line of Defence begins from the Conjunction, of which, with the Curtin, the Shot only razes the Face of the next Baſtion.

Flank Fichant is that from whence a Cannon playing, fires directly in the Face of the oppoſite Baſtion.

There are the Right Flank, Right Raſant, the Flank Right Fichant, the Second Flank, the Oblique Flank, the Flank of the Curtine, the Second Flank, or Fire of the Curtine, are only to be met with in Places with Flanks Fichant, and in that Part of the Curtine which diſcovers the Face of the oppoſite Baſtion.

The Line of Defence is the Line drawn from the Angle of Defence to the Point of the Baſtion, and properly the Courſe of the Ball of any ſort of Fire-arms, eſpecially Musket-ball, according to the Situation it ought to have to defend the Face of the Baſtion.

Line of Defence Fichant is that which is drawn from the Angle of the Curtine to the flank'd Angles of the oppoſite Baſtions, yet ſo as not to touch the Face of the Baſtion. This muſt never exceed 800 Feet, which is reckon'd the Diſtance of a Musket-ball will do Execution.

Line of Defence Raſant is that which being drawn from a certain Point of its Curtine, razes the Face of the oppoſite Baſtion.

Radius's are Lines drawn from the Center of the Figure, and ending at the Angle of the Figure, either External or Internal. Theſe are alſo term'd *Demi-diameters*

The Capital Line is the Line drawn from the Angle of the Baſtion to the Angle of the Figure Interior, which is the Center of the Baſtion.

The Center of the Baſtion is the Point where the two Demi-Gorges meet.

The Gorge of the Baſtion is nothing but the Prolonging of the Curtines from their Angles, with the Flank to the Center of the Baſtion, where they meet. When the Baſtion is flat, its Gorge is a Right Line, which terminates the Diſtance comprehended between two Flanks.

The Exterior Side of the Figure or Polygone, call'd alſo the Caſe is an Imaginary Line, which is drawn from the flankt Angle of a Baſtion to that which is oppoſite to it.

The Interior Side of the Figure is the Line which goes from the Center of one Baſtion to the other, and is compos'd of two Demi-Gorges and the *Curtine*, the latter taking in the greateſt Part of it.

Rampart is a Heap of Earth rais'd about the Body of any Place to cover it from great Shot, and conſiſts of ſeveral Baſtions and Curtines, having its Parrapet, Platform, Interior and Exterior Talus, a Stone-Wall, call'd a *Chemiſe* when lin'd, and a *Berm* when 'tis not.

Platform is a Place prepar'd on the Ramparts for raiſing of a Battery of Cannon. It ſhould be Horizontal, with a little bending towards the Outſide, for the Recoil of the Cannon.

Talus is the Slope allow'd to ſuch a Work, whether it be Earth or Stone, that it may have the more Strength to ſupport the Weight of the Rampart.

Berm is a little Space or *Retraite*, three, four or five Foot wide, according to the Height left without, between the Rampart and the Scarp of the Ditch, to receive the Earth that falls in. 'Tis never us'd but in Earth Works.

Chemiſe is a Wall with which a Baſtion, or any other Bulwark of Earth, is lin'd at the Solidity of the Wall, from the Talus to the Stone-Row.

Counter-Forts, or *Eporons*, are Parts of the Wall, perpendicularly joyn'd to the Principal, diſtant 20 or 30 Foot from one another. They may be advanc'd as much as you pleaſe in the Platform,

form, and are ſeldom made uſe of now-a-days, but in great Heights.

Parapet is an elevation of Earth or Stone upon the Rampart, five or ſix Foot high, conſiſting of Banques, to cover the Cannon and Men from the Enemy's Shot; it is only to defend the Soldiers againſt Musket-Ball; any Thickneſs is ſufficient: But for defence againſt great Shot, it ſhould be eighteen or twenty Foot Broad, to be Ball Proof, if of Earth, and ſix or eight, if of Stone. Every *Parapet* has its Embraſures and Merlons, Banques and Glacis: Embraſures and Merlons are only made where there's Cannon. Embraſures have Port-holes through which the Soldiers fire on the Beſiegers, either in the Country, or the Ditch; and Merlons are heaps of Earth or Stone, between theſe Embraſures. The Ancients call'd 'em Battlements, and ſhot their Arrows through 'em before Muskets were in uſe: And becauſe the Top of the *Parapet* is ſhelving, 'tis term'd the Glacis.

Banquet is a Step a Foot and half high behind, and at the bottom of the *Parapet*: On this the Soldiers ſtand to diſcover the Country, and fire on the Enemy; they deſcend when they are to Charge, there's but one on the Rampart, becauſe the Men are Cover'd enough on account of its Height: But in Cover'd Ways there are two or three.

Chemin des Rondes is a Space left for the Rounds to paſs between the *Parapet* and the Wall, that they may diſcover the Foot; but becauſe they have but a Parapet of a Foot thick, which in Sieges was ſoon beaten down by the Artillery of the Beſiegers. 'Tis rarely not made uſe of.

Guerittee or *Centry-Box*, is a little place of Shelter or Lodgment, to defend againſt the Weather, where the Soldiers Lodge a-Nights, when upon Duty: There are commonly three at each Baſtion, at the flank'd Angle, and the two Angles of the Shoulder, at the Gates, and in the middle of the Courtines, when they are long.

Cavalier is an Elevation of Ground on the Platform of the Rampart, towards the Angle of the Curtines and Flanks, or on the Battery, to lodge the Cannon to ſcour the Field.

Corps de Garde is a Lodgment for a good Body of Foot in ſome Poſt. From hence Centries are Detach'd and chang'd twice or thrice in a Night. There are *Corps de Garde* at the Gates, at the *Gorges* of the Baſtions, and at the Foot of the Rampart.

Fauſſe-Braye is a Space left at the Foot of the Rampart or Wall, and is made to defend the Approach to the Counterſcarp, and to hinder the Ruins of the Batteries from falling into the Ditch: It ſhould be thirty Foot wide in all its Circumference, for the Cannon to have room to Recoil. It has a Parapet Cannon-proof, to defend the Paſſage of the Ditch. This part of Fortification is not us'd, ſince it has been found by Experience, that when the Enemy is lodg'd in the Counterſcarp, over againſt the flank'd Angle it is not Tenable, the Beſiegers diſcovering from thence all that's below the Faces of the Baſtion: It may be proper for Flanks and Courtines.

Ditch is a Place dug between the Town and the Field, from whence the Earth is fetch'd to raiſe the Rampart and the Eſplanade of the Covert-Way,

Canelle is a little Ditch, in the middle of the Great one, and is kept full of Water, or Mud, if it can be done, with Quickſet-Hedges and Buſhes all along, to prevent Suprizes.

Reveſtement is the Wall on the ſide of the Place, either to ſupport the Fauſte Braye, or the Rampart only.

Poſtern is a Falſe Gate, made conveniently in the Angle of the Flank and the Courtine, for ſecret Sallies by the Ditch.

Caponnieres are Cover'd Lodgments, or Trenches, in the bottom of a dry Ditch, to lodge the Soldiers.

Battery is a Place where Artillery is cover'd and put in a condition to fire on a Platform of thick Planks, plac'd on Joyces, behind a good Parapet Ball proof, with Embraſures for the Cannon to go through. Field Batteries are encompaſs'd with Ditches, when expos'd to the Enemy's Inſults.

Mine is a ſubterranean Chamber run along under the Ramparts, or under the Face of the Baſtion, in which the Miners go by Oblique Ways, and Turnings and Windings: Powder is put there, in Quantity according to the Height and Weight of the Body to be blown up.

Counter-Mine is properly an Interior Gallery, Vaulted three Foot in Depth, and ſix in Height, made in the Wall all round the Place.

'Tis alſo a ſubterranean Paſſage, made by the Beſieg'd in ſearch of the Enemy's Mine, to give Air to it, or take away the Powder, or by any other Means, to fruſtrate the Effect of it, tho' it ſhould even happen to be forc'd by the Beſiegers.

Fougate is a ſmall Mine dug in the form of a Well, in a Place ready to be gain'd by the Enemy; who having made themſelves Maſters of it, 'tis ſprung like a Mine, by means of a *Saucidge*, which is a long piece of Cloth, the Sides ſewn in form of a Gut, as large as to contain a Tennis-Ball. This is dip'd in Pitch or Tar, and fill'd with Powder to ſerve as a Train to ſet Fire to Mines, Fougades, and Bomb-Cheſts.

Sappe is a Work which may be carry'd on ſeveral Ways; by Undermining, or deep digging with Pick-Axe and Shovel, at the Foot of a Work, to overthrow it without Powder. The uſual Way now is, to dig a deep Trench far into the Ground, and deſcend by Steps from Top to Bottom, by which means, the Men are cover'd Side-ways; and to ſave 'em from Danger on the Top, Madriers, or ſuch-like Planks, are laid acroſs it on branches of Trees cloſe bound together, and Earth thrown over all, to ſecure 'em from Fire. When a Covert-Way is well Defended by Muſquetiers, the Beſiegers muſt make their way down into it by the Sap.

Definitions of Out-Works.

Out-Works are all ſorts of Works diſjoyn'd from the Body of the Place. They are of ſeveral Kinds and Figures, according to the Ground and the Situation of Places; the Names of 'em as follows.

Counterſcarp is that ſide of the Ditch which is next the Camp, or properly the Salus which ſupports the Earth of the Covert-Way; tho' by this Term is often underſtood the whole Covert-Way, which is Parapet and Glacis; and 'tis thus to be underſtood, when it is ſaid, *The Enemy Lodg'd themſelves on the Counterſcarp.*

Half-Moons are ſaillant and flank'd Angles, which are commonly form'd on the *Angles Rentrans* on the Counterſcarp, overagainſt the middle of the *Courtines.* They are alſo plac'd before the Points of the Baſtions according to the Ground, and to cover the Hornworks. They have but two Faces, and are on all Sides encompaſs'd with Ditches. They may be made either with Flanks, or without 'em, as well as Ravelins, of which ſome are joyn'd to the *Courtines* in Ancient Fortifications, and ſome are disjoyn'd. Formerly Half-Moons were at the point of the Baſtion, and ſo call'd, becauſe they are roundiſh as they grow larger behind: Thoſe that were in the Courtines, were call'd Ravelins; but now the Term of Half-Moon is apply'd to all Triangular Works.

Covert-Way or *Coridor,* is a Space of four or five Fathom Broad, running all round the Place and Half-Moons. Lately Covert-Ways have been made ſeven or eight Fathom wide: It has a Parapet rais'd on a Level, together with Banquets and Glacis; which from the Height of the Parapet, ought to follow the Parapet of the Place, till 'tis inſenſibly loſt in the Field. It has alſo a Foot-Bank.

One of the greateſt Difficulties in a Siege, is to make a Lodgment on the Covert-Way, becauſe the Beſieg'd generally Palliſſade it along the middle, and Undermine it on all Sides.

The Eſplanade or *Glacis* of the Counterſcarp, is nothing elſe but the Parapet of the Covert-Way, and all the Ground that's loſt in the Field.

Crown-Works are certain Works advanc'd towards the Field, to gain ſome Hill, or riſing Ground, being compos'd of a ſpacious Gorge and two Wings that fall on the Counterſcarp, near the Faces of the Baſtion, inſomuch that they are Defended by them, and preſent on the ſide of the Field an entire Baſtion between two Demi-Baſtions, whoſe Faces look towards one another. Theſe Works have their Half-Moons: They are rais'd alſo to defend the Head of a Camp when 'tis Intrench'd.

Horn-Works differ only from Crown-Works, in that they preſent only to the Field two Half-Moons, terminated alike by two Wings: Theſe are alſo plac'd overagainſt the *Courtines,* according as there's occaſion of 'em.

Tenailles are properly Works like the Horn-works; they differ commonly in this only, that inſtead of two *Demi-Baſtions,* they have nothing in Front but an *Angle Rentrant,* between the ſame Wings without Flanks and the Sides are Parallel.

Counter-Gardes are Parallel Triangular Works, or Baſtions, which cover them between the Ditch and the Counterſcarp; they have their Rampart, their Parapet, their Ditch, and Covert-Way, and are only defended by the Half-Moons or Ravelins, which cover the Courtines. All the Difference between Half-Moons and *Counter-Gardes,* is, that the former are Broader and Longer.

Redans are Works made in the form of the Teeth of a Saw, with *Saillans* and *Rentrant* Angles, to the end that one Part may defend another. They are commonly rais'd at the Parapets of the Covert-Way, and on that ſide of a Place which looks towards a Marſh or River.

Lodgment is when the Counterſcarp, or ſome other Poſt, is taken from the Enemy, and the Aſſailants Lodge and Entrench themſelves there, to hinder the Enemy's recovering it.

Trenches of Approach are Oblique Ways by which the Beſiegers approach a Place without being ſeen: Or Oblique Lines, as little expos'd to the Works of the Beſieg'd as poſſible. Theſe Trenches have their Parapet every where on the ſide of the Place, with two *Banquets,* and ſometimes Redoubts at their Saillant Angles, to ſuſtain the effort of Salleys.

Boyaux's are winding Trenches without Angles, as the *Turks* make 'em. Theſe Curv'd Lines are one before another, and all Parallel to the Face, which the Place Beſieg'd preſents, as was ſeen at the Siege of *Candia,* where this Term became firſt in Vogue.

Lines of Circumvallation are Entrenchments drawn all round a Place that is to be Attack'd, to prevent Succours being thrown into it: They are Lines flank'd at the length of a Musket-ſhot, either with Redans, or other ſmall Works, or by Forts rais'd in the Field at the moſt conſiderable Ports.

Lines of Contravallation are made within thoſe of Circumvallation, and with a Ditch on the ſide of the Place where the Gariſon is ſtrong; when the Beſiegers would Starve it, or cover the Army without from the Inſults of the Enemy's Salleys.

Profil is the Imaginary Section of a Plan or Place with Right Angles, to mark and exactly repreſent all the Heights and Breadths of the Ramparts, Parapets, Walls, Talus, Ditches, Covert-Ways, and *Eſplanades,* which *Ichnography* does not do, marking only the Lengths and Breadths.

Definitions of the Angles of Fortification

Angle of the Center is that which is made in the Center of the Place, by the meeting of two Neighb'ring Radius's, drawn from the Angles of the Figure.

Angle of the Interior Figure is that which is made in the Cetner of the Baſtion, by the meeting of the two Interior ſides of the Figure.

Angle of the Polygone or Exterior Figure, is that which is made by the meeting of the two Exterior Sides of the Polygone.

The Flank'd Angle is the Point of the Baſtion, compris'd between the two Faces. We may alſo ſay, the Flank'd Angle of a Half-Moon.

The Flanking Angle is that which is made by the meeting of the two Lines of Defence *Raſant*: That is, the two Faces of the Baſtion prolong'd.

The Angle of the Shoulder, which Name ſeems odd in *Engliſh*; but having met with it in a Noted Author, we prefer it to the *French,* is that which is made by the Lines of the Face and the Flank.

The Diminiſh'd Angle is that which is made by the meeting of the Exterior Sides of the Polygone, and the Face of the Baſtion.

The Angle Saillant is that which advances in Point towards the Field.

The Angle Rentran, or Re-entring, is that which preſents its Point to the Place.

Explanations and Definitions of ſeveral Machines and Inſtruments belonging to Fortifications and Sieges.

There are two ſorts of Bridges, the one term'd *Ponts Dormans*, and the other *Ponts Levis*, or Draw-bridges. The former, which are fix'd, are not ſo Convenient as the latter.

There are alſo *Ponts a Bacules*, which riſe on the one Side, and fall on the other, in the Form of a Pit-fall. There's a ſort of *Portcullis*, term'd a *Bacule*, made like a *Pit-fall*, with a Counter-poiſe, and ſupported by two great Stakes, uſually plac'd before the Corps de Gardes advanc'd near the Gate. *Pont a Fleches* are a ſort of Bridges which riſe and fall entirely, having their Movements on the ſide of the Gate, and the other End hanging by Chains of Iron ſupported by *Beams*, the Motion of which raiſes or abaſes them.

After the Draw-bridge and the Gate, there's commonly a Counter-Gate, made of Pieces of Wood ſet a-croſs in ſquares, with Iron Points at the bottom. Theſe Counter-Gates are call'd Herſes or Sarraſins, and are let down when the outward Gate has been forc'd with the Petard. 'Tis alſo made uſe of to prevent Surprizes in the Day-time, or otherwiſe.

Orgues, or *Port-Cullices*, are great Pieces of Wood Iron'd at the End, and hung as *Herſes*, differing only in this, that the Pieces of Wood in Herſes are faſten'd together, and in Orgues are looſe; ſo that they cannot be all broken at a time, as Herſes may.

Barriers are great Stakes, ſet up at 8 or 10 Foot diſtance from each other, and about 4 Foot high, with *Tranſoms* or overthwart Rafters to ſtop ſuch as would ruſh in with Violence. They are generally plac'd at the firſt Avenues of a Town, at the Eſplanade, the Half-Moons and Paſſages for Horſe and Waggons. Some turn on a Pivot.

Moulinetts are what we call *Turn-Styles*. They are often ſet up near the Out-works of fortify'd Places, at the ſide of the Barriers, thro' which People paſs on Foot.

Cheval de Frieſe is a large ſquare Joyſt, about 10 or 12 Foot long, in whoſe Sides are three Ranges of Wooden Pins, with Iron Spikes, at the End of 'em. It ſerves for a Barrier to an Avenue when balanc'd Horizontally on the middle of a Stake, ſo that it may be open'd or ſhut. The chief Uſe of it is to put a good Number together in thoſe Places, where there's reaſon to apprehend a Surprize from Cavalry, as well in the Field, as the Avenues to a Town that's Beſieg'd, and at a Piſtol-ſhot from the Cover'd Way, to receive thoſe that ſally and ſtop the Enemy's Horſe and Foot.

Chauſſe-Trappes, or *Coltropps*, are Iron Inſtruments with four Points, two Inches long, in the Form of Stars, made ſo, that throw 'em which way you will, one Point always falls upwards. They are uſually ſcatter'd up and down in thoſe Places where the Inroads of Horſe are fear'd, at Breaches, in Ditches, *&c.*

Gallery is a Cover'd Paſſage with good Plank, Muſket-Proof on each ſide of it. The Top is ſometimes cover'd with Turf, or Earth, to hinder the Effect of the Enemy's Artificial Fire, as 'tis call'd. Galleries are frequently made uſe of in the Moat already fill'd with Faggots and Bavins, to the end that the Miner may approach ſafe to the Face of the Baſtion, when the Artillery of the oppoſite Flank is diſmounted. They are not now much in Vogue: *Felibien* ſays, *Nos* Francois *ne s' amuſent plus gueres à toutes ces Ceremonies*, We *French* no longer amuſe ourſelves with theſe Ceremonies. How many of their fine Military Reflections has the Laſt War made Ridiculous, as well as this.

Mantelet is a Covering made of Madriers, or thick Planks, which are put up againſt a Wall *Pentwiſe*, when Saps or Mines are to be carry'd on. It ought to be Muſket-Proof by the Sides, but ſtronger a top, to defend the Sappers or Miners againſt the great Stones which may be thrown down upon 'em. It is alſo cover'd with Raw Hides, that Artificial Fire may not burn it. 'Tis made uſe of on other Occaſions. There are ſeveral ſorts of Mantelets; ſome cas'd with Tin, and ſet upon little Wheels to be driven before the Pioneers.

Blindes are two or more Pieces of Wood ſet upright, and on the ſame Line, at ſix or eight foot diſtance, with Tranſoms from the Head of the one to the Head of the other. There muſt be two Parellel Rows on both ſides of the Trench, to ſupport the Bavins laden with Earth. They are uſeful in Places *enfiladed*, either by Neceſſity, or the Ingenier's Miſtake; and when in Attacking an Enemy's Place, we muſt firſt deſcend into, and croſs a Bottom. For in ſuch a Caſe the Beſiegers lie open to the View of the Beſieg'd. If they are not cover'd with Blindes, or Chandelieres, made of two upright Stakes to ſupport Planks laid a croſs one another, or Faſcines, by means of Pins faſten'd into the Stakes; they are different from Blindes, in as much as the former are made uſe of for *Fore-Coverings*,and *Chandeliers* for *Top*.

Gabions are large Baskets, made of Oſier Twigs, deep and round, which are plac'd upright and fill'd with Earth. Between two of theſe is a Cannon for Battery. There are a ſmaller ſort, which are put on Parapets; and in the Trenches and other Places, to cover the Musketeers. They are plac'd ſo cloſe to one another, that but one Muſket can be put between two of them.

Palliſſadoes are Ranges of Stakes, pointed and planted at half a Foot diſtance, with a Tranſom, that binds them together; they are four or five Foot above Ground, and commonly put on the Eſplanade without the Glacis, as alſo near Baſtions and Curtines, and along the Cunette.

Fraiſes are Ranges of ſharp Stakes fixt in Bulwarks, made of Earth on one ſide of the Rampart, a little below the Parapet. They preſent their Points ſloping towards the Ditch, and ſerve to prevent Scalades and Deſertion.

Rules to be obſerv'd in raiſing a Fortification.

THE greateſt Part of the *Italians*, and the Chevalier *de Ville*, will have the flank'd Angles above the Exagone to be always 90 Degrees, and conſequently the Flanking vary on the contrary; the *Dutch* make no Baſtions of Right Angles, but at Decagones and above, and acute Angles at all Polygones below. By which means their Works, eſpecially the Curtine, have more Flank; but making their Ditches parellel, it thence happens that the Flanks which are on the Eyes of a Place, do not ſee the Ditch entirely at the Face of the Baſtion, where Places are attack'd, becauſe the *Rentrant Angle* of the Counterſcarp takes away the Defence of the Flankt Angles, which ought to be Subject to the Flankings. For, according to the Doctrin of Monſieur *de Pagan*, Flanking Angles ought to be invariable; and as to the Flank'd, they being obtuſe above the Exagone, and acute below, 'tis of no Importance, whether 90, 100 or more Degrees, provided they are well defended, and well flank'd.

There can be no Second Flank without diminiſhing the true Flank. A ſixth Part of Diminution, or a fourth at moſt, is ſufficient, becauſe Cannon cannot be mounted there on account of the Obliquity of the Parapets and its being expos'd to Field Batteries, and in as much as two Inch Plank, defends the Paſſage of the Ditch from Musket-ball, which is the Time when the *Second* Flank is wanted.

The Exterior Side of the Polygone ought not to be leſs than 100 Fathom, nor more than 200, becauſe the Line of Defence ſhould not exceed 150 Fathom. The flankt Angles muſt not be leſs than 60 Degrees, which is what may be given to Places with four Baſtions; and it is of no Conſequence, whether they are very obtuſe or not. The *Italians* follow this Maxim, and put Caſemats on the Flanks.

The largeſt Flanks are beſt; they ought to be 12 Fathom, when the Exterior Side or Baſe is but 100, and 24 Fathom; when 'tis 200, the half of that Diſtance ſerves for the *Orillon*, and the other half for the Cover'd or Retiring Flank, which conſiſts of two or three practicable Places behind, and above one another in the Form of Steps in the Bottom of the Demi-Gorge. If you make three, there muſt be 36 Fathom in Flank, which ſhould be ſeen only by the oppoſite Counterſcarp, and the Breadth of the Ditch, which is 15 or 16 Fathom broad. This makes but the third Part of the Flank oppoſite to the Enemy's Batteries, the 12 Fathom of the Orillon, which is not to be minded ſo much as *Retir'd Places*, becauſe 'tis more expos'd, and may be batter'd from other Places beſides the Counterſcarp. And becauſe but a third Part of the Cannon can be mounted on the Counterſcarp, as on the three Places and the Orillon, 'twill be very hard to paſs a broad, deep Ditch, well defended. This is the moſt important Part of a Fortification, and the Paſſage the moſt difficult Action of an Attack; and yet we ſee, as ſoon as the Beſiegers are Maſters of the Out-works, the Beſieg'd Capitulate, and the Body of the Place is not to be Defended, on account of the Imperfections of Simple Flanks, which are eaſily render'd uſeleſs by Batteries.

The ſofteſt Matter is proper for Parapets, but not for Ramparts, for being only ſupported by *Chemiſes* of Turf, their Talus muſt be ſo large, that it renders them acceſſible, and eaſily to be inſulted, as it happen'd in 1672. to the moſt Part of the Places the *French* King took on the *Rhine* and *Iſſel*. From theſe particular Rules a General one may be inferr'd, That there ought not only to be no Place that is not well flank'd, but that all theſe Defences every where ſhould be equal, and the leſs Places there are to defend the Fortification, is the better for it.

Thoſe Parts of the Fortification that are near at its Center, ought to be bigger than thoſe that are farther off, and ſhould ſucceſſively command them. Of all the Out-works, none is ſo good as a Half-Moon, becauſe being defended by the two Baſtions which it covers, one may, as has been often experienc'd, recover it from the Enemy, by the help of Fire from the Place, which renders the Lodging there very difficult and dangerous.

Crown-works, Horn-works and *Tenailles* are not ſo eaſily to be recover'd, becauſe they are only defended by themſelves, and the Enemy's are cover'd, and find a good Lodgment ready made to their Hands; wherefore they ſhould never be made uſe of, but when the Nature of the Ground requires it.

There's a great Diſpute among Ingeniers, whether a dry Ditch be better than one full of Water. The following Reaſons are alledg'd by one Side and the other.

A dry Ditch has the Advantage that it may be defended by Hand, in making ſecret Salleys by Poſterns, killing the Miners, and hindring the raiſing of Galleries, which cannot be done when the Ditch is full of Water. The Soldiers defend there the Half-Moon and Cover'd-Way to Extremity, becauſe they can throw themſelves into the Ditch by ſliding down the Talus of the Counterſcarp; and they may with the ſame Eaſe ſuccour the Out-works, without being oblig'd to go all round the Place by the Cover'd-Way. Theſe Reaſons are very Strong. The following are what is ſaid for Ditches full of Water.

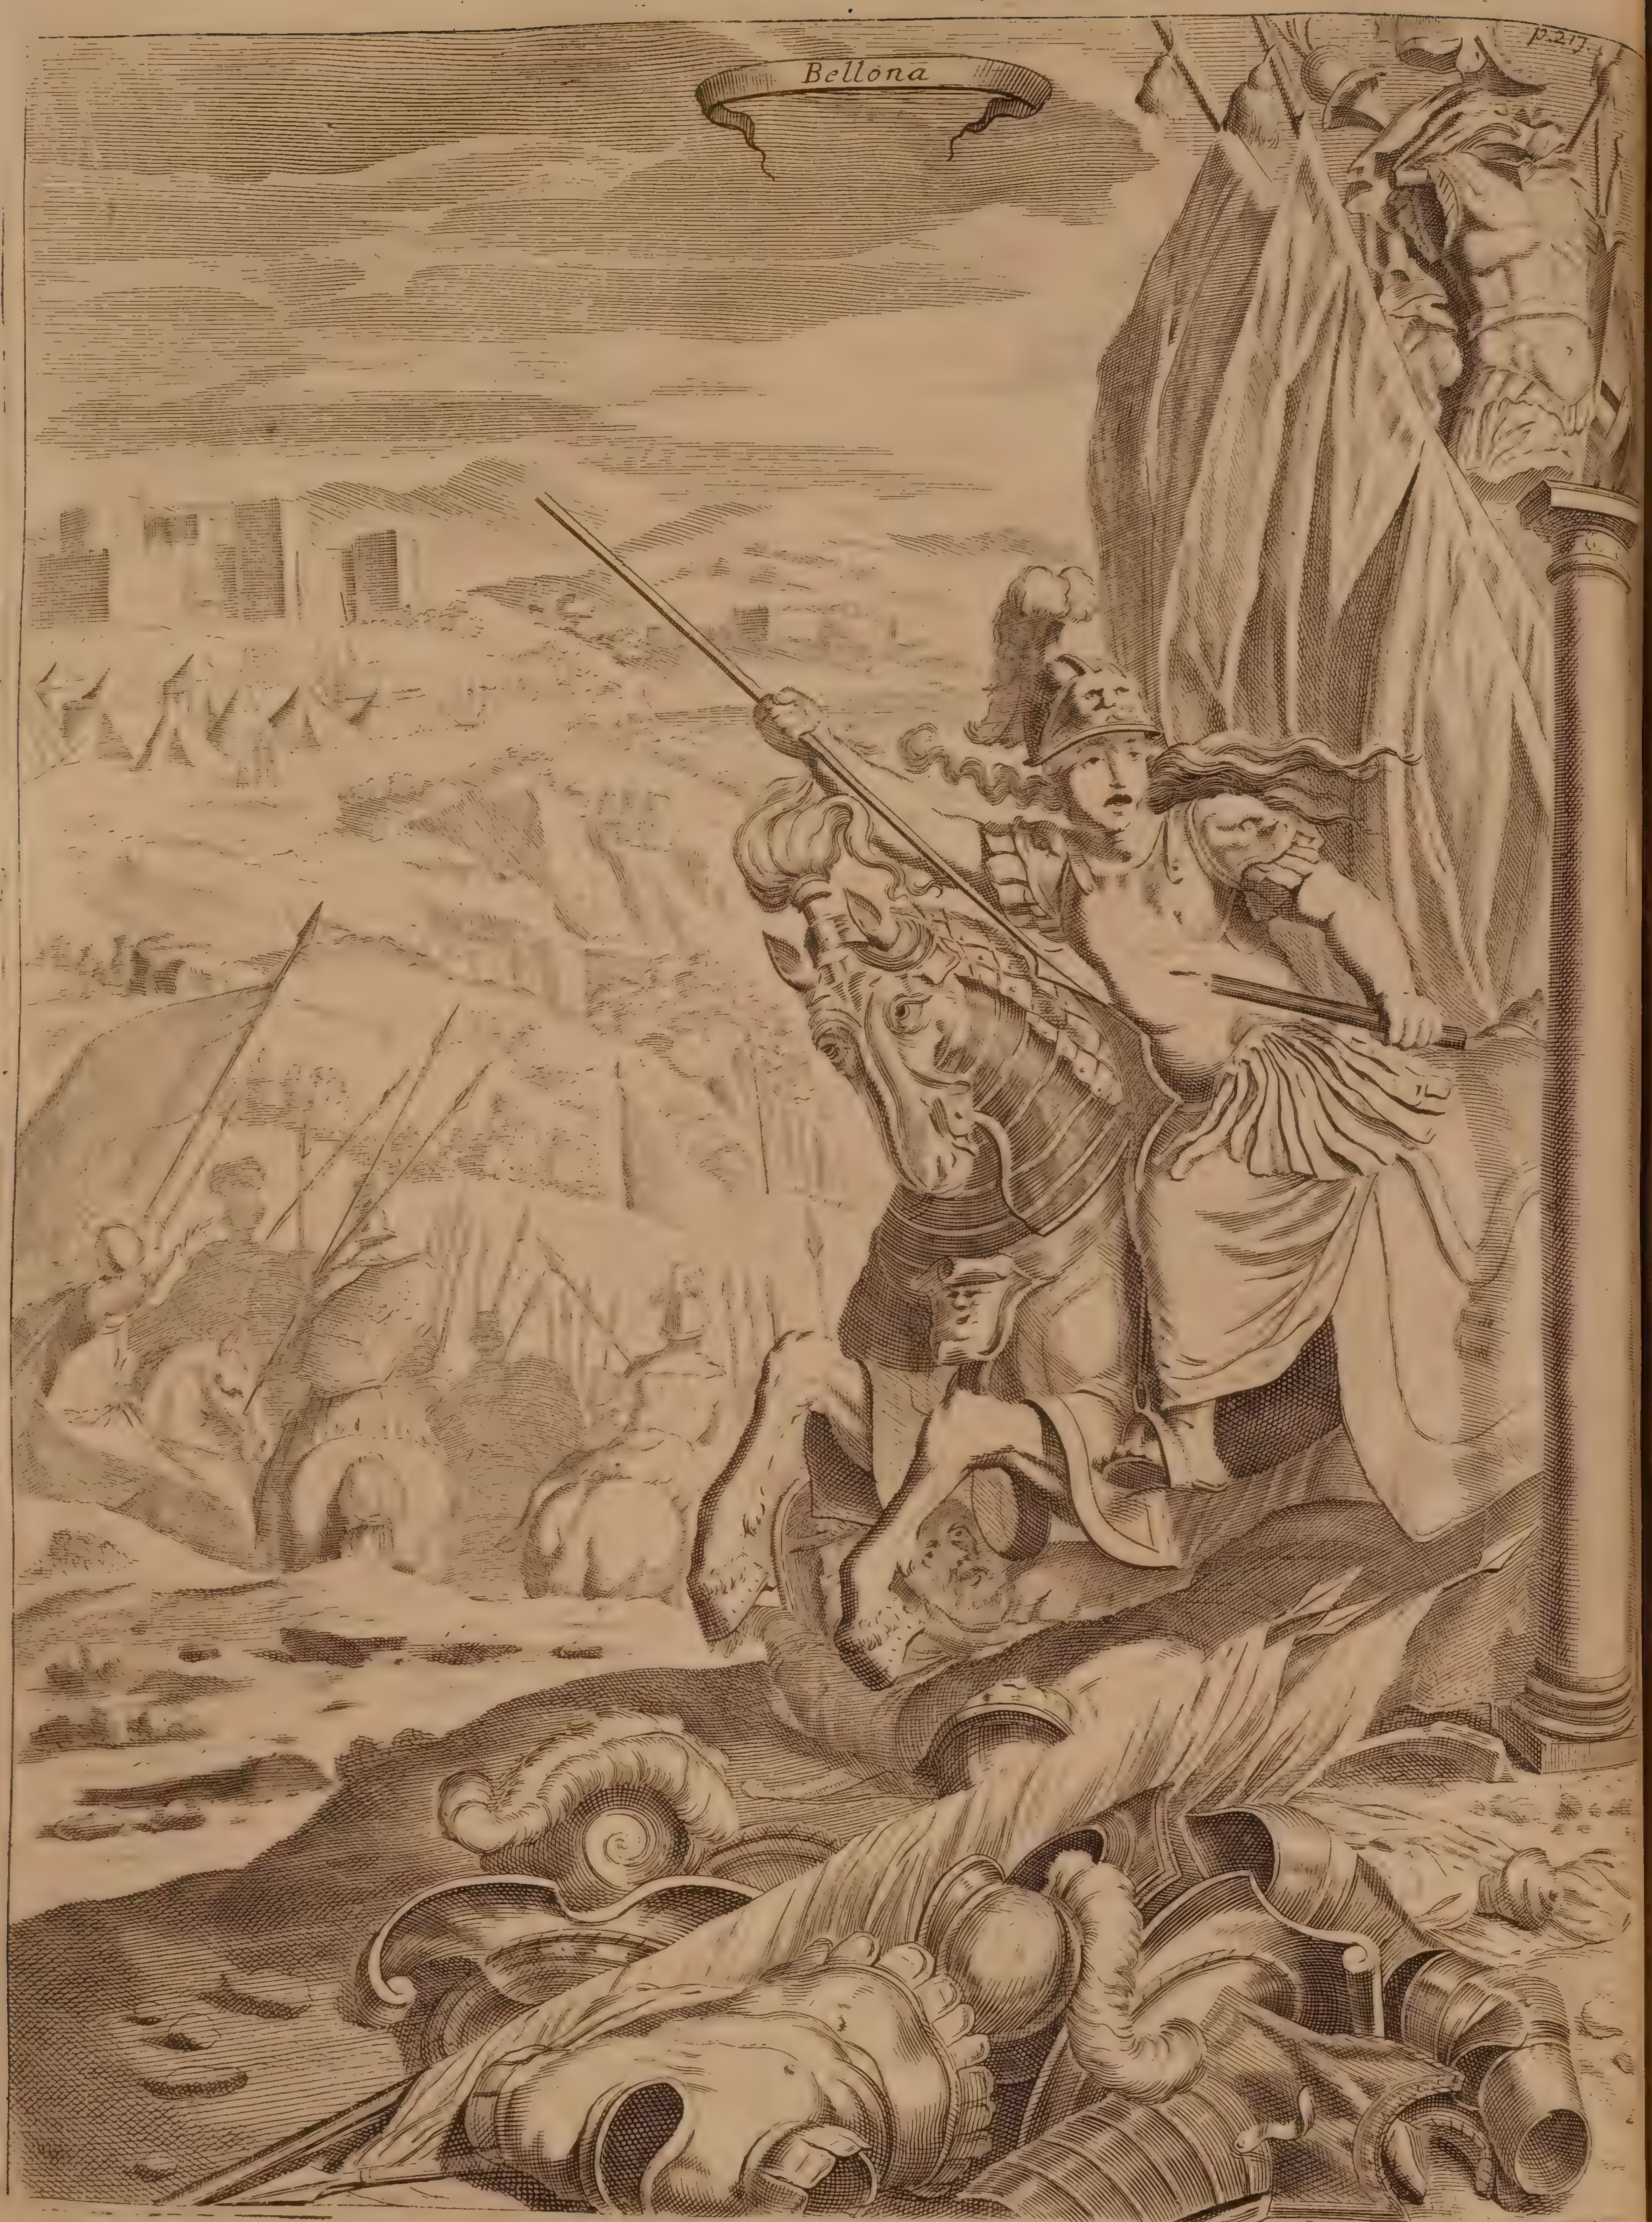
The Enemy can't paſs Ditches full of Water, but by Galleries or Cauſeys, which are long in Raiſing; nor of a Breadth nor Front ſufficient for a great number of Men to go on the Aſſault.

No Mines can be carry'd along under thoſe Ditches, which is done when the Artillery of the Flanks cannot be diſmounted. And if Men are repuls'd in an Aſſault, they cannot retire to the Right nor Left to make a new Mine, becauſe of the Water in the Ditch.

Places with ſuch Ditches are ſafer againſt Surprizes and Scalades than when Ditches are dry. But then in Exchange the Beſiegers cannot in the former countermine the Cover'd-Way to blow up the Lodgment the Enemy has made there, nail down the Cannon deſign'd for battering the Flanks, and hindring a Deſcent into the Ditch, when the Eſplanade is broken thro'.

So that as toDitches Places would be very ſtrong, if they could be fill'd or empty'd according to Occaſion and Neceſſity, as at *Roſes*. And for want of this Advantage, which is very rare, ſome are contented with a good Paliſado'd Cunette, deep and full of Water in the middle of a dry Ditch.

WAR.



To the Worshipfull John Cutts of Arks
in Essex & of Childerly in Cambridgshire Esq.

This Plate is humbly Dedicated by Richard Blome.

WAR.

The Introduction.

THE Art of *War* is ſo noble and neceſſary a Study for all Gentlemen as well as Soldiers, that would fit and prepare themſelves to be Inſtruments for the Glory of their King, and Safety of their Country, that without it they muſt be uſeleſs at Home, and altogether Strangers to Battles and Tranſactions Abroad. How was it poſſible for a handful of *Greeks* to Conquer moſt of *Aſia*, and ſubdue that mighty *Perſian* Empire, more likely to have given the Law to *Europe*, than to have receiv'd it from ſo ſmall a Part, and People of it; but by being exceedingly their Superiors in Military Arts and Diſcipline: Having for the Education of their Youth, their *Tactici*, or Publick Teachers; and their *Gymnaſias*, or Publick Schools; by which means the *Grecian* Youth were ſo accuſtom'd to Military Exerciſes, that it was a Reproach and Ignominy to any that had not learn'd to handle their Arms; and (as ſome relate) they were ſo train'd up in their Schools, that they were Fed and Lodg'd as if they had been actually on Duty in the Field; which, doubtleſs, was a Method worthy of Praiſe and Imitation; for thereby, in an Inſtant, they were able not only to form an Army of Soldiery, expert in the uſe of their Arms; but alſo to have it conſiſt of Men, accuſtom'd with the Dyet and Hardſhips of War.

The *Romans* (thoſe great Examples of Military Worth) altho' they had not ſuch Publick Teachers, or Schools to fit their Youth for Arms; yet we find they had their Field of *Mars*, whither the *Roman* Youth reſorted to the Practice of Military and Warlike Exerciſes; and we read, they were ſo ſtrict in the Choiſe of their Soldiers, that none could be admitted to, or attain the Dignity of one of the 24 Military Tribunes (altho' he was moſt in favour) that had not ſerv'd at leaſt five Years in the Wars; and none that had leſs favour could be a Tribune, before he had ſerv'd in the Wars 11 Years amongſt the Foot, or 15 amongſt the Horſe; whereby we ſee, none could be an Officer before he had been a long time a Private Soldier, judging him unfit to Command, who had not firſt learn'd to Obey: And their Great Care in this matter, we may learn from the prudent Diſtribution of their Tribunes in their *Legions*; that whereas the firſt *Legion* of a Conſular Army had four Tribunes, which might have ſerv'd in the Wars but 5 Years, yet it had two Tribunes which had ſerv'd 11, or 15 Years, and ſo in courſe for the remaining three *Legions*; whereby they diſtributed as near as might be the moſt knowing and experienc'd Tribunes in every *Legion*. Such was the Excellency of the *Roman* Military Diſcipline! War was the Policy of their Common-wealth, the Renown of their Families, the Glory and Employment of Private Men: It was a Diſhonour to their Great Men to be overcome, and for their Followers not to go as far as they: Their Soldiers went Singing to the Battle; and ſuch as ow'd their Safety to their Heels, were forc'd, thro' meer Shame, to rid themſelves with a Halter of their hated Lives. Thus they were endow'd with ſuch Noble Courage, for which they were Celebrated above any other Nation.

But why do we dazle our Eyes with the Splendor of either the *Grecian* or *Roman* Arms, or be ſo unjuſt to ourſelves, as to diminiſh or leſſen the Glorious Actions of this Nation, that thereby we might only flatter Antiquity? The *Engliſh* has fill'd their Hiſtories with Paſſages as truly Noble, as thoſe we read of, with ſo much Admiration in the *Grecian* and *Roman* Writers, and Foreign, as well as their own Hiſtories do them the right to tell the World, how not only Towns, but Provinces and Kingdoms have been the Reward of their Victories, as their memorable Exploits, famous Victories, and large Conqueſts in *France*, *Ireland*, *Cyprus*, &c. how they brought under *Cicily*, and carry'd the Terror of their Arms into *Aſia*: But withal, they bid us obſerve, that ſuch great and noble Actions were due to their great Knowledge in Military Arts and Diſcipline, acquir'd by unweary'd Induſtry and Pains, when their Youth were bred up in ſhame of Vice, and Boldneſs to undergo Peril for Virtue's ſake: For it is certain, as *Plutarch* ſpeaks of the *Lacedemonians*, in his Life of the *Theban General*, *Pelopidas*, *That it is neither* Eurotas, *nor the Place betwixt* Babyx *and* Gnacion (Rivers in and about the City *Lacedemon*, then famous for brave Soldiers) *that bringeth forth Valiant and War-like Men*. There is in moſt Men a kind of Fear that is born with them; few with *Hercules* in the Cradle dare encounter and ſtrangle Serpents. It is true, in ſome few Youths we may diſcover a certain kind of Greatneſs of Mind, that betimes by their forward and lively Spirits, and by ſome brave Excurſions of Mind, may give ſure Signs of their innate Courage; yet we muſt do ſo much right to Diſcipline, as to acknowledge, that Valour rather ſprings from that, than from any Prerogative of Birth; and thus that Man that hath been afraid at the very Name of *War*, when brought (as it were) to ſee and handle the Dangers thereof; and when he perceives, that Death is not certain in Battles, that but a few fall, when 'tis couragiouſly Fought, and that his Fears have often deceiv'd and fool'd him, now dares be one in the hardeſt Service, and can meet the moſt threatning Dangers boldly and chearfully, obtaining that by Experience, which he never had by Nature. Where Courage is Natural, Diſcipline muſt have the refining and ordering of it, before it be Genuine and True. And it is certain, where Courage is not innate, Diſcipline, when apply'd, never fails to produce it. The *Thebans* (which till the Day they obtain'd the Victory againſt the *Lacedemonians*) had no Reputation of Valour; yet by Exerciſe and Uſe of Arms, under their Experienc'd and Skilful Generals, *Epaminondas* and *Pelopidas*, are too hard for the brave *Spartans*, who before were accounted the moſt Valiant People of *Greece*.

It is not to be doubted, but that the old *Engliſh* Valour is ſtill the ſame, altho' it were to be wiſh'd, that Young Gentlemen, and Perſons of Quality, were more inclinable, in imitation of the Noble Performances, and Illuſtrious Exploits of their Anceſtors, to acquaint themſelves with Military Exerciſes, and Manly Employments, that by their acquir'd Knowledge, joyning with their Genius, they may be an Ornament to a worthy Poſterity, in being ſerviceable to their King and Country, like that brave and reſolute *Spartan*, *Iſadas*, in a Juſt and Honourable War, whenever they ſhall be call'd to the Field.

And can there be any greater Encouragement to ſet about the Practice of this ſo Great and Noble a Study, than to be bleſs'd with a General to your Armies, and an Admiral to your Fleet, in the Perſon of a King; and of as Active a Temper, and Warlike Spirit, as either the *Greeks*, *Alexander*, or the *Roman Cæſar*, who has Courage to lead you as far as your's dare follow; and wiſe Conduct to raiſe the Glory of this Nation as high as you can wiſh; and who (without doubt) will take notice of ſuch as endeavour to render themſelves thus fit for his Service.

I do not deſign in this ſmall Treatiſe to ſpeak of the handling of Arms, nor of the ſeveral Poſtures and Motions taught the Soldiers, nor of the divers ways of Exerciſing a Troop or Company; ſince there is in the *Engliſh* Language ſo many Printed Books on this Subject: And that which would make one the leſs Curious in doing it, is, becauſe (tho' there be a great many fine Things taught in theſe Particulars, which are graceful to the Sight, and makes Soldiers the more ready) yet when they come in earneſt to Fight, few of them are practis'd but to keep their Ranks even and cloſe, their Files right, to Fire nimbly, to Charge boldly, to be watchful of the Word of Command from their Officer, and to be exactly Obedient to it.

I ſhall only diſcourſe a little of the 3 Principal Heads in the Art of *War*, viz. *Marching*, *Incamping*, and *Imbatteling* an Army; which, if rightly underſtood, with the following Treatiſe of *Fortification*, of *Defending* and *Beſieging* a Town; the Ingenious Soldier will find them very uſeful Inſtructions to him in divers Occaſions.

Of Marching an Army.

BEfore the Army comes to their Rendezvous, in order to March, the General ſends an Officer with ſome Horſe to the Neigbouring Villages, to have a ſufficient number of Guides of thoſe moſt knowing of the Country, and Ways, he deſigns the Army ſhall march, and to bring them to his Quarters, which muſt be always near the General's, and there kept, eſpecially if Men not thorowly known, and to be truſted. To this Officer the General gives the Title of the *Captain of the Guides*. Having (upon the diligent comparing of their Informations) reſolv'd on the Way to march, after the *Reveil* is beaten, all the Waggoners and Men that attend the Baggage are to take up their Horſe and Oxen, and make ready to load. The Vag-Maſters (whoſe Duty is to Mend the Ways, and Conduct the Baggage) are to come to the Quarter-Maſter General of the Army, to receive his Orders. And being inſtructed in the Way the Army is to March, he is to provide himſelf Guides, and to Aſſemble together all the Baggage of the Army, whoſe Colours they muſt follow, and March according to the Rank of the Regiment they belong to, and according to the Place the Brigade is order'd to March in, whether in the Van, Body or Rear.

After the Army is form'd into as many large Squadrons and Battalions as the Ground or Field (where they are drawn up) will admit of, and according to their Number regulated into the Van, the Body and the Rear-Guard; all the Ordnance, Carriages and Baggage being drawn up on one ſide, ready to fall into their Places, as the Army marches off; The General gives Orders for the Van to begin their March, which for the firſt Day is always begun with his Regiment, and therefore is drawn up on the Right; and afterwards every Regiment is to take it by Turns, according to its Priority, being a General Officer's, and Antiquity being a Colonel's. Then he ſends out Guides and Light-Horſemen to diſcover the Ways and Paſſages, yet ſo that they always keep in ſight of the Van-Guard, that upon the Diſcovery of an Enemy they may give notice thereof in time. With the Van he orders the Carpenters of the Train, and moſt of the Pioneers to march for the Mending of ſuch Bridges that need it, or ſhall be judg'd inſufficient to bear the Weight of the Carriages, *&c.* and when there are bad Ways for the Horſe or Train, to Mend them againſt the Army comes up.

The Ordnance and Ammunition do ordinarily march in the Center, or Body of the Foot, as adjudg'd the ſecureſt Place from the Attemps of the Enemy; for if the Attack be in the Van, or Rear, or both, half the Army will be free from the Incumbrances of the Carriages, and will be ready to make Head where need requires; but ſometimes, as Neceſſity requires, ſome ſmall Field Pieces march in the Head of an Army, eſpecially when the Enemy is expected to fall on.

'Tis impoſſible to give a certain, or ſtanding Rule, for the moſt advantageous and ſafe Way of Marching an Army, ſince the Form muſt vary according to the Country you march in, or the Enemy you have to do withal; altho' you are to obſerve, whenever the Ground will allow of it, as in Marching over an Heath, or large Field, always to march in Battalia; and if the Army can't, yet at leaſt that the Horſe and Foot do march in as large Squadrons and Battalions as the Ground will admit of.

The March of an Army, as aforeſaid, being Compos'd in general of an Advanc'd Guard, the Main Body, and the Rear; yet ſeeing we frequently read, that upon ſuch Occaſions they mov'd in two, four, ſix or eight Columns, more or leſs, according as the Ground will allow, the

Column of an Army on a March ſignifies no more than a long Row of Troops following one another, the firſt and ſecond Lines, as they are incamp'd, make generally two Columns on a March, filing off either from the Right or Left.

The Chief Officer that Commands the Rear-Guard gives Orders that ſome Troops of Light-Horſe ſhall march within ſight of the Rear, eſpecially in paſſing over a Heath, Foreſt, or the like; but if the Country be Mountainous or Hilly, then the Light-Horſe may be commanded to march ſometimes in the Van, and ſometimes in the Rear of the Army, and to keep ſuch Watches and Centinels on the high Places, that the Enemy may not diſcover the Strength of the Army as it paſſes, or in what Order it marches.

In paſſing thro' narrow Ways, the Van-Guard is generally ſtrengthned with ſome Foot and ſome Ordnance drawn up before it, leſt the Enemy ſhould ſurprize it, and then march up by Defiles, and draw up as the Condition of the Place will permit.

In paſſing thro' a great Wood, there ought to be plac'd good ſtore of Horſes upon the Ways that lead into it, and to round and guard it very well on both Sides, to be ſecure from the Enemy's Ambuſcades; and if there be any plain or open Places in it, the Horſe are to over-ſpread them, and to be drawn up to ſecure the Paſſage until the Ordnance and Baggage are paſt, and the Rear brought up: And if after the paſſing the Wood the Army come into a plain Champaign Country, ſome Horſe are to guard the Way that comes out of the Wood, until they be drawn up again into large Squadrons and Battalions.

When an Army is to march thro' a Country where there are many Brooks and Rivers, Bridges are to be made, which is eaſily done, if there be good Ingeniers, Carpenters and ſtore of Workmen. Sometimes Bridges are made with empty Barrels and Hogſheads, laying Planks over them and faſtned together. The lateſt and beſt Invention for making Bridges, are the Pontons, being Boats of *Latin* of about eight Yards long, and two broad; the Form of which is a long Square, having a large Ring at each Corner. It's laid upon a Carriage when the Army marches, and drawn by five Horſes. Each Boat has an Anchor and Cable, and Baulks and Cheſts belonging to it. The Baulks are about 5 or 6 Inches ſquare, and about 7 Yards long. The Cheſts are Boards joyn'd together by Wooden Bars, about a Yard broad, and 4 Yards long: When there is occaſion for uſing theſe Boats, they are ſlip'd into the Water, and plac'd about 2 Yards aſunder, each faſtned with an Anchor, having beſides a ſtrong Rope which runs thro' the Rings, and is faſtned on each ſide the River to a Tree, or a Stake made very faſt in the Ground. The Baulks are laid acroſs the Boats at ſome Diſtance one from another, and the Cheſts upon them joyn'd cloſe; which makes a Bridge in a very ſhort time, for Horſe, Foot or Artillery to march over.

Now for the ſecuring the Bridges whilſt they are marching over, there ſhould be ſome Pieces of Cannon drawn up, and planted by the River-ſide, to annoy the Enemy, if they ſhould force their Paſſage over it; and when the Bridge is laid over, ſome Fire-Locks, Half-Pikes and Horſe ſhould march over to make good the other ſide, until all the Army with the Cannon and Baggage are come over. If the River be fordable, but rapid, and above Knee-deep, the ſtrongeſt Horſe, by Turns, are to ſtand in Files in the River, on the upper and lower Sides of the Ford, that the Foot may paſs the ſafer between them, the upper Files breaking much of the Rapidneſs of the Stream, and the lower ſaving ſuch of them that by the violent Current might be caſt down.

An Army is ſometimes all on a ſudden oblig'd to make a Counter-March, or to turn their March another Way than they intended, which may be occaſion'd by the Enemy's endeavouring to get betwixt them and their Garriſons, or may be done to diſappoint and amuſe them; but for a Battalion, 'tis ſaid to Counter-March, when being charg'd in the Rear they change the Front, by Marching thoſe that are in the Front, or File-Leaders, to the Rear, in place of the *Bringers-up*; whereas Ranks are ſaid to Counter-March, when the Wings of a Battalion inter-change Ground.

There are ſeveral other Caſes which muſt be provided againſt, as Emergencies happen, by the Care and Prudence of the Chief Commander, for which no poſitive Rules can be ſet down; but the Orders muſt be given on the Place, and proportionable to the Ground, the Enemy and the Occaſion.

Of Encamping an Army.

When an Army is to Encamp and Quarter, eſpecially not far from an Enemy's Country (altho' but for a Night) the General ſends out to view and inform himſelf of the Nature and Condition of that Place where they deſign to encamp, which muſt be a Place (if poſſible) in a plain Field, near Water; to which Place the Army being come, and that in good time by Day, the Quarters may be made near unto the adjoyning Villages, if there be any; and the Horſe lodg'd about them in the moſt ſuſpected places of Danger. To this end the Quarter-Maſter General is to go with the Camp-Mareſchal, that is upon Duty, to the appointed Camp; and being there come, he divides the Ground, diſtributing it to each Quarter-Maſter of the reſpective Regiments of Foot, and Troops of Horſe; then he takes up a Quarter for the General, in which he marks out the General Officers Quarters, and of all thoſe that have right to be there. An Army always incamps fronting the Enemy, and generally in two Lines, running Parallel, about 100 Yards diſtance, the Horſe and Dragoons on the Wings, and the Foot in the Center. Sometimes a ſmall Body of two, three or four Brigades is incamp'd behind the two Lines, and is call'd the Body of Reſerve. The Artillery and Bread Waggons are generally incamp'd in the Rear of the two Lines.

When an Army comes to be incamp'd near the Enemy, and that there is no River betwixt them, the General gives Orders to intrench his Army; and the greateſt part of the Troops muſt not go to Reſt, each Regiment placing a ſmall Guard at the Head of their Camp, Commanded by a Subaltern Officer, which is call'd the *Quarter-Guard*; and the Camp-Mareſchal that is upon Duty takes care to place the Main-Guard about a Mile beyond the Army towards the Enemy, chuſing for that purpoſe a Place from whence they may diſcourſe all round about them, and there the Guards muſt ſtay until 'tis Day; but when the Night approaches, they muſt draw near the Army, putting themſelves at the Head of the Foot. The Colonel that is upon the Guard orders another Guard to be more advanc'd than where he is, of about 20 Horſe, Commanded by a Quarter-Maſter; this Guard muſt be advanc'd a Muſket-ſhot from the Great or Main Guard, which conſiſts of Horſe, and is poſted a Mile and a half from the Camp towards the Enemy, on the Right and Left, by the Lieutenant, or Major-General of the Day, in a Place where they may ſee all about them. Beſides this Guard there muſt be made a Detachment of about 50 Horſe, Commanded by a Captain, to march all about, eſpecially upon the Ways that come to the Camp, that the Army may not be ſurpriz'd.

That which they call Piquet, or Piquet-Guard, is a certain number of Horſe and Foot, which are to keep themſelves in a Readineſs, in Caſe of an Alarm, the Horſe keep their Horſes ſaddled, and are booted all the time, in order to mount in a Minute. The Foot draw up at the Head of the Battalion, at the beating of the Tattou, but return to their Tents, where they hold themſelves in a Readineſs to march upon any ſudden Alarm. This forms a good Body, able to make a Reſiſtance, till the Army can be in a Readineſs.

The Army very frequently leaving, eſpecially, the heavy Artillery behind, when they ſet upon a March, uſually ſend a Detachment from the Camp to ſecure its coming up; they march in the Front and Rear of the Artillery, and muſt be ſure to leave nothing behind. If a Gun or Waggon break down, the Captain is oblig'd to leave part of his Guard to aſſiſt the Gunner and Montroſſers in getting it up again.

When the Artillery is brought up, the Quarter-Maſter General appoints a Place in the Rear of both Lines of the Army for incamping it; and this they call the *Artillery-Park*. It's drawn up in Lines; the Guns are in one Line, the Ammunition Waggons make two or three Lines, forty Paces behind the Guns, and thirty diſtant from each other. The Pontons and Tumbrils make the laſt Line, and all is ſurrounded with a Rope, which properly forms the Park. The Gunners and Montroſſers incamp on the Flanks, and the Conductors, Bombardiers, Ponton-Men and Artificers in the Rear. The *Corps de Garde* of the Artillery Guard is in the Front, and their Centries are round the Park. This is a forty eight Hour's Guard.

It is not found, that the *Romans* (who were the great Maſters in Military Acts and Diſcipline) ever us'd a Line about, or Intrenc'd their Camps, until ſuch time that they had vanquiſh'd *Pyrrhus*, King of *Epyrus*, lying always before in open Fields; but finding that Prince's Army Intrench'd, they lik'd it ſo well, that afterwards they did not allow themſelves to Encamp in Fields, altho' but for a Night, but in Camps Intrench'd; and it is almoſt incredible to read, in what little time they Intrench'd their Camp, and how laborious the Form of it was. So Excellent was their Military Diſcipline, their Soldiers being accuſtom'd to it by conſtant Practice, whence they ſoon found the great Advantages that attended it, together with the many Dangers, and Inconveniencies that before accompany'd the Neglect thereof; ſuch Entrenchments kept them ſafe, and freed them from Dangers to which their Army was always expos'd by Quartering in the open Fields and Villages, where, if the Enemy was awake, he would ſure every Night endanger the carrying or beating up ſome Quarter of it, whilſt on the other hand, being lodg'd in a Body, and within an Intrench'd Line, they were exempt from thoſe Inconveniencies; and to Aſſault an Army ſo Intrench'd, was held ſo daring and dangerous an Attempt, that we read of few that undertook it, and fewer that were ſucceſsful in it. And it is certain, that the *Romans* (as we find by reading their Hiſtories) ow'd as much of their Conqueſts to their Incamping well, as to their other excellent Military Diſcipline and Valour; and it would be almoſt endleſs to enumerate what Kingdoms and Provinces they kept in Obedience by their ſtanding Camps, having firſt weary'd out their Enemy by ſuch ſafe and beneficial Delays, and then on ſome great Advantages they would give them Battle, and ſo Defeat them.

The ordinary Dimenſions of an Intrench'd Camp: 8 Foot are for the Breadth of the Ditch round the Camp, the Depth 5 Foot, the exterior Height of the Earth thrown up 5 Foot, and the interior 6 Foot; altho' if need be, the Line may be rais'd higher, and thicker, and the Ditch deeper and broader. On this Line are to be made ſome ſorts of Works, as Redoubts, Baſtions, Tenails, *&c.* which are to flank and defend the Line, and are to be about the Diſtance of 720 Foot the one from the other, which is the Point-blank that a Musket doth Execution. The raiſing the Line and Works upon it, are to be diſtributed equally amongſt the Regiments of Foot that are not on the Guard, every Regiment taking, according to its number of Men, his equal Proportion, and every Diviſion of the Regiment relieving the other by Turns, until the Work is finiſh'd. Every 100 Soldiers are to have a Commiſſion'd Officer, a Serjeant and a Corporal to ſupervise them, that they loſe no time. If there be any Mooriſh Grounds, they may be ſet with Turn-pikes and Paliſadoes, which may be taken up when the Army decamps.

The manner of Incamping of Horſe and Foot is thus: For a Battalion conſiſting of 12 Companies, and 50 Men in each Company, there is to be allow'd 100 Paces. For a Squadron conſiſting of 3 Troops, and 50 Men in each Troop, 50 Paces.

From the Head of the firſt Line to the Head of the ſecond (if there be more than one Line) there is commonly allow'd 300 Paces, whereof 120 are for Incamping the firſt Line; ſo that there remains 180 Paces for the Diſtance between the laſt Tents of the firſt Line, and the Head of the ſecond, the 100 Paces being allow'd for the ſecond Line to draw up in; and there muſt be as much allow'd for the Front of the firſt Line to the ſaid purpoſe. It muſt be endeavour'd, as much as may be, that the ſecond Line be equal to the firſt, keeping the ſame Diſtance upon the Right and Left. All the Troops, and Companies of Horſe and Foot, conſiſting but of 50 Men apiece, are to be Incamp'd in one Row of Tents and Huts; but when the Troops and Companies conſiſt of more Men, there muſt be two or three. The Horſe are to be Incamp'd on the two Wings, and the Foot in the

Center. The General's Regiment is to have the Right, and the Colonel's Company the Right of the Regiment.

The particular Dimenſions of the Ground allotted to the Adjutant, or Quarter-Maſter, for the Encamping a Battalion conſiſting of 12 Companies, and each Company being Encamp'd in one File, is commonly 100 Paces, allowing 3 Foot for a Pace, which he is thus to divide.

The Streets are each to be of 6 Paces, which is in all 72 Paces; the breadth of each Tent 2 Paces, and ⅓ of a Pace, or 7 Foot; the Depth is according to the number of the Tents, and 4 or 5 Men to a Hutt, each Tent taking 2 Paces, the diſtance betwixt each, being uſually 2 ½ Foot: The diſtance of the Subalterns from the Soldiers, is 5 Foot: The great Street between the Captains and Subalterns, is ſometimes 15 Paces, and ſometimes 20. Behind the Captain's Hutt is their Equipage, and at a convenient Diſtance the Sutlers Encamp'd: The Pikes, Colours, and Muskets, muſt be plac'd at the Head of every Company; the Hutts of the Foot always to be open to the Streets, and thoſe of the Cavalry towards the Horſes Heads: And it is always to be obſerv'd, that every Evening after the Tattou is beaten, the Word is to be given; after which, none is to paſs along the Line that hath not the *Word*.

To conclude; The Quartering the Army at all times, (eſpecially when the Enemy is very near) ought to be in ſuch manner, as that the Soldiers may be ſooneſt in Battalia to receive them; that is, that ſuch Forces as compoſe the Wings and Body, may have only to go out of their Hutts and Tents, to be in the Figure you deſign to fight in; elſe in caſe of an Alarm, the Dangers will be many and great.

If an Army continues any time in a Camp, the Horſe will want Forage; ſo a Forage-Guard is appointed by the General, which is a Detatchment ſent out to ſecure the Foragers, and are poſted at all the Places, where either the Enemy's Parties may come to diſturb them, or they may be ſpread too near the Enemy, and be Taken. This is likewiſe call'd the Covering Party, and Marches directly the Night before the Foraging, that they may be Poſted in the Morning before the Foragers come. They conſiſt both of Horſe and Foot, and muſt ſtay at their Poſts till the Foragers be all come off the Ground.

Of Giving of Battle.

AS there is no Act of *War* ſo Great in itſelf, or in the Conſequences thereof, as Fighting, or giving Battle, the Advantages being eminent to the General that wins it, and the Prejudices many and conſiderable to him that loſeth it; ſo nothing ought to be more exactly Weigh'd, and judiciouſly Conſider'd, and hardly any thing more eſſentially to be Study'd by a General, than perfectly to know and lay hold on all the Advantages in the Day of Battle, and to know all the Diſadvantages to avoid them.

The Ranging an Army in Battle to the beſt Advantage, is a great Step to the winning the Victory; which depends not only on the Wiſdom and Skill of the General, the Nature of the Ground, and the Quality of his own Forces, but alſo on thoſe of his Enemy's, and on the Diſpoſition of him that Commands them. And although no certain or ſtanding Rule can be given, to anſwer all theſe Varieties, yet ſome poſitive Maxims may be ſet down, which if punctually obſerv'd, may beneficially anſwer all Occaſions that may fall out; for, we find, that even the Greateſt Captains of ancient Times (whoſe Military Knowledge and Practice the Moderns Extol and Value) have not ever obſerv'd one and the ſame Form of giving Battle, but vary'd as occaſion offer'd.

Cæſar, at that Memorable Battle fought on the *Pharſalian* Plains againſt *Pompey*, did quite alter the manner of the *Roman* Embattelling; for having found that *Pompey* exceedingly out-number'd him in Horſe, he cover'd one of his Flanks with a little River, and drew all his Cavalry to the other Flanks; among the Squadrons whereof, he plac'd Bodies of the beſt Infantry, and there he began to Battle; whereby, having all his Horſe on one Wing, and theſe accompany'd with ſelect Legionary Foot, he ſoon routed the half of *Pompey*'s Horſe that oppos'd all his; and then falling into the Flanks and Rear of his Enemy, won the Victory.

The Maxims are as followeth.

Firſt. To be firſt drawn up on the Ground the Army is deſign'd to Fight on, which is always attended with ſeveral conſiderable Advantages, as the Honour gain'd by being earlieſt on the Spot, which animates the Soldiers, and often daunts the Enemy, having thereby the Opportunity of poſſeſſing all the Advantages of the Ground, which are to be ſo exactly conſider'd, and the Field you fight in view'd ſo well, that when the Army is drawn up, the Order of it may not afterwards be alter'd, or the Ground chang'd; for all ſuch Mutations in the Face of an Enemy, are very Dangerous, giving them the greater Confidence, and the Army the leſs Courage, as being an Evidence to both of a great Failure in Conduct. Likewiſe, being firſt drawn up in the Field, the Army is in a Poſture to fall on, and rake the Enemy with their Cannon, whilſt they are drawing up, which Advantage, when it may be taken, is of great Uſe.

Secondly. That a General is never to omit in the drawing up of his Army, to diſpoſe of his Squadrons and Battalions, as that every one of them may come to fight again and again, if need require, before they are totally Routed.

It is alſo obſervable, That in a Battle, whoever keeps in Reſerve a Body of Men, that are not led to fight until all the Enemy's Squadrons have fought, rarely fails to get the Victory; and thoſe that have the laſt Reſerves, are very likely at laſt to be Victorious.

The *Romans* conſtantly fought their Infantry in their Lines, or Orders of Battle, the one behind the other; if the *Hoſtatii* were worſted, they fell between the Intervals of the *Principi*, and there Rallied again, whilſt the *Principi* advanc'd; and if both the *Hoſtatii* and *Principi* were Routed, they fell in between the Intervals of the *Triarii*, and if thoſe could not ſuſtain the Shock, the Day was loſt.

Thirdly. To have Expert, Valiant, and Vigilant Commanders, to be at the Head of the five groſs Bodies, of which an Army is uſually compos'd in the day of Battle; *viz.* the three *Tertias* of the

Infantry (which, as they March, are call'd the *Van*, the *Body*, and the *Rear*) and the two *Wings* of the Cavalry, and this in the ſecond Line as well as the firſt (the Diſtance between them being 300 Paces) ſince it is eaſier to Attack well, while all is in Order, than to recover a Diſorder, when once happen'd. With theſe Officers, 'tis of great Importance to have an able General of the Artillery, and that he have ſufficient Officers under him. That the Carriages, Ammunition, *&c.* be in good Order, and the Cannon early and well planted, as that the Shot may rake thwart the Squadrons and Battalions of the Enemy, which will not only do great Execution, but alſo diſorder the Bodies of the Enemy's Infantry and Cavalry.

Fourthly. Always place the beſt of the Soldiery in the Wings of the Army, and begin the Battle on that ſide of the Army which is Strongeſt, and the Enemy the Weakeſt.

This has been a very ancient Method, and ſeldom has been omitted, but to the loſs of thoſe that are guilty of ſuch Omiſſions; and the Reaſon is clear, becauſe the Troops on the Wings are not wedg'd in, as the Troops in the main Battle are, but are at liberty to make all the Advantages that by Accident, or the ill Conduct of the Enemy may be offer'd: And it cannot rationally be expected to fall upon the Enemy's Flanks and Rear, but by attacking them on the Wings, which muſt be done as expeditiouſly as poſſible, (without diſordering the Troops) while the reſt of the Army move as ſlowly as they can; and if the firſt Attack be ſucceſsful, then there is opportunity to fall into the Flank and part of the Rear of the Enemy, while the reſidue of the whole Army is marching to Attack them in the Front, which muſt be quicker in Motion, when they ſee the advanced Wing ſucceſsful. None are to ſpeak but the Commander in Chief, or the Major by his Order. In advancing againſt the Enemy in Battle, out of their Musket-Shot, the Captains and other Officers at the Head of the Battalions are all to march in a Line, with their Pikes in their Hands, two good Paces before the Soldiers, and are often to look behind them, leſt they ſhould inſenſibly get too much before the Body, and the Soldiers, by following too faſt, fall into Diſorder, at which time the Ranks are to be two great Paces diſtant, and the Files cloſ'd in ſuch a manner, that every Soldier may March at his Eaſe, and ſo Charge and Fire without preſſing one upon another, which ordinarily cauſeth breach of Silence in the Battalion.

When the Army comes within Shot of the Enemy, and the Musketiers march ready with their Pans guarded, inſtead of the Ranks being cloſed forward to the Sword's Point (which is uſual) there is the diſtance of one Pace to be allow'd between the Ranks, and then the whole Line of Captains and other Officers, are to retire each of them into the Intervals of his Files next after his Poſt, yet ſo as they may look to the Right and Left of the Battalions.

As ſoon as the Battalions come to 30 Paces diſtant from the Enemy, the Musketiers are to Fire, the manner of which Firing being order'd them before.

The Officers Commanding the Rear, are to obſerve that the Battalions keep Marching, to cauſe the Soldiers to cloſe forward eaſily, and without Noiſe and Confuſion; that the Pikes march even with the Musketiers; for if the Pikes be even on the Right and Left, the Battalion can't be diſorder'd by its March.

The Grenadiers (if any) are to be drawn up on the Right of the Battalions, and to augment them without intermixing with them, they being a ſeparate number of Men that are always to be ready for whatſoever ſhall be Commanded them.

The Commanders of the Battalions may be on Horſeback at the Head of them, by reaſon they are to be ſtirring to all Parts, to ſee that the Diſtances be obſerv'd; and above all, that none ſpeak except himſelf, or the Major by his Order, altho' he is to alight when the Musketiers make ready, and is to march with his Pike charged againſt the Enemy.

Fifthly. The laſt Maxim is, to prohibit and forbid under ſevere Penalties, the abſolute Chaſe, or Pillage, until the Enemy is totally Routed on all Sides; and then have thoſe Troops only to Purſue that are expreſly appointed for it, always having Squadrons to march after the Purſuers, as near, and in as good Order as if they were going to the Charge, that if the Purſu'd ſhould Rally and Face about, thoſe Troops and Squadrons may be ready to fall on, and break them a ſecond time. This is of ſuch Importance, that a great many Victories ſeemingly won, have in an Inſtant been loſt for want of due Care in theſe two Particulars, and therefore ought never to be omitted; for there is nothing that more Encourages flying Enemies to Rally and Fight again, than the ſeeming diſorderly Purſuit of them.

And if *Hannibal* the *Carthaginian* General, who was ſo excellent a Captain to win Victories, had but made this uſe of them during the ſecond *Punick* War againſt the *Romans*, having defeated them in four Great Battles at ſeveral Places, and ſo routed their Army, that it had been eaſie for him to have taken *Rome*, had he not (after being ſixteen Years in *Italy*) been forc'd to fly into *Africa*, overcome by *Scipio*, and been oblig'd to beg Peace of him.

The uſual, and I may ſay, inſeparable Concomitants of War, being Sickneſs, Wounds, and the like Miſeries, there is nothing in the World more neceſſary for an Army, whether Beſieging a Town, Encamping, or Fighting in the Field, than an *Hoſpital*, which ought to be provided with Phyſicians, Surgeons, Overſeers, and the like; as alſo all ſorts of Medicines, Drugs, and whatſoever elſe may be wanted, in great Quantities; as alſo Beds, Sheets, Coverlets, Shirts, and ſpare Linnen for Bandages. The Director of an Hoſpital ought to be a very Careful Juſt Man, and to ſee that the Men want nothing; for there are often very great Abuſes committed in theſe Places, becauſe they have every thing at Command, as the Wine, Brandy, Syrups, Bread, Butter, *&c.* which are often miſemploy'd. The Hoſpital ought to be furniſh'd with the beſt Phyſicians and Surgeons, that the Life of a Man, which has been expos'd for the Service of his Prince or Country, may not be loſt by an evil Operation of a bad Chirurgeon, when it may be preſerv'd by being well Dreſt. The Hoſpital is generally ſetled in ſome Town near the Army, where the Sick and Wounded may be conveniently carry'd to it; only a part of it ſtays with the Army, moves with it, and is call'd the Flying Hoſpital.

Of General Officers in an Army.

AN Officer in General, is a Perſon having a Command in the Army: Thoſe having Commiſſions from the Queen or General, are call'd Commiſſion'd Officers; which comprehends all from the General to an Enſign: Such as have no Commiſſions, but only Warrants from their Colonels, are call'd Warrant Officers; as Quarter-maſters of Horſe and Surgeons: Thoſe that have neither Commiſſions nor Warrants, are call'd Staff-Officers, as Serjeants, Corporals, Landpeſades, *&c.* An Officer ought to be endow'd with many good Qualifications; as Preſence of Mind, Judgment, to execute what he is Commanded to the beſt Advantage; Conception, to apprehend eaſily what he is to do; Complexion, to enable him to endure the Fatigues of War; Integrity, that whatſoever is entruſted to him, he may behave himſelf Honourably; Diligence, to execute every thing with Diſpatch; Secrecy in all Affairs of Conſequence, with which he is Entruſted; Conduct, to gain the Eſteem of his Superiors; no Preſumption or Obſtinacy, as being the Stumbling-block of ſuch as have too much Spirit.

General Officers are thoſe that Command a Body of Troops of ſeveral Regiments: The Captain-General, or General of an Army, is he who Commands in Chief, and is much the ſame in an Army as the Soul is in the Body: For, as all the Actions of the Body proceed from the Motions of the Soul; ſo great numbers of Regiments ought to do nothing but by Order of the General, who ought to be a Man of Courage and Conduct; to have great Experience; to be of good Quality and Liberal: His Valour makes him a Terror to his Enemies; and upon his Conduct depends the Safety of the Army; and therefore 'tis the greater Qualification of the Hero; ſeeing Bravery without Conduct hath often brought things to Extremity.

Now, a General's Conduct appears in eſtabliſhing his Magazines in convenient Places; in examining the Country; that he do not Engage the Troops too ſoon, without knowing which way to bring them off, and to ſubſiſt them, and in knowing to take the moſt Advantageous Poſts; either to Fight or ſhun a Battle at his Pleaſure. His Experience makes his Army have freſh Confidence in him, that they reckon themſelves ſure of Victory before they Engage. His Quality begets a greater Reſpect, and augments his Authority. His Liberality begets him Intelligence of the Enemy, their Strength, Deſigns, without which, he is in the Dark, and cannot tell how to take his Meaſures; wherefore he ought to give Encouragement to his Spies, and to have ſuch as he knows are more enclin'd to him than to the Enemy.

A General ought likewiſe to be naturally enclin'd to great Enterprizes, to be a Lover of Glory, and to have an Averſion to Flattery; to ſtrive to make himſelf Belov'd by every Body; by treating his Officers with Civility; hearing their Reaſons; praiſing and rewarding good Actions, and puniſhing Crimes: However, he ought, upon occaſion, to be Rigorous and Severe, in ſeeing his Orders punctually obſerv'd; otherwiſe Military Diſcipline would be loſt.

The Function of a General is to regulate the March of the Army, and their Encampment; to viſit the Poſts; to Command Parties for Intelligence; to give out the Orders, and the *Word* every Night, to the Lieutenant and Major-Generals: He chuſes the moſt advantagious Ground in the Day of Battle; makes the Diſpoſition of his Army; Poſts his Artillery; ſends off the Baggage to a Place of Security, and ſends his Orders by his *Aid de Camp*, where there is occaſion. At a Siege, he cauſes the Place to be Inveſted, Views, and Obſerves it; orders the marking the Lines of Circumvallation, Contravallation, and forming the Attacks: He often viſits the Works, and makes Detachments to ſecure his Convoys. The Charge of a General is of great Extent, and requires a particular Care; becauſe in him the Sovereign repoſes all the Care of the Army; of which, the Duke of *Marlborough* is Captain-General. A Mareſchal of *France* in the Field, is the ſame as Captain-General; and if there are two, or more of them in the Army, the Eldeſt Commands. Velt-Marſhal in *Germany*, *Brandenburg*, *Holland*, &c. is the ſame alſo with Captain-General.

Next under the Captain-General, or General of an Army, are the Generals of Horſe, and Generals of Foot; Commands that ought to be in the Hands of Perſons of ſingular Merit, who by their Birth, or good Qualifications, have render'd themſelves worthy of ſuch an Employ: They have an abſolute Command over all the Horſe and Foot in an Army, above the Lieutenant-Generals. *Richard*, Earl *Rivers*, is, at preſent, General of Her Majeſty's Horſe, and *Charles Churchil* Eſq; of the Infantry.

Before we come to treat of the Poſt of Lieutenant-General, we are to take notice of another Great Officer in *England*, that bears the Title of General; and that is *of the Artillery*, or *Maſter-General of the Ordnance*; which is one of the greateſt Employs in the Kingdom, being a Charge of great Truſt: It's generally beſtow'd on a Peer of the Realm; the Mareſchal Duke of *Schomburg*, and after him, *Henry*, Earl of *Romney*, had it in the late Reign, and now 'tis enjoy'd by his Grace the Duke of *Marlborough*. His Buſineſs is to manage all the Ordnance in the Kingdom, and he ought to know and conſider whatever may be uſeful and ſerviceable in the Artillery, and to diſtribute the Vacancies to ſuch as are Qualify'd for them. He has for his Aſſiſtance in that Employment, a Lieutenant-General, who Commands in the Abſence of the General; a Surveyor-General, Treaſurer, Clerk, Store-keeper, and Clerk of Deliveries; who are all call'd the principal Officers of the Ordnance.

There is likewiſe an Officer in the Artillery call'd Commiſſary of the Stores, who has the Charge of all of them, for which he is accountable to the Office: And another they call Commiſſary of Horſe, who is appointed to have the Inſpection of the Artillery Horſes, to ſee them Muſter'd, and to ſend ſuch Orders as he receives from the Commanding Officer of the Artillery, by ſome of the Conductors of Horſes, of which he has a certain Number for his Aſſiſtance; and whoſe Buſineſs it is to receive or deliver out Stores to the Army, to attend at the Magazines by Turns, when in Garriſon, and to look after the Ammunition Waggons in the Field: They bring their Account every Night to the Commiſſary, and are immediately under his Command. I ſhould have mention'd before another Officer of great Truſt in the Field, and that is the Comptroller of the Artillery, who is to inſpect the Muſters, makes the Pay-Liſts, takes Accounts and remaining Stores, and is accountable to the Office of Ordnance.

A Lieutenant General of the Army is a Charge of great Conſequence, requires Perſons of Courage and Conduct, and whoſe Ability and Fidelity has appear'd on ſeveral Occaſions. They ought not only to underſtand their own, but alſo the Buſineſs of a General, becauſe they are often entruſted with the Command of a Flying Camp, and ſometimes with a Part of the Army; the Number of Lieutenant-Generals is not limited; they are more or leſs, according as the Army is, great or ſmall; there is every Day a Lieutenant-General upon Command, who is call'd the Lieutenant-General of the Day: They Command the Wings of the Army in the Day of Battle, and at a Siege in the Trenches by Turns. They are to execute the General's Orders upon all Occaſions; ſome are appointed over the Cavalry, others for the Infantry, ſometimes on the Advanc'd Guard, others on the Rear Guard, and ſometimes they Command a Flying Army. They ought to be daily with the General to obey his Orders; they are each of them allow'd his Aid de Camp, and a Foot Guard mounted by a Subaltern, with a Serjeant and 30 Men.

Major-General is the next Poſt to that of a Lieutenant-General, and one of great Conſequence; and he who poſſeſſes it, ought to be Brave, Judicious, and a Man of Experience, in Marching and Incamping of Troops: When there are two Attacks on a Siege, he Commands that on the Left. His chief Buſineſs is to receive the Orders every Night from the General, or in his Abſence from the *Lieutenant-General of the Day*, which he is to diſtribute to the Brigade-Majors, with whom he is to regulate the Guards, Convoys, Parties and Detachments, and appoints the Place and Hour of their Rendezvouz. He is to know the Strength of each Brigade in general, and of each Regiment in particular, and to have a Liſt of all the Field Officers. Finally, He is in the Army the ſame as a Major of a Regiment in the Regiment, he is allow'd an Aid de Camp, and has a Serjeant and 15 Men for his Guard.

There is no Officer in the Army under a Major-General, that is allow'd an Aid de Camp, who is an Officer employ'd to carry Orders, and he but one only; wheras a Lieutenant-General has two, and the General as many as he pleaſes. It is a very Honourable Poſt for a Young Gentleman, who is oblig'd to a very conſtant Attendance, to be very well Mounted, and to be Diligent and Active.

The next General Officer to a Major-General is a Brigadier, who has the Command of a Brigade. Now an Army is divided into Brigades of Horſe, and Brigades of Foot; a Brigade of Horſe is a Body of 8 or 10 Squadrons; a Brigade of Foot conſiſts of 4, 5, or 6 Battalions. The Eldeſt Brigade has the Right of the firſt Line, and the ſecond the Right of the ſecond Line; the two next take the Left of the two Lines, and the Youngeſt in the Center. The Battalions which compoſe a Brigade obſerve the ſame Order.

The Eldeſt Colonel is generally the Perſon advanc'd to this Poſt of Brigadier; they roll in Duty amongſt themſelves, and he that is upon Duty is call'd *Brigadier of the Day*. He viſits all the Out-guards and Poſts of the Army, and at Night takes the Orders from the Major-General of the Day, and delivers them to the Majors of the Brigades, who muſt all attend at orderly Times: They march at the Head of their Brigades, and are allow'd a Serjeant and 10 Men of their own Brigade for their Guard.

The Office of Brigadier-General being too much for him to diſcharge exactly and conveniently himſelf, he appoints an Officer call'd Brigade-Major, to aſſiſt him in the Buſineſs of his Brigade, and acts in his Brigade the ſame as Major-General does in the Army: They chuſe the moſt Ingenious and Expert Perſons for this Poſt; they are to wait at orderly Times to receive the Word and the Orders which they carry firſt to their proper Brigadier, and afterwards deliver to the Adjutants of Regiments at the Head of the Brigade, where they regulate together the Guards, Parties, Detachments and Convoys, and appoint them the Hour and Place of Rendezvouz at the Head of the Brigade, where the Brigade-Major takes and marches them to the Place of General Rendezvouz. He ought to know the State and Condition of the Brigade, and to keep a Roll of the Colonels, Lieutenant-Colonels, Majors and Adjutants.

When a Detachment is to be made, the Major-General of the Day regulates with the Brigade-Majors how many Men and Officers each Brigade muſt furniſh; and they again with the Adjutants of the Regiments, how many each Battalion is to ſend, which the Adjutants divide amongſt the Companies. The Complement each Regiment is to furniſh, is taken by the Adjutant at the Head of each Regiment at the Hour appointed, and to deliver them to the Brigade-Major at the Head of the Brigade, who again delivers them to the Major-General of the Day, and he remits them to the Officer who is to Command the Detachment.

We come next to the Quarter-Maſter General, who is a conſiderable Officer in an Army, and ought to be a Judicious Man, and a Man of great Experience, and to underſtand Geography; and ſince 'tis his Function to mark the Marches, and Incampments of an Army, he ſhould know the Country perfectly well, all the Rivers, Plains, Marſhes, Woods, Mountains, Paſſages, Defiles, and even to the ſmalleſt Brook. The Evening before a March he receives the Orders and Rout from the General, and appoints a Place for the Quarter-Maſters of Foot and Horſe to meet him next Morning, with whom he marches to the next Camp; where being come, and having view'd the Ground, he marks out to the Quarter-Maſters the Ground allotted for each Regiment for their Camp. He chuſes the Head-Quarters, and appoints the Villages for the General Officers of the Army, where they ſhall Quarter: He appoints a proper Place for the Incampment of the Train of Artillery; he carries the Army a Foraging, and plants the Covering Party for their Security at all the Paſſes round them, and aſſiſts in diſtributing the Winter-Quarters to the Army.

This being the Office of Quarter-maſter General, and having mention'd juſt before, the Quarter-Maſters of Horſe and Foot; the firſt is a Warrant Officer, appointed by the Colonel; he is to take up the Ground for the Troops, and to Divide it, in allowing ſo much for each Tent; he receives the Orders; keeps a Liſt of the Troops; viſits the Stables, and takes care of the Arms: He marches in the Rear of the Troops, but in Camp his Tent is pitch'd in the Front: In Winter-Quarters he receives and diſtributes Forage to the Troops: Each Troop has a Quarter-Maſter.

As to a Quarter-Maſter of Foot, he is an Officer who takes care of Encamping the Regiment; for there is but one to a Regiment of Foot: His Buſineſs upon the March, is to attend the Quarter-Maſter General, to know where the Ground is for his Regiment, which he divides among the Companies.

Adjutant-General is a conſiderable Officer, whoſe Buſineſs it is to attend the General of the Field upon proper and neceſſary Occaſions, to receive his Orders; and then going to his Tent, the reſt of the Adjutants of the Army, whether Horſe or Foot, are duly to attend him there, to have 'em deliver'd them, to the end they may be communicated to the proper Perſons in each Regiment.

Another ſort of a General Officer is the Muſter-MaſterGeneral, but now uſually call'd Commiſſary of the Muſters; he is an Officer appointed to Muſter the Army as often as the General pleaſes, to know the Strength of each Regiment, and of each Company; to receive and inſpect the Muſter-Rolls, and to keep an exact State of the Strength of the Army.

Of Field-Officers.

Having done with General Officers and their Dependants, we come now to Field-Officers, and begin with a Colonel, who is a Commander in chief of a Regiment, whether Horſe, Foot, or Dragoons, and ought to be a Perſon of Authority; to aſſume an abſolute Command; to ſee that the Companies of his Regiment be full, and kept in good Order; that they be duly Exerciſed, and well Paid: He may lay any Officer in his Regiment under Arreſt, but muſt acquaint the General with it: A Colonel is not allow'd a Guard, but only a Centry from the Quarter-Guard. A *Maſter de Camp* in *France*, is he who Commands a Regiment of Horſe, being the ſame as a Colonel of Horſe: But *Maſter de Camp General* in *France*, is a Poſt different from this, being the ſecond Officer over all the Light-Horſe, and Commands in the Abſence of the Colonel-General.

The next Field-Officer is a *Lieutenant Colonel*, and the ſecond Officer in the Regiment, and ſhould be one who has Signaliz'd himſelf by ſome brave Action; a Man of great Experience, knowing how to Attack or Defend a Poſt, lead the Regiment to Battle, and how to make a good Retreat: He is to ſee the Regiment kept to their Exerciſe, and is to know the Qualifications of all the Officers of the Regiment: In the Colonel's Abſence he Commands the Regiment; his Poſt is on the Colonel's Left-hand, three Paces before the Captain's, where there is but one Battalion; but if the Regiment conſiſts of two, the Colonel Commands the firſt, and he the ſecond. Colonels and Lieutenant-Colonels are excus'd from Mounting the Guards, when the Regiment is in Garriſon.

A Major of a Regiment of Horſe or Foot is the next Officer to a Lieutenant-Colonel, and a Field Officer alſo: He is generally made ſo from Eldeſt Captain, and ought to be a very Careful and Vigilant Man: He is to take care that the Regiment be well Exercis'd, that they be drawn up in good Order at a Review, or upon the Parade, or any other Occaſion; to ſee it march in good Order, and to Rally it, in Caſe of its being Broke. He is the only Officer among the Foot that is allow'd to be on Horſe-back in time of Action, that he may be the readier to execute the Colonel's Orders, either in advancing or drawing off the Regiment.

A Major has an Aid-Major, or Adjutant, appointed for his Aſſiſtant, to eaſe him in his Duty: This Perſon receives the Orders every Night from the Brigade Major, which after he has carry'd to his Colonel, he delivers out to the Serjeants aſſembled in a Ring. If there be Detachments for Convoys, Guards, or Parties to be made, he gives the Number each Company muſt furniſh; he receives and diſtributes Ammunition to the Companies, keeps a Roll of the Officers to do them Juſtice in their Duty, and by the Major's Order regulates the Price of Bread, Beds, Meat, &c. to prevent the Mens being impos'd upon by the Sutlers: He muſt be Vigilant and Active. Each Regiment of Horſe has an Adjutant; and a Regiment of Foot has one for each Battalion.

Of Captains and Subalterns.

The next Officer in Degree to a Major, tho' no Field one, is a Captain, being a Perſon who in Field-Regiments, Commands either a Troop of Horſe, or Company of Foot: He ought to be very Careful and Diligent, to keep his Company full of Young Luſty Soldiers; to know their Names and Diſpoſitions, and what every Man is capable of; to viſit their Tents and Lodgings, to ſee what is Wanting; to Pay them well; to cauſe them to keep themſelves Clean and Neat in their Cloaths, Shoes, Stockings, &c. and to keep their Arms bright: He has power in his own Company, of making Serjeants, Corporals, and Lanſpeſades: He marches ſtill at the Head of his Company and Ranks, according to the Seniority of his Commiſſion. A Captain-Lieutenant is he that Commands the Colonel's Troop or Company.

As for thoſe Commiſſion-Officers in the Army, who come under the Denomination of *Subalterns*, they are Lieutenants, Sub-Lieutenants, Cornets and Enſigns. A Lieutenant of Horſe and Foot, is the Second Officer in the Troop or Company, and ought to be a very Intelligent Perſon, becauſe he Commands in the Abſence of the Captain, and therefore ought to be as well Qualify'd as he: When the Company is at Arms, he takes the Left of the Captain, but the Right if the Enſign be there: He marches the Company in the Abſence of the Captain; but when the Captain is preſent, his Poſt is in the Rear. When the Battalions march in Line of Battle, the Lieutenants take their Poſts at the Head of the Diviſions, according to their Seniority: He ought to inſpect the Serjeants and Corporals; to keep them to their Duty, and take care of every thing that is neceſſary to the Company; to ſee them Exerciſe; to cauſe them to keep their Arms clean and fit for Service; and to ſee that the Soldiers be provided with Powder and Ball.

A Sub-Lieutenant is an Officer in Regiments of Fuſiliers and Marines, where there are no Enſigns, having Commiſſion as Youngeſt Lieutenant, and paid only as Enſign, but takes place of all Enſigns, except the Guards.

A Cornet is the third Commiſſion Officer in a Troop of Horſe, or Dragoons: It's a very conſiderable Poſt: He Commands in the Lieutenant's Abſence. His principal Duty is to carry the Standard near the middle of the firſt Rank of the Squadron, and ſhould rather die than loſe it; for it is a great Diſhonour for a Squadron to loſe their Standard.

Enſign is an Officer of Foot that carries the Colours, being the loweſt Commiſſion'd Officer in a Company of Foot, ſubordinate to the Captain and Lieutenant. Is a very Honourable proper Poſt for Young Gentlemen. At his firſt coming into the Army he is to carry the Colours, both in an Aſſault, or day of Battle, and ſhould be no ways daunted with Danger; nor ſhould he quit his Colours but with his Life: He ſhould carry his Colours himſelf on his left Shoulder in entring into a Place; mounting the Guard; paſſing a Review, or going to Battle; but upon a March, may have them carry'd by a Soldier; tho' this is not practis'd in the *Engliſh* Army.

Having but juſt before mention'd *Standards* and *Colours*, which the Cornets of Horſe, and Enſigns of Foot carry; the firſt is a piece of Silk or Damask, about a Foot and half ſquare, on which is Embroider'd the Arms, Device, or Cypher of the Prince, or of the Colonel: It's fix'd on a Lance of about eight or nine Inches long, and carry'd in the Center of the firſt Rank, as aforeſaid; but in rainy or bad Weather, it has a Caſe of Leather over it to preſerve it: Whereas, the Colours are large Flags of Silk, fix'd on Half-pikes, carry'd by the Enſign; and when a Battalion is Encamp'd, they are ſtuck before the Front of the Battalion; but if the Battalion be in Gariſon, they are lodg'd with the Colonel, or Commanding Officer: They are never carry'd on Detachments, nor with the Battalion when it mounts the Trenches. Field Colours are ſmall Flags of about a Foot and half ſquare, which are carry'd along with the Quarter-Maſter General, for marking out the Ground for the Squadrons and Battalions.

Of Staff-Officers.

Having gone through with an Account of Commiſſion Officers, from the General to the Cornet and Enſign, the next and moſt inferior ſort of Officers of all in an Army, are thoſe call'd Staff-Officers, who have no Commiſſions, but are appointed by the Captain. The firſt of theſe is a Serjeant, whether of Foot or Dragoons, who carrys a Weapon call'd a Halbert; the Head of which ought to be a Foot, or fifteen Inches long; one End ought to be hollow to receive the Staff, but the other broad, Ribb'd in the Middle, Edg'd on both Sides, and drawing to a Point, like the Point of a two-edg'd Sword; on one ſide the Head is likewiſe fix'd a Piece in form of a Half-Moon, or Star, and on the other a broad Point four Inches long, a little crooked, which is very Commodious for drawing Facines, Gabions, or whatever Obſtacle elſe happens in the way: The Staff of the Halbert is about five Foot long, and an Inch and an half Diameter, made of Aſh, or other hard Wood. Halberts are very uſeful in determining the Ground betwixt the Ranks, for dreſſing the Ranks and Sides of a Battalion, and likewiſe in chaſtizing the Soldiers: The Serjeant carries it on the left Shoulder: His Perſon ought to be Vigilant and Active in his Buſineſs, and ſhould Read and Write, becauſe he is oblig'd to keep a Liſt of the Soldiers and their Lodgings, and to Viſit them often; they are in like manner to teach the Company the Exerciſe of their Arms, and how they are to keep their Ranks and Files: Their Poſt on a March, is on the Flanks, to cauſe the Company to march in good Order. A Serjeant of each Company is to be on the Parade at Night, to receive the Orders and the Word from the Adjutant, which he is to carry to his Captain and Subalterns: When the Adjutant comes, the Serjeants place themſelves in a Ring, which being according to the Precedency of their Companies, with their Hats on the Spears of their Halberts: And after he has given them the Orders, he whiſpers the Word to the firſt Serjeant, who gives it to the next, and ſo on, till it come to the Youngeſt, who gives it to the Adjutant; they acquaint the Officers that are to go next upon Duty; they viſit the Mens Arms, and diſtribute Ammunition to them.

A Corporal is an Inferior Officer, under the Serjeant in a Company of Foot: He is commonly an old Soldier; he receives the Word from the Rounds that paſs by the Grand Guard; he receives likewiſe the Word from ſuch as are ſtop'd by his Centries; and when the Guard is Reliev'd, he gives the Orders he had, to the Corporal that is to Mount, and ſhews him all the Poſts. He carries a Fuſee.

Next, and under the Corporal, is a ſort of inferior Officer call'd a Lanſpeſade, or Anſpeſade, who aſſiſts him in his Duty, and in his Abſence performs it: They are generally the moſt Vigilant and Brave of the Company; they have the ſame Pay only as a Foot Soldier; but a greater Allowance in *France*; they are excus'd from common Duty; they teach the New Soldiers their Exerciſe, and Poſt the Centries: Their Place on a March, is on the Right of the ſecond Rank.

Of Squadrons, Battalions, Troops, Companies, &c.

An Army conſiſting of ſeveral Bodies of Horſe and Foot, (otherwiſe known by the Names of Cavalry and Infantry) the ſmalleſt of Horſe and Dragoons, are call'd Troops, and conſiſt of about fifty or ſixty Men, ſometimes more, and ſometimes leſs; and a Regiment of Light-Horſe in *England*, conſiſts of ſix Troops, and ſometimes of Nine, (but of Dragoons uſually Eight in time of War.) A Squadron of Horſe, is uſually a Body compos'd of three Troops, making 150, and ſometimes 200 Men, when the Troops are larger than Fifty each, but never above that, becauſe a greater Number can never be advantagiouſly Poſted, nor have room to Act in narrow Grounds, as Woods, Marſhes, and Defiles. The Eldeſt Troop takes always the Right of the Squadron, the Second the Left, and the Youngeſt the Center: A Squadron is always drawn up Three deep, that is to ſay, in three Ranks, having the length of a Horſe, or rather more, between Rank and Rank. When the Army is Encamp'd, a Squadron of Horſe is allow'd thirty Paces for its Front, and thirty Paces Interval between one Squadron and another; and on a March, the Squadrons of the ſame Column, ought to keep a convenient Diſtance. As for the Foot, the ſmalleſt Regular Body, as I may ſay, is what they call a Company; that uſually conſiſts of fifty Centinels, three Serjeants, three Corporals, and two Drums, beſides the three Commiſſion Officers; but a Company of Guards is uſually about Eighty private Men. There have been frequent Diſputes among otherwiſe very Intelligent Perſons, about how many Companies of Foot make a Battalion; my Author, *Grillet* ſays, thirteen, of which one Company is always Grenadiers; and this Body of Foot is, or ought to be generally ſeven Hundred Men, not including Officers or Serjeants; ſo that thoſe Perſons reckon wrong, who alledge that every Regiment is a Battalion, ſeeing the

Number of Companies differ in them, tho' in *England* they are generally Thirteen, including always a Company of Grenadiers. But the firſt Regiment of *Engliſh* Guards has four Battalions; the Second, the Regiment of *Scotch* Guards, and the Royal *Scotch*, have each two Battalions. The Private Men are arm'd with Firelocks (Pikes being quite laid aſide) Swords and Bayonets. The Eldeſt Company takes the firſt Poſt next to the Grenadiers, who have always the Right of the Battalion, and the ſecond Company the Left; the Youngeſt has its Poſt always in the Center

Of the ſeveral Denominations of Private Soldiers.

The Soldiery, both Cavalry and Infantry, go under ſeveral Denominations, according to the different Arms they carry, or Duty they perform. A Musketier is a Foot-Soldier, arm'd with a Musket or Firelock, Sword, Bayonet, *&c.* But the Grand Musketiers in *France* are Troopers, who Fight ſometimes on Foot, and ſometimes on Horſeback, being uſually Gentlemen of good Families, are divided into two Troops, call'd the *Grey* and *Black Musketiers*, from the Colour of their Horſes.

Grenadiers are Foot-Soldiers, arm'd like the Musketiers, but have a Pouch to hold their Grenades; they are differently cloath'd from the reſt of the Battalion, and wear High Caps; each Regiment having a Company of them, which always takes the Right of the Battalion. In *Holland* each Company in a Regiment has five or ſix Grenadiers, which being drawn out together form a Company. The Grenadiers are generally the Talleſt and Briskeſt Fellows, and are always the firſt upon all Attacks; and when there is any Appearance of Action, each Grenadier carries three Hand-Grenades. The Horſe Grenadiers, which the *French* call *Grenadier Volant*, or Flying-Grenadiers, are ſuch as are mounted on Horſeback, but fight on Foot, and their Exerciſe is the ſame as the other Grenadiers.

Fuſiliers are Foot-Soldiers, arm'd with Fuſees, with Slings to ſling them; there are four Regiments in the *Britiſh* Army, which have always been call'd Fuſiliers, and go by the Name of the *Engliſh*, *Scotch*, *Iriſh* and *Welch* Fuſiliers; but now there are none but Fuſiliers abroad, ſince Pikes are quite laid aſide. The firſt Deſign of Fuſiliers was to guard the Artillery, for which end the Regiment of *Engliſh* Fuſiliers, now Commanded by the Lord *Tirawley*, were at firſt Rais'd to ſupply the want of Pikes. The Fuſiliers us'd to carry Turn-Pikes along with them, which in a Camp were plac'd along the Front of the Battalion, and on a March were carry'd by the Soldiers, each carrying one of the ſhort Pikes; and two by turns the Spar, thro' which they are thruſt, ſo that they were quickly put together.

As for a Dragoon, he is a kind of Amphibious Soldier, mounted on Horſe-back, but Fighting ſometimes on Foot, and ſometimes on Horſeback, as Occaſion requires. They are divided into Brigades, like the Cavalry, and are very uſeful on any Expedition that requires Diſpatch; for they can keep pace with the Cavalry, and do the Duty of Infantry. They generally incamp on the Wings of the Army, or at the Paſſes leading to the Camp; and ſometimes they are brought to cover the General's Quarters. They do Duty on the Generals of Horſe and Dragoons, and march in the Front and Rear of the Army.

We had none of thoſe ſort of Cavalry call'd Curiaſſiers, in the *Britiſh* Army, ſince the laſt Revolution; they are arm'd with Back, Breaſt and Head-piece, as moſt of the *Germans* are.

The Carbiniers are Regiments of Light-Horſe, carrying longer Carbines than the others, and are ſometimes us'd on Foot. There are none of them in the *Britiſh* Army, but the late Lieutenant-General *Windam*'s Regiment.

The Soldiery call'd *Guards*, are of two ſorts, Horſe and Foot; the firſt are Gentlemen, choſen for their Bravery and Fidelity to be entruſted with the Guard of the Queen's Perſon, and are divided into three Troops, each having a Colonel, two Lieutenant-Colonels, a Cornet-Guidon, four Exempts, Brigadiers and Sub-brigadiers, and 160 Private Men. But there is now a fourth Troop of Guards added, call'd the *Union-Troop*, with their Grenadiers, under the Command of the Duke of *Argyle*. The Foot-Guards are only the firſt and ſecond Regiment, appointed for the Guard of Her Majeſty and Her Palace.

Thus much for the Guards; we ſhall only add in this Place, that having very frequently found mention of the *Gens de Armes* of *France*, in the Courſe of the laſt War, and more eſpecially in this, we are to obſerve, that they are a Body of Horſe, divided into Independent Troops, ſo call'd, becauſe they formerly fought in Armour; they are part of the *French* King's Houſhold. Theſe Troops being Commanded by Captain-Lieutenants, the King and Princes of the Blood being their Captains. The King's Troop, beſides a Captain-Lieutenant, has two Sub-Lieutenants, three Enſigns and three Guidons. The other Troops, which are thoſe of the *Scotch Gendarms*, the Queen's, the *Dauphin*'s, the *Gendarm* of *Anjou*, *Burgundy*, the *Engliſh* and *Flemiſh* Guards, and thoſe of the Duke of *Orleans*, are call'd the ſmall *Gendarmery*, and have each a Captain-Lieutenant, Sub-Lieutenant, Enſign, Guidon and Quarter-Maſter: They carry a longer Standard than the Light-Horſe, divided into two Points a little rounded, generally adorn'd with ſome Device or Cypher in Embroidery, and a Fringe; each of theſe Troops has a Pair of Kettle Drums and two Trumpets. The *French* valu'd themſelves mightily upon the Goodneſs and Bravery of theſe Troops, beyond all others of their Enemies, which to their fatal Diſappointment they did not find to prove true in the Battle of *Blenheim* and *Ramellies*, where they were bore down by the ſuperior Valour and Weight of the Confederate Cavalry.

Of ſome other Particular Offices and Things belonging to an Army.

Tho' the Title of Waggon-Maſter General might ſeem to claim room among the General Officers, yet being of a much more inferior Dignity, we have rather choſen to bring him in here. This Perſon has the Ordering and Marching of the Baggage of the Army. On a Day of Marching he meets the Baggage at the Place appointed in the Orders, and Marſhals it according to the Rank of the Brigade or Regiment each Waggon belongs to, and marches it according to the Rout given him, which is ſometimes in one Column, ſometimes in two, ſometimes after the Artillery, and ſometimes the Baggage of each Column follow their reſpective Columns. Another Officer they have in an Army, call'd Captain of the Guides, whoſe Buſineſs it is to provide Guides for the Army, of which he ought to have always a ſufficient Number with him, that know the Country very well, to ſend out as Occaſion requires. Such as are to guide the Army on a March, for Convoys, Parties, Baggage, Artillery and Detachments; to provide which, he ought to have a Party of Horſe to go to the adjacent Villages, Caſtles or Forts to demand Boors, whom he brings to his Quarters, and keeps under his Guard, for fear they may make their Eſcape, till the Army come to another Gound, where he can be provided with others. He ought to underſtand ſeveral Languages, eſpecially that of the Country in which the Army is.

Provoſt-Marſhal is a neceſſary civil kind of an Officer in the Army, who is appointed to ſecure Deſerters, and all other Criminals; he is to go often abroad round the Army, to hinder the Soldiers from Pillaging: He regulates the Weights and Meaſures of the Army, and the Price of all ſorts of Proviſions. When the General calls a Court-Marſhal to try Offenders, which Court is compos'd of a Preſident, nam'd by the General, and of Twelve Members and a Judge-Advocate, who take an Oath to do Juſtice, according to their Knowledge, the Provoſt-Marſhal, after the Sentence is given and approv'd of by the General, is to put it in Execution.

Muſick of War.

DRUM is a Martial Inſtrument us'd by the Foot and Dragoons in Form of a Cylinder, hollow within, and cover'd at the two Ends with Vellum, which is ſtraightned or ſlackned at pleaſure, by the means of ſmall Cords and ſliding Knots. Some are made of Braſs; but they are commonly made of Wood. The Drum-ſticks are made of hard firm Wood, about 15 or 18 Inches long, tapering towards the Point, where there is a ſmall Knot, which, by beating againſt the Drum-head, makes the Sound, which varies as the ſeveral Occaſions require. As 1. To *beat the General*, is the Signal for the Army to make ready to March. 2. The *Aſſembly*, being an Order for the Soldiers to repair to their Colours. 3. The *March*, to Command them to move. 4. *To beat the Retreat*, is for the Army to keep to their Tents, and not to Fire till next Morning, for fear of alarming the Camp. This is done about Sun-ſet, at the firing of a Gun, call'd the Warning-Piece, after which the Centinels challenge, and the Piquet-Guard is reliev'd. 5. *The Reveille*, beat at Break of Day, to warn the Soldiers to Riſe, and the Centries to forbear Challenging. 6. *The Alarm*, to call the Soldiers to Arms, or notice of ſome ſudden Danger. 7. *To beat a Parley or Chamade*, to deſire a Conference with the Enemy. 8. *To beat a Call*, to advertiſe the Soldiers to ſtand to their Arms, when a General Officer is paſſing by.——Each Company of Foot has two Drummers, and a Battalion a Drum-Major, Commanding over the other Drums; their Cloaths are different from the Soldiers, being uſually lac'd with a Worſted Livery-Lace; their Poſt is on the Flanks, when a Battalion is drawn up; but on a March, betwixt the Diviſions.

A Trumpet is an Inſtrument of Wind Muſick, us'd more particularly in War; each Troop of Horſe has two Trumpets: It's made of Metal, moſt commonly of Braſs, but ſometimes of Silver. The Mouth of the Trumpet is always of Braſs, and is to be taken out and put in at pleaſure. He that blows the Trumpet is call'd the Trumpeter, who ought to be Vigilant, and a Man fit for Fatigue. The firſt Sound of a Trumpet before a March, is to *Boot and Saddle*, at which the Troopers get themſelves ready to Mount. This is ſounded when the Drums beat the *General*. When the *Aſſembly* is beat, then the Trumpet ſounds *to Horſe*, and they all Mount. The third is *to March*. The Trumpets alſo ſound a *Charge* in Day of Battle, and the *Retreat* at Night.

We come in the next place to the *Kettle-Drums*, which are two ſorts of large Baſins of Copper or Braſs, rounded in the Bottom, and cover'd over with Vellum or Goat's-Skin, which is kept faſt by a Circle of Iron, and ſeveral Holes faſtned to the Body of the Drum, and a like Number of Screws to ſcrew up and down, with a Key for the Purpoſe. The two Drums are kept faſt together by two Strops of Leather that go thro' two Rings, which are faſtned, the one before, the other behind the Pomel of the Kettle-Drummer's Saddle. They have each a Banner of Silk or Damask richly Embroider'd with the Sovereign's Arms, or thoſe of the Colonel, and are fring'd with Silver or Gold; and to preſerve 'em in bad Weather, they have each a Cover of Leather. The Drum-ſticks are made of Crab-tree, or other hard Wood, of 8 or 9 Inches long, with two Knobs at the Ends, which beat the Drum-head, and cauſe the Sound. The Kettle-Drum with Trumpets, is the moſt Martial Sound of any; each Regiment of Horſe has a Pair, and of late the Dragoons have likewiſe Kettle-Drums. The Train of Artillery have a very large Pair, drawn by two white Horſes.

The Kettle-Drummer takes his Name from the Inſtrument he beats: He ſhould be a Man of Courage, and of a good Mien, having a neat Motion with his Arms, and a good Ear; he marches always at the Head of the Squadron, and his Poſt is on the Right, when the Squadron is drawn up.

Hautboys are alſo Warlike Muſical Inſtruments, us'd among the Foot, and ſometimes by the Dragoons; but of theſe, and other yet leſs conſiderable Inſtruments, we ſhall ſay no more.

Utenſils of War.

Utenſils of War are all ſorts of Hand-Tools us'd in an Army, or at a Siege, of which we ſhall briefly give their Names and Uſes. And firſt a *Spade*, an Inſtrument for digging up the Ground, the Handle, or Shaft of which, is about 3 Foot long; the Head is all of Iron, the upper Part being flat for the Pioneer to ſet his Foot on to force it into the Ground; the Length of the Head is a Foot, or 15 Inches, and the Breadth 6, or 8.

A *Shovel* they carry along with the Artillery, to be deliver'd out to the Pioneers, who are to mend the Ways, or to work in the Approaches at a Siege. It ſerves to gather and throw up the Earth, which the Pickax and Mattock raiſe. It's made of a Shaft of about three Foot and an half long; and the Head of it, which is thin, and ſhod with Iron, is about 15 Inches deep, and 8 broad.

A *Pickax* is a Tool of no leſs Uſe, the ſame being carry'd by the Pioneers to dig up the Ground that is too hard for the Spade; They are of great uſe for mending the Ways, and in Fortification.

Axes are very uſeful in an Army for cutting Ways thro' Woods, for cutting Trees to make Bridges, for mending the Ways, and many other Uſes. Moſt of the Foreign Regiments of Foot, eſpecially the *Danes*, have ſix Carpenters with Felling-Axes, to march at the Head of each Battalion; and in the Artillery the Carpenters march with their Axes to mend any thing that may break down, and to help the Ways.

A *Small Ax* or *Hatchet* is alſo of uſe in an Army, with which the Pioneers go before to prepare the Ways, in cutting down Hedges, Buſhes, Stiles or Gates. The Grenadiers carry ſometimes each a

Hatchet

FORTIFI CATIO

To yͤ Rᵗ Honᵇˡᵉ George Legge, Baron of
Dartmouth, Maſter Generall of yͤ Ordnance,
Maſter of yͤ Horſe to his Maᵗʸ King Iames
yͤ Second, Leivtenant of Alceholt
and Wolmer Foreſt in Hantshire,
Admirall of his Maᵗʸˢ fleet of
ſhips, in y Mediterranian,
Captaine Generall of his Maᵗʸ
forces in Affrica, and

Fortification is the art of rendring a Place Defenceable
The neſseſsary Parts of a Fortification wᶜʰ are either
Within the Place, as the
Place of Armes, Comanders Quarters, Lodgeings for Souldiers { Horſ Foot Magazin, Ciſterns, or Wells.
Gates, ſally Ports, & the like.
Ramparts, or wall.
vpon which, are
Batteries, Parapet, Sometymes Cavalliers.
Vnder which, are
Counter-Mines.
Without the Place, as
The Ditch, Covert way, or Counter-Scarp, Eſplanade.
Bastion whoſe parts are
within
The Demi-Gorge, & a larg place of Earth, in which are made retrenchments in caſe of a breach.
Without
The Point, The Face, The Shoulder, The Flanke, & ſome tymes Caſmates.
Regular
When the Angles, and ſides are equall.
Irregular
when yͤ Angles, or ſides are Vnequall.
Places Fortified, are
Cittyes, Cittadells, Paſſes in { Mountains Marſhes Bridges, Mouths of Havens, & yͤ like.
Joyned to yͤ Place, as
Double Baſtion, Flatt Baſtion, halfe Baſtion, Towers -- { Round Square Nooks, or Redens.
Flanques, are
not Joyned, as
Ravelins, Halfe Moons, Seperate Baſtions, Horn works, Crowns, Horns Crown'd, & yͤ like.
When the walls are ſtrong and high enough to reſiſt yͤ Violence, and Engines of an Enemy. And when every Part of the Fortification is ſeen by ſome other Part that is Flanqued.

To the Right Noble George Fitz Roy, Duke and Earl
of Northumberland, Viscount Falmouth, Baron
of Pontefract, and Knight of the most
noble order of the Garter &c.a
This Plate is humbly dedicated by Richard Blome

Hatchet by his Side; and the *French* Dragoons, who have but one Piſtol, have each a Hatchet hanging at his Saddle-Bow, on the Right-ſide.

There are alſo *Bills*, being a ſort of Hand-Tools carry'd along with the Artillery for the uſe of the Army, for cutting Ways thro' Hedges, Woods, *&c.* and are much the ſame with our Hedge-Bills in *England.*

There being no Army can be ſaid to be Compleat, and well Appointed without Artillery, we ſhall add a few Inſtruments that are us'd about a Gun, and begin with what they call the *Ladle*, which is an Inſtrument wherewith the Powder is is put into the Piece. It's made of a Plate of Copper, bor'd in the Form of a half Cylinder, rounded at one End, the other being fix'd upon a long Staff. This, fill'd with Powder, the Gunner carries with his Left-hand under the End of it, to keep the Powder from falling out, till he enters it in the Muzzle of the Piece; when he has carry'd his Powder home to the charg'd Cylinder, he turns the Ladle that the Powder may fall out, and withdraws it. Ladles are fitted to the Bore of each Gun, and hold Powder ſufficient for the Charge.

Another Inſtrument appertaining to a Gun, they call a Rammer. It's a Piece of Wood fitted to the Diameter of the Bore, ſtuck upon a long Staff, and is us'd in ſetting home the Charge and the Wadding.

That which they call the *Sponge* of a Gun, is a long Staff put into a Rod of Wood, which is cover'd over with a Sheep-Skin, with the Wooll outwards, to ſponge and clean the Gun. As ſoon as the Gun has fir'd, a Montroſſer is ready with the Sponge, while another claps his Finger on the Vent to ſtop the Air, and ſtifle what Fire may remain in the Chamber; the Sponge, Rammer and Ladle, after the Gun is loaded, are laid under her between the Wheels.

The *Head-Hook*, or Work, is a ſmall Iron turn'd Serpent-wiſe like a Screw, and put upon the end of a long Staff, to draw out the Wad of a Gun, when ſhe is to be unloaded. The Wad is a Stopper of Hay or Straw forc'd into a Gun upon the Powder, to keep it cloſe in the Chamber; when it is home at the Powder, the Gunner gives it generally three Thumps with the Rammer.

That which is call'd the *Lynſtock*, is a ſhort Staff of Wood about three Foot, upon one End of which is a Piece of Iron, which divides in two, turning from one another, having each a Place to receive Match, and a Screw to keep it faſt; the other End is pointed, and ſhod with Iron to ſtick in the Ground. It's us'd by Gunners to fire the Guns; and failing of it, a Piece of cleft Stick to ſtick the Match, does the Buſineſs every jot as well.

Coins are Wedges of Wood us'd under the Breech of a Gun, by which a Gunner raiſes or falls the Muzzle of his Piece, till he point it exactly at the Object. Each Gun has three Coins belonging to her, and they are for the ſame uſe about a Mortar.

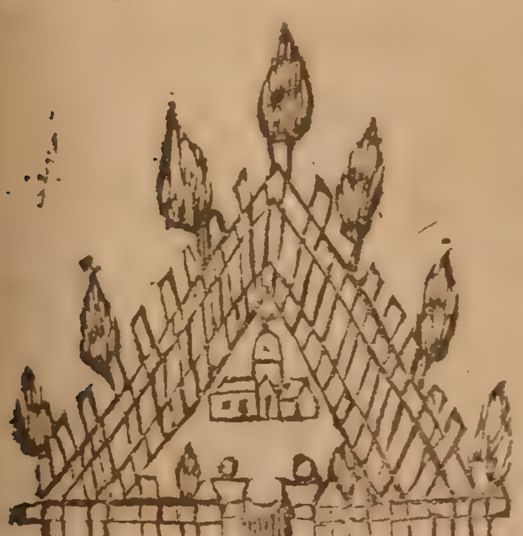
Another Utenſil is an *Hand-Spike*, being a Piece of Aſh, Elm, or other ſtrong Wood, 3, 5, or 6 Foot long, cut thin like an Edge at one End, that it may get the eaſier betwixt Things that are to be ſeparated, and under any thing that is to be rais'd. It's better than an Iron-Crow, becauſe its Length allows a better Poize.

FORTIFICATION:

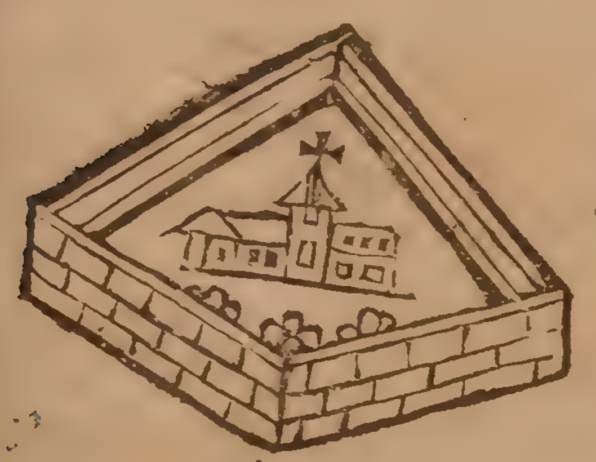
O R,

The Art of Rendring a Place Defenſible.

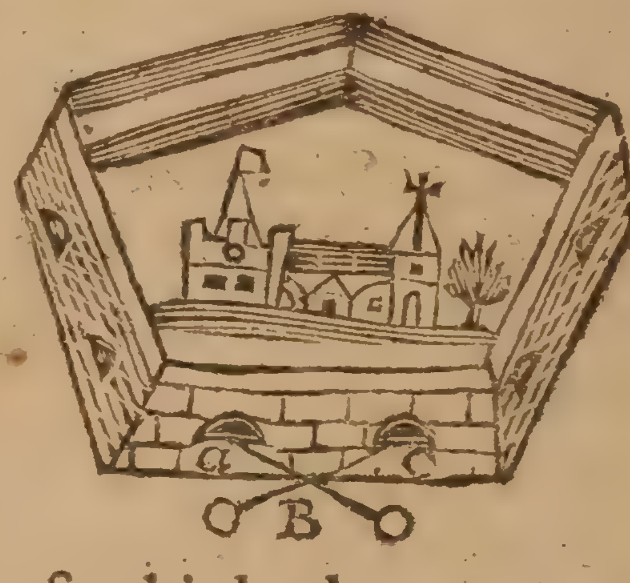
THAT as nothing is at once brought forth to Perfection in any *Art* or *Science*; ſo in this of *Fortification*. At the firſt beginning the People (as *Cæſar* in his *Commentaries* on the Wars with the *Gauls*, tells us; and as it is amongſt the *Indians* at preſent) were wont to ſurround their *Towns* with *Piles* driven into the Ground in manner of an *Impalement*, as by this *Figure* appears.



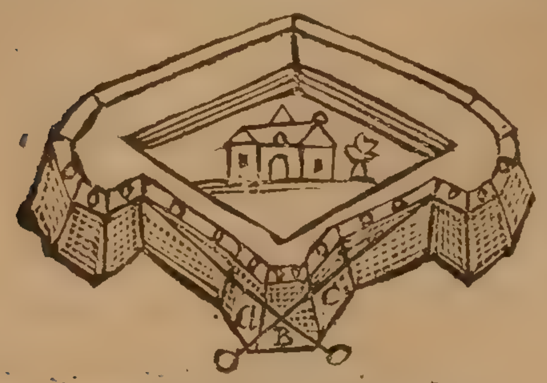
But when they found that the Fury of an attemping *Enemy* (as well as *Fire*) would ſoon deſtroy theſe *Wooden Retreats*, they began to build high and thick *Walls*, defending the ſame from the Top, by throwing down *Darts*, *Arrows* and *Stones* to annoy the *Enemy*, according to this *Figure*, as *Cartins* obſerves of the *Babylonian Walls*, which were 150 Foot high, and 32 Foot thick.



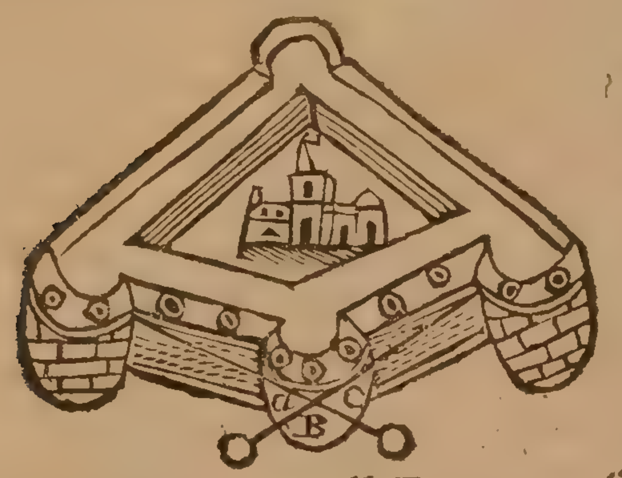
Experience, the trueſt Cenſurer in this Matter, finding the Imperfection and Diſadvantage of this ſort of Structure, that the *Defenders* ſtanding on the Top of the *Walls*, were no more ſafe from being expos'd to Danger, than the *Enemy* without; and that they could never hit or annoy them any more, when they were come near to the Foot of the *Wall*, unleſs they ſtood on the very Edge of it, where bowing themſelves to diſcover the *Enemy* at the Bottom, muſt be expos'd to the danger of Tumbling down; and therefore the *Beſiegers* being hidden, it was no hard matter for them to place there *Battering Rams*, and other *Engines* (then in uſe) to force down the *Walls*, and ſo get into the *Town*. For the remedying this, they were forc'd to make *Loop-holes*, or *Windows* below in the *Walls*, according to this *Figure*, out of which they annoy'd the *Enemy*.



But it was found, that at the *Enemy*'s approaching the *Wall*, they were ſecure betwixt theſe two *Loop-holes*, or *Windows*, within the *Triangle a, b, c,* according to this *Figure*; therefore they invented Square-flank'd *Towers*, parallel to the *Wall*.



The *Beſieg'd* finding the Fore-part of the *Tower* to be out of ſight, and the *Angles* eaſie to be Batter'd by their *Rams*; and there yet remaining a *Triangle a, b, c,* in which the *Enemy* was hid, they chang'd them to Round ones; by which means a Remedy was found againſt the moſt preſſing Force, threatned either by the *Rams*, or other Ancient *Engines*, which by their *Battering*, inſtead of looſing the *Stones*, forc'd them towards the *Center*, and made them ſtick cloſer together; and altho' there was a little *Triangle a, b, c,* according to this *Figure*, yet they could not unfaſten the *Stones* without great difficulty, and by adding a few *Windows*, all Danger (if any remain'd) was taken away.



Thus the ancient manner of *Fortifying* at laſt was in this Structure of round *Towers*, and ſo continu'd until about the Year of our Lord 1359, one BARTHOLDVS SCHAVART, a *German* Monk at *Cologne*, invented that admirable Compoſition of *Gunpowder*, which was ſoon after follow'd with that of the *Musket* and *Cannon*; ſo that by this means the manner of Waring was chang'd from the *Battering Rams*, to the *Thundring* of *Guns*; and the *Round Towers* (which were not altogether flank'd by the *Beſiegers Fire*) were turn'd into *Bulwarks* and *Baſtions*, with ſharp Points towards the *Campaign*, defending and flanking one another without the leaſt hidden Place to the *Enemy* to lodge themſelves in, having thick and ſolid *Ramparts* of *Earth* behind their *Walls*, to reſiſt the Violence of the *Enemy's Batteries*; the which are in uſe to this Day.

CHAP. I.

Of the Terms *and* Angles *relating to* Fortification, *Illuſtrated by the Letters of the Alphabet, as well on the* Ichnography, *or* Ground-Plot, *as on the* Orthography, *or* Profile; Scenography, *or* Perſpective.

Of Ichnography, *or* Ground-Plot Lines. Plate I. Fig. 2.

A, Is the *Polygone*, or a Figure made of ſeveral *Sides* and *Angles*.

B, D, is the *Radius*, or Diſtance from the *Center* of the *Polygone*, and repreſents the *Wall* that ſurrounds a Place.

A, a, is the Exterior Circumference, or *Polygone*, that paſſes by the Points of the *Angles* of the *Baſtions*.

V, X, F, G, H, is the *Plane* of a *Baſtion*, on which there is to be rais'd a thick and ſolid Maſs of *Earth*, ſometimes lin'd with *Stone*, or *Brick*: Their Uſe is to contain under Covert a ſufficient number of *Muſketiers*, and to plant the *Artillery* thereon to ſcour the *Campaign* and *Ditch* round; a Place to flank and defend the Body thereof, and by their Solidity the better to reſiſt the Force of *Mines*, and make *Retrenchments* behind *Breaches*, if need require; and they are to be large, that *Granadoes* do not much Execution on them.

Royal Baſtions are ſuch as are not able to reſiſt the Force of an *Army Royal*, being ſo call'd when there is a *Train* of *Artillery* brought into the Field to *Attack* the Place. *H, V,* is the *Gorge* of the *Baſtion*, or the Diſtance between the two *Flanks* of the *Baſtion*, and is the Ground where ordinarily the Beſieg'd make their laſt *Retrenchments*.

C, V, is the *Demi-Gorge* of the *Baſtion*, or the Diſtance from the *Angle* of the *Polygone* to the *Angle* of the *Curtain* and *Flank*.

C, F, is the *Capitol* of the *Baſtion*, or the Extenſion of the *Radius* betwixt the *Angle* of the Interior or Exterior *Polygone*.

F, G, is the Face of a *Baſtion*, or the Part the *Baſtion* that extends itſelf from the Point of the *Baſtion* to the *Flank*, and is the weakeſt Part in all the *Fortification*, becauſe of its being more expos'd to the *Beſiegers Batteries*; and being only defended by the oppoſite *Flank*, is the Place where the *Enemy* ordinarily make their *Breaches*, to which they paſs their *Galleries*, and where they generally make their *Mines*.

H, G, is the *Flank*, or the Line rais'd from the Extremity of the *Demi-Gorge* to the Face. This is the *Poſt* from which the *Beſieg'd* defend the *Curtain*, and the oppoſite *Flank* and *Face* of the *Baſtion*, ſcouring the *Ditch*, *Counterſcarp* and *Glacis*, and other Out-works, which is the reaſon why the *Beſiegers* endeavour by their *Batteries* and *Artillery* to ruin the *Flanks* at the beginning of a *Siege*.

H, is a *Cazemat*, and *Orillon*, which covers the *Cannon* in the *Flank* from being diſmounted at any Diſtance, and to this end obliges the *Enemy* to raiſe their *Batteries* almoſt under the *Beſieged's* Fire.

H, I, is the *Curtain*, or the part of the Side of the *Polygone* that is between the two *Demi-Gorges* of the two oppoſite *Baſtions*. This is the Part beſt defended in all the *Fortification*, being thus ſecur'd by the two oppoſite *Flanks*; and for this Reaſon the *Ports* and *Gates* of a *Town* are ordinarily made in the midſt thereof.

P, O, is the Plain of the *Rampart*, or the *Terraſe* of the *Town*.

P, Z, is the *Parapet* or *Breaſt-work*, that covers the *Musketiers* that are on the *Rampart*.

H, I, is the ſecond *Flank*, or that Part of the *Baſtion* which defends the Face of the oppoſite *Baſtion*.

H, E, is the *Line* of *Defence*, which extends itſelf from the *Angle* of the *Flank* and *Curtain*, to the Point of the oppoſite *Baſtion*, and is not to exceed the *Point-Blank* diſtance of a *Musket*'s Execution.

I, E, is the *Stringent Line* of Defence, which determines on the *Curtain* the Length of the ſecond *Flank*, the *Flanks* and the *Faces* of the *Baſtions*.

F, E, N, is the *Ditch* that goes round a Place, out of which the *Earth* is taken that makes the *Ramparts*.

R, T, M, S, is the *Counterſcarp*, or the Edge of the *Ditch*, that is towards the *Campaign*.

1, 2, 3, is the *Cover'd-Way*, or *Corridor*.

4, 5, 6, is the *Baſe*, or Largeneſs of the *Eſplanade*, or *Glacis*, or the *Parapet* of the *Cover'd-Way*.

Of the Angles. Plate 1. Fig. 1.

It is to be obſerv'd, that an *Angle* is mark'd by three *Letters*, and the middlemoſt always denotes the *Angle*.

C, B, D,

C, B, D, is the *Angle* of the *Center*, and is made by the meeting of two *Semi-diameters*, drawn from the *Angles* of the *Polygone* to its *Center*.

A, C, D, is the *Angle* of the *Polygone*, and is form'd by the meeting of two ſides of the *Polygone*.

X, F, G, is the *Angle* of the *Baſtion*, or *Flanked Angle*, and is made by the meeting of the two Faces of the *Baſtion*.

F, G, h, is the *Angle* of the *Shoulder*, made by the meeting of the *Face* and *Flank*.

C,H,I, is the *Angle* form'd of the *Flank* and *Curtain*.

Of the Orthography, *or* Profile, *with the* Scenography *and* Perſpective *of a* Fort. Plate 1. Fig. 2.

Engeniers uſe to repreſent the different Heights and Thickneſs of the Earth of a *Fort* by a Section, through the middle of the *Curtain*, which they call *Profile*.

B, B, is the *Horizontal Line*, on which the *Fort* is to be rais'd.

B, C, E, D, is the *Rampart*, or the *Solid Earth* round a Place.

B, C, is the *Baſe*, or *Foot* of the *Rampart*, the Diſtance between the *Ditch* and the *Town*.

D, E, the *Tarraplane*, or the upper Largeneſs of the *Rampart*.

F, D, is the *Interior Slope* of the *Rampart*.

E, C, is the *Exterior Slope*, or *Talum*, which ofttimes is lin'd with *Brick* or *Stone*.

N, O, E, is the *Parapet*, or *Solid Earth*, that is raiſed upon the *Rampart*, to cover the Soldiers from being expos'd to the Beſiegers Fire.

K, N, is the *Interior Height* of the *Parapet*, which is always the height of a Tall Man.

N, O, is the *Superior Slope*, or *Glacis* of the *Parpet*, on which the Beſieg'd lay their Muskets when they Fire towards the *Campaign*.

4, are the *Embraſures*, or *Cannon Ports*.

L, O, is the *Exterior Slope* of the *Parapet*.

P, H, I, is the *Banquet*, or *Foot-Bank*, at the foot of the *Parapet* towards the Town, on which the Muſketiers ſtand when they Fire.

C, R, is the *Plane* of the *Fauſſe-bray*.

R, S, T, is the *Parapet* of the *Fauſſe-bray*.

T, V, is the *Barm*, or little *Plane*, to hinder the *Parapet* of the *Fauſſe-bray*, which is always to be of *Earth* lin'd with *Turf*, from tumbling into the *Ditch*.

V, Y, X, Z, is the *Ditch*, or *Moat* that is round the *Fort*.

V, Y, is the *Scarp*, or *Slope* of the *Wall* next the *Ditch*.

2, is the *Cunet*, or little *Cannal*, in the midſt of the *Ditch*.

Z, X, is the *Counterſcarp*, or outward *Slope* of the *Ditch*.

Z 4, is the *Cover'd-Way*, and is that which Soldiers ordinarily call the *Counterſcarp*.

6, 7, 8, is the *Glacis*, or *Eſplanade*, or the *Parapet* of the *Cover'd-Way*, which ſlopes until it loſeth itſelf into the *Campaign*: On the Top of this *Parapet* there are *Paliſodoes* uſually Planted.

C H A P. II.

General Maxims to be obſerv'd in Fortification.

1. THat there be no Place or Work that is not *Flanked*, and Defended by another. This is evident from what has been ſaid already, and the common Practice of an *Enemy teaches*. For the *Beſiegers* ruining by their *Batteries* the *Parapets* and *Flanks*, as Diſmounting the *Beſieged's Cannon*, they have no other Deſign, than to make their *Miners* paſs the *Ditch*, where if they find any Place out of ſight of the *Beſieged's Fire*, 'tis eaſie for them in a little time, to make their *Mines*; and ſo by this means, betwixt a *Town Beſieg'd* and *Taken*, there is oft times no more than the difference of eight, or ten Days; for which Reaſon, the Emperor *Charles* the Fifth, improv'd the round *Bulwarks* of his Conqueſts into ſharp-pointed *Baſtions*.

2. That the great *Line* of Defence, or that which is near equal to it, *viz.* The Interior *Polygone*, exceed not 120 *Fathoms*, or 720 *Feet*, which is the *Point-blank* of a Muſket's Execution: For 'tis to be obſerv'd, that the Defence is to be taken from the *Muſket*, and not from the *Cannon*, ſeeing the *Cannon* require too many Men to manage them, conſumes a great deal of *Ammunition*, are eaſily Diſmounted, and with great difficulty Planted again, neither can they maintain a continual *Fire*. And it has oft times been obſerv'd, that *Engeniers*, to make the fewer *Baſtions*, and conſequently to ſpare a little *Mony*, have commited this intollerable Fault.

3. The greater and more ſpacious the *Gorges* and *Flanks* are (provided the reſt of the Works be not prejudic'd thereby) the better is the *Fortification*.

The *Gorges* ought to be ſo Large, that on both ſides of the *Flanks Cannon* may be Planted, that the Soldiers may go up and down to the *Baſtion*, in a good *Front*, without giving any Inconveniencies to thoſe that are at the *Flanks*: Likewiſe, there muſt be place to make *Retrenchments*, if neceſſity require.

The *Flanks* are the moſt conſiderable Parts of *Fortification*, and from which depends the Defence of the other Parts, as the *Curtain*, *Flanks*, and *Faces* of the oppoſite *Baſtions*, the *Ditch*, and *Counterſcarp*, &c. They are to be made ſo great as the juſt proportion of the *Baſtion* will admit of; for in making them too great, the *Capitols* will become too long, and by conſequence, the *Line* of Defence will exceed the *Port* of a Muſket, (which is againſt the ſecond *Maxim*); or in making them too little, the *Baſtions* will become obtuſe, and will entirely cut off the ſecond *Flank*, while we ought to have Conſideration for it.

4. That the *Angle* of the *Baſtion* be not much leſs than 60 *Degrees*, or much more than 90, for being leſs than 60, it is ſo ſlender, as eaſily to be batter'd down; and being greater than 90, it will be more large than is neceſſary, and ſhorten the ſecond *Flank*; and beſides it ſhall contain leſs Ground than the *Baſtion* of an *Angle* of leſs *Degrees*, built on the ſame *Gorges* and *Flanks*.

5. The greater the *Angle* is that is made of the outward *Polygone* and the *Face*, the greater is the Defence of the *Face*; for then the *Stringent Line* of Defence comes not ſo much upon the *Curtain*, and conſequently leaves the greater ſecond *Flank*.

6. All the *Works* ought to be *Cannon Proof*.

C H A P. III.

Of Regular Fortification.

IN the Conſtruction of *Regular Figures*, and how to Fortify them according to the moſt Modern ways uſed by the *Italians*, *French* and *Dutch*; with the Methods of ſome Modern *Authors*.

Equi-

Regular Fortification is that which is made upon *Equiangular* and *Equilateral Figures* deſcrib'd in a *Circle*; ſuch as a *Triangle*, *Quadrangle*, or Four-ſquare *Pentagone*, or Five-ſided *Figure* to a *Dodecagone*, or Twelve-ſided *Figure*; the *Baſtions* being ſo plac'd, that the Points of them are alike diſtant from the *Center*; the *Curtains* on one Length, and all the other *Lines* and *Angles* of one Form and Greatneſs.

Regular Figures are made by Calculating the *Angle* at the *Center*; which is by dividing 360, the number of *Degrees* a *Circle* is always divided into, and in which the *Regular Figure* deſcribed by the number of the Sides of any *Polygone*, or *Regular Figure* the *Fort* is to conſiſt of. The *Quotient* ſhews the *Angle* of the *Center*; as in this Example of a *Pentagone*, or Five-ſided Figure. By the Operation, the *Angle* of the *Center* is found to be 72 *Degrees*, and ſo of any other *Figure*. Then if with a *Protracter*, or a *Line* of *Chords*, you draw a *Circle*, and ſet off the *Angle* at the *Center*, as in the *Example* 72 *Degrees*, it will divide the *Circle* exactly into 5 equal Parts, on which ſtrait *Lines* drawn from one Point to another, gives the Sides of a *Pentagone*.

The *Protracter* is deſcrib'd in the Treatiſe of *Geometry*, viz. *Surveying*, and is nothing elſe but a *Semicirle* made on *Braſs*, or *Horn*, divided into 180 *Degrees*.

The *Line* of *Chords* is the fourth part of a *Circle*, or 90 *Degrees*, projected on a *ſtrait Line*, ſuch as are always upon any plain *Scale*.

The *Radius*, or *Semi-diameter* of a *Circle*, for which this *Line* ſhews the *Degrees*, is always repreſented by the Brazen Point at 60 *Degrees*, on the ſame *Line*, and if your *Compaſſes* you take from the *Line* of *Chords* 60 *Degrees*, and draw a *Circle* 72 *Degrees*, taken from off the ſame *Line*, will go 5 times exactly round the Circle; and ſo of any other *Figure*.

Of the Italian Method, according to P. Sardi.

This Author being Learned, and much Experienced in the Wars in his Time, has wrote much, and to good purpoſe; ſo that I chuſe him as the moſt approved of the *Italian* Authors. He makes the *Interior Polygone* 800 *Venetian* or *Geometrical Feet*, (which makes 921 of the *Engliſh*) the *Demi-Gorges* 150, and the *Flanks* alſo 150; ſo that the *Gorges* and *Flanks* are equal, and in *Engliſh Feet*, make 172 $\frac{1}{2}$ for each, which is betwixt a $\frac{1}{5}$ and $\frac{1}{6}$ part of the *Interior Polygone*: He raiſes the *Flanks Perpendicular* to the *Curtain*; and to ſet off the *Faces* and *Angles* of the *Baſtions* in a Square and *Pentagone*; he makes the *Line* of Defence fall on a $\frac{1}{10}$ of the *Curtain* in the *Hezagone* or $\frac{1}{4}$ Part; in a 7, 8, and 9 ſided *Figure*, on a $\frac{1}{3}$; and in all above on the Half. In this Example of a *Hexagone*, divide the *Curtain* into 4 equal Parts from *N*, which is $\frac{1}{4}$ of it; draw a *Line* by the Top of the *Flank*, until it cut the *Radius* prolong'd in the Point *a*, ſo you have the *Stringent Line* of Defence, the *Face* of the *Baſtion*, and the *Angle* requir'd, and ſo a *Polygone*.

To reduce this Conſtruction to the ſecond *Maxim*, you are to find the particular Meaſures by the Rule of *Proportion*, thus.

If 800 *Venetian Feet* give 150 for the *Gorge*, How much will 921 *Engliſh Feet* give? Anſwer, 172. Then again, If 921 *Engliſh Feet* give 172 for the *Gorge*, How much will 720 give? Anſwer, 134.

After this manner all the reſt of the Parts are found out.

Now to the Conſtruction. Plate 1. Fig. 3.

In the *Hexagone*, drawn as before taught, on the Side mark'd *P. Sardi* divides the ſide *P,P*, into 720 Parts, at 134, or *c, c*, make a Mark for the *Demi-Gorges*, ſet up *Perpendicular* to the *Curtain*; the ſame Meaſure for the *Flanks c, f*, and draw the *Faces* as before. Theſe Parts may be taken off from any *Sector*, or *Joynt Ruler*, or from any *Diagonal Scale* of an *Inch*. or $\frac{1}{2}$ an *Inch* divided into 100 Parts.

In a Book of *Military Architecture*, Entituled *Corona Imperialis*, written by this Author, he ſets *Cazemats* and *Orillons* on the *Flanks*: Of which in their Place.

Of the French Method, as it is by Maneſſon Mallet, *Author of the* Travaux de Mars. Plate 1. Fig. 3.

This Author obſerves the ſame Rules for the Conſtruction of all *Regular Figures*, as are here given in the *Example* of a *Hexagone*.

Having drawn the *Polygone P, P*, extend the *Semi-diameters* by the Extremities of the ſide of the *Polygone* mark'd *M. Mallet*; divide the Side *P,P*, into 3 equal Parts; ſet one of theſe Parts on the extended *Semi-diameter* or *Radius*, from *P*, to *A*, for the *Capitols*; take a fifth part of the *Polygone* for the *Demi-Gorges*, ſet it from *P*, to *C*, to make the *Faces* and *Flanks* draw the *Stringent Line* of Defence, from the *Capitol* to the Extremity of the *Gorge*, and raiſe the *Flanks* at an *Angle* of 98, or 100 *Degrees*, with the *Curtain*; where they cut the *Line* of Defence, determines the length of the *Flanks* and *Faces*, as *c, f*, and *f, A*; with the length of this *Face* you may compleat a *Polygone* all round, by Transferring it to other *Lines* of Defence.

This Author hath no ſecond *Flank*; he makes the *Stringent Line* of Defence, 120 *Toiſes*, or *Fathoms* (allowing 6 Feet to a *Fathom*) which is 720 *Feet*,

See Travaux de Mars *by this Author of* de Ville, *and* Furnier's *Method*. Plate 1. Fig 3.

They Divide the *Interior Polygone* into 6 equal Parts, and take one of them for the *Demi-Gorge* and *Flanks P, c, c, f*, both being equal, and at right *Angles* to the *Curtain*, for drawing the *Faces* of the Square, and *Pentagone*, lay a *Ruler* from the extremity of the *Gorge C*, by the Top of the *Flank f*, until it cut the *Capitol* in *A*; Theſe have no *Flanks*.

For the *Hexagone*, and all *Figures* above it, joyn *f, f*, by a *Line*; the *Capitol* will divide it into two equal Parts at *e*, as a *Center* draw the *Circle f, A, f*, at the Diſtance *a, f*, where it cuts the *Capitol* at *A*, draw *a, f*, for the *Faces*.

Theſe Authors make their *Interior Polygone*, or *Line* of Defence, 150 *Toiſes*, or 960 *Engliſh Feet*.

This Method is to be reduc'd to the ſecond *Maxim* by the former *Rules*.

See *De Ville's Ingenieur Perfait*, and *Furier's Architecture Military*.

Of the Dutch Method, as it is Abridg'd by the Emperor Ferdinand *the Third*; *with an Account of the Conſtruction of Fortifications at the* Grave *in* Holland. Plate 1. Fig. 3.

The *Dutch* have been as Famous for their Experience in *Fortification*, as their *Country* at preſent is for their Fortify'd *Towns*; and by their *Engeniers*, as *Dogen*, *Marolois*, &c. have fill'd the World full of their *Books*, and ways of Fortifying; although they might have ſav'd themſelves the trouble and laborious Pains, in Calculating the *Triangles*, and other *Mathematical Learning*, more for Curioſity than Uſe in this Matter. For which Reaſon, the Emperor

Ferdinand the Third, found out Rules approv'd of, by turning their *Fortifications* out of the way of Calculating *Angles* into *Lines*. He ſets down this univerſal way of drawing the *Lines* of any *Fort*.

'Tis to be taken as a *Rule*, That if the *Interior Polygone* be 66 of any Meaſure, the *Gorge* muſt be 15, the *Flank* 12, and the *Capitol* 24.

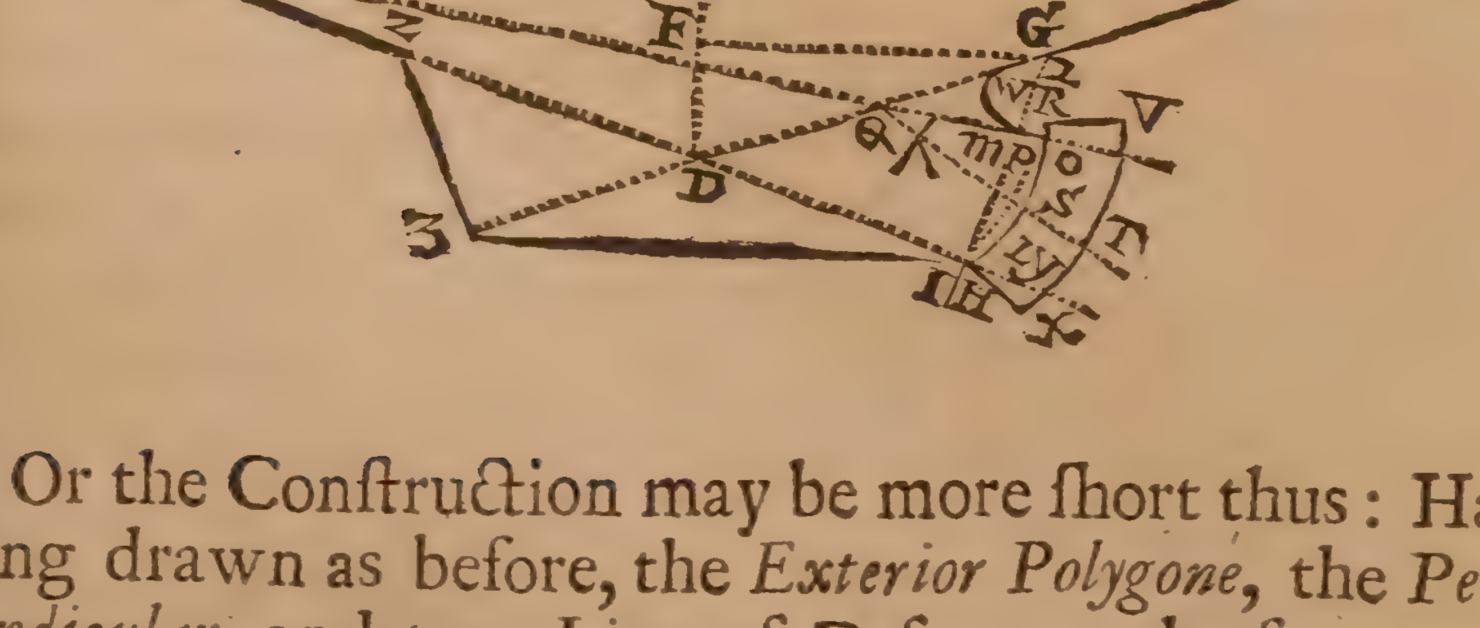
Now, in proportion according to the ſecond *Maxim*, if the *Polygone* be 720 Feet, the *Capitol* will be 261 Feet 9 Inches, the *Gorge* 163 Feet 7 Inches, the *Flank* 130 Feet 10 Inches, which is to be ſet at right *Angles* with the *Curtain*: Thus, by taking of theſe Proportions from the *Sector*, you may Fortify any Figure according to this Method.

This is an Abridgment or Epitomy of all the *Dutch Fortifications*, except the Square, which hath no ſecond *Flank*.

See *Schottus's Edition* of *Amuſſis Ferdinandea.*

The Conſtruction of the Fortification of the Grave, *according to Monſieur* Storf.

Having drawn the *Exterior Polygone A, B*, of 94 Rods, and divided it into two equal Parts in *C*, let fall the *Perpendicular C, D*, of 15 $\frac{2}{7}$ Rods, which is $\frac{1}{6}$ of the Exterior *Polygone*; then from the Points *A, B*, draw the *Lines* of Defence *a, e*, and *B, Y*, thro' *D*, infinitely; divide the *Perpendicular C, D*, into two equal Parts at *F*, by which draw *F, G*, *Parallel* to *A, B*, cutting the *Line* of Defence in the Point *G*, which determins the *Face A, G*. Then for the Point *F*, at the Interval *F, G*, deſcribe the *Arch I, H*, and from the Point *G*, at the diſtance of 15 Rods deſcribe *I L*, cutting the other in the Point *I*, which ſhall be the Extremity of the *Curtain*, and of the *Line* of Defence *B, I*: To trace the Circular *Flanks* and *Orillons*, divide the *Flank G, I*, into 3 equal Parts, one of which is for the *Orillon*, and the other two the length of the lower *Flank*. Let alſo *B, N*, be $\frac{2}{7}$ of the *Face B, Z*, and draw *N, O*, infinitely, by the Points *N*, and *M*, on which take *M, P*, of 2 Rods; then draw *I, P*, with the diſtance *I, P*; From the Points *P* and *I*, deſcribe 2 *Arches* cutting one another in *Q*, which ſhall be the *Center* of the low and high Circular *Flanks*; let the *Interval* of them be a *Rod*; draw *R, V*, *Parallel* to *M, O*, and at the *Interval Q, P*, or *Q, I*, draw the *Arch R, S, I*; and having taken *S, T*, of 5 Rods, draw the *Arch V X*, make *X, Y*, 2 Rods; ſo you have trac'd the two Circular *Flanks*. For the *Orillon* find the *Center W*, which is the half of *G, M*, and deſcribing the *Arch* of a *Circle*, at the diſtance of *W, M*, it comes to touch the *Face* prolong'd in the Point 2.



Or the Conſtruction may be more ſhort thus: Having drawn as before, the *Exterior Polygone*, the *Perpendicular*, and two *Lines* of Defence, take for every one of 69 Rods 3 Feet; take for the *Face* 25 Rods, and having drawn the *Flanks* at the Extremity of the *Lines* of Defence to the Extremity of the *Face*, the reſt you will find as before, or inſenſibly near.

The Method according to Count Pagen. Plate 1. Fig. 3.

This Author in his Retirement, after having been unfortunately ſhot in the Eye at the Siege of *Arras*, wrote a great many good Things on this Subject.

He takes a Method quite contrary to any that wrote before him; he works by the outward, or *Exterior Polygone*, and ſets his *Flanks Perpendicularly* to the *Lines* of Defence; he divides Forts into *Royal, Mean*, and *ſmall Royal*.

Royal, when the *Exterior Polygone* is 200 Fathoms, or 1200 Feet. *Mean*, when the *Exterior Polygone* is 180 Fathoms. And *ſmall Royal*, when the *Exterior Polygone* is 160 Fathoms.

The Example ſhall be for a great Royal. The Conſtruction is as followeth.

Divide the *Exterior Polygone A, A*, into two equal Parts at *M*, each being 600 Feet; on *M*, raiſe a *Perpendicular M, M*; take 180 Feet, or 30 Fathoms, and ſet it on the *Perpendicular* from *M*, to *T*; then draw *A, T, C*, for the *Lines* of Defence, from *A*, ſet at *A, F*, 60 Fathoms, or 360 Feet; from *f*, let fall a *Perpendicular* on the *Line* of Defence at *c*, or from *T*, ſet off 222 Feet, joyn *c, c*, for the *Curtain*; upon the Points *a, a*, ſet at the half of the *Angle* of the *Figure a, o, a*, as in the *Hexagone* 60 Degrees, that will determin the *Centero*; ſet off the *Gorge P, C*, and the *Capitol P, a*, which you may Meaſure on the ſame *Scale* with the reſt, and know the Length of them in Feet.

For the *Mean Royal*, work as before; Take 30 Fathoms, or 180 Feet for *M, F*, the Perpendicular, 55 Fathoms for the *Faces*, 32 Fathoms for *T, c*, or 192 Feet; the *Flanks* will be found to be 24 Fathoms.

For the *ſmall Royal*, take 30 Fathoms, or 180 Feet for the *Perpendicular M, T*, 50 Fathoms, or 300 Feet for the *Faces*, 27 Fathoms, or 162 Feet for *T, c*; the *Flanks* will be found to be 23 Fathoms, or 138 Feet, and are at right *Angles*, or 90 Degrees with the *Line* of Defence.

See Fortification de Pagen, *Printed at* Paris.

The Method of Monſieur * * * Plate 1. Fig. 3.

Having ſhew'd the ſeveral Ways and Rules for laying the fundamental *Ground-Lines*, according to the moſt conſiderable *Engeniers* of this laſt *Age*, I ſhall end this Chapter by giving an Account of the Method uſed by a famous *Engenier* Monſieur * * * in the building of ſeveral *Fortifications* beyond Seas, the which I ſuppoſe from the Advantages that attend it, it will commend itſelf.

You are to take the *Interior Polygone* of 720 Feet, or 60 Rods, (allowing 12 Feet to a Rod) according to the ſecond *Maxim* the Point *Blank* that a *Musket* doth Execution; a fifth Part of this you are to ſet off for the *Demi-Gorges*, which is 12 Rods, or 144 Feet; a ſixth Part to the *Flank, viz.* 10 Rods, or 12 Feet; theſe two together, *viz.* 22 Rods, or 264 Feet for the *Capitol*, there remains 36 Rods, or 432 Feet for the *Curtain*. See the Figure.

The Reaſon why I give a $\frac{1}{5}$ Part of the *Interior Polygone* to the *Demi-Gorge*, is; Firſt, That the *Line* of Defence may never exceed the Port of a Musket, which would happen, if I did but give a $\frac{1}{6}$ Part. Secondly, The *Gorge* being too ſhort, the Point of the *Baſtion* would become too ſharp, or the *Capitol* too ſhort; and by Conſequence the *Baſtion* too little; This Proportion is beſt for the *Pentagone, Hexagone*,

agone, and *Heptagone*, becauſe by theſe Figures we cannot have the *Flanks* greater, or the Defence better. But for the *Octogon*, 9, 10, 11, and 12 ſided Figures, the following Method is much better. There is given to the *Face* 29 Rods; to the *Flanks* 12, and to the *Curtain* 36. The Point of the *Baſtion* is 90 *Degrees*, then the other Parts, *viz.* the *Demi-Gorge*, the *Capitols*, the *Polygone*, *Interior* and *Exterior*, are found by calculating and forming *Triangles*.

This Method for theſe *Figures* is much the better, becauſe the *Flanks* become greater, and the *Angle* of the *Polygone* is greater, the *Gorges* become greater, the Interior *Polygone* longer; and conſequently a great deal of more Ground encloſed, than according to the firſt Method of Fortifying.

The *Flanks* ought to be Perpendicular to the *Curtain*, or very near it, to the end the Enemy may not make *Batteries* afar off, but be oblig'd to make them to ruin the *Flanks* juſt under the *Beſiegers* Fire, which will coſt them much Blood and Pain; and the Reaſon is evident: For in bringing them to fall Perpendicular to the Line of *Defence*, the *Flanks* are too much expos'd to the Enemy, and ſo diſcover'd to the *Campaign*, that the Enemy find all Advantages imaginable to raiſe many Batteries afar off, to batter and ruin the *Flanks* with their *Cannon*, which is an Enemy's chief Deſign in a Siege, that they may the eaſier approach the Town, and paſs the *Ditch*. That the Deſign of the *Flanks* are chiefly to ſcour the *Ditch* and *Counterſcarp*, to hinder the *Enemy* to paſs their *Gallery*, and make a *Lodgment*; the which ſeems very Reaſonable, ſeeing the Guns from the *Faces* of the *Baſtions* and *Curtain*, ſcour the *Campaign* more directly than the Guns from the *Flanks*; and 'tis found by the Account of *Sieges*, that an Enemy advanceth in a little time, very ſecurely in their *Trenches* to the *Counterſcarp*, wherefore, if the Guns be ſtill mounted on the *Flanks*, to diſcover them at their breaking the *Scap*; and that one or two *Batteries* at moſt, can be rais'd to Diſmount them, and that in ſo dangerous a Poſt too, to be under the *Beſiegers* Fire, it is certainly an Advantage not to be found, when the *Flanks* fall Perpendicular on the *Lines* of *Defence*.

CHAP. IV.

Of Out-Works, and their Uſes.

AS it is a great Advantage to a Place to be ſurrounded with a good *Ditch*, and good *Rampart* and *Walls*; ſo likewiſe it is a conſiderable Diſadvantage, when there is found low, or riſing Ground near the *Counterſcarp* of a Town, which may ſerve either for Lodgments to the *Beſiegers*, to facilitate the carrying on the Trenches, or for Advantage-Ground, to raiſe Batteries againſt the Town. For this Reaſon, *Engeniers* have invented divers ſorts of Works for the remedying theſe Faults; as, to take in the diſadvantageous Ground, to Elong the Enemy (and to hinder, by being low) their ſudden Approaches bp raiſing the *Campaign* almoſt with a *Horizontal Shot*, and ſpend their Time before they advance to the main *Works*, and force them to gain theſe *Out-Works* with as great Hazard and Loſs, as if they attempted the Fort itſelf; and after the *Out-Works* are loſt, it may be a new Work to them to approach the Town.

There are ſeveral ſorts of *Out-Works*, ſuch as *Ravelins*, *Half-Moons*, or *Demi-Lines*, *Horn-Works*, *Tenails* and *Crown-Works*; of which in order.

Of the Ravelins.

THere are two ſorts of *Ravelins*; the one with *Flanks*, and the other without.

The *Ravelins* with *Flanks* are ſet before long *Curtains*, when the two *Baſtions* can't Flank one another with Musket-Shot, and the *Curtain* not long enough to build a Plate *Baſtion* on the middle of it. Theſe *Ravelins* ſupply the defect of a *Baſtion*, not only to Cover, but alſo to Defend.

The making of theſe *Ravelins* is thus; Cut the *Ditch* Parallel with the *Curtain*, above which, ſet up a *Capitol* from 18 to 22 Rods; the *Demi-Gorges* from 10 to 12 Rods; the *Flanks* from 8 to 10 Rods; the *Ditch* round them; the Largeneſs of the *Flanks* going Parallel with the Face of the *Ravelin*, till it meet the *Ditch* of the Face of the *Baſtion* of the Place, to the end the two Flanks of the *Ravelin* may ſcour over all the *Ditch* before the Face of the *Baſtion*.

The other ſort of *Ravelins* conſiſt only of a *Capitol* and two *Faces* (as Fig. 4. Plate 1. the *Ravelin* A.) the *Capitol* from 12 to 18 Rods; the *Faces* are drawn towards the Shoulders of the *Baſtions*, that the *Ravelin* may be Commanded within, not only by the *Curtain*, but alſo by the two *Flanks*.

This Work is oft-times by the Soldiers call'd a *Half-Moon*: The chief Uſe of it is to cover the *Curtain*, *Bridge* and *Gate*, and is very often uſed in moſt Works. They ought to be lower than the Works of the Place, that they may be under the Fire of the Beſieged, in caſe the Enemy ſhould endeavour to Lodge themſelves there. Their *Parapets*, as thoſe of all Out-Works, ought to be Cannon-Proof; that is, about 18 Foot thick. Their *Rampart* ought to be half, or a Third of one of the Flanks of the Place, and the Breadth of the Moat half the Breadth of the Moat of the Place.

The ordinary way of making them is thus.

Take with the Compaſſes, the Extention of the *Curtain B, Q*; from the Points *B* and *Q*, make two *Arches* croſſing one another in *D*, the *Line* that paſſes through the middle of the *Curtain*; then from the Point *D*, draw Lines towards *E* and *F*, till they cut the *Counterſcarp* in *G* and *H*, joining *G I*, and *H I*, you have *Faces* and *Demi-Gorges*. The *Ditch* round this Work, as it is in all *Out-works*, is half the Breadth of the Great *Ditch*.

Becauſe theſe *Ravelins* are Weak, they may be made double, one within another, ſeeing the *Ditch* round them is Narrow, and the *Profile* Slight, and therefore ſoon Taken and Mined. The *Interior Ravelin* will ſerve for a good Retrenchment, being four Foot higher than the other: But both are to be Mined, leſt the Enemy find too great Advantage to make Batteries, and fill the *Ditch*.

Of the Demi-Lunes, *or* Half-Moons. Plate 1. Fig. 4.

The *Demi-Lune*, or *Half-Moon*, is a Work raiſed always before the Point of a *Baſtion*, and compos'd of two *Faces*, making a *Saillant Angle*, whoſe *Gorge* is turn'd like a Creſcent, or forming an Arch of a Circle.

The Conſtruction is, by prolonging the two *Faces* of the *Baſtions*: From the Point *O*, at the Diſtance of *O, K*, make the *Arch K, L*, where the *Faces* prolong'd out of the *Counterſcarp*, raiſe the *Capitol M, N*, of $\frac{2}{3}$ of the Face of the *Baſtion*; then drawing the *Faces* to the *Angle* of the *Counterſcarp I*, till it cut the Face of the *Baſtion* prolong'd at *P*, ſo you have the Flanks *K* and *P*, and the Face *N, P*, which are to be ſet off on the other ſide from *N* to *Q*, and from *L* to *Q*; the *Ditch* is to be Parallel to the *Faces* of the ſame Breadth with that of the *Ravelin*.

This *Work* is no more in uſe, ſeeing their *Faces* have but a weak Defence from the *Ravelin*, the *Enemy* may ruin them eaſily, and paſs without any Difficulty their *Ditches*, and ſo make themſelves Maſters thereof; and the *Faces* and *Flanks* of the *Demi-Lunes* will ſerve them for *Batteries* againſt the *Ravelin*, and the *Flanks* of the oppoſite *Baſtions*. And altho' they may be Retrench'd by *Traverſes*, yet the *Enemy* will not fail to Attack the *Face* entirely, or the Place where the laſt *Retrenchment* is. This happens to another Work, call'd a *Counter-Guard*, which being likewiſe out of uſe, I ſhall not deſcribe the *Figure* of them. *Vide* Plate 1. Fig. 4.

Of the Horn-Works. Plate 1. Fig. 9.

Horn-Works are to be ſet before the *Curtains*, in drawing *Lines* from it perpendicularly at the two *Flanks*, towards the *Campaign*, of 60 *Rods*; their *Front* is of 36 *Rods*, equal with the *Curtain*; this is to be divided into three Parts, one for the *Curtain*, the other two for the *Demi-Gorges* of the *Horn-Work*; the *Flanks* of ſix *Rods*, or 72 *Feet* every one.

This *Work* is the Principal of all the *Out-Works*, and it's found by Experience, that an *Enemy* is kept back, and gains as little Ground as poſſible by this *Work*, rather than by any other; they extend themſelves far into the *Campaign*, their *Fronts* defend themſelves, the Interior of them is open to the *Town*, they may be often Retrench'd, and conſequently fatigue and cozen the *Enemy*.

But this *Work* requires many *Men*, the *Flanks* and *Faces* of the *Demi-Baſtions* are too little, and the *Rampart* too thin to plant *Cannon*, and to ſtay on when there is a Breach. Thus an *Enemy* may eaſily Mine the *Defences* on the *Front*, and by Force maſter the *Demi-Baſtions*, and on this Height make *Batteries* to ruin the *Retrenchments*.

For this Cauſe, theſe *Works* are only to be made, when there is a great Neceſſity, and in ſuch Places only, where the *Enemy* is oblig'd to attack the Place.

Coehorn quite rejects this Work, as being ſo great a Circumference, and ſo ſmall a Defence, that 'tis not worth the Maſon-Work with which it is fac'd.

To place *Ravelins* before this *Work*, obſerve only the Method in the firſt *Paragraph*.

Of the Tenails. Plate 1. Fig. 4.

The *Tenails* (if there be not time to make a good *Fortification* for the Defence of the *Bridges* and *Paſſages*) 'tis uſual to raiſe in haſte a *Parapet*, in form of a *Tenail*, as *Fig*. 4. their Sides are no longer than the 50 *Rods*; their Front is of 36 *Rods*, which is to be divided into four Parts; in the Middle we draw a *Perpendicular*, on which is ſet off a $\frac{1}{4}$ part of the *Front*, towards the *Town*, and draw *Lines* from the Sides forming the *Faces*.

This *Work* is very proper for the *Counter Approaches*, when we would ſuccour the Place with *Men*; that which is the true Origen of ſo many *Horn-Works*, as well as *Tenails*, being firſt invented to this end, in the Sieges of *Bomel*, and *Bergen-op-Zoom*.

Having Time, we make the *Tenails* ſtronger, and joyn them to *Horn-Works*, that the *Enemy* may be the better diſcover'd at the *Angle* of the *Counterſcarp*, and the *Work* better defended.

Our Author being not particular enough in his Account of *Tenails*, let us improve it a little out of *Guillet*, and others, and the rather, becauſe of the Defences made by them at the Siege of *Liſle*, they ſay, that a *Tenail* is an *Out-Work* longer than broad, whoſe long Sides are *Parallel*, and it's either ſingle or double; and there are likewiſe *Tenails* in the *Foſs*.

A *Single Tenail* is a Work whoſe Front is advanc'd towards the Country, having two *Faces*, forming a *Re-entring Angle*; it's two long Sides terminate on the *Counterſcarp*, oppoſite to the *Angle* of the *Shoulder*.

A *Double Tenail* is a Work, whoſe Front having four *Faces*, forms two *Re-entring*, and three *Saillant Angles*: It's long Sides are likewiſe *Parallel*, and terminate on the *Counterſcarp*, oppoſite to the *Angle* of the *Shoulder*. Both the *Single* and *Double Tenails* have their Faults, that they are not flank'd or defended at the *Re-entring Angles*, becauſe the Height of the *Parapet* hinders the *Soldiers* from diſcovering before that *Angle*: Therefore *Tenails* are only made, when there is not Time enough to make *Horn-Works*. The *Ramparts*, *Parapets*, *Foſſes*, *Covert-Way* and *Glacis* of *Tenails*, are the ſame with other *Out-Works*.

Tenail in the *Foſs*, is a *Low Work* rais'd before the *Curtain* in the Middle of the *Foſs*, and is of three different ſorts; The firſt compos'd of a *Curtain*, including the *Parapet* and *Talus*, is but five Fathom thick, but the *Rampart* of the *Flanks* and *Faces* is ſeven. The ſecond, which Monſieur *Vaubon* has by Experience found to be of very good Defence, is compos'd only of two *Faces*, made on the *Lines* of *Defence*, whoſe *Rampart* and *Faces* are *Parallel*. The third differs from the laſt, only in having its *Rampart Parallel* to the *Curtain* of the Place. All theſe Sorts are very good Defences for the *Foſs*, and lie ſo low, that they cannot be hurt by the *Beſiegers Cannon*, till it be on the *Cover'd-Way*.

The *Tenail* of a Place, or *Front* of a Place, is what is comprehended between the *Points* of the two Neighbouring *Baſtions*, as the *Faces*, the *Flanks*, and *Curtain*; ſo 'tis ſaid, the *Enemy* attack'd the whole *Tenail* of a Place, when they made two Attacks on the Faces of the two *Baſtions*.

Of the Crown-Works. Plate 1. Fig. 4.

A *Crown-Work* is ordinarily made, when a Height is ſo near a Place, that the *Shot* of a *Musket* reaches it; to this end we extend the Sides of this *Work* (whether the *Crown-Work* be before the *Curtain* or *Baſtion*) 65 *Rods*, the Point of the *Demi-Baſtions* are to be at leaſt 60 *Degrees*. Joyn the Extremities of the Sides; on the Middle raiſe a *Line* Perpendicular, on which ſet 18 *Rods* for the *Capitol*, making an *Angle*, and two *Interior Polygones*, every one of about 50 *Rods*, giving 10 to the *Demi-Gorges*, and 8 to the *Flanks*. We make *Ravelins* to this *Work*, as is taught in the firſt *Paragraph*.

This *Work* may ſerve to adjoyn to *Forts*, that are too little to Lodge a great *Garriſon*, which oftentimes happens when ſmall Places, or *Towns* of no great Conſequence, become great *Frontiers*, when it would coſt too much to enlarge the whole *Fortreſs* round by making of a new *Wall*: And it would not be ſo convenient to throw down the old *Work*, which a ſmall *Garriſon* (if need were) could maintain.

All the *Out-Works* ought to be detach'd from the Place, and environ'd all round with a *Ditch*, having their Communication by *Bridges*; or if the *Foſs*, or *Ditch*, be dry by Land, yet not joyn'd with the *Counterſcarp*, leſt the *Enemy* inveſt them behind.

All theſe *Out-Works* (with many more) are repreſented in the *Figure* on the *ſecond Plate.*

Of Citadels and Caſtles.

Citadels and *Caſtles* are built to Command and Bridle a *Town*, in caſe the *Burghers* ſhould be Rebellious, and to be the laſt Refuge of Retreat. They are commonly of four or five *Baſtions*, and are us'd when a *Town* is ſo great, that the *Garriſon* makes in Number but a $\frac{1}{5}$ or $\frac{1}{6}$ Part of the *Burghers*; altho' ſometimes they are us'd as *Blinds*, built on any Hill, or Riſing-Ground near a *Town*, from hindring an *Enemy* from Shooting into it. They are ſet ſo, that there may be two *Faces*, and a *Curtain* towards the *Town*. The Difference between a *Citadel* and a *Caſtle* is, that the firſt is fortify'd with *Baſtions*, whereas the other hath only round or ſquare *Towers*.

The *Pentagone* is the moſt advantageous *Figure* to make a good *Citadel*, which oppoſes three *Baſtions* to the *Enemy*, and two to the *Town*, Commanding at the ſame time both the *Campaign* and the *Town*.

The *Interior Polygone* of the *Pentagone* may be made of $\frac{1}{4}$ of the adjoyning *Curtain*, or a little more; the two *Ports*, or *Gates* of the *Citadel*, are plac'd, that one may be towards the *Campaign*, the other towards the *Town*, every one cover'd by a *Ravelin*.

If the *Citadel* or *Caſtle* be a ſquare, or 9 ſided *Figure*, then the *Center* of it may be on the Point of the *Interior Polygone* of the Place.

The Center of the *Pentagone*, or 5 ſided *Figure*, may be near on the Point of the *Baſtion* of the *Town*, taken away to make the *Citadel* in, altho' ſome uſe them at a greater Diſtance.

The *Gorges*, *Flanks* and *Capitols* are ſet off in proportion to their *Interior Polygones*; the *Ramparts* are to be as high as thoſe of the *Town*.

For a more particular Deſcription of the *Out-Works*, conſult *Trevaux de Mars.*

CHAP. V.

Of the Ramparts and Parapets; Walls, Cazemats and Orillons; Foſſebray, Ditch or Moat, and Cover'd-Way.

Of the Ramparts *and* Parapets.

THE *Rampart* is a great and thick Maſſy Bank of *Earth*, rais'd round about the *Fort*, encloſing it to reſiſt the *Enemy*'s Great Shot, and to ſave the Buildings of the *Town* from Ruin; and by their Height, the better to annoy the *Enemy* in their Approaches: And therefore ought always to be ſo high, that they may Command with the *Artillery* planted on them, the *Campaign* all round, and that the *Enemy* may not Command them by raiſing the *Batteries* higher.

But to this end, you muſt take notice of the *Meaſure*, and make the *Ramparts* never higher than 20 Feet without the *Parapet*, that it may Command the better the *Cover'd-Way* and *Ditch*, and not by too great Height give opportunity to the *Enemy* to be under *Covert*. And on the contrary, the *Rampart* ought not to be leſs than 12 Feet without the *Parapet*, otherwiſe the *Enemy* will Command it eaſily by their *Batteries*.

The Thickneſs ought to be ſo regulated, that the *Parapets* built on them may be ſtrong enough to reſiſt the Violence of the *Enemy's Cannon*, and that behind them there may be place enough to plant great *Guns*.

But as the *Earth* is not always the ſame, you are to conſider what the Nature of it is. If the *Earth* be Tough and Clayiſh, a *Bullet* of 24 *lib.* will enter no farther than 10 Feet; but if the *Earth* be Light, Looſe or Sandy, than a *Bullet* of the ſame Weight will enter 15 Feet, or more. Therefore the *Parapet* muſt be made from 16 to 24 Feet, chiefly in the *Flanks*, and other Places where there are made *Counter-Batteries*.

The Interior Height of the *Parapet* is 6 Feet, the Exterior 4 Feet; the *Baſe* of the Interior *Talii*, or *Slope*, 7 Feet, the Exterior *Talii* 2 Feet; the *Banquet*, or *Foot-Bank*, 3 Feet broad, and a Foot and an half in Height. The Largeneſs of the *Terraplane* of the *Rampart* is always proportion'd to the Length, and Recoiling of the *Cannon*. Since then, that a *Demi-Cannon*, or a *Culverin*, are about 15 Feet long, and they Recoil about 6, 7, 8, or 9 Feet; and there being place neceſſary to manage them, the *Terraplane* ought to be at leaſt from 32 to 40 or 50 Feet large.

This Largeneſs ought to be ſet all round a Place, and the *Baſtions* ought to be entirely fill'd, if it could conveniently be done; but ſo, that the *Talii*, or *Slope* towards the *Town* may be proper to aſcend with the *Cavalry* (as it is in the *Citadel* of *Antwerp.*) In ſuch *Baſtions* you may more eaſily Rencounter and diſcover the *Enemy's Mines*; and they ought to this end to be Vaulted, either in Building; or if that be neglected, in time of a *Siege*.

The *Interior Talii* of the *Rampart* is equal to the Height of it, that is, a Foot for a Foot; the *Exterior Talii*, or *Slope*, is the half of the Height, if the *Earth* be good, otherwiſe $\frac{2}{3}$. The *Baſe* of the *Rampart* is found by adding to the *Terraplane*, the *Banquet*, *Parapet* and two *Talii*'s

It were very convenient (if there were *Earth* enough) to make the *Ramparts* larger, and Vault'em under with *Entries* towards the *Town*, to be Places of Refuge for the *Citizens*, to be ſafe from the *Enemy's Bombs*, which do great Execution in their *Houſes*. To this end, at the *Grave* in *Holland*, having *Earth* enough, by reaſon of their enlarging the *Fortifications* of the *Town*, they do intend to improve it to this Advantage.

But the Solidity and Dimenſions of the *Rampart*, muſt have their Determinations from the Judgment of the *Ingenier*, according as the Ground may prove, and from the *Purſe* of the *Prince*, according as there is *Money* enough to finiſh withal. Therefore I have given the higheſt Meaſure that is to be us'd in ſome of the *Works*, and the leaſt in others; from which you may proportion any mean Meaſure, according as the *Ground* and *Money* gives leave.

If it were the Cuſtom now to agree with *Ingeniers*, as *Princes* and *States* did not many Years agon, in the Building the *Fortifications* of their *Towns*, to treat with them according to ſuch and ſuch a Deſign, as propos'd to them, to render the *Town* defenſible in a limited Time; and it is to be their Buſineſs to provide *Earth*, *Stone*, *Inſtruments*, and all *Materials* neceſſary to the carrying on and compleating the *Works*; by this means the *Ingenier* was oblig'd to Calculate the Thickneſs and Solidity of the *Ramparts*, to the end he might know exactly how much *Earth*, *Stones*, and other *Materials* he muſt have; and how much he muſt dig and enlarge the *Ditch*; and conſequently be able to tell in what Time, and for how much *Money* he could raiſe and compleat the *Work*. If this were the Cuſtom, it would not be impertinent to ſhew how to build up a *Fort*, and make an Eſtimate of the *Coſts* and *Moneys* requir'd to perform the ſame; altho' it were a very hard Task to perform exactly: For there being ſuch a variety in the Body, or Maſs, whereon the Fort is to be built, as either Brick, or Stone, ſolid ſtrong Earth, or mooriſh, or marſhy Ground, where there will be a prodigious Expence in Pilating the Foundations of the Ramparts, the neglect of which has made very fine and fair Deſigns tumble into the Ditch. Upon this Account Princes take another Method; they have particular *Engeniers* and *Intendants*, of which the one gives the Deſign, and pays the Work-Men, and the other furniſhes the Stones, and other Materials, and to keep the Work-Men at their Work, Overſeeing them.

In a Word, this Buſineſs paſſes through ſo many Hands, that it is difficult to know how much the Work will coſt to raiſe it compleat, unleſs all the Accounts be gather'd into one, which cannot be done till after the Works are finiſh'd.

In *Plate* 1. *Fig*. 5. you have the Dimentions and Meaſures of the *Rampart* and *Parapets*, and is as followeth in the *Profile*, cut at Right *Angle* through the Face of a *Baſtion*.

		Feet.
R, *A*,	The *Baſe* of the *Rampart*, is	80
T, *S*, or *Q*, *O*,	The Height of the *Rampart*, is	20
R, *S*,	The Interior *Talii*, or *Slope*,	20
O, *A*,	The Exterior *Talii*	04 ½
L, *Q*,	The *Baſe* of the *Parapet*	21
Z, *D*,	The Interior Height of the *Parapet*	06
N, *P*,	The Exterior Height	04
N, *Q*,	The Exterior *Talii* of the *Parapet*	02
Q, *D*,	The Interior *Talii*	01 ½
V, *Q*,	The Breadth of the *Banquet*, or *Foot-Bank*	03
V, X,	The Height of the *Foot-Bank*	01 ½
T, *V*,	The Largeneſs of the *Terraplane*	35

The *Profile* of the reſt of the Works will be found in their particular Paragraphs.

To give Rules, to caſt up and find the ſolid Content in Feet and Rods, of the *Rampart* and *Parapet*, were to repeat what I ſuppoſe is handled in the Treatiſe of *Geometry*; and I do not find the great uſe of this Curioſity to be particular in applying the Rules to this purpoſe: For I do think, that if there be not Earth enough had out of the juſt Deepneſs and Wideneſs of the Ditch, it will do no great hurt, to make either the Ditch deeper, or Wider; and if there cannot be had enough, but by altering too much the Proportion, or the Ground not giving leave, it may be had ſomewhere elſe near the Town; and ſeeing Work-men are to be paid by Day-Wages, if the Overſeers do their Duty right, the Prince is not at all Cheated, although he knows not how many Baskets full of Earth the Works contain, yet not to let this altogether paſs.

Note, That the Earth, or Solidity that lies between *T*, *Q*, and *S*, *O*, is a *Parallelipipedon*, all of one Height and Thickneſs, and the Content of it is found by multiplying the Superfices at the Bottom, by the height of the Rampart. The *Earth* that lies on either ſide of this Body, and has each *Talum* for its Baſe, and ends the top of the Rampart in a Line, are *Priſmes*, or half of *Parallelipipedons*, as *o*, *a*, *c*, and *S*, *R*, *T*; and their Solid Content is found by multiplying the Superficies at the Bottom, by half the Height.

There is found in caſting up the Solidity of the Ramparts, two ſorts of *Pyramids*, *viz*. Erect Pyramids, and their Solidity is had by multiplying the Baſe into $\frac{1}{3}$ of the Height, thoſe lie to the outſide of the Rampart, and have one or two Sides to be ſeen.

The ſecond ſorts are *Pyramids jacent*, and their Solidity is found by multiplying the Superficial Content of the *Baſe*, by $\frac{2}{3}$ of the Height; theſe lie with all their Sides hidden in their Rampart; all the Sums added together, give the ſolid Content of the Rampart. For the Parapet and Banquet, you are to follow the ſame Rules.

Of the WALLS.

The Ramparts that are Revetued; or Faces with Stone or Brick, are the beſt both againſt Scaling and Mining, and are very uſeful to ſuſtain the Ramparts from tumbling into the Ditch, by the badneſs of the Weather.

Engeniers have made a conſiderable Improvement in the form of erecting the Walls, which certainly muſt turn to a conſiderable Account. Inſtead of building the Walls, as before Perpendicular towards the Town, now they bring them up with ſuch a Slope as they give to the Walls without, which both ſaves about a $\frac{1}{5}$ or $\frac{1}{6}$ part of Stone or Brick, that muſt be uſed; and the Earth of the Ramparts behind them lying almoſt in its natural Poſition, doth not preſs the Wall ſo much forward into the Ditch, as when the Walls are brought up Perpendicular; as is clear in *Fig*. 6. *Plate* 1.

This they put in uſe at the *Grave*, where they find it turns to good Account: And I am ſure, that if what was before built of the Town had been after this Method, the State had not been put to double Expenſes.

The Walls of the Baſtions are to be built higher than the Walls of the Curtain, which may be only about 12 Feet in Perpendicular height, and 3 Feet for the Slope, their *Center-forts* may be about 14 or 15 Feet in Length, three Feet in Thickneſs and 12 Feet diſtant one from the other. But the Walls of the Baſtions, may be erected ſo high as in the *Figure*, 22 Feet in Perpendicular height, $4\frac{1}{2}$ for the Slope, 6 Feet thick at Top and Bottom; the *Counter-forts* 16 Feet long, thick at the Wall 5 or 6 Feet, 12 Feet in Diſtance, or leſs, according as the Ground or Foundation proves.

If the Ground be Mooriſh or Marſhy, then the Foundation of the Walls muſt be Piloted, and the Piles drove ſo deep, that a 16 or 20 Hand Bill-bettle will not drive at laſt above a quarrer of an Inch, when then the Piles will touch the firm Ground. The Piles are to be ſet at greater or leſſer diſtance, according as the Foundation is, and are ordinarily of about 10 Inches Square. Over theſe Piles there muſt be ſtrong Timbers lay'd; and croſs theſe, there muſt be others of the ſame thickneſs, notched into one another ſo thick as the ſeat of the Wall is; at the inſide thereof, is lay'd a Timber of 6 Inches Square, or thereabouts; and at the fore-part of the Wall, there is another of a Foot Square laid over the Croſs-Timbers, and Notches into them to Prop the Foot of the Wall: Betwixt this Timber and the Wall, there are Planks 4 Inches thick joyn'd together and driven into the Ground juſt with the Slope of the Wall, to hinder the Water of the Ditch from waſhing out the Lime from the Walls, or the Earth under the Timbers, betwixt the two Square Timbers above the croſs ones; there are to be Planks laid of 3 Inches thick, on which the Wall is to be erected. The Earth betwixt the *Counter-forts* is to be well ramm'd and beaten.

If there be no Fauſſey-bray before the Faces of the Baſtions, there ought to be made a Vault or Alley of 3 Foot Large, 6 Foot High, with ſmall Windows to ſhoot into the Galleries.

A, (in *Fig*, 7. *Plate* 1) is the Figure of the Inſtrument the Work-men apply to the Walls, to bring up the Slope true, by the Plumet's playing down exactly upon the Line.

Of Caſemats and Orillons.

Caſemats are ſeveral Platforms for Guns to be made in the Corners of the Flanks, to be hid conveniently from the Enemy's Batteries, and to be preſerved, if poſſible, againſt the Enemy ſhall begin to lay their Gallery, and paſs over the Ditch, or to plant their Guns and raiſe Batteries on the Counterſcarp. There are ſometimes three ſuch Platforms one behind another, the uppermoſt of which, is on the Terra-Plain of the Baſtion, which makes the other two to be call'd Places Baſſee, or Low Places; they are cover'd from the Enemy's Batteries by a Work of Earth added to the Angle of the Shoulder; and are call'd *Orillons*.

Theſe are *Orillons* ſet on the Flanks, of ½ or ⅓ of the Flank, to keep at leaſt two Cannon under Covert, and are made either of a round Figure or Square; *as are to be ſeen on the* Flanks *of ſeveral of the* Baſtions *of the* Figure *on the ſecond Plate.* For the Conſtruction of theſe Figures, conſult *Travaux de Mars*.

Engeniers of late do find fault with theſe *Orillons*, ſince they ought neceſſarily to be revetued with a Wall. If the Enemy do play with their Cannon, no body will be able to ſtand in the *Caſemats*, by reaſon of the broken Wall flying, and they find that the *Orillons* do hinder from defending from within the *Ravelins*; and for theſe Reaſons they do not commend the uſe of them.

In Flanks that are not Perpendicular to the Curtain, and conſequently too open to the Beſiegers Batteries: Theſe *Orillons* ſupply the fault of their being too open; which has been the Reaſon why ſome Authors ſeem ſo poſitive for them; but where the conſtruction of the Flanks is perpendicular to the Curtain, they do not appear to be needful, ſeeing the Embraſures of the Parapets cover enough.

But notwithſtanding theſe oppoſite Opinions, 'tis certain, that at the famous Siege of *Candia*, the *Turks* having Attack'd it regularly on the Baſtions *Bethleem* and *Panigra*, for ſixteen Years after they were Maſters of all the Out-works about the Town, and that thoſe two Baſtions had ſuffer'd the Effect of many Mines, the Beſiegers had made terrible Breaches in both the Faces, but never could Lodge themſelves, for the Artillery of the Caſemats ſtill ruin'd their Lodgments, and forc'd them to quit that Attack.

Of the Fauſſebray.

At the foot of the Rampart Engeniers make a *Fauſſebray* all round a Place, but eſpecially before the Faces of the Baſtions; they are Large, from 18 to 24 Feet of a *Terraplane*, with a Parapet, as that of the Rampart: Of late they have neglected to make *Fauſſebrays*, alledging for Reaſons,

1. Since the *Fauſſebray* is but a Parapet raiſed above the Level of the Campaign, the Enemy being advanced to, and poſſeſſed of the Counterſcarp, which is ordinarily of the ſame Height, it may enfile it with their Batteries ſo eaſily, that it were impoſſible for the Beſieged to ſtay thereon, and hinder that the Enemy might not paſs the Ditch.

1. That the Ditch being paſſed, the Miners find place to Mine the Faces of the Baſtions where they will, and in many Places at a time, and the *Mine* being made, the Beſiegers may not only make the Aſſault at the Breach, but alſo on the Right and Left, in the *Fauſſebray*, and Attack over all.

3. And that which is the greateſt Reaſon, that the quantity of of Bombs, which are at preſent ſhot, the *Fauſſebray* will in few Hours be totally Ruin'd.

But in conſidering the great Advantages the *Fauſſebray* gives to a Place, ſince from them the eſcape which the Enemy is oblig'd to make through the Cover'd-Way, is eaſily diſcover'd, and the Enemy not only annoy'd on the Side, but likewiſe on the Front, and ſo hinder'd by Musket-Shot, Granadoes, and Artificial Fire, to fill the Ditch, and make a Gallery: And ſeeing alſo they defend the Ravelins and Cover'd-Way, much better than an high Rampart, it is more reaſonable to remedy the Faults, than to reject the uſe of the *Fauſſebray* before the Faces of the Baſtions.

As to the firſt Reaſon, *viz.* The *Enfilement* that the Enemy may make, the *Fauſſebray* may be made 9 Feet higher than the Parapet of the Cover'd-Way.

The ſecond and third Faults may be remedy'd by Traverſes, Caponiers, with little Paliſadoes and Countermines; the reſt of the Faults are remedied by making a ſmall Ditch of 20 Feet between the Rampart of the Town and the *Fauſſebray*.

When the Ditch, or Moat is dry, Then the *Fauſſebray* is not found ſo convenient, as when it is full of Water.

But in Places ſurrounded with a wet Ditch, the *Fauſſebray*, which is border'd with a Parapet and a Banquet for the Defence of the Foſs, may be more uſeful, provided it may be made only before the Curtain and Flanks; for lying Low, it cannot be eaſily hurt by the Enemy's Cannon, and defends the Foſs better, becauſe of its low Scituation, than the Ramparts, which becauſe of its Height, cannot ſo well diſcover the Foſs.

Fauſſebrays ought never to be made before the Faces, eſpecially in Places fac'd with Brick or Stone, becauſe the Breach being generally made in the Face, the Ruins and Rubbiſh of the Rampart are ſtopp'd in the *Fauſſebray*, which facilitates the Aſcent of the Breach; and in Places lin'd with Brick or Stone, the pieces of Stone or Brick fly among the Soldiers that are in the *Fauſſebray*.

See (concerning the Advantage of the *Fauſſebray*) *Chap*. 2. *Lib*. 1. *Dogon*, and *Chap*. 28. *Lib*. 1. *de Ville*.

Of the Ditch or Moat.

The *Ditch* or *Moat* is to be made ſo that the Flanks may command and ſcour it before the Faces of the Baſtions; to this End, the *Ditch* before the Faces is ſo broad as the Flanks are long, by drawing it towards the Shoulders of the oppoſite Baſtions.

A wet *Ditch* ought to be ſo deep, that in the Summer there be no leſs than 6 Foot of Water in it.

The dry *Moats* may be deep from 20 to 30 Feet; and *Moats* that are deep, and tolerable large, are eſteem'd better than ſuch as are leſs deep and larger, to render the getting up the more difficult to the Enemy; although the *Moat* ſhould never be leſs than 6 Rods, or 72 Feet, otherwiſe there cannot be made Retrenchments, and other Works in it; and the Enemy by firing a Mine at the Counterſcarp, may cover and render all unprofitable. In the middle of the *Ditch*, there is a *Cunet* or *Canal* made, of 20 or 24 Feet Broad, which ſerves in dry *Moats* to Counter-mine, and cauſe greater Pains to the Enemy to fill it.

The Ditches full of Water are much better than the dry ones; becauſe theſe require too great a Gariſon to defend them. For, when the Enemy is once Maſter of the Counterſcarp, he may render himſelf Maſter of the whole *Ditch*, and Attack in different Places, in ſuch a manner, that the Beſieg'd will be oblig'd to furniſh all their Poſts, and to have them ready over all. The dry *Ditches* are likewiſe too much expos'd to Surprize and *Scaling*; when (on the other Hand) the wet *Ditch* coſts the Enemy much Pains and Time before they can fill it, and the Beſieged ſee where they are to Paſs and Mine; and therefore has need only to take notice of that Poſt, and at the reſt to keep little *Corps des Guards* and Centinels.

Se *De Ville*'s *Ingenieur Perfaite* on this Subject.

Of the Cover'd-Way and Counterſcarp.

Beyond the Ditch, towards the Campaign, there is a large Place of 20 or 30 Feet, cover'd with a Parapet parallel with the Ditch, and ſometimes made with Salient Angles in form of Ravelins; and if there be a Ravelin, then they are made on both ſides thereof.

The *Cover'd-Way* is to Flank and defend the Campaign Horizontally, to hinder the Enemy's Approach, that it may coſt them ſome Pains and Time before they become Maſters of the *Counterſcarp* and Ditch: The Beſieged have their Place of Arms to make Aſſaults, and their Retreats, in caſe they be beat back. The Interior Height of this Parapet is 6 Feet, and it falls ſloping 50 Feet, or thereabouts, till it loſe itſelf in the Campaign. This ſloping is call'd *Glacis* or *Eſplanade*.

This Parapet is ordinarily ſet on the Level of the Campaign; but ſeeing this Height gives too great an Advantage to the Enemy, when he once becomes Maſter of it, therefore it's better to take away 3 Feet from the Height of the *Cover'd-Way*, and ſet the Parapet ſo that it may be elevated no more than 3 Feet above the Level of the Campaign.

This is that Part of the Fortification of a Town that the Soldiers do commonly call the *Counterſcarp*; although properly the *Counterſcarp* is the *Talii*, or Slope of the *Cover'd-Way* next the Ditch, whoſe *Baſe* is equal to the depth of the Ditch, if it be not revetued or lin'd with Stone or Brick.

CHAP. VI.

Of the Repreſentation of Figures, *and the Plat of any Fortify'd Town upon Paper, by way of Perſpective.*

FOR deſcribing of Forts and Towns, there is a kind of Perſpective, call'd by Engeniers, *Perſpective Cavalier*, that imagines the Eye at an infinite Diſtance, that is, at ſuch a Diſtance, that all equal Heights in the Fort are ſeen under one Angle, whether further or nearer, and all other Heights proportionable, and all Lines which would meet at the Eye are Parallel, becauſe of the Diſtance; as we ſay, the Rays of the Sun falling upon a Burning-Glaſs are Parallel.

The other kind of *Perſpective*, that Deſigns by a Principal Point, from whence all Parallels to that Principal do meet in that Point, being a very troubleſome way, and does ſo confuſe the Body of the Work, that unleſs one be very expert that way, he is not able to know what it means; although the Compleat *Engenier* ought to be Skill'd therein, as to repreſent a Body near at Hand, or ſome Engine.

Draw the Lines of your Fort with White-Lines, or with any thing that will rub out, with all the Parapets, Ramparts, and Out-Works; then conſidering what Side you deſign towards you, whether the *Curtain* or point of the *Baſtion*, or what other Point, draw a long Horizontal Line *A*, *B*, (*Fig.* 8. *Plate* 1.) having a Square of Braſs or Wood, run one ſide of it along the Line *A*, *B*, and at the extream Points of the *Baſtions*, *Flanks*, and *Shoulders*, draw Perpendiculars towards the Line *A*, *B*, over all, omitting thoſe that will cut the *Rampart*, or *Parapet*, becauſe we cannot repreſent the Interior Height of the Rampart *O*, which is hid by the Exterior Height *P*; the Interior Heights *C*, *F*, *D*, *G*, and *E*, *H*, of the Rampart, are repreſented by ſetting on the Perpendiculars, $\frac{2}{3}$ of the Flanks of the Fort, and joyning the Lines *F*, *G*, *H*, parallel to *C*, *D*, and *E*. For the height of the Walls, take what Height you pleaſe; as ſuppoſe the $\frac{1}{2}$ of the Flank, and ſet it on all the Perpendiculars, from all the *Faces*, *Flanks* and *Angles*, and join them with Parallels to the *Faces*, *Flanks*, and *Curtains*, and finiſh all as you ſee in the Figure of a *Nonagone* compleated.

The *Angles* that fall within the Body of a Place, cannot ſerve to repreſent the Exterior Elevation of the *Baſtions*, becauſe the Exterior is hid by the Interior Height of the *Rampart* and *Parapet*, as the Height, *Z*, *Y*, *X*, *V*, *T*, *R*, *Q*, *P*, on the Perpendiculars that fall from the Angles of the Counterſcarp in the Ditch; ſet off $\frac{1}{3}$ of the Flank, to repreſent the depth of the Ditch. And Note, That Lines drawn from the Angles of the Counterſcarp that do not fall into the Ditch, cannot repreſent the deepneſs of it.

The *Out-Works* are repreſented after the ſame manner; only obſerve, that the Works next to the Town ought to be repreſented higher.

The *Talli*, or Slope of the Walls, may be ſet off from the Perpendiculars, that the Fort may be the more naturally repreſented.

Note, That in giving the Shadows to a Work, all Opaque, and Bodies not tranſparent, caſt their Shadows always oppoſite to the ſide from whence the Day, or Light comes; or towards the Right-hand generally, when we Deſign any thing on Paper.

CHAP. VII.

Of Irregular Fortification.

FRom Regular proceeds Irregular Fortification, or the fortifying ſuch Figures as have not their Sides and Angles equal one to another, as the forms of Towns to be fortify'd commonly are, by reaſon of the Irregularity of their Form, and Situations; and therefore are the harder to be fortify'd the more they differ from Regular, which is the perfecteſt. And becauſe it hapneth but ſeldom that a Regular Fortification is newly rais'd, unleſs it be ſome ſmall *Field-Forts*, or *Citadels*, by reaſon that every one is enclinable to preſerve his own; therefore *Irregular Fortification* is more in uſe, and conſequently neceſſary to be exactly ſtudied and known.

The ſame Laws and Maxims for regular Fortification ſtand, and are in force in the Irregular, and ſerve for general Inſtructions, as occaſion requires, to fortify any Place; and although they are not always to be preciſely follow'd (for Time, Place and Charge, may hinder) they ought to be obſerv'd as near as poſſible.

The greateſt Art that is in *Irregular Fortification*, conſiſts chiefly in rectifying the Sides of any *Polygone* that are too ſhort, or too long; and in altering the Angles that are too little, or too great, by either going inward or outward of the Place, to augment or leſſen the Lines to ſuch a Proportion, as that they may be capable to receive a ſtrong defencible *Baſtion*, (that is, a Baſtion according to the Maxims.) The Angle of the *Polygone* leſs than 90 Degrees, is not fit to ſet a *Baſtion* on, becauſe then the Point of the *Baſtion* will become too ſharp, the *Flanks* too ſhort, and the *Faces* too long.

But before any Judgment can be made, it is requiſite that there be made a *Map* or *Plat* of the whole, with all the Ways Paſſages, old Walls (if there be any Rivers, Pools, Encloſures) and all other Things fit to be known in the Draught; and then there is to be deſign'd what Works ſhall be thought moſt agreeing to the Place to be fortified; and according to the proportion of the Draught on Paper, the ſame is to be ſet and rais'd on the Ground round the Town.

A *Polygone* leſs than 45 Rods, is incapable to place a *Royal Baſtion* on. And a *Polygone* longer than 65 Rods, is alſo too long; in ſuch Caſes, the Angle is either to be made greater, the ſhort Lines longer, or the long Lines ſhorter, to the juſt proportion.

If therefore there be a *Polygone* of 50 Rods, and another of 60 Rods, then according to the fifth Paragraph of the third Chapter, take $\frac{1}{5}$ of the Interior *Polygone* for the *Gorge*, $\frac{1}{6}$ for the *Flanks*, and both theſe together for the *Capitol*. Thus for a *Polygone* of 50 Rods, there is 10 Rods for the *Gorge*, 8 Rods 3 Feet for the *Flanks*, and 18 Rods 3 Feet for the *Capitol*. For a *Polygone* of 60 Rods; there is by the ſame Rule 12 Rods for the *Gorge*, 10 for the *Flanks*, and 22 Rods for the *Capitols*.

Therefore divide the Angle of the *Polygone* into two equal Parts, through the middle draw a Line, on which ſet the *Capitols*, the one of 18 Rods 3 Feet, the other of 22 Rods; then draw from the *Flanks* of 10 Rods towards the *Capitol* of 22 Rods, and ſo from the other *Flank* by his *Capitol*, till you meet the *Face* of the other, and ſo you have an *Irregular Baſtion*.

Thus by conſidering the Overture or opening of the Angles, and the length of the Sides, you may fortify any Figure in Proportion, obſerving always the *Rules* and *Maxims*. As,

Suppoſe you find the Angle of a *Polygone* of 120 Degrees, conſider to which in Regular *Fortification*, it comes neareſt; as in this Example, To a 12 ſided Figure, or *Dodecagone*; then according to the Rule of *Proportion*, If the *Polygone* of the 12 ſided Figure of 64 Rods, give the *Demi-Gorge* of 14 Rods, the *Flanks* 12 Rods, and the *Capitol* 24 Rods 6 Feet, or $\frac{1}{2}$ a Rod; how much will a *Polygone* of 50 Rods, and how much will a *Polygone* of 60 Rods give?

If a *Line* be very long, then it is to be fortified with a *Plat Baſtion* in the middle of it, the proportion is a great *Royal*.

A *Polygone* of 133 Rods, may be fortified after this manner.

If it be leſs, *viz.* from 90 Rods to 130, then it is to be fortified according to the Rule of *Proportion*. If it be ſhorter than 90 Rods, the *Plat Baſtion* will be too little; and therefore it is better to ſet on the two Angles of the *Polygone*, two great *Royal Baſtions*, and in the middle a *Ravelin* with *Flanks*.

The *Angle* of a *Baſtion* leſs than 90 Degrees, is not well fortified with *Demi-Baſtions*, ſeeing the *Face* is much expos'd to the Fire of the Beſiegers *Batteries*, and the Point too ſharp; therefore the *Angle* is to be made greater; or, if the Place will permit, to Retrench it in form of an *Horn-Work*.

Seeing there is ſo much Variety in *Irregular Fortification*, the Young *Engenier* muſt Practice by himſelf, by drawing ſeveral *Plats* of Irregular Places, and fortifying them. And becauſe Examples in this Matter, (as in other Things) exceeds all Precepts, he may peruſe the beſt Books he can find on this Subject; as *Maralois*, *Dogen*, and ſeveral others, where he will find infinite Caſes and Examples, that will help him and inform his Judgment for effecting his Deſire.

The raiſing the *Ramparts* and *Parapets*, are the ſame as in *Regular Fortification*; and all, or any of the before-mention'd *Out-Works* may be plac'd before the *Curtains*, and made in proportion to them as Occaſion requires.

CHA. VIII.

The Explication of the Second Plate.

A, Is a Town environ'd with a Wall and Moat, which ſerves to cover and defend the Houſes from the Violence of the Enemy.

B, is the Place of Arms where the main Guard is kept; or the Place where the Soldiers of the Gariſon aſſemble at the time of Mounting the Guard, to know their Poſts.

C, are the Market-Places.

D and *E*, are the Houſes, by which is meant, not only private, but publick Houſes, as *Halls*, *Priſons*, *Churches*, &c.

I, is a *Baſtion* or *Bulwark*.

L, are the *Caſemats*.

6, is an *Orillon*.

P, is a *Retrenchment*, or a Work the Beſieged make behind the Place Attack'd, to keep the Enemy the longer off from being Maſters of the Town.

7, are *Fraiſes*, or ſeveral pieces of Wood fixed in the Wall under the *Cordon*, or upper Row of Stone or Brick in a Wall. In Places that the *Ramparts* are not riveted or lin'd with Stone, they are plac'd always at the Foot of the *Parapet*; their uſe is, to hinder Deſertion and Surprizes by Scaling.

M, is a *Platform* or *Earth* thrown up along the *Curtain*, which ſerves to plant great Guns on.

N, is a *Cavaleer*, or a Height ſometimes of Earth, Stone, or Brick, raiſed in the middle of a *Baſtion*, to plant ſome Pieces of Cannon on, to ſcour the *Campaign*, to oblige the Enemy to begin their Trenches at a great diſtance from the Fort, and to make them the deeper.

O, is a *Counter-mine*, or ſort of a Well the Beſieged dig or make in their *Ramparts*: Towards the Bottom of them they make ſeveral little Alleys branching under Ground, to diſcover the Enemy's Mines, and to give Vent to them when made and ſprung.

S, is a *Gwerit*, which covers the Centinel from the Weather.

V,

V, is a Port with a *Stone-Bridge.* The Wooden Bridges are eſteem'd the beſt; becauſe as occaſion requires, they may be burnt down eaſily.

R, is a *Draw-Bridge.*

F, is a *Citadel.*

G, is the *Caſtle*, or *Governor*'s Lodging, environ'd with a *Moat*; there is ordinarily on the top of it a Tower, which diſcovers a great way into the *Campaign*, on which there is a Bell to ſound Allarum or Retreat, as there is occaſion.

Z, is the *Cover'd-Way*, or that which the Soldiers ordinarily call the *Counterſcarp.*

X, is the *Glacis*, or *Eſplanade.*

Y, are the *Trenches*, in which the Enemy, under Covert, approach the *Fort.*

H, are *Batteries* rais'd at every turning of the Trenches, to diſmount the Beſiegers Cannon, and ruin their Walls.

1, is the *Line* of *Contravalation*, to ſecure the *Camp* from Surprizes from the Town, by frequent Sallies that the Beſieged might make.

2, is the *Line* of *Circumvallation*, which is to hinder any Succour or Aſſiſtance to get into the Town, and to hinder the Soldiers Deſertion.

*, are *Redoubts*, *Triangles*, *Squares*, and other *Field-Works* upon the *Line*, to *Flank* and Defend it.

3, is the *Ground* and *Tents* of the *Infantry.*

4, are the *Cavalries*, *Huts* and *Tents.*

5, is the *Artillery* part, where the Cannon, and all Tools (and Things neceſſary for Service) are kept.

7, are *Bruſhes* and *Faggots* or *Facines*, which ſerve both to make *Parapets* of, and to fill the *Ditch.*

8, are *Baskets* full of *Earth*, which ſerve for *Parapets*, through which the Musketiers ſhoot.

9, is a *Gallery*, or a Frame of *Wood*, which ſerves to cover the Miners in paſſing the *Ditch*, or *Moat.*

10, is the Quarters for the *Victuals.*

11, are big Pieces of *Wood* to mend the Ways, to facilitate the Paſſage of the *Artillery.*

12, are *Crow-foots*, *Calthrops*, or Four-pointed *Irons*, one Point being always uppermoſt, to ſtrow on the Ground, to hinder the *Cavalry* to paſs, gauling, or pricking their Feet.

13, *Horſe de Freeze*, is uſed inſtead of a *Gate*; it is ſometimes called a *Turn-Pike.*

14, are *Piles*, or *Palliſadoes* made of *Spars*, plated or ſhod with *Iron* at the Points, having two or three Nails drove through them: They are ſet in two or three Rows, the loweſt Breaſt-high, and every Row higher; ſo deep, as they may not be pull'd up. They are planted on the top of a *Breach*, or on ſome *Paſs*, on a ſudden.

15, is a *Barricade*, to plant on a *Paſs*, or on the top of a *Breach.*

CHAP. IX.

Of Beſieging Towns.

WHen a *General* does intend to Beſiege a *Town* or *Fort*, he firſt ſends to Inveſt it with a Body of Horſe, Commanded by a *Lieutenant-General* and a *Camp-Marſhal*, that no Succour may go in, while he marches with the reſt of his Army to it; and to that end, they take care to ſtop all the *Ways*, *Paſſage*, and *Intelligence*, that may be ſent either in or out of the Town; This is called the Blocking up the Town.

When the Army is come before the Town, if it is ſituated on a *River*, there muſt be made a Detachment of ſome part of the Army, and ſend them of the other ſide of the River, to take up their Quarters, having *Bridges* of *Communication* laid over, and *Redoubts* made to defend them, in which there muſt be put a ſtrong Guard of Foot.

If the Place be ſurrounded with Hills, then the General poſſeſſes himſelf of the Heights of them.

As ſoon as the Place is Block'd up, and conſequently the reſt of the *Army*, *Baggage*, *Proviſions*, *Amunition* of *War*, and the *Artillery* are arriv'd, and the General hath form'd out his *Camp*, for the *Army*, which in a Siege always Encamps with their Backs to the Town, having *Squadrons* of *Horſe* betwixt each *Battalion*; then the *Engeniers* mark out the *Line* of *Contravallation*, call'd breaking of Ground, which is to be choſen beyond *Musket-Shot*, or *Falcon*, from the Town, under which the Cavalry may ſecurely Lodge.

This *Line* is carry'd round about the Town, if the Garriſon be very ſtrong and full of Men; elſe on one Part.

If the Enemy have Armies near, and that it's thought they will endeavour to raiſe the Siege, before the Town can be taken, then the *Engeniers* mark out another *Line* further into the *Campaign*; this is call'd the *Line* of *Circumvallation.* This *Line* is carry'd round about, incloſing Ground enough for all the Army to Lodge in. The Quarters of the General and other Chief Commanders, are to be plac'd round about, ſo as one may Relieve another conveniently.

Upon this *Line*, within Musket-Shot one from another, are to be plac'd *Redoubts*, *Triangles*, *Long Squares*, and other *Field-Works*; each *Regiment* is to Work at them before their own Camp. Their *Ramparts* are generally ſome 8 or 10 Foot thick, 6 Foot high, with a *Foot-bank* to mount upon the *Parapets.* The outward Height 5 Foot, the *Ditch* caſt about them 10 or 12 Foot broad, and 4, 5, or 6 Foot deep, altho' the Proportions are to be made always according to the Danger the Enemy may put the Army unto.

The next thing to do, is opening of the Trenches, that is, beginning the *Lines* of *Approaches* towards the Town, at about 1200 Foot from it. To this end, the Colonel, or Commander of the *Infantry*, (whoſe Buſineſs is to open them) ought early in the Morning to viſit the General, or more particularly the Lieutenant-General, if he be appointed for this Action; and it were neceſſary he had well review'd the Place himſelf, before he comes to Diſcourſe thoſe that know it. Then the Regiments make their Detachments, and are to furniſh ſuch number of Work-men that the *Engenier* requireth; and beſides their ordinary Arms, they take along with them *Spades*, *Shovels*, *Pick-axes*, and other Materials neceſſary for the Work. The *Engenier* is to ſhew and inform them well how they are to run their *Line*, which he draws out to them as neceſſity requires, being of divers Lengths, but moſt commonly ſome 20 or 40 Rods long, or ſometimes ſhorter or longer, and broken and turned as often as is neceſſary.

That the Work-men may begin with the more ſafety where the *Line* begins (which is with a great place of Arms) there is to be built a *Redoubt* or *Battery* with Guns, and there are cover'd from the Enemy's Cannon, by two great *Eſpaulments* well *Flank'd*, ſeveral Guards of *Foot* and *Horſe* ſtanding near to defend them, if the Beſieged ſhould Sally out. The *Line* being laid out and mark'd, which is to be cary'd out Obliquely, ſo that no Shot can be made out of any Work of the Town, that may ſcour that *Line*; the *Engeniers* are to divide and place the Work-men, in order that one may not hinder another.

Now they give to every Man the length of 4 or 5 Foot, and every one maketh as much haſte as poſſible to get into the Ground, for the avoiding of the Danger whereunto he is expos'd while he ſtands upon the open Field. To this end, the *Earth* which he diggeth, he caſteth up before him; and he is to dig the Hole ſo deep, that with the *Earth* thrown up, he may be under Covert, which will be when he digs three *Feet* into the Ground, the *Earth* thrown up making other three above the Ground, or 6 *Foot* in all.

The Workmen being thus got into the Ground, they enlarge and deepen the *Trenches* as neceſſity requires; as when they come nearer to a *Fortreſs*, they are to be made deeper: The breadth or width of them may be 12 or 14 *Foot* at the Top, and 6, 8, or 10, at the Bottom, with *Foot-banks* for the conveniency of Musketiers: Sometimes one is conſtrain'd to to make 'em larger, in regard Waggons may be driven through them, with Materials neceſſary for the Gallery; and alſo Cannon muſt be drawn down and mounted on the *Batteries*. But it is always to be obſerv'd, by how much larger the Approaches are made, by ſo much ought the *Parapet* of the Trench to be heighten'd, that the Enemy may not diſcover the Soldiers that are in them; eſpecially one ought to heighten thoſe Points and Windings where the *Line* turns; and when it cannot be conveniently done, the Soldiers are to take great *Facines* and cover the Place that is ſeen with them.

The Trenches are to be reliev'd every 24 Hours; and in ſhort, are to be order'd with great Care.

If the Ground be *Rocky*, *Mooriſh*, or *Marſhy* with *Bogs*, where one cannot Dig, then there is a Foundation made with *Sinkers*, that is, Bundles of *Boughs* faſten'd together, upon which *Earth* is caſt. Upon this Foundation there are *Traverſes* and *Gabions*, which are deſcrib'd in the laſt Chapter. Theſe *Gabions* are uſed alſo in ſtony Ground, where one cannot dig the *Earth*, becauſe of Stones.

As the Trench advances, there are at the Windings and Turnings, Batteries to be made about 10, 12, or 16 *Foot* high; the *Breaſt-Works* made with *Gabions*, or Sacks of *Earth*, and *Cannon-Baskets*; theſe *Batteries* are to ſhoot into the Town, to beat down the Houſes, and terrify the Burghers, and to play continually Day and Night. Or *Batteries* may be made on any Hill, or riſing Ground to this Effect.

There muſt be a good *Line* of *Communication*, betwixt the two, or more Approaches: When they are once advanc'd into the *Foot* of the *Glacis*, take in and fortify the Ground betwixt the *Attacks*, by which means the Enemy coming to Sally out, will find themſelves betwixt two *Firings*.

In the carrying on the *Lines* of *Approaches* and *Batteries*, the *Engeniers* muſt be ſure to be provided with *Palliſadoes de Camp*, and *Piles* of 6 *Foot*, *Turn-Pikes*, *Horſe de Freeze*, *Barricadoes*, or a Fence made of *Paliſadoes*, Thouſands of *Crow-feet*, or *Carthrops*, to hinder the March of *Horſe*, together with good ſtore of Planks and Timber ready.

The nearer the Approaches advance to the *Fortreſs*, and the more the Soldiers are expos'd to Danger, their Pay is encreas'd every Day; ſometimes they have half a Crown a Night, and ſometime a Crown for an Hour's Work, if their Poſt be Dangerous.

Every Morning as ſoon as Day begins to break, the *Lieutenant-General*, or *Marſhal de Camp*, orders the Soldiers too low to the Trenches, and there take their Places; to Fire continually, and hinder the Enemy from ſhewing their Heads above the Works, whilſt the Cannon from the *Batteries* are beating down the *Parapets*, and levelling the *Works*; the *Batteries*, to this end, are advanced as the *Attacks* advance, and the beſt Place for them is betwixt the two *Attacks*; for by this means one diſpoſes them in ſuch a manner, that he is Maſter of the Firings of the two *Flanks* of the two oppoſite *Baſtions*.

When the Approaches are advanced to the *Counterſcarp*, along the *Breaſt-work* of it, there is to be made a great Lodgment, in the middle of which, there is a Deſcent cut into the *Ditch*, which is call'd the *Sap*: When it is brought to the *Ditch* or *Moat*, there muſt be good ſtore of *Pioneers* employ'd to run Earth in Wheel-Barrows Night and Day to fill up the *Ditch*; and as ſoon as it is Dark, the *Horſe* of the Army, but thoſe that are upon the Guards, to carry *Facines* to the Tail of the Trenches, to be caſt into the *Moat*, to fill it up, even to that Place where the Mine is to be made; for in ſo doing, the *Ditch* will be fill'd up by degrees, and there will be a good Foundation for the *Gallery* to reſt upon. The *Pioneers* fetch in the Wheel-Barrows good ſtore of Earth upon Planks laid in the *Gallery*, and bring it to the Mouth thereof, caſting it upon a heap, and ſome Work-men appointed to work in the Mouth of the *Gallery*, caſt it into the *Moat*, to ſettle the *Facines* and *Faggots*.

This Earth thus caſt up, ſerves to cover and make *Blinds* for the Work-men, which they uſe to make at the Mouth of the *Sap*, and continue ſo doing till they bring the *Gallery* to the *Face* of the *Baſtion*. The *Blinds* are to be raiſed on that ſide which reſpects the Enemy's *Curtain* and oppoſite *Flank*.

To bring on the *Gallery*, firſt there is made two Frames of Timber, ſome 8 or 10 *foot* wide, and about 9 in height, in form of a Gallows; the Timber may be 6 or 8 Inches thick; and the ſide oppoſite to the Enemy's *Flank*, ought to be double Plank'd. Theſe Frames ought to ſtand 6, or 7 *foot* from one another, and ſo one after another, till the *Gallery* reach to the *foot* of the *Baſtion*.

The *Gallery* is to be cover'd at the Top with Earth a *foot* thick, to hinder *Fireworks* from burning it: There are little Windows made in the *Gallery*, betwixt every 3 or 4 *Frames*, to give the Work-men Light,

When the *Gallery* is thus brought to the *Face* of the *Baſtion*. The next Thing is to make a *Mine*, which is to be done by *Miners*, who are to have *Pick-Axes*, and all kinds of *Maſons* Tools, with all things requiſite to pierce and break the Wall. The height of the *Mine* is about 4 or 4 ½ *foot* high at the moſt; the breadth about 3 ½ *foot*; according to which Meaſures the Props and Planks are fram'd, wherewith the *Mine* is under-prop'd. The *Earth* that is taken out of the *Mine* under a *Rampart* or *Baſtion*, is to be carry'd away in a Veſſel or Pail of Leather, which is light in handing it one to another, till it be brought out of the Hole or entrance of the *Mine*, and laid in the *Gallery*, to the end the Enemy may not ſee it, and gueſs whereabouts the *Mine* is.

The *Mine* is wrought on by ſeveral Turns; to prevent the blaſt of Powder coming forwards: Sometimes the Maſter *Miner* makes uſe of a *Compaſs*, and conducts his *Mine* by the help of the *Needle*, that he may carry it right; and always the nearer he comes to the Place where the *Chamber* is to be, the narrower he makes the way of the *Mine*, in ſuch ſort, that it be no broader or higher at the entrance into the *Chamber*, than a Barrel of Powder may ſcarcely paſs into it, for by this means the *Mine* is eaſier ſtopt.

The bigneſs of the *Chamber* is made according to the greatneſs of proportion of the *Wall* and *Rampart*. The commonOpinion is, that a Barrel of Powder will blow up 12 *foot* of Earth; the Barrels are to be laid in ſuch order, that in an Inſtant they may all take Fire together. The *Chamber* may be made 10 or 12 *foot* wide, and about 5 *foot* high: The Earth is to be blown up either into the *Fortreſs*, or elſe without, by making that ſide which is to be blown up, not ſo thick as the other. Thus having made the *Mine*, place the Powder therein, and cloſe up the Mouth of it; which muſt be carefully done, putting croſs Timbers in every Return, and at the Entrance ſtop it with thick and ſtrong Planks, ram'd in with Earth, leaving a Trunk or hollow Pipe all the way fill'd with Powder, and carry'd to the end of the *Mine*, at the *Wall*, where the Paſſage is to be well ſtopp'd, ſince the ſtronger a *Mine* is ſtopp'd, it takes the better effect; then Fire it as ſoon as conveniently may be, leſt the Powder take harm by two much moiſture; after which, follows the Aſſault, and ſeconding the Mine, if the Breach be made conſiderable.

CHAP. X.

Of Defending a Town or Fort.

IT is a certain Rule, that where there is an *Offenſive War*, there is alſo a *Defenſive*; and therefore, as ſoon as the Governor of any Fort gets notice of an Army coming before it to Beſiege the Place, and before they form their *Blocus*, or *Block it up*, he ſends the Gunners to the *Batteries*, with Orders to ſhoot ſeveral *Cannon* to inform the Country round, and give the Signal of Retreat, that they may come in with all the Proviſions they can find about the Place: And alſo by making ſeveral Shot, keep off the *Light-Horſemen* and *Spies*, that they approach not ſo near as to view the Works of the Fort; and alſo to favour the *Foot* and *Horſe*, who ought every Day to make a Sally, to ſhew the *Garriſon* is Strong and in good Heart: The *Infantry* muſt not go beyond Musket-Shot; but the *Cavalry* ought every Day from the opening the *Trenches*, to Sally in ſmall Squadrons, to draw the Army near, that it may lie open to the *Cannoneers*, who may make ſome good Shot, and cut off ſome of the Principal Officers.

If the *Garriſon* be but Weak, then the Governor is to manage it to the beſt Advantage; and is not obſtinately to defend the *Out-Works*, but rather to look to the defence of the *Ditch* and the Body of the Place, that the *Flanks* be well furniſh'd with *Cannon*, and as ſoon as he perceives the Attacks of the Enemy, is to Counter-mine the *Flank'd Angles* of the *Out-Works*, and to blow them up at ſuch time as he is forc'd to quit them; and after having Retrench'd the *Baſtions* after a conſiderable Breach, all that he can do, is upon the moſt Honourable Terms to make Capitulations; as to March out with *Arms* and *Baggage*, *Drums Beating*, *Trumpets Sounding*, *Colours and Standards Flying*, *Matches lighted at both Ends*, *Bullets in their Mouths*, *with ſome Pieces of Cannon and Mortars*, *and Amunition neceſſary*; the Beſiegers furniſhing them with *Waggons*, *Horſes*, and every thing neceſſary for their March. But if the *Garriſon* be conſiderable Strong, it is to be Govern'd quite in another manner.

The *Governor* is to Husband the Proviſions well, and defend boldly the *Out-Works*, and to Countermine round about them, as the Enemy ſhall Attack, and to Retrench them; and alſo to make *Retrenchments* and *Barricadoes* all along the *Cover'd-Way*; that he may loſe all things Piece by Piece, and to quit nothing but by main Force.

After the *Governor* is Advertis'd, by ſmall Parties he ſends out, what Part the Enemy will Attack, he is always to annoy them by continual ſmall Sallies of the ſtouteſt Soldiers, two by Two, and Three by Three, who are to fire upon the *Pioneers*, by creeping into the Field unperceiv'd, and not to give them Reſt, or let the *Trenches* be quiet; and afterwards to Retreat into the *Counterſcarp*: And in the mean time the *Governor* is to have the Soldiers in readineſs, to give Fire as ſoon as the Party is return'd, by which commonly many Officers are Kill'd that do advance: To this end, the *Out-Works* are to be well furniſh'd with Men, to keep continually Firing; and to render them the more able, they are to be Reliev'd twice a Day, and twice a Night.

It is very ordinary to the *Garriſon*, to make a great and brisk Sally about *Sun-riſing*, or break of Day, after a Stormy or Rainy Night, as opportunity admits, and to carry along with them a quantity of Nails to cloy the Guns, *Pick-Axes*, *Spades*, and *Shovels*, to throw down their Lodgment; ſome *Grenadiers* and *Musketoons*, to make a conſiderable Aſſault, and to throw down their Works in ſuch a manner, that the Enemy coming to regain Ground, may lie open to the Shot from the *Out-Works*, which ought eſpecially then to be well furniſh'd with Men, and in readineſs to make a continual Firing, to favour the Retreat of the Sally; and ſo by this means the Enemy ſhall not gain a Foot of Ground but at a very dear rate, and loſe much of his time before he be able to gain any of the *Out-Works*. The *Out-Works* ought to be *Mined* and *Retrenched*, and the *Mines* fired when the Enemy makes a Lodgment on them, and the *Garriſon* forc'd to retire to their *Retrenchments*.

The *Retrenchments* turn to account when their *Ditch* is 12 *feet* broad at Top, and 6 *feet* at the Bottom, and 8 *feet* deep; and the *Earth* that comes out of the *Ditch* makes a good *Parapet*. All theſe *Retrenchments* and Cuttings off, are to lie open towards the Town, or *Fortreſs*, with this *Proviſo* alſo, that they be not made ſo high, but that the main Works may overlook and Command them.

When the *Garriſon* is forc'd to quit their laſt *Retrenchments* on the *Out-Works*, and retreat into the Town, the Governor is to have the *Flanks* well furniſh'd with *Cannon*, which may beat upon the flanked *Angles*, and ſcour the *Ditch*; for there is nothing makes greater Slaughter, or with greater eaſe hinders *Undermining* than this; and it is almoſt impoſſible for the *Enemy* to make any *Lodgment*, or ſet any *Miners* at work upon the Body of the Place: And being not able to make a Breach, but by their *Cannon*, it is ſoon repair'd with *Palliſadoes*, and the *Baſtion* cut off and Retrench'd with *Mines* prepar'd under the Breach, and the *Batteries* made firm before they can Storm; and for ſome Days they cannot make any *Lodgment*, notwithſtanding they have won the *flank'd Angles*, and made a conſiderable Breach, even to the *foot* of the *Baſtion*, yet they cannot maintain it but with great Loſs; neither can they avoid the *Granadoes* and *Fire-works*, that will be continually caſt upon them, and ſo forced to approach by *Sap*, which may with all facility imaginable be Rencountered.

If the Enemy by diſmounting the *Guns* on the *Batteries*, with their *Counter-Batteries* approach to the Foot of the *Baſtion*, and ſet their *Miners* at work, and prepare their *Mines*, then the Governor is diligently to ſearch out the *Enemy*'s *Mines*; and being aſſured of the Place where they are hid, and a working, which may be done by ſetting a *Drum* on the place ſuſpected, with ſome *Dice* or *Peaſe* upon the Head of it, which with any ſtirring, will leap upon the *Drum*, when it ſtands over the Place where the *Miners* are at Work.

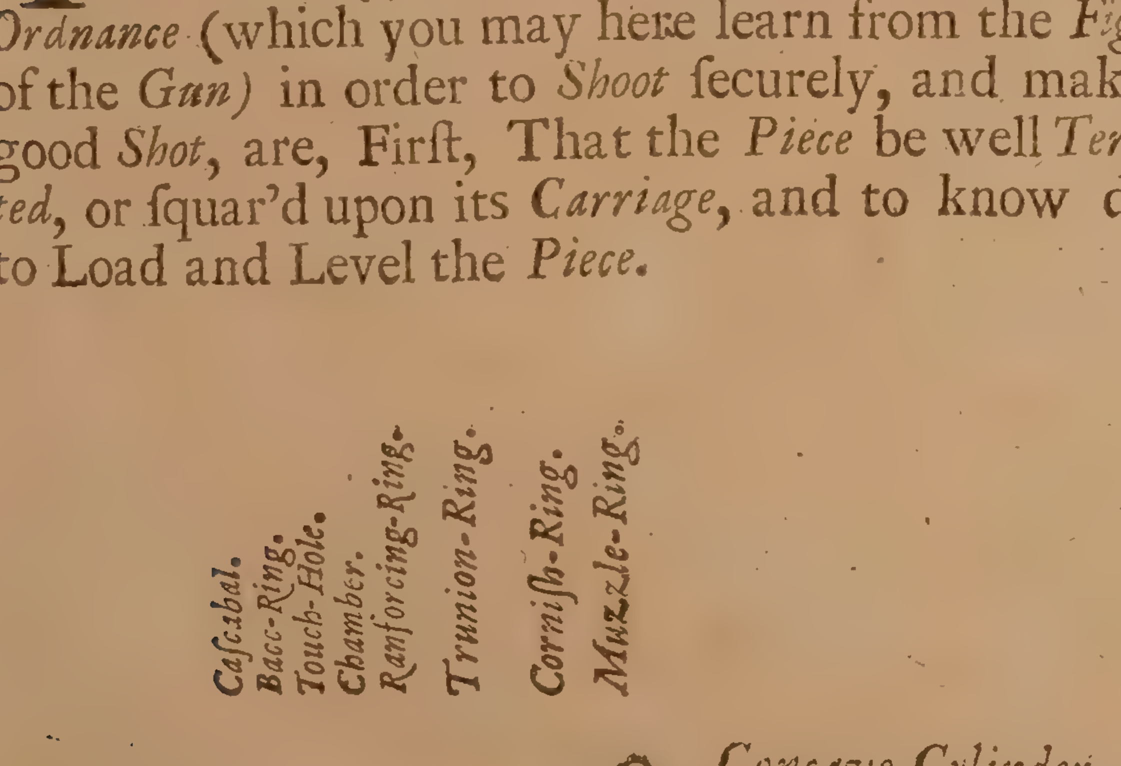
After the Place is thus found out, nothing remains but to make a *Counter-mine* againſt them, which is made after the ſame manner as a *Mine*, deſcrib'd in the laſt Chapter. Now, becauſe one is not ſure to meet juſt with the *Enemy*'s *Mine*, which may be made either too high or too low, therefore there are ſeveral *Mines* to be made, till by one of them the *Enemy*'s Mine is found out, and ſo take away their Powder out of the *Chamber*.

When an *Enemy*'s *Mine* is carry'd ſo ſecret and hidden, that one can't find it out; then the Garriſon muſt of neceſſity reſolve to quit that part of the *Rampart*, or *Baſtion*, under which they ſuſpect there is a Mine, and ſo Retrench and cut it off inwardly; but for their Advantage, they muſt make ready alſo their Counter-mines made in that Place, and *Chamber* their Powder, attending the effect of the *Enemy*'s *Mine*; and when they ſpring it, they muſt retire themſelves into their new *Work* cut off, or *Retrenchment*; and the *Enemy* being Lodg'd on that part of the *Rampart* or *Baſtion*, which they have quitted, then the *Counter-mine* is to be blown up. The like is alſo done in *Out-Works*, and on the *Counterſcarp*, when one is driven to quit them.

CHAP. XI.

Of GUNNERY.

THE General Things to be known in the Art of *Gunnery*, next after the *Names* and *Parts* of *Ordnance* (which you may here learn from the *Figure* of the *Gun*) in order to *Shoot* ſecurely, and make a good *Shot*, are, Firſt, That the *Piece* be well *Tertiated*, or ſquar'd upon its *Carriage*, and to know duly to Load and Level the *Piece*.



To *Tertiate* a *Piece*, is to know if it has its due thickneſs of *Metal* at the *Touch-hole*, *Trunions*, and *Neck*; by which you may judge at the ſtrength of the *Gun*, whether well fortified or no. This you do with a *Coliper* pair of *Compaſſes*; and if the *Piece* be Home-boar'd, the *Diameter* leſs by the Height divided by 2, is the thickneſs at any Place.

To *Quadrate*, or *Square* a *Piece* Mounted, is to ſee if it is directly placed, and equally poiſed, which depends on the *Carriage*, in regard of the *Wheels* and *Axle-Tree*.

To *Diſpart* a *Piece* of *Ordnance*, is to ſet ſuch a Mark upon the *Muzzle-Ring*, or thereabouts, that the viſual *Ray*, or *Sight-Line*, taken upon the Top of the *Baſe-Ring*, againſt the *Touch-hole*, by the Mark ſet at, or near the *Muzzle-Ring*, may be parallel to the *Axis* of the *Concave Cylinder*. To do this, take the *Diameters* of the *Baſe-Ring*, and the Place at the *Muzzle*, where you intend the *Diſpart* to ſtand; divide the difference of theſe two into two equal Parts, one of them will be the *Diſpart*, which you may ſet upon the *Gun* with *Pitch*, or *Wax*. If you have not *Compaſſes*, meaſure the *Cirles* about, and work with them.

The *Weights* of *Shot* are regulated by the *Cubes* of the *Diameters*, and by knowing the Weight of one, the Weight of any other is found thus:

A *Bullet* of *Iron* of 4 Inches *Diameter*, is found by Experience, to weigh 9 *lb.* and ſo is any other *Diameter* Cub'd to its Weight: Or as 9 *lb.* is to the *Cube* of 4, ſo is any other Weight to the *Cube-Root* of its *Diameter*. *Lead* and *Iron* in weight, is as 2 to 3, that is, a *Shot* of 2 *lb.* of *Iron*, and a *Shot* of 3 *lb.* of *Lead*, will have the ſame *Diameter* of height. *Iron* to *Stone* is as 3 to 8, *Lead* to *Stone* is as 4 to 1; that is, a *Bullet* of *Stone* of 10 *lb.* is equal in height to a *Bullet* of *Lead* of 40 *lb.* Therefore knowing what a *Bullet* of *Iron* of any *Diameter* weighs, you will find the weight of a *Bullet* of the ſame *Diameter* of *Lead*, and *Stone*; for *Lead* having the weight of 9 *lb.* of *Iron* for 4 *Inches Diameter*. If 3 give 2, what will 9 *lb.* give? Anſwer 6; and ſo of any other. As the *Shot* is regulated by the *Cubes* of the *Diameters*, ſo alſo is the *Powder*. Suppoſe 1 *lb.* ½ of *Powder* be a Charge for a *Falcon* of 2, 68 *Bore* of *Diameter*; what weight in *Powder* will be fit for a Charge of a *Cannon* of 7; The proportion is thus: As the *Cube* of 2, 68 is to 1 *lb.* ½ of *Powder*, ſo is the *Cube* of 7 to 26.

The Names of the *Pieces* of *Ordnance*, which are taken from the height of the *Bore*, are ſet down in the following *Table*, which gives in the firſt *Column* the Names of the *Pieces*; next, the weight of *Fortify'd Guns*; the Third, the height of the *Bore*; the Fourth, the height of the *Shot*; the Fifth, the weight of the *Shot*; the Sixth, the *Powder* for *Proof*; the Seventh, *Powder* for Service; the Eighth *Paces* (five *Foot* to a *Pace*) the *Piece* ſhoots *Point-blank*, or upon the *Level*; the Ninth the utmoſt *Random*, the *Piece* mounted to 45 *Degrees*; the Tenth, the *Horſes*; and the Eleventh, the *Men* requir'd to draw a *Piece* of *Ordnance*.

As to the ſeveral *Shootings* in *Artillery*, and the knowledge of the true Diſtance that any Piece will carry to, is a Matter that depends upon many Uncertainties, there being ſuch Varieties in the trueneſs of the *Bore*; in the heights of the *Shot*; in the ſtrength of the *Powder*; in the *Diſparts*; in the *Levelling* and *Direction*; in the *Air*, *Wind*, &c.

The *Ball*, when it is ſhot flies through the *Air* with a violent, mix'd and natural Motion, deſcribing a *Parabolicol Line*, in whoſe Beginning, and End, are *Lines* ſenſibly ſtreight,and in the middle Curv'd. The *Shootings*, or *Shots* in *Artillery*, are therefore three: The firſt is call'd *Point-Blank*, which is that Space, that the *Ball* flies in a *Line* ſenſibly right, without any Inclination. The ſecond is call'd the *Mean*, which comprehends all that Space the ſhot flies in a *Curv'd Line*. The third is call'd the *Dead-Shot*, which is the fall of the *Ball* by a ſenſible right *Line* towards the Ground, after that the Violence is ceaſed.

Gunners do take notice of theſe three Differences and *Ranges* of *Shot*, for three ſeveral Ends. The *Shots* of *Point-Blank* ſerve to Batter the *Ramparts* and *Walls* of *Forts* and *Caſtles*; the *Mean*, or *Middle Range*, to moleſt afar off the *Troops* in the *Campaign*, and in their *Quarters*, and to ruin the *Houſes* within the *Cities*, and *Caſtles*, &c. The *Dead-Shots* ſerve for *Mortars* to ſhoot *Bombs*, and other Artificial *Fire* upon the *Enemy*, eſpecially when they cannot be otherwiſe offended, nor ſeen; being cover'd behind with *Ramparts*, *Trenches*, *Hills*, and other *Eminennencies*.

A Shot *Point-Blank*, which is the moſt ordinary and moſt Important, is diſtinguiſh'd, in regard of the *Horizon*, and in regard of the Object which it ſtrikes. As to the *Horizon*, they are of three ſorts, Firſt, *Level*. Secondly, From *Low* to *High*. Thirdly, From *High*, to *Low*, call'd *Under Metal*.

The *Horizontal*, and by the Level of the *Chaſe*, or *Concave Cylinder*, is the moſt ſecure and certain.

That from *Low* to *High*, proves fallacious, becauſe by the Recoyling which the *Piece* makes, the *Shot* flies higher than the Mark: And that from *High* to *Low* is moſt fallacious, becauſe the *Shot* (beſides other notable Effects) comes more *Low* by the Recoyling of the *Piece*. Therefore an Experienced *Gunner* muſt remedy theſe Faults, by taking the due Advantages in *Shooting*.

As to the Object, a *Shot Point-Blank* is made either at *Right Angles* againſt the *Superfices* of the Object, or at oblique *Anglees*: At right *Angls* it ſtrikes more furiouſly than at oblique; therefore it is uſed againſt ſtrong *Walls*, to batter them; and are uſed to make *Batteries* of ſeveral *Tire*, and diſcharging them againſt the ſelf-ſame Mark, and in the ſame Inſtant. At oblique *Angles* they ſtrike either Croſs-ways, or Rebounding like a *Tennis-Ball*. If they ſtrike Croſs-ways, with two *Batteries*, one upon each ſide of the Object, it ruins more ſpeedily the Defence either of *Earth* or *Wall*: If they batter obliquely, or by a Rebound, which is done when they cannot do it right forward, as if one would batter a *Flank* cover'd with an *Orillon*, or *Shoulder*, one muſt ſtrike the *Curtain* in ſo fit a Place, and obliquely, that by the Rebound, the *Shot* may leap into the *Flank*; holding it for a *Maxim* in this Operation, *That the Angle of Incidence, is equal to the Angle of Reflection.*

The *Mean* or middle *Ranges* are diverſe, according to the different Elevations of *Ordnance*: The Elevations are regulated by the *Gunners Square*, which is an Inſtrument made of *Braſs* or *Wood*, of two right *Lines* (See *Fig.* 10. *Plate* 1.) one longer than the other, both which make a right *Angle*, from which, as from the *Center*, is deſcrib'd an *Arch* divided into 90 *Degrees*, or into 12 equal Parts, call'd *Points*; ſo much of the *Arch* as exceedeth a *Quadrant*; as 45 Degrees, or 6 Points, ſerves for ſhooting below the *Horizon*, as the *Quadrant* doth for above. From the *Center* hangs a *Thread* with a *Plumet*, the longeſt Leg put into the *Chaſe*, or *Concave Cylinders* of a Piece of *Ordnance*; the *Thread* cutting the *Arch*, doth ſhew the Degrees of Elevation, or Depreſſion; one never exceeds 6 Points, or 95 Degrees of Elevation, in ſhooting with long *Cannon*.

The *Dead-Shot*, which is made with *Mortars*, is done by giving Elevation from the *Points* 6, or 95 Degrees, to the *Point* 12, or 90 Degrees, which are meaſur'd with the *Square*, or with a particular *Inſtrument* like a Level, putting a *Staff* a-croſs the the Mouth of the *Mortar*, and upon that the *Quadrant*.

In *Shooting* in theſe, its obſerv'd, that at the ſixth *Point* is the fartheſt off, and that at the ſeventh *Point* comes the neareſt, and at the eighth *Point* nearer; and ſo nearer and nearer to the twelfth *Point*, in which the *Bomb* falls into the ſame Place from which it departed.

Of *Shots* made out of *Mortars*, betwixt the *Middle* or *Mean-Shot*, and the *Dead-Shot*, it is to be obſerv'd by Experience, thoſe are Equal which are equally remov'd from the ſixth *Point* of the *Quadrant*, viz. That the *Bomb* fall as far diſtant, being ſhot from the ſame *Piece*, and with the ſame ſtrength at the fifth as at the ſeventh *Point*, and the ſame thing at the fourth as at the eighth, and as much at the third as at the ninth, and ſecond as tenth.

Shots from the *Mortar-Pieces* are very fallacious, ſometimes flying farther, ſometimes ſhorter than needs, and the *Bombs* break in the Air; ſometimes after the fall they do not break, which gives time to the *Enemy* to retire, or to Choak it: Therefore to have a juſt Blow, and to take Effect, theſe following Advertiſements muſt be obſerv'd.

Firſt, One ought to know how many *Paces* are to the Place, which you would ſhoot, which may be done with an *Inſtrument*.

Secondly, That the *Bombs*, or other Bodies, which are to be *Shot*, be of equal weight, otherwiſe the *Shots* will vary.

Thirdly, That the *Carriage* in breadth be always upon a Level, and without any Deſcent, that it do not leap in Diſcharging.

Fourthly, That the *Powder*, with which the *Mortar* is loaded, be always of the ſame force and weight.

Fifthly, That the Charge of the *Mortar*, as well in *Powder*, as in *Wadding*, be always ramm'd in with Blows equally heavy, and of equal number.

Sixthly, that the *Fuſees* be newly made in thoſe Days they are to be us'd, and that they be made of a mixture proportionable to the Range the *Shot* ſhall make in the Air, and that it break in the very Fall; which Skill is in the *Fuſee* fill'd with mixture of Compoſition, which is to be ſuch, that altho' the *Bomb* fall in the Water, it ought to break.

CHAP. XII.

Of Mortars, and the ſeveral ſorts and uſes of them, for Bombs, Carcaſſes, &c.

HAving mention'd Mortars ſo often in the laſt Chapter of *Gunnery*, we ſhall not only from *Guillet*, give a brief Deſcription of a Mortar-piece, but add the ſeveral Sorts and Uſes of them: It's a ſhort Piece of Artillery reinforced, and of a wide Caliber, differing from a Cannon both in Form and Uſe; the Cannon ſerving to throw Ball, and the Mortar to throw *Bombs*, *Carcaſſes*, *Fire-pots*, and ſeveral other ſorts of *Fire-works*; as likewiſe *Stones*.

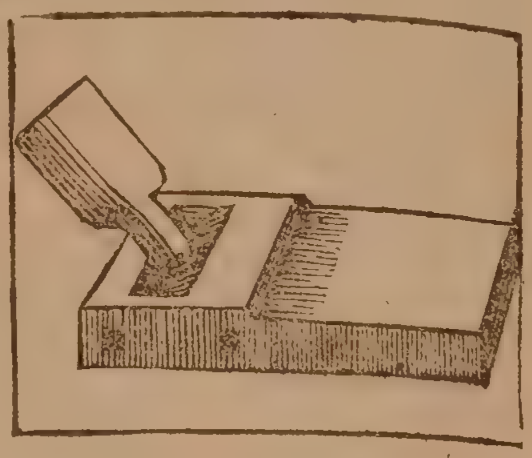
Mortars are us'd both by Sea and Land, but differ very much in Form: A Sea Mortar is generally thirteen Inches Diameter of the Bore, longer, and more reinforced than a Land-Mortar, becauſe they are fir'd with a greater quantity of Powder; ſometimes with thirty, or three and thirty Pounds: Some of them have their Beds or Stools of Metal, caſt in a Piece with the Mortars; others have them of a thick ſquare Piece of Oak, which by the help of Hand-Screws, or Jacks, is turn'd round upon a ſtrong Axis of Iron, to fire any way: They are always fix'd at an Elevation of 45 Degrees: They carry Bombs of 200 Pound, and generally weigh 9 or 10000 weight.

Land-Mortars are of different ſorts: Thoſe moſt us'd in *England*, are ten, thirteen, fifteen, and eighteen Inches Diameter. There are ſmaller Mortars of ſix or eight Inches. All but the eighteen Inch Mortars are mounted on a very thick Plank of Oak, on which riſe two Cheeks or Brackets on the ſides of the Mortar; but the eighteen Inch, is mounted on a low *Dutch* Carriage, conſiſting of two ſtrong Planks of Wood, bound with thick Plates of Iron, and joyn'd together with Tranſoms of Wood. All Land Mortars may be elevated to any Degree of the *Quadrant*: They have no Wheels, and therefore on a March, they are laid on a Block Carriage made on purpoſe. They are never carry'd along with the Army, becauſe of their great weight, except upon occaſion of a Siege or Bombardment: But a ſort of ſmall Mortars call'd *Hobits*, mounted on Gun-Carriages, are always a part of the Field Artillery. The *Hobits* are about ſix, ſometimes ſeven or eight Inches Diameter, have much ſhorter Carriages than the larger ones, and are very good for annoying the Enemy at a diſtance with ſmall Bombs, which they throw two or three Miles, or for keeping a Paſs, being loaded with Cartouches.

Now to make every thing as Intelligible as may be to the Gentle Reader; a *Cartouch* is a caſe of Wood, about three Inches thick at bottom, girt round with Marlin, holding about 400 Musket Balls, beſides ſix or eight Balls of Iron of a Pound weight. A new ſort of them was made in the Year 1703. much better than the former in *England*, of a Globular Form, and fill'd with Ball of a Pound weight; others were alſo then made for the Guns, being of Ball of half a quarter of a Pound weight, according to the nature of the Gun, ty'd in form of a Bunch of Grapes, on a Tompion of Wood, and Coated over; they were made in the room of the Partridge Shot formerly us'd, and exceed them very far, as ſome of the *French* Battalions Experimented to their Coſt, at the Battle of *Blenheim*.

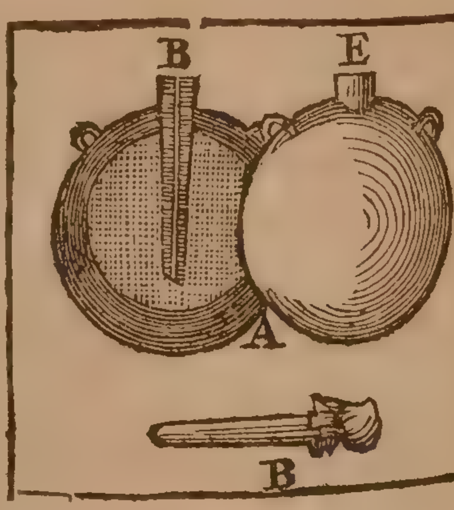
Hand-Mortars, are in like manner of ſeveral ſorts; as Tinker-Mortars, which are fix'd at the end of a Staff of about four Foot and an half long, the other end being ſhod with Iron, to ſtick into the Ground, while a Soldier with one Hand keeps it at an Elevation, and with the other Hand Fires. *Fire-lock-Mortars*, are fix'd in a Stock with a Lock like a Fire-lock; they ſwing between two Arches of Iron, with Holes anſwering one another, by which the Mortar is Elevated; theſe ſtand upon a Soal or Plank of Wood, and may be carry'd by one Man from one Place to another.

There are more ſorts of *Hand-Mortars*; but *Coehorn*'s new Invention exceeds them all, ſo as to deſerve a particular Deſcription.



They are made of Hammer'd Iron of four Inches Diameter of the Bore, ten Inches and an half long, and nine Inches in the Chace, fix'd upon a piece of Oak of twenty Inches long, ten and an half broad, and betwixt three and four thick: They ſtand fix'd at 45 Degrees of Elevation; they throw Hand-Granadoes, as all other Hand-Mortars do: They are placed in the Bottom of the Trenches at two Yards diſtance from one another, having each a Soldier to ſerve it, and an Officer to every forty or fifty, who lays them to what Elevation he pleaſes, by raiſing or ſinking the hind part of the Bed; three or 400 of them are ſometimes in Service at once, in different parts of the Trenches, 60, 70, or 80, in a Place: Thoſe in one Place fire all at once, immediately after the Batteries have done, and are anſwer'd from another part of the Trench, which flings ſuch a Shower of Hand-Granadoes into the Cover'd-Way, that thoſe that Defend it, cannot prevent being in Confuſion. Now, an Hand-Granado is only a Shell of Iron fill'd with fine Powder, which being fir'd, burſts the Metal in Pieces among thoſe that are near where it falls, who are oblig'd to quit their Poſts, or run the hazard of having their Legs and Arms broke and ſpoil'd: It has a Vent to receive a Fuſe, which is of the ſame Compoſition as that of a Bomb, (of which in the next Paragraph) that the Granado may not burſt in the Grenadier's Hand before it be deliver'd.

Having ſaid ſo much concerning Mortars (out of the largeſt of which they throw Bombs) this is a great Shell of Caſt Iron *A*, with a large Vent to receive a *Fuſee*: This *Fuſee B*, is made of Wood, and drove full of a Compoſition of Meal, Powder, Sulphur, and Salt-Petre: Now when the Bomb is fill'd with Powder, the Bombardiers drive the Surface into the Vent within an Inch of the Head, and Pitch it over to preſerve it; but when the Bomb is put into the Mortar, the *Fuſee* is Uncap'd, *E*. and ſalted with the flaſh of the Powder in the Chamber, and burns all the while the Bomb is in the Air: When the Compoſition is ſpent, it fires the Powder in the Bomb, which being confin'd, breaks the Bomb with great Violence, blowing up whatever is about it; for the great height it goes in the Air, and the force with which it falls, makes it go deep into the Earth.



As for *Carcaſſes*, they are repreſented by the following Figure *A*. It's an Invention of an Oval form, made of Ribs of Iron, afterwards fill'd with a Compoſition of Meal-powder, Salt-petre, Sulphur, broken

broken Glaſs, ſhavings of Horn, Pitch, Turpentine, Tallow, and Linſed-Oyl, and then Coated over with a Pitch'd Cloth: it's Prim'd withMeal-powder and Quick-Match, and fir'd out of a Mortar; the Deſign being to ſet Houſes on Fire. For lifting it up to put it into the Mortar, it has too ſmall Cords fixed to the ſides of it. Another ſort there is of them of a late Invention for the Sea Service, which does not differ from a Bomb, ſave its being fill'd with a Compoſition as before, and having Five holes all Prim'd with Powder and Quick-Match, which takes fire from the flaſh of the Mortar; and having fir'd the Compoſition, it burns very vehemently from thoſe Holes, Letter *B.*

To meaſure a juſt Time, is done by filling a *Fuſee* after the ordinary manner. Take a ſmall Barrel or Cane of Iron of equal Bore to that of the *Fuſee*, but ſomewhat longer, with many little Holes all along its length, and filling it in the ſame manner as the *Fuſee*; then the Bomb being fitted to the Mortar, you give Fire at the ſame time to the *Fuſee* in the Mortar and the Iron Barrel, letting the Barrel burn until you ſee the Bomb break, in which Moment you obſerve the Barrel, and to what Hole the Fire burns down, which will give an aſſured Mark of the Time the *Fuſee* ought to have.

If the Bomb in the very Fall ſhall break, the ſame quantity of Compoſition ſhall be continu'd in the *Fuſee*; but if it break before the Fall, you muſt abate the Heat, by adding a ſmall mixture of *Charcoal-Duſt* incorporated in the ſame Compoſition: And if after it Fall, it ſhall delay its Effect, then you ſhall joyn with its Mixture a little fine *Powder-Duſt*: And ſo you may by Experience with this Barrel, obſerve into what Mark or Hole it burns, ſo that with ſuch *Fuſees* the *Bomb* ſhall juſtly break in the very Fall among the Enemies, obſerving always to fill the Barrel with the ſame Mixture.

MUSICK.

Muſick is the Art of making Harmony, either by *Voice* or *Inſtrument*: Or (which is the ſame thing) the Art of well Singing, or playing on *Muſical Inſtruments*. The firſt is call'd *Vocal*, the other *Inſtrumental Muſick*, and conſiſts both of *Sounds*.

A *Sound* is that which affects the *Ear*, of which there are two Sorts, *Simple* and *Compound*: The *Simple* is conſider'd by itſelf.

There are but 20 *Simple* or *Single Sounds*, mention'd by *Muſicians*, from *Gam-ut* to *E-la*, and all contain'd in the *Gam-ut*; which is call'd the *Scale*, invented by one *Guido Aratin*, an *Italian*, the better to learn to *Sing* and *Play* well: The Enumeration of which *Simple Sounds* take as followeth.

The firſt, *Gam-ut*; ſecond, *A-re*; third, *B-mi*; fourth, *C-fa-ut*; fifth, *D-ſol-re*; ſixth, *E-la-mi*; ſeventh, *F-fa-ut*; eighth, *G-ſol-re*; ninth, *A-la-mi-re*; tenth, *B-fa-B-mi*; eleventh, *C-ſol-fa-ut*; twelfth, *D-la-ſol-re*; thirteenth, *E-la-mi*; fourteenth, *F-fa-ut*; fifteenth, *G-ſol-re-ut*; ſixteenth, *A-la-mi-re*; ſeventeenth, *B-fa-B-mi*; eighteenth, *C-ſol-fa*; nineteenth *D-la-ſol*; twentieth *E-la*.

Of which *Simple Sounds*, firſt are to be conſider'd the *Accidents*, and then their *Diviſion*.

Their *Accidents* are *Muſical Time*, or *Meaſure*.

Time in *Muſick*, is a Quantity which either lengthens, or ſhortens the *Sound*.

The *Muſical Time* to expreſs the *Sound*, is known by eight *Characters*, viz. *A Large*, *a Long*, *a Breve*, *a Semi-Breve*, *a Minim*, *a Crotchet*, *a Quaver*, and a *Semi-Quaver*.

But the Time to ſuppreſs the *Sound* is different, that is, in ſeveral ſorts of *Reſts* or *Pauſes*, longer and ſhorter.

Muſical Meaſure, is that by which the aforeſaid *Simple Sounds* are Meaſur'd.

There are two ſorts of *Meaſure* in *Muſick*; the one *Spondaick*, and call'd by the Modern *Muſicians Imperfect* or *Duple*; the other *Trochaick*, which they call *Perfect*, or *Triple*.

Secondly, theſe *Simple Sounds* are divided into ſeven *Hexachords*, vulgarly call'd *Cliffs*.

An *Hexachord* is a Deduction, or Conduct of ſix *Voices*, as *Ut*, *Re*, *Mi*, *Fa*, *Sol*, *La*.

The three firſt of which *Cliffs* that have *G* for their *Character*, are rough and harſh, and call'd *Tunes* of *B. Sharp*.

The two others, whoſe *Characters* are *F*, are ſoft and ſweet, and are call'd *Tunes* of *B Flat*.

But the other two, whoſe Character is *C*, are the Mean, and between both, and are call'd *Tunes* of a natural *Key*.

It often happens, in theſe *Cleffs*, that the Naural *Song* is chang'd into *B Flat*, or into the contrary: But *Tunes* in *B Sharp*, are never chang'd into *B Flat*, nor thoſe in *B Flat*, into *B Sharp*.

The *Compound Sound*, is that which is compounded, and repeated with another.

The *Compoſition* of *Sounds*, is call'd in *Muſick Interval*; that is to ſay, *Muſical Concord*, as well of the *Voice*, as on *Inſtruments*; of which ſome are Principal *Chiefs*, the others Effects of the *Chiefs*.

There are three *Chiefs*, viz. a *Tone*, a *Semi-Tone*, and a *Dieſis*: And four Effects of the *Chiefs*; as *Diateſſaron*, *Diapente*, *Diapaſon*, and double *Diapaſon*.

A *Tone* is an Interval of *Muſick*, compos'd of two half *Tones*, and proceeding from a *Seſquioctave ration*.

Muſicians call it the Second Perfect: For Example, If when two Sing, one ſings *Ut*, and the other *Re*, this Compoſition of Sounds is call'd a *Tone*.

A *Demi-Tone* is the Moity of a *Tone*, or of a *Seſquioctave*.

A *Tone* can't be divided by Numbers into two unequal Parts, but only into equal; for when you have divided a *Tone* into two Parts, you have two *Demi-Tones*: That which is the Sharp of the two, is call'd the *Demi-Tone Major*, or Greater, and is ſeldom in uſe; the other which is Flat, is call'd the *Minor*, or leſs *Demi-Tone*, and is only in uſe, and call'd the ſecond Imperfect, which is made from *Mi*, to *Fa*.

A *Dieſis* or *Perfation*, (call'd by *Bœtius* a leſſer *Demi-Tone*) is the ſmalleſt of the *Intervals*; that is to ſay, the fourth part of a *Tone*, or a *Seſquioctave*.

A *Diateſſaron* is a ſoft imperfect Fourth, which is frequently uſed, as from *Ut* to *Fa*: It contains two *Tones*, and a leſs *Demi-Tone*.

A *Diapente* is call'd a Fifth, which is a very ſweet and frequent *Interval*; it contains three *Tones*, and one leſs *Demi-Tone*.

A *Diapaſon* is a moſt perfect *Interval*, and very much in uſe, and conſiſts of eight *Sounds*, and is call'd an *Octave*: It contains five *Tones*, and two leſs *Demi-Tones*.

A Double *Diapaſon* is the fifteenth, or a double *Octave*; and ſo two *Octaves* make one entire Body of *Concords*, viz. The greateſt *Syſtem* and *Interval* in *Muſick*, which is ſo vulgarly call'd, as a little before, ſo as well here below; that is to ſay, twice through all the *Sounds* and eſſential *Chords*, *A,B,C,D,E,F,G.*

Beſides this *Tract* of *Muſick*, which is adapted to the *Eliptical Table*, 'Tis thought fit to add this folloing Diſcourſe, as recommended from a Perſon very Knowing in the ſaid *Art*, where he ſaith, That the two chief Parts of *Muſick* are *Compoſition* and *Modulation*.

Compoſition is ſetting together of ſeveral *Muſical Notes*, into a *Tune* of ſeveral Parts, into a *Conſort* fit to be *Sung* or *Play'd*.

There chiefly belongs to *Compoſition*, the Knowledge of the *Chords*, of the *Moods*, and of the ſeveral Parts which make up a *Muſick Conſort*.

In all the ſeven *Notes*, (for there are in Nature but ſeven diſtinct *Sounds*, however repeated in different *Keys*) an Eighth, being but a *Union* to the firſt, a Ninth, to the ſecond; a Tenth, to the third; an Eleventh, to the fourth; a Twelfth, to the fifth; a Thirteenth, to the ſixth; a Fourteenth to the ſeventh: So likewiſe in a higher *Key*, a Fifteenth to the eighth; a Sixteenth, to the ninth; and ſo of the reſt. In all the ſeven *Notes* (for an Eighth, is but the firſt of another *Septenary*; and every *Note* whatſoever is a Firſt, or *Union*, in reference to its *Octave*) there are five *Concords*, and two *Diſcords*; of the five *Concords*, three are perfect *Chords*, and two *Imperfect*.

The three *Perfect*, are an *Octave*, call'd by the *Greeks*, *Diapaſon*; that is, from *A-re* the *Proſlambanomenos*, to *Elamire*, the *Meſe* of the *Greeks*. A Fifth, call'd *Diapente*; that is, from *B-mi* the *Hypate Hypaton*, to *F-fa-ut*, the *Parhypate Meſon* of the *Greeks*; a Fourth, call'd *Diateſſeron*, that is, from *D-ſol-re*, the *Licanos-Hyppaton*, to *G-ſol-re-ut*, the *Licanos-Meſon* of the *Greeks*.

The two *Imperfect*, are a Third, call'd by the *Greeks*, *Ditonom*; that is, from *C-fa-ut*, the *Parhypate-Hypaton*, to *E-la-mi*, the *Hypate-Meſon* of the *Greeks*. A Sixth, call'd *Hexachordon*; that is, from *F-fa-ut*, the *Parhypate-Meſon*, to *D-ſol-re*, above the *Nete Synemenon* of the *Greeks*.

The two *Diſcords* are a ſecond; otherwiſe call'd a whole *Tone*; that is, from *C-ſol-fa-ut*, the *Paranete-Synemenon*, to *D-ſol-re-ut*, the *Nete-Synemenon* of the *Greeks*; and a Seventh, call'd *Heptachodron*; that is, from *D-ſol-re*, the *Nete-Synomenon*, to *G-ſol-re-ut*, in the higher *Key* to the *Poranete-Hypaton* of the *Greeks*.

The moſt uſual *Moods* of the *Greeks* (for *Alpinus* names fifteen) were five, the *Dorick*, the *Lydian*, the *Æolick*, the *Phrygian*, and the *Ionick*. What the Uſe and Nature of theſe *Greek Moods* was, is not certainly determined, even by the moſt diligent Enquirers into the *Muſick* of the Ancients; only thus much is generally noted, That the *Dorick* is the moſt Graver and Solid; the *Lydian* the moſt Sprightly, and what we now-a-days generally call *Air*.

There are reckon'd among the Moderns four *Moods*; two great, the *Perfect* of the More, and the *Imperfect* of the Leſs: But of theſe the two laſt alone are chiefly in Uſe.

The *Imperfect* of the More, is, when three *Minims* go to the *Semi-brief*, with a *Prick* of Perfection; this is call'd *Triple-time*, and hath uſually this Mark $\overset{\mathrm{C}}{_3}$.

The *Imperfect* of the Leſs, hath as the former, two *Longs* to a *Large*, two *Breves* to a *Long*, and two *Semi-brieves* to a *Brieve*; but in this it differs, that it hath alſo but two *Minims* to a *Semi-brief*, &c. and this is call'd *Time*, and thus mark'd 𝄵

The Parts of Muſical Conſort.

THere are indeed in *Muſical Conſort* but three Material Parts, *viz. Treble*, *Mean*, and *Baſe*; but our *Muſicians* commonly make four Parts, *viz.* the *Supremus*, or *Cantus*, that is, the *Treble*; the *Altus*, or *Counter-Tenor*; the *Tenor*, which we call the *Mean*, or *Tenor*; and the *Baſſus*, which we call the *Baſe*, or loweſt Part.

In the ordering of theſe *Parts*, there are two ſeveral ways of *Compoſition*, viz. *Counter-Point*, and *Deſcant*.

Counter-Point, is a ſetting of Parts together in ſuch ſort, that they may anſwer each other exactly, *Note* for *Note*.

Deſcant, is the ſetting of Parts together in ſuch ſort, that the *Notes* of one may anſwer to thoſe of the other, not in equality of *Number*, but only in *Time* and *Proportion*; as two *Minims*, or four *Crotchets* to a *Semi-brief*, and in like manner in all the reſt.

Modulation, is the *Muſical* Performance, or expreſſion for Harmony, by *Singing* or *Playing* upon an *Inſtrument*.

In *Singing* or *Playing*, there are five Things to be obſerved. 1. The Number of their *Notes*. 2. Their *Names*. 3. Their *Tunes*. 4. Their *Times*. And 5. Their *Adjuncts*.

The Number of *Muſical Notes* is indeed but ſeven; for tho' from the loweſt of a Man's *Baſe*, to the higheſt of a Boy's or Woman's *Treble*, there are reckoned 21 *Notes*, yet they are really but 7, three times repeated; ſo that the whole *Scale* of *Muſick*, commonly call'd the *Gam-ut*, ſhould reach from *Gam-ut* below to *F-fa-ut* above; that is, from *G*, to *F*, in the loweſt *Septenary*, or *Baſe*; from *G*, to *F*, in the middle *Septanary* or *Mean*; and again from *G*, to *F*, in the higheſt *Septenary*, or *Treble*. But the moſt uſual *Scale* falls ſhort a *Note* in the third *Septenary*, reaching but to *E-la*; this poſſibly being ſuppoſed the ordinary Compaſs of a *Voice*. But ſome there are, who add to the *Scale* ſeveral *Notes* beneath *Gam-ut*, and above *E-la*, in *Alt*; this increaſed *Scale* being probably ſuppoſed, the extraordinary Compaſs of the *Voice*, or *Inſtrument*.

The ſecond Thing to be obſerv'd in *Singing* or *Playing*, is the Knowledge of the Names of the ſeveral *Notes*, which are commonly joyn'd with the ſeven firſt *Letters* of the *Alphabet*, which are properly to be look'd upon as the *Cleffs*, or *Signs* of the *Notes*.

The *Names* of the Seven *Notes* are, *Ut*, *Re*, *Mi*, *Fa*, *Sol*, *La*, *Fa*; where Note, that the ſeventh, is call'd by the ſame Name as the fourth, as being but half a *Tone* above *La*, as *Fa* is above *Mi*; and the Truth is, conſidering that *Ut* and *Re*, are much rejected by Modern *Muſicians*, or at leaſt accounted but the ſame with *Sol* and *La*. There are indeed but four ſingle Names, *viz. Mi*, *Fa*, *Sol*, *La*, tho' oft repeated, and variouſly commix'd one with another, as appears in the following *Gam-ut*, or *Scale* of *Muſick*.

The *Treble*, or higheſt *Septenary*.
F-fa-ut,
E-la,
De-la-ſol,
C-ſol-fa,
B-fa-bi-mi,
A-la-mi-re,
G-ſol-re-ut,

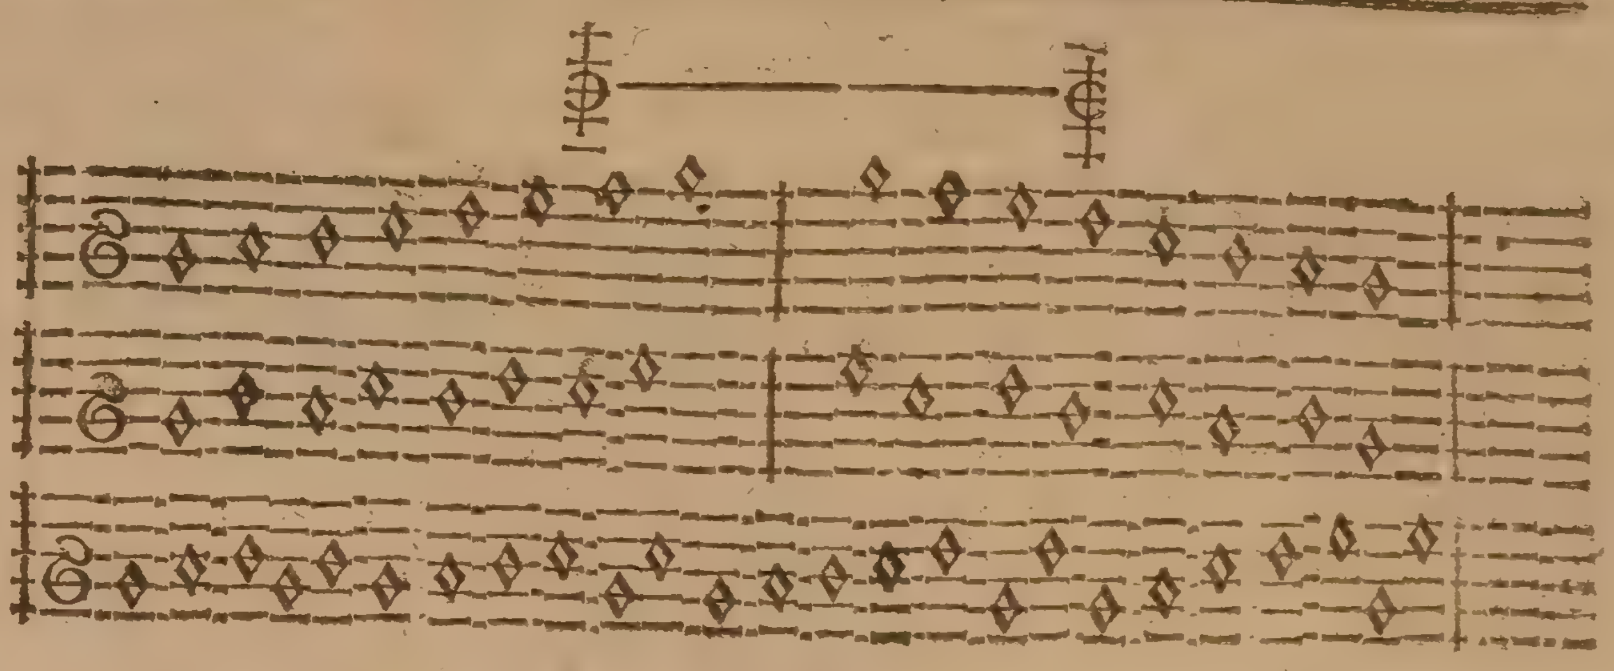
The *Mean*, or middle *Septenary*.
F-fa-ut,
E-la-mi,
D-la-ſol-re,
C-ſol-fa-ut,
B-fa-bi-mi,
A-la-mi-re,
G-ſol-re-ut.

The *Baſe*, or loweſt *Septenary*.
F-fa-ut,
E-la-mi,
D-ſol-re,
C-fa-ut,
B-mi,
A-re,
Gam-ut.

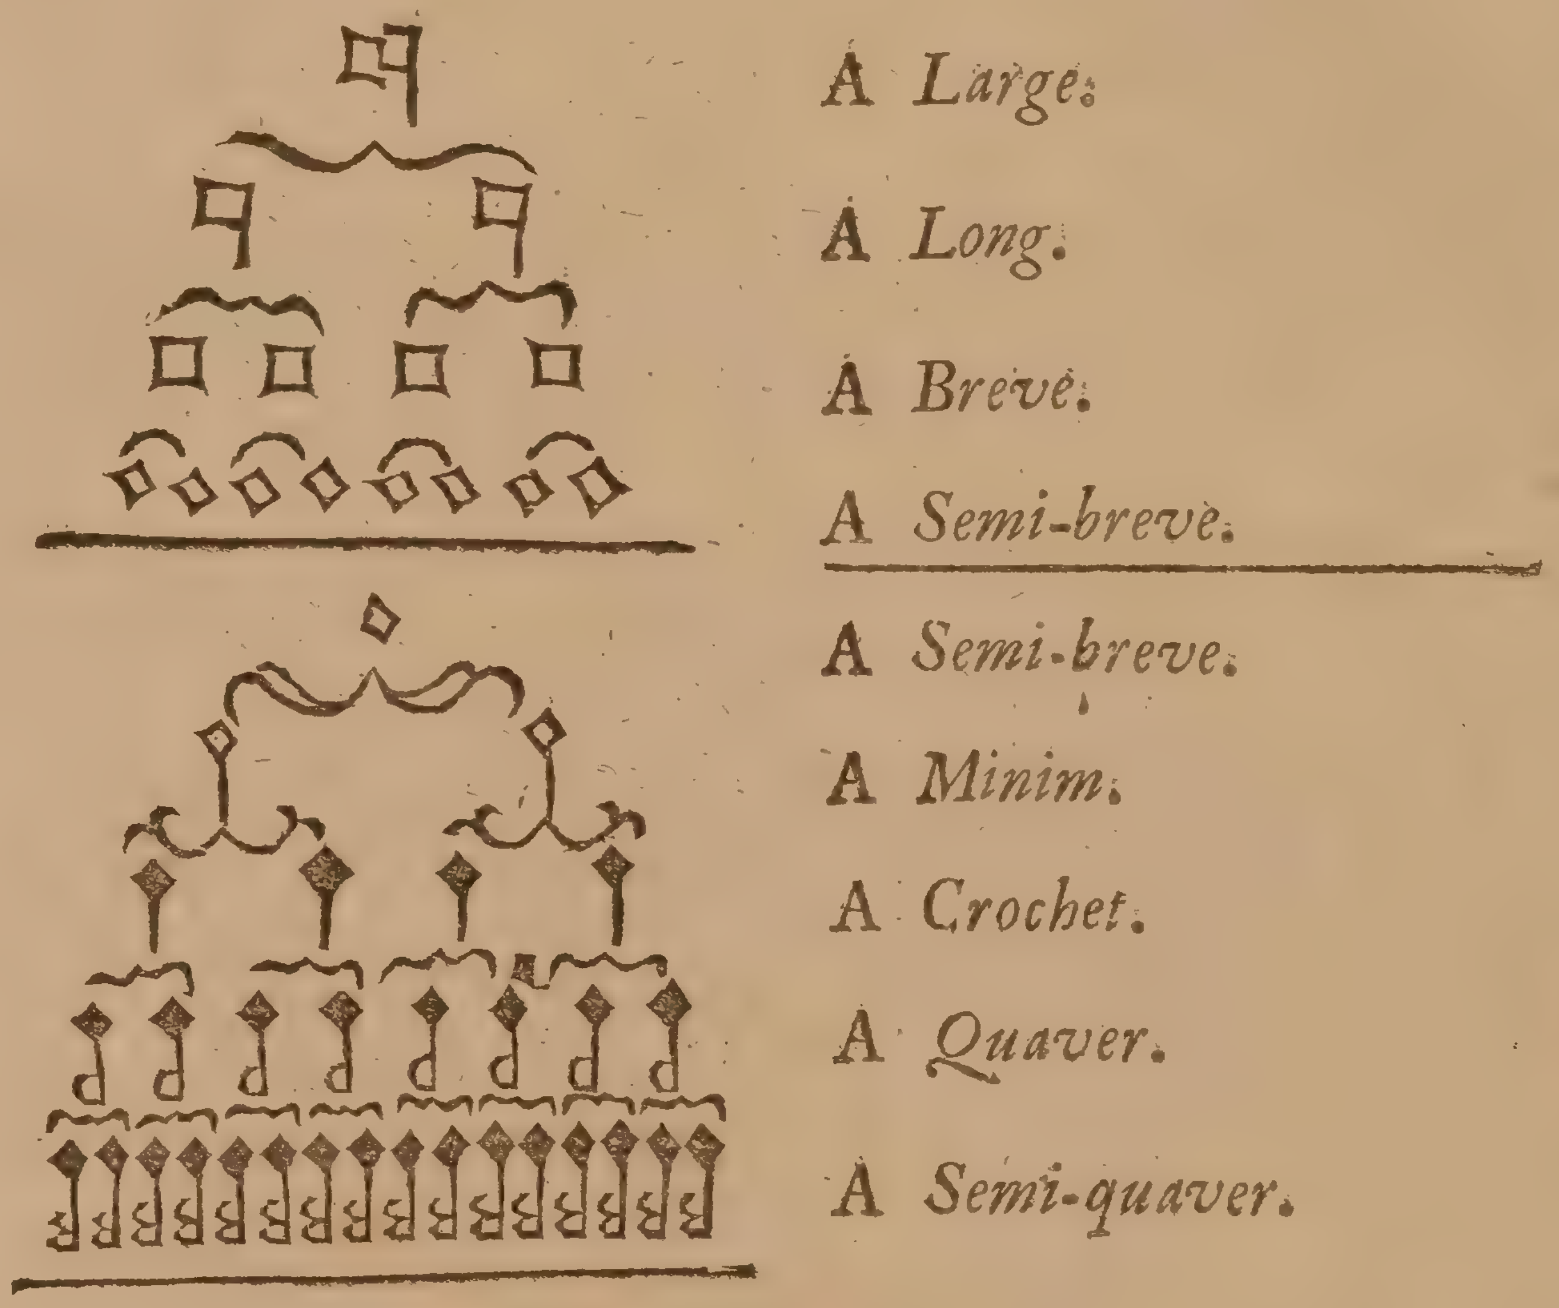
Of the ſeven *Cleffs*, or *Keys*, noted by the ſeven *Letters*, four only are in uſe; the firſt is *F-fa-ut Cleff*, which is peculiar to the *Baſſus*, or lower *Part*; and at the beginning of *Songs* and *Muſical Airs*, is ſet upon the uppermoſt *Line* but one, and is thus Mark'd The Second is *C-ſol-fa-ut*, which belongs to the *Mean*, or *Middle Part*, and is commonly, (but not always) upon the middlemoſt *Line*, and is thus Mark'd The Third is *G-ſol-re-ut Cleff*, which is appropriate to the *Treble*, or uppermoſt *Part*; and at the beginning of *Leſſons*, or *Songs*, is uſually ſet on the lowermoſt *Line* but one, being thus Mark'd . Theſe are the three firſt and Signed *Cleffs*. The Fourth, which is call'd *B Cleff*, is unfix'd to any particular *Part*, but goes through all, and ſerves wherever it is for the Flatning, or Sharpning of *Notes*, where it is call'd *B-fa*, or *B flat*, and is thus Mark'd (♭); where it ſharpneth, it is call'd *B-mi* or *B ſharp*, being thus Mark'd .

Of all the four *Notes*, *Mi* is the principal, and claims a ſtation in theſe Places, *viz.* in *B-mi*, *E-la-mi*, and *A-la-mi-re*. In the firſt, as in its proper Station, in the others when *B flat* chanceth to be plac'd there; alſo moreover immediately from *Mi*, *Fa-ſol-la*, is ſung twice upwards, and *La-ſol-fa*, twice downwards, and then you return to *Mi* again.

The third Thing to be conſider'd in *Singing* or *Playing*, is the Knowledge of the *Tunes* of the *Notes*, wherein this Thing is chiefly to be obſerv'd, *viz.* That from *Mi* to *Fa*, and from *La* to *Fa*, is but half a *Tone*; but between any other two *Notes* is a whole *Tone*, as will appear in theſe following Examples.



The fourth Thing to be conſider'd in *Singing*, or *Playing*, is the *Time* of *Muſical Notes*, which is denoted by eight ſeveral *Terms* of Diſtinction, each having their ſeveral *Marks* or *Characters*, and each comprehending the other double, *viz.* a *Large* contains two *Longs*, a *Long* two *Breves*, a *Breve* two *Semibreves*, &c.



The fifth Thing to be conſider'd, is the knowing the *Adjuncts*, which are theſe, *viz.* A *Tye*, a *Repeat*, a *Pauſe*, a *Direct*, and a *Cloſe*.

A *Tye* is a Mark by which two *Notes* are ſignified to be joyn'd together, and eſpecially when two *Notes* are to be Sung to one *Syllable*: This *Tye* is made by a *Semi-circle*, whoſe two Ends point to the two *Notes* conjoyn'd; as thus 
A *Repeat* is to ſignifie, that a part of a *Song*, or *Leſſon*, is to be Sung, or Play'd over again from that *Note* over which it is plac'd, and it is thus mark'd .

A *Pauſe*, or *Reſt*, is to ſignifie a ceaſing for the ſpace of ſome *Note* Sung or Play'd: This *Pauſe* is nam'd according to the Name of the *Note* for which it ſtays; as a *Large-Reſt*, a *Breve-Reſt*, a *Semibreve-Reſt*, &c. all thus Noted: 
A *Direct* is to ſhew at the end of one *Line*, where a *Note* ſtands in the beginning of the next *Line*; as thus mark'd 
A *Cloſe* is the end of a *Song*, or *Strain*; the firſt is call'd *Perfect*, and thus mark'd . The other *Imperfect*, and thus mark'd .

As to the exact *Rules* of *Compoſing*, I refer you to larger Volumes of that *Subject*, it not being deſign'd here.

CHRONOLOGY.

CHAP. I.

Of the DAY.

THE *Day* is either *Aſtronomical*, or *Political*, otherwiſe call'd Civil: The *Aſtronomical* is that which is ſo term'd by *Aſtronomers*, and is divided into *Natural* and *Artificial*.

I. The *Natural Day* is that interval of Time wherein the *Sun* departing from any Point of the *Heavens*, or from the *Meridian*, returns again to the ſame Point: Or otherwiſe it may be Defin'd, The *Sun*'s converſion from any firſt *Meridian* to the ſame again, which is perform'd in the ſpace of 24 equal *Hours*.

2. The *Artificial Day*, is the ſpace of Time from *Sun-riſing* to *Sun-ſetting*, or the whole Time of the *Sun*'s ſhining in our *Hemiſphere*, the oppoſite Time whereof muſt accordingly be call'd *Artificial Night*.

Note, That the *Artificial Day* differs from the *Natural*, in regard the *Natural* is always and every where the ſame; whereas, the *Artificial* hath almoſt always a perpetual Mutation, eſpecially in Regions remote from the *Æquator*; for, as I ſaid, the *Artificial Day* comprehends only the ſpace of Time comprehended between the *Sun*'s Riſing and Setting, being ſhorter in Winter, and longer in Summer.

Note Secondly, that the *Days* are longer in Summer by reaſon of the *Sun*'s longer continuing above the *Horizon*, and the larger *Arches* of *Heaven* the *Sun* runs through in reſpect to our *Horizon*; as you may ſee in the Deſcription of the *Sphere*: On the contrary, the *Diurnal Arches* the *Sun* makes in Winter, are ſhorter. The *Diurnal* and *Nocturnal Arches* appear almoſt all equal. Not to ſpeak of the *Twilight*'s being an Impreſſion of Light from the Sunbeams upon the Air, either before *Sun-riſing*, which is call'd *Diluculum*, or *Day-break*, or in the Evening after *Sun-ſet*.

Note Thirdly, That the *Natutal Day* hath not the ſame beginning among all People, but is determined according to the different Inſtitution of each of them. The *Babylonians* uſe to denominate the *Day* from one *Sun-riſing* to another. The *Italians* on the contrary from one *Sun-ſetting* to another, and accordingly they number their *Hours*. The Ancient *Romans*, and accordingly the *Romiſh Church*, at this Day reckon from Midnight to Midnight. The *Arabians* and *Aſtronomers* from *Moon* to *Moon*, becauſe the *Sun* and *Stars* keep always the ſame Regularity to each other, in reſpect of the *Meridian Circle*, but not in reſpect of the *Horizon*, which always varies according to the variety of the *Polar Elevation*.

Nor can we in reſpect to the *Holy Scriptures*, omit the Cuſtom of the ancient *Jews*, who, as they were commanded by God, began all their Feaſts from the foregoing *Sun-ſetting*, according to that of *Leviticus*, *from Evening to Evening ye ſhall celebrate your Sabbaths.* Contrarily the *Tyrians* began their *Day* from the *Sun-riſing*; and probably in this Matter they differ'd not from the *Babylonians*, and other Neighbouring Provinces, who computed the *Hours* not from *Sun-riſing*, but from its *Setting*.

Further *Note*, This *Natural Day* conſiſting of *Artificial Day* and *Night*, is call'd *Civil*, or *Political*, as it takes beginning or ending from the different Inſtitution of *People* and *Countries*: And of theſe *Political Days* ſome *Feſtival* or *Holy-Days*, in which Shops are ſhut up, and common Works laid aſide, or *Working-Days*, allotted for the exerciſe of all manner of Works and Profeſſions; and theſe *Days* are noted in theſe *Tables*, or *Books*, which from the *Arabians* we call *Almanacks*, and from the *Latins*, *Calenders*; for a *Calender* is the Order and Series of all Months, *Lunations*, and *Feſtival-Days*, which happen through the *Year*; and it is call'd *Calender* from the *Calends*, which are the firſt *Days* of every *Month*.

CHAP. II.

Of the HOURS.

AN *Hour* is one of thoſe leſſer Spaces of *Time*, into which every *Day* of the *Year* is continually divided. It is more particularly thus Defin'd: An *Hour* is the 24th part of a *Natural*, or the 12th of an *Artificial Day*.

Note Firſt, That of *Hours* ſome are call'd *Equal*, which are the 24Parts(as have been ſaid)of a *Natural Day*, otherwiſe term'd *Aſtronomical*, or *Equinoctial*; becauſe each of them is that ſpace of *Time* wherein the *Equator* aſcends 15 Degrees above the *Horizon*, or in which the *Sun* in his Courſe runs through 15 *Meridians*: Each *Hour* is divided into four *Quarters*, and every *Quarter* into 15 *Minutes*, or *Scruples*, making in the whole 60.

Note Secondly, Others are call'd *Unequal Hours* by the *Greeks*. There are 12 Parts as well of *Day* as of *Night*; that is, as well of that Time wherein the *Sun* is above the *Horizon*, as wherein he ſtays beneath it: And they are call'd *Unequal*, not that the *Hours* of one and the ſame *Day* or *Night* are unequal among themſelves; but becauſe when as there are 12 equal Parts of unequal *Days*; that is, of *Summer-Days* and *Winter-Days*, it muſt neceſſarily follow, that the *Summer* and *Winter-Hours*, are by this means unequal among themſelves. They are alſo call'd *Unequal*, becauſe in the *Summer* time the *Diurnal Hours* are longeſt, and the *Nocturnal* ſhorteſt; but in the *Winter* time quite contrary. They are alſo call'd *Temporary*, becauſe according to the diverſity, that is, the *Length* or *Shortneſs* of *Days* they have different *Magnitudes*. Laſtly, They are ſaid to be *Planetary*, in regard certain Ancient *Aſtronomers* were of Opinion, that the ſeven *Planets* rul'd the Hours ſucceſſively; that is, in ſuch a manner as this, That the firſt Hour of the *Day* ſhould be allotted to that *Planet* from whence the ſaid *Day* took Denomination.

It is to be obſerv'd out of *Baronius*, in his Remarks upon the *Year* of our *Lord* 34, That the *Jews* divided as well the *Day* as the *Night*, not only into 12 *Temporary Hours*, but alſo into 12 *Equal Parts*, as it were, into 4 *Stations*, each of which contain'd 3 of thoſe which are call'd *Temporary* and *Unequal Hours*; but the 4 Parts of the *Night* were call'd *Vigiliæ*, by a Name borrow'd from *Vigiles*. The firſt began at *Sun-ſetting*; the ſecond ended at *Mid-night*, where alſo the third began; and the fourth ended at *Sun-riſing*.

Now, the 4 Parts of the *Day* were properly call'd *Hours*, each conſiſting (as aforeſaid) of 3 *Temporary Hours*, ſo as at the laſt part of this ſort of *Hour*, that is, the Second, was the Sixth *Common* and *Temporary Hour*, which the Third proper *Hour* of the *Jews* follow'd, containing of the *Temporary Hours* the Seventh, Eighth, and Ninth: And according to this Calculation, St. *Mark* rightly ſaith, that our *Saviour Jeſus Chriſt*, was Crucify'd in the *Third Hour*, that is, in the Third of thoſe Four equal *Stations* into which the whole *Day* was divided; whereas, St. *John* Writing, that he was Condemn'd by *Pilate* in the *Sixth Hour*; that is, in the Sixth *Temporary*, or *Vulgar Hour*.

CHAP. III.

Of the WEEK.

THE *Week*, call'd by the *Latins*, *Septimana*, is a Period of 7 *Days*, ſtill circling in a *Ring*; firſt Inſtituted by *God* in the beginning of the *World*, Religiouſly obſerv'd by the *Hebrews*, and the Obſervation thereof deliver'd by Tradition from them to others. But the *Hebrews* themſelves call'd the principal *Day* of the *Week*, the *Sabbath*, as it were a *Day* of *Reſt*, in which *God* is ſaid to have Reſted after his finiſhing the *World's Creation*: Moreover, among them this *Day* gave Name to the whole *Week*; ſo that *Sabbatum* was the ſame as *Hebdomada*; and what we call the firſt, ſecond, or third *Day* of the Week, &c. was by them call'd the firſt, ſecond, or third *Day*, &c. of the *Sabbath*.

The *Ethnicks* gave to each of theſe *Days*, the Name of one of the 7 *Planets*, taking beginning from the *Sun*, whence the firſt *Day* was call'd *Dies Solis*, or Sunday; after which follow'd the reſt in order, as *Dies Lunæ*, Monday; *Dies Martis*, *Tueſday*; *Dies Mercurii*, Wedneſday; *Dies Jovis*, Thurſday; *Dies Veneris*, Friday; and *Dies Saturni*, Saturday.

The *Chriſtians* uſed to call theſe Days *Feriæ*, to ſignify that there ought to be a Divine keeping *Holy-Day*, by reſting from all Profane or Secular Employments, and following only *Religious Duties*, eſpecially thoſe ſet apart for the *Holy Function*. The firſt *Feriæ*, they call'd *Dies Dominica*, or the Lord's Day; becauſe on that Day our Lord and Saviour *Jeſus Chriſt*, was rais'd from the Dead. The ſeventh *Feriæ* ſtill retains the Name of *Sabbath*, to ſignifie that the *Jewiſh Sabbath* was only a Type or Shadow of the *Lord's-Day*, and as it were, a Preparation to the celebrating thereof.

For the better repreſenting the Revolution of theſe 7 Days throughout the whole *Year*, the 7 firſt *Letters* of the *Alphabet*, *A*, *B*, *C*, *D*, *E*, *F*, *G*, have been made choice of in ſuch an Order and Method, that each of theſe *Letters* in their turn, ſhould declare the *Dominical Day*, whence they are generally call'd *Dominical Letters*.

CHAP. IV.

Of the MONTH.

THE *Month* is two-fold, *Solar* and *Lunar*. The *Solar* is that ſpace of Time in which the *Sun* runs through one whole Sign of the *Zodiack*; wherefore, in conſideration that the *Sun* runs through thoſe 12 Signs of the *Zodiack* in 365 Days, and ſome odd Hours and Minutes, there are attributed accordingly to ſome of the *Months* 30, and to others 31 Days, *February* only excepted, to which the Remainder falls, and compleats the above-mention'd number of Days in the Year. The *Lunar Month*, is that ſpace of Time in which the *Moon* runs through the *Zodiack*, or the Space between the two Conjunctions of the *Sun* and *Moon*; for there is a double *Lunary Month*, one call'd *Periodical*, being the Space wherein the *Moon* departing from any *Point*, returns to the ſame again, that is (as is vulgarly computed) in 27 Days, 7 Hours, and odd Minutes. The other *Lunary Month*, is that which they call *Synodical*, or the Month of the *Lunary Syzygie*, or *Conjunction*, and is that ſpace of Time wherein the *Moon* going from the *Sun*, returns again into the *Conjunction* with him; and this is ſaid to be in the ſpace of 29 Days, 12 Hours and an half; for when the *Moon* finiſhes her Period of 27 Days and 12 Hours, the Sun in the mean time makes ſome Progreſs, that is to ſay, 27 Degrees; and this muſt be made up in the *Moon's* Circle, before ſhe can come again to her *Conjunction* with the *Sun*, which can't be done in leſs than 2 Days and 5 Hours, which being added to the number of the *Periodical Months*, make 29 Days and 12 Hours, not to mention Minutes. And thus the *Periodical Month* are by turns of 29 and 30 Days; the twice 12 Hours remaining making in 2 *Months* one whole Day: And this is that ſort of *Month* that the Year is divided into.

Thirdly. It is to be noted, that the *Lunar Months* are joyn'd with the *Solar*; and that the *Lunation* is properly of that *Solar Month*, in which it ends, according to the Vulgar Saying,

In quo finitur Menſi Lunatio detur.

The Reaſon of this is unfolded by *Clavius* in his *Calendarium Gregorianum*, C. 17. that is to ſay, for that it would otherwiſe happen, that ſometimes the *Months* would ſcarce have one or another Day of their proper *Lunation* through the whole Year, eſpecially when the firſt *Lunation* of the Year happens upon the firſt of *January*; for the other *Lunations* of the ſame Year, begin only in the laſt Days of the Month.

Fourthly. Obſerve that the firſt *Month* of the Year among the Ancient *Ægyptians*, was call'd *Thot*; among the *Romans*, *Martius*; whence *July* was call'd *Quintilis*, and *Auguſt*, *Sextilis*, as being the fifth and ſixth *Months* from *March*. But when *Numa* added *January* and *February*, then the uſual Computation was made from the firſt of *January*.

Fifthly. It is alſo obſervable, that the *Months* were divided by the *Romans* into three ſorts of Days, *Calends*, *Nones*, and *Ides*. The firſt Day of every *Month* was call'd *Calendæ*, from the *Greek* Word Καλεῖν, that is, *to Call*; becauſe on that Day the People were call'd as well to the *Fairs* and *Markets*, as to the *Capitol*, to receive from the *Prieſts* what was to be obſerv'd for that *Month*, in reference to the Worſhip of the *Gods*. Next follow'd the *Nones*, ſo call'd, as contracted from *Nundinæ*, that is, *Fairs*, as ſome are of Opinion. Laſtly, came the *Eight Days* of the *Ides*, which follow the *Nones*; theſe *Ides* are generally ſuppos'd to be ſo call'd from the old Word *Iduo*, which ſignifies *to Divide*; becauſe they make a diviſion between the *Nones* and the *Calends*; which *Calends*, becauſe they have their fix'd and certain Seat in every *Month*, as falling upon the firſt Day of every *Month*, when as the Days of the *Ides* and the *Nones*, are variouſly diſpoſed. There are theſe following *Verſes* vulgarly made uſe of to give direction by what Method the *Nones*, or *Ides*, are aſcrib'd to their reſpective *Months*.

Sex Maius Nonas October, Julius & Mars,
Quatuor, at reliqui dabit Idus quilibet octo.

So that when the *Nones* are once known, the finding out of the reſt will follow of courſe.

Sixthly, From theſe three Days all the reſt take their Denomination: For Example; the Day which preceeds the *Calends*, that is, the laſt Day of the fore-going *Month*, is call'd *Pridie Calendas*, or *Primus Calendas*, *Secundus Calendas*, the Second Day before the *Calends*, and ſo of the reſt; and the ſame is to be ſaid proportionable of the *Nones*, and *Ides*.

CHAP. V.

As the Month, *ſo alſo the* Year *is Two-fold, viz.* Solar *and* Lunar.

I. THE *Solar Year*, is the ſpace of Time wherein the *Sun* departing from any *Cardinal Point* of *Heaven*, returns again to the ſame. The *Principal* or *Cardinal Points*, are theſe four; the *Vernal Equinoctial*, the *Summer Solſtice*, the *Autumnal Equinoctial*, and the *Winter Solſtice*, which gives beginning to the four *Seaſons* of the *Year*, viz. *Spring*, *Summer*, *Autumn*, and *Winter*.

But 'tis obſerv'd, that among the Ancient *Ægyptians* and the *Romans*, this Circuit of the *Sun* was meaſur'd exactly by 365 *Days*, which Computation was found ſhort of the *Celeſtial Motion* about 6 Hours; whence it came to paſs, that every fourth *Year*, the firſt Day of the *Year*, and conſequently the reſt following, loſt their Place, and had no firſt Station; whereupon thoſe *Feaſts* which ought to have been celebrated at certain Times, fell out ſometimes in *Winter*, and ſometimes in *Summer*, as it hapned. This Error *Julius Cæſar* at length corrected, by adding to the 365 Days, 6 Hours, which at the end of every fourth *Year*, being added together, made up a Day, which Day was inſerted into the *Month* of *February*, the laſt and ſhorteſt of all the Months; and it is call'd *Biſſextile*, becauſe it is inſerted, *bis ſexto Calendas Martias*, twice on the ſixth Day before the *Calends* of *March*? and not only the *Day*, but the whole *Year* is call'd *Biſſextile*, or *Leap-Year*.

This Conſtitution of the *Year* was obſerv'd in the *Roman Empire*, and from its Author call'd the *Julian Account*, being twofold; the one *Common*, conſiſting of 365 Days; the other *Biſſextile*, of 366.

II. The *Lunar Year* is that Space of Time wherein the *Sun* and *Moon* are 12 in *Conjunction*: And thus the *Lunar Year*, conſiſting of 12 *Synodical Lunations*, contains 354 Days; which *Lunar Year* is at this Day only in uſe among the *Turks* and *Saracens*, neither hath it among them any certain beginning, nor is it determined by any certain *Seaſon*, or *Point* of the *Heaven*, as among us the *Julian Year* begins always about the *Winter Solſtice*. Others have ſo accommodated the *Year* to the *Moon*'s Motion, as to joyn alſo the *Sun*'s Motion thereunto.

But it is to be noted, that the *Lunar Year* falls ſhort of the *Solar* about 11 Days, ſo that if this *Year* the *New Moon* falls upon the *Calends* of *January*, the Common *Lunar Year* of 12 *Lunations* will be finiſh'd on the 20th of *December*, the *New-Moon* ſtill going back the Space of 11 Days, until by the third *Year* 13 *Lunations* are brought about, the laſt whereof will be finiſh'd on the 27th of *December*; and this ſort of *Lunar Year* is call'd *Emboliſmical*, or *Emboliſmal*, from the *Emboliſm*, or *Intercalation* of that *Lunation*. And thus the *Lunar Year*, as well as the *Solar*, is twofold; the one Common, conſiſting of 12 *Lunations*; the other *Emboliſmical*, containing 13.

It hath been obſerv'd by *Meton* a famous *Aſtrologer*, that the New *Moons* after the Revolution of nineteen *Years* elapſed, return all again to the ſame Days, and the ſame point of Time: For Example; if this preſent *Year* the New *Moon* ſhould fall on the firſt of *January*, it would in like manner certainly fall on the ſame Day on the nineteenth Year enſuing. Hence proceeds the moſt famous *Cycle*, or perpetual Revolution of Numbers, from One to Nineteen; by the benefit whereof it may eaſily be underſtood upon what Day of every Month the New *Moon* happens, inſomuch that it is uſed to be ſet down in the *Calender* in *Golden Letters*, and ſo it was call'd the *Golden Number*, being commonly defin'd to be a Revolution of Years from 1, to 19; which Revolution being finiſh'd, there is a return again to Unity. For *Example*, in 1653, the *Golden Number* being 1, that of the following Year will be 2, and ſo forward to 19; and thus the proper Number of the Year in the *Decennoval Series*, extending through every Day of the Year, will ſhew the New *Moons* as often as it happens; but every Year of the *Golden Number* terminates in the end of *December*, and in the beginning of *January* of the enſuing Year, another takes its beginning.

And this was the Doctrine of *Meton*, which heretofore was vulgarly follow'd by all; but at length it was found not abſolutely free from Error, for as much as by this Computation, the *Moon* appear'd to have finiſh'd her *Period* ſooner by one Hour, and about 27 Minutes, than ſhe had begun it 19 Years before; whereupon, after 66 *Cycles* the *Golden* was got 4 Days diſtant from the New *Moons*: Upon which the *Epacts* were brought into the room thereof, of which more hereafter in the ſeventh Chapter. However, it was by no means thought fit to be left out of the *Calender*, ſince it is of great uſe for the finding out of the *Epacts* of every *Year*.

III. Divers Nations, according as Cuſtom hath prevail'd, have given different beginnings to this Year: I ſhall only mention the Cuſtom of the *Jews* and *Romans*, as being moſt obſerv'd throughout *Europe*.

The *Jews* heretofore began their Year from the *Vernal Æquinoctial*, becauſe according to the Common Opinion, the World was Created at that time of the Year, although when they ſojourn'd among the *Ægyptians*, they conform'd to their Cuſtom, beginning the Year from the Month *Thoth*, which (by reaſon of the neglected Intercalation of one Day every fourth Year) anſwer'd to no certain Point of the *Celeſtial Year*: But as ſoon as they were come out of *Ægypt*, they were commanded by God, to have recourſe to their old beginning, as is mention'd in the 12th of *Exodus*: The Month *Niſan ſhall be to you the beginning of Months; it ſhall be the firſt of the Months in the Year*.

But this is to be underſtood out of the Sacred Year, to which their *Feaſts*, New *Moons*, and all other Sacred *Rites* were accommodated; for as the Interpreters of *Scripture* obſerve, that the Civil Year of the *Jews* after their departure from *Ægypt*, began from the Month *Thiſri*, and all their Civil Affairs and Negotiations were reckon'd according to the courſe of this *Civil Year*. Hence it is, that ſome Authors aſſert, that the *Jews* before *Moſes*, began their Year in the *Autumn*, and make it their chief Argument to prove, that the World was created in the *Autumnal Equinoctial*.

The beginning of the *Roman Year*, was from the *Calends* of *January*, and conſequently but a few Days diſtant from the *Winter Solſtice*: And the *Chriſtians* have for the moſt part follow'd their Example, upon the account of our *Saviour's Birth*, being ſo near that Time. But the *Franks* not till the Year 1564, before which, they began the Year from *Eaſter-Day*.

CHAP. VI.

Of the Gregorian *Account.*

THE *Catholicks* have thought fit in this one Particular, to give ſome way to the *Jewiſh Ceremonies*, that is, in exactly obſerving the time of their *Paſſover*, in their celebration of *Eaſter*; by reaſon that the one (as St. *Auguſtin* obſerves) is a *Type*, or a Myſterious *Allegory* of the other; ſo that as the old *Paſſover*, as we have already mention'd, was celebrated by God's Command, in the firſt *Moon*, or Month of the Year, ſo alſo the *Chriſtian Paſſover*, or *Eaſter*, was by the *Nicene* Council order'd to be kept on that Month; and that no Controverſie might ariſe in the Celebration thereof, they pitch upon the 14th Day of the firſt Month, both as to the *Feaſt*, and as to be the Seat of the *Vernal Equinoctial*, accounting that the firſt Month whoſe twelfth Day ſhould fall upon the *Equinoctial*, or immediately following it: Afterwards the *Equinoctial Epoc*, was by the Judgment and Conſent of the moſt Skilful *Aſtronomers*, determin'd to the 21ſt of *March*; and at length the *Golden Number* was fitted to the *Calender*, by the benefit whereof the *New Moons*, and other Days of the *Moon* might be eaſily found. Moreover, herein alſo the *Chriſtians* differ'd from the *Jews*, in that they appointed *Eaſter* to be kept, not as the *Jews* did, on the very 14th *Moon* of the firſt Month, but on the *Lord's-Day* immediately following it, and that chiefly for this Reaſon, *viz.* Becauſe on the firſt *Dominical*, or *Lord's-Day* after the *Jewiſh Paſſover*, our *Saviour* roſe from the Dead. For as the Author of the *Gregorian Calender* ſaith, the *Jews* Celebrate the *Paſſover* on the 14th *Moon*, which repreſented the Death of *Chriſt*; ſo we, in this Feaſt, Celebrate the Memory of *Chriſt's*, which happen'd on the *Dominical Day*: So that not to concur with the *Jews*, in caſe the 14th *Moon* of the firſt Month ſhould fall upon the *Dominical Day*, the obſervation of *Eaſter* muſt be transferr'd to the *Lord's-Day* following; therefore for the more exact Celebration of *Eaſter*, upon which all the reſt of the movable *Feaſts* depend, theſe three Things are eſpecially to be obſerv'd, *viz.* the *Vernal Equinoctial*; the 14th *Moon* of the firſt Month, and the *Lord's-Day* following the ſaid 14th Month.

But after this Conſtitution, it came to paſs however, through the Miſtakes of *Aſtronomers*, that the *Vernal Equinoctial* at length, inſtead of hapning on the 21ſt of *March*, it was on the 11th; nor could the *New Moons* be well computed by the *Golden Numbers* plac'd in the *Calender*, but fell out above 4 Days later than their juſt Time; and conſequently *Eaſter-Day* could not be kept in its due turn, according to the Sanction of the *Nicene Council*: Whereupon, by the Authority of *Pope Gregory* the 13th, who call'd together all the ableſt *Aſtronomers* of that Age, the *Calender* was rectified, *Anno* 1582. the Year brought to its juſt Meaſure; and by taking away 10 Days, the *Vernal Equinoctial* re-inſtated in its former Seat; and laſtly, 30 *Epactal Numbers* put in the room of the *Golden Number*.

According to this Form, that ſpace of Time wherein the Sun departing from any Point of the Heaven, for Example, from either *Equinoctial*, or *Solſtitial Point*, returns again to the ſame, is call'd the *Cæleſtial*, or *Tropical Year*; and this ſort of Year is unequal, that is, ſometimes greater, and ſometimes leſſer, by ſome *Scruples*; and by this means it leaves us in Obſcurity as to its *Solution*. Wherefore *Aſtronomers* following a middle way, have allotted to the Year 365 Days, 5 Hours, and 49 Minutes, reckoning it as a Mean between the *Tropick*, or *Cæleſtial Year*, and the *Julian Year*, which is greater by 11 Minutes, or *Horary Scruples*; and becauſe the *Julian Year*, tho' greater than the *Tropical*, was not however totally thrown aſide, it was provided to prevent all Error for the future, that every Century of Years one *Biſſextile Day* ſhould be omitted, excepting only every 4th Century, which ſhould retain the *Biſſextile*, according to the common Cuſtom.

CHAP. VII.

Of the various Cycles *and* Periods *of Years.*

NOT to inſiſt long upon the Explaining the ſeveral *Epochs* of Time, it is enough to ſay, that *Epochs* are certain Heads, or Beginnings, from whence Time is computed, and agree'd upon among all *Chronologiſts*, as among the *Epochs* of the *Old Teſtament*; *Noah's Flood*; the *Jews deliverance from Bondage*, and the *Babyloniſh Captivity*: Among the *Chriſtian Epochs*, the *Birth* and *Paſſion* of our *Saviour*, the Deſtruction of *Jeruſalem*, &c. Among thoſe of the *Romans*, the Building of *Rome*: And among the *Greeks*, the Deſtruction of *Troy*, the *Olympiads*, the Death of *Alexander*, &c. Much of the ſame Nature are the ſeveral *Area's*, as the *Area*, or *Hera* of the World; that is, the number of Years from the *World's Creation*, the *Chriſtian Area*, or number of Years from the *Nativity* of our *Saviour*: Alſo the *Hegira* of the *Arabians* from *Mahomet*.

The *Cycles* and *Periods* of Years, are a certain number of Years circuiting about, by which, as ſo many Faithful *Guardians*, the *Series* of Times are preſerv'd whole and entire. Famous among the *Greeks* were their *Olympiads*, which were every 5th Year, in which all ſorts of *Games* and *Exerciſes* were perform'd. Among the *Romans* was their *Luſtrum*, which was alſo the ſpace of five Years, at the end of which Time all *Tributes* and *Taxes* were paid; but in the Reign of *Conſtantine* the Great, the *Olympiads*, and *Luſtres*, being abrogated, the *Indiction* was put in the room thereof: This *Indiction* was the ſpace of 15 Years, which was the time allotted to the Provinces of the *Roman Empire*, for the paying their Tributes: And the uſe of this *Indiction* is retain'd among the *Eccleſiaſtical Accounts*. Among the *Jews* there were two noted Periods, *viz.* The *Sabbarian Year*; that is, every 7th Year, in which the *Earth* was to reſt from all manner of Tillage, in like manner as Man from all manner of daily Labour on the 7th Day of the Week. Secondly, the Year of *Jubile*, which was every 50 Years; at which time, not only the *Earth* reſted from Tillage, but all *Debts* were remitted, *&c.* There needs no more to be ſaid of that which we call *Seculum*, but that it is the ſpace of 100 Years; nor of the *Acunm*, but that it may be properly ſaid to contain 1000 Years. As for the *Decemnoval Circle* of the *Golden Number*, it hath been ſufficiently Treated of, *Chap.* 5. There now remains only the *Cycle* of the *Epacts*, and the *Solar Cycle*.

I. The *Epact* is the Series of 11 Days, by which ſpace the *Lunar* Year is exceeded by the *Solar*; ſo that if this Year the *Epact* be 11, the next Year it will be 22, but the third Year not above 3; becauſe that as often as by the Addition of ſeveral *Epacts* together, the number 30 ſhall come to be included in the ſum of the ſaid *Epacts*, 30 is to be taken away, and what remains, is to be retained for the *Epactal Number* of the following Year; ſo that every third Year in which the Thirties are caſt away, there happens an *Emboliſmical Moon*: Where Note, That the *Epacts* always proceed by the Addition of the Number 11, till the *Golden Number* happens in its courſe to be 19, and then the Number 12 is added in the room of 11, for the *Epact* of the following Year; and therefore this *Cycle* is call'd becauſe it is oftentimes thus interrupted.

II. The *Solar Cycle*, or Circuit of Dominical Letters is a revolution of 28 Years, at the end whereof the ſame Order or Combination of Letters returns as at firſt; for ſince it hath been ſaid before, that the Series of Letters, *A*, *B*, *C*, *D*, *E*, *F*, *G*, which repreſents the 7 *Feriæ*, or Days of the Week, are ſo diſpoſed in the *Calender*, that the Letter *A*, prefixt at the beginning of the Year, continueth on in the ſame capacity, and denotes the ſelf-ſame Day of the Week to the Year's end, unleſs that the Year happen to be *Biſſextile*, the next Year in like manner *B*, and ſo forward in their order. The whole *Cycle*, or revolution of the 7 Letters would by this means be brought about, and finiſh'd in 7 Years, if the *Biſſextile* Day did not obſtruct; for this being every 4th Year inſerted, and in the whole Series of Years 7 times coming about, tho' in a different manner, doth not happen in the ſame order of Letters, until all the 28 Years are compleated, as may be ſeen in the *Calender*; for it is call'd the *Solar Cycle*, becauſe it conſiſts of *Solar Years*, which being 4 times Multiplied upon 7, compleat that Number; and this *Cycle* according to the *Roman* Cuſtom, begins from the *Biſſextile Year*, which hath *F* for its Dominical Letter. Of all the ſorts of *Cycles* mention'd, the three moſt in uſe among *Chronologiſts*, are the *Decemnoval Cycle* of the *Golden Number*, the *Solar Cycle* of 28 Years, and the *Cycle* of *Indiction*, conſiſting of 15 Years.

The *Solar Cycle* being Multiply'd by the *Decemnoval Cycle* of the *Golden Number*, produces the Number of 532, which is call'd the *Dionyſian Period*, from the Inventer thereof, *Dionyſius*, Sirnam'd *Exigans*, who obſerv'd, that the revolution of theſe 532 Years brought about an exact conformity of the 3 *Cycles*; and conſequently by that the *New Moons* return not only to the ſame Days of the Year, but alſo the ſame Days of the Week, as they are noted in the *Calender*.

Hitherto may alſo be added the *Julian Period*, conſiſting of 7980 Years, which ariſeth from the Multiplication of the *Dionyſian Period* by 15, the number of Indiction: They call it the *Julian Period*, becauſe it is compos'd of the *Julian Year*, Multiplied upon each other; and it is finiſh'd of the ſame Conjugation, upon the return of the 3 *Cycles* of which it is compos'd; neither will the ſame Conjugation of the *Solar Cycle*, the *Golden Number*, and the *Indiction*, ever happen again in any Year of this *Period*, until after the revolution of 7980 Years: For Example; It is to be ſuppos'd from the Doctrin of *Petarius*, that 3983 Years, of this *Period* had paſt from the *Creation* of the *World*, to the *Birth* of our *Saviour*; and that the *Chriſtian Area*, or firſt Year of *Chriſt*, began with the Year of the *World*, 3984; and that the *Solar Cycle*, then 10, the *Lunar*, or *Golden Number* 2, and the *Roman Indiction* 4, fell upon the firſt Year of *Chriſt*, as appears from the exact computation of them. For if in this preſent Year of *Chriſt*, the *Cycle* of the *Sun* be 9, and of the *Moon* 10, as all *Mathematicians* agree, it follows that thoſe above-mention'd were in the firſt Year.

Laſtly, it muſt be taken for granted, that thoſe three *Cycles* agree together in the Year of the *Julian Period* 4714; becauſe if this Number be divided by 28, which is the entire *Solar Cycle*, the Remainder from the *Diviſion* will be the Number 10; and by the ſame Reaſon, if afterward the ſame Number of the *Julian Period* be divided by the *Cycle* 19, the Remainder will be 2; and if by 15, the *Cycle* of the *Indiction* 4.

Theſe things being firſt laid down, it follows, Firſt, That the firſt Year of *Chriſt*, which is ſuppoſed to be the Year of the World, 3984, concurs with the Year of the *Julian Period*, 4714. Whence obſerve Secondly, that the Years of the *World* being ſubtracted from that Number, their remains out of the *Julian Period* the 730 Years which went before, and were coexiſtent with no real Time, 731 Years of the *Julian Period* being paſt before the Creation of the *World*.

And thus we may underſtand what the true Reaſon is of the *Julian Period*, namely, that every Year thereof may have its proper *Cycles*, all which can be found in no other Year of the ſame *Period*.

CHAP. VIII.

Practical Examples of CHRONOLOGY.

To find the Solar Cycle *of any given Year.*

TO the Year of our *Lord* propounded, add 9; then divide the Sum added by 28, and the Remainder is the *Solar Cycle* of the given Year: If nothing remains of the Diviſion, the Number of the *Solar Cycle* is 28.

Note, That the *Quotient* in this Diviſion ſhews how many Revolutions of this *Cycle* have been made from our *Saviour's Nativity* to the Year propoſed.

'Tis further to be noted, that the Number 9 is therefore added, becauſe that our *Saviour* being Born in the 10th Year of this *Cycle*, 9 Years thereof had then paſt.

To find upon what Day of the Week, the firſt Day of any aſſigned Year ſhall fall.

Divide the fore-going Year of *Chriſt* by 4; then add the *Quotient* to the Number divided, omitting the remainder of the *Diviſion*; from Sum Total ſubtract 10, and then divide the reſidue by 7, and the Remainder from this *Diviſion* will be the Number ſought: Or if there be no Remainder, then 7 itſelf will be the Number. For Example; Let 1654 be the Year propoſed, the Year preceeding being divided by 4, the *Quotient* will be 413; which being added to the divided Number, produceth 2066; but 10 being ſubtracted, 2056 is the remaining Number; which being divided by 7, hath 5 for its Remainder; ſhewing that the firſt Day of the ſaid Year is the fifth Day of the Week, *viz.* *Thurſday.*

To find the Dominical Letter of any given Year.

Subtract the Day of the Week, found by the former *Rule*, from 9. For Example; 5 from 9, and there reſts 4; which Remainder ſhews, that the ſought Letter is the 4th among the *Dominicals*, reckoning incluſively from *A*, whence it follows that *D*, is the *Dominical Letter* of the ſaid Year; for it may be taken for granted from what hath been ſaid before, that *A*, is always affixed to the beginning of the Year.

To find out the Biſſextile Year.

Divide the given Year of *Chriſt* by 4; if nothing remains, then the Year itſelf is it; or if any remain, then the ſaid Remainder ſhews the Number of Years from the *Biſſextile*, both for the Time paſt and that to come. For Example; from the *Diviſion* of the Year 1654, there reſts the Number 2, which ſhews that 2 Years before, that is, 1652, was the laſt *Biſſextile*, and that 2 Years after, *viz.* 1656, will be the next.

The Year being given, to find the Number of the Roman Indiction.

To the Year of our *Lord* propoſed add 3, becauſe it is determin'd, that our *Saviour* was Born in the 4th Year of this *Cycle*, ſo that conſequently 3 *Years* were then paſt. Now let the Number compos'd of the ſaid *Year* and added, be divided by 15, the Number left of the Diviſion will be the *Indiction* ſought; if nothing be left, conclude it to be the Year of the *Indiction* compleated, *viz.* 15, and the *Quotient* will ſhew how many Revolutions of this *Cycle* have paſt until that given Year. For Example; In the Year 1654, the Year of the *Indiction* is 7, and there have paſt to this time 110 *Cycles* of the *Indiction.*

To find the Golden Number of the given Year.

To the given Year of our *Lord*, add 1; which Number divide by 19, the remainder will be the *Golden Number* of the current Year; the given Year of our *Lord*, being 654, the *Golden Number* will be 2.

To find the Epact of the given Year.

To the *Golden Number*, which is ſuppos'd already found, and conſiſts of 3, or a compoſition of ſeveral *Threes*, add 20: The Sum, if it amount not to 30, or the Surpluſage if above, (for then the 30 muſt be caſt away) is the *Epact* ſought. For Example: The *Golden Number* of the Year 1651, is 18, being a multiplicity of *Threes*, to which 20 added, makes 38; ſo that after the 30 caſt away, the remaining 8 is the *Epact* of the Year. Otherwiſe, if the *Golden Number* ſhould be leſs by a Unite than 3, or a Compoſition of *Threes*, then add 10, and the Sum thereof will be the *Epact*; yet ſtill with a rejection of 30, when ever there is a Surpluſage of that Number. And thus in the Year 1654, the *Epact* is 12: But if the *Golden Number* chance to be greater by a Unite than 3, or a Compoſition of *Threes*, the *Golden Number* itſelf will be the *Epact* ſought.

To find when it will be New-Moon in any given Month.

Add the *Epact* of the Current Year to the number of Months incluſively from *March*, and Subtract the *Product* thence ariſing from 30; or if it exceed that Number, then from 60, and the Remainder will ſhew the Day of the Month on which the *New-Moon* happens. For Example; It is enquir'd on what Day of the *Month* of *Auguſt*, *Anno* 1651, the *New-Moon* was, ſuppoſe the *Epact* of that Year was 8, add thereunto 6, the number of Months from *March*, the Sum of both theſe Numbers will be 14; then Subtract from 30, and there remains 16; whence it is apparent, that the *New-Moon* of that Month was about the 16th Day.

To find the Age of the Moon on any Day given.

Having from the foregoing *Problem*, gain'd the *New-Moon*, if the given Day of the Month be after the *New-Moon*, reckon how many Days incluſively have paſt from thence; but if before, it will belong to the laſt Part of the preceeding *Moon*. For Example: If the Age of the *Moon* be ſought on the 24th of *Auguſt*, in the Year 1651, in which the *New-Moon* is found to fall on the 16th Day, by conſequence it may be concluded, that ſhe was 9 Days Old; but if it be ſought on the 8th of *Auguſt*, it was on the 22d of the *Moon* preceeding; upon this *Hypotheſis*, that 30 Days are attributed ro the *Moon*; for if from 30 you Subtract the Days numbred from the *New-Moon* found, and conſequently from the end of that preceeding *Moon*, which is found to be 8, there remains 22.

There is another Vulgar way of finding the Age of the *Moon*. Add together theſe 3 Numbers, the proper Epact of the Year, the number of Months incluſively from *March* to the given Month; and Laſtly the given Day of that Month: If the ſum of theſe Numbers added, be under 30, it ſhews the *Age* of the *Moon*; if above 30, then ſubtract 30 from it, and the Remainder will be the *Age* of the *Moon* ſought.

Note, That when the *Age* of the *Moon* is ſought in the Month of *January*, or *March*, nothing is to be added to the *Epact*, but the Day of the Month, and that only 1 is to be added for the Month of *March* and *April*. But remember, that that *Epact* begins from *January*.

The Age of the Moon being known, to aſſign its Place in the Zodiack.

Suppoſe that on the 31ſt of *October* the *Sun* be in the 8th Degree of *Scorpion*, and that the *Moon* be at that time 16 Days Old, and conſequently that 16 Days before ſhe was in Conjunction with the *Sun* in the 23d Degree of *Libra*; and laſtly, that the *Moon* in one diurnal Circuit paſſeth through very near 16 Degrees of the *Zodiack*: Hereupon multiply thoſe 16 Days by the 13 Degrees, and the Product will ſhew how many Degrees ſhe is diſtant from the *Sun*; then by reckoning the Degrees which the *Sun* hath finiſh'd at that time, and knowing how many Degrees the *Moon* hath departed from the *Sun* it may conſequently be collected in what Sign the *Moon* is, and in what Degree of the Sign, ſince every Sign contains 30 Degrees. Or thus, multiply the Age of the *Moon* by 4, and again the Product of this *Multiplication* by 3, and you will have the number of Degrees of the *Moon*'s diſtance from the *Sun*.

Note, That the *Moon* departs every Day farther and farther from the *Sun* about ¾ of an Hour; ſo that if ſhe riſeth to day with the *Sun*, to Morrow ſhe riſeth not till ¾ of an Hour after.

To find the Paſchal Moon *of any given Year.*

Seek in the *Gregorian Calender*, from the 8th of *March* to the 5th of *April* for the *Epact* of the Year Current, and that will ſhew, that the *New-Moon* is on ſuch or ſuch a Day; then reckon 14 Days from thence; which done, ſeek the *Dominical Letter*, which follows next after the ſaid 14th Day; and hereby the true Time of the *Feaſt* of *Eaſter* is known.

Note, That theſe *Moons* only which begin at the 8th of *March*, and end at the 5th of *April*, can become *Paſchal*, and conſequently that *Eaſter* can't fall ſooner than the 22d of *March*, ſince the 14th Day of the *Moon* falls upon the 21ſt of *March*, and the Day following is the *Dominical*, or *Lord's Day*, which is *Sunday*. But neither on the other ſide, can *Eaſter* fall later than the 25th of *April*: And conſequently, it is alſo to be obſerv'd, that a *March Moon*, that is, wholly within the Month, can never become *Paſchal*, ſince (as it hath been already obſerv'd) the *Moon* is only attributed to that Month in which it ends; but the *Paſchal Moon* always ends out of the Month of *March*; whence it follows, that a *March-Moon* can never be *Paſchal*; or a *Moon* of the firſt Month, according to the *Jews*, and the Decree of the *Nicene Council*.

The Time of the Day, or Night, being given, to find what a Clock it is.

Firſt, Let the *Sun*'s Elevation above the *Horizon* be known, and the Degrees of the *Zodiack*, which the *Sun* or *Moon* poſſeſſeth, be rightly diſpoſed in the *Circle* of the Elevation, then apply the *Oſtenſor* to that Degree or Part of the *Zodiack*, according to the *Line* of Direction, which upon the *Limbo* will point to the Hour ſought; that is, if in the Eaſt-part, the *Anti-meridian*, or *Forenoon-Hours*; if in the Weſtern-part, the *Po-meridian* or *Afternoon-Hour*.

Where *Note*, That *Equal*, or *Equinoctial* Hours are here treated of; for if an *Unequal*, or *Temporary* Hour be ſought, the *Oſtenſor* is applied to the Part oppoſite to the *Sun*, or to the oppoſite *Sign* and *Degree* in the *Zodiack*, the lower Part of the *Oſtenſor* will denote the *Unequal*.

To find the Riſing, and Setting of the Sun; *and conſequently the quantity of the* Artificial Day, *at any time of the Year.*

Place the *Part*, or Degree of the *Sun*, found by the *Aſtrolabe*, on the Eaſtern Part of of the *Horizon*; then ſet the the *Oſtenſor* to that Part of the *Sun*, and it ſhews the ſought Hour of the *Sun's-Riſing*. In like manner the Hour of the *Sun's-Setting*, is to be found by transferring that of the *Zodiack*, where the *Sun* is to the Weſtern *Horizon*.

The ſame is alſo done by the *Globe*, or *Armillary Sphere*, by applying that part of the *Ecliptick* where the *Sun* is, to the *Meridian-Circle*, and at the ſame time putting the *Horary Index* upon the *Meridian-Hour*; and laſtly, turning that part of the *Zodiack* Eaſtward, till it exactly anſwer the *Horizon*, and then the *Horary Index* will ſhew at what Hour the *Sun* Riſeth: In like manner anſwerably for finding the Hour of the *Sun's-ſetting*.

Of the Morning and Evening Crepuſcle, *or* Twi-light.

The Morning *Crepuſcle* begins when the *Sun* comes within 18 Degrees of the *Horizon*, towards his Riſing in the Morning: The Evening *Crepuſcle* ends when the *Sun-ſetting* is gone 18 Degrees beneath the *Horizon*. To find the Hour of this *Crepuſcle*, turn the *Globe* ſo about, that that part of the *Ecliptick* where the *Sun* is may fall 18 Degrees beneath the *Horizon*, and then the *Horary Circle* will declare the ſought Hour; and ſo the oppoſite Part being Elevated 18 Degrees above the *Horizon*, proves that the *Sun* at the ſame time is deſcended 18 Degrees beneath; as will appear by numbring theſe Degrees upon the *Æquator*.

To know what A-Clock it is in any part of the World.

This will eaſily be found by the help of the *Terreſtial Globe*; the Hour being firſt known of thoſe Regions which lie under your *Meridian*, by moving that *Meridian*, and directly applying it to the immovable *Meridian* of your *Inſtrument*, and placing the *Horary Index* at ſuch or ſuch an Hour; then upon turning about the *Globe*, the immovable *Meridian* will point out thoſe Regions, whoſe Hour deſir'd is ſhewn in the *Horary Index*.

Firſt, It is to be Noted, for the unfolding of ſeveral *Problems* of this Nature, That the *Earth* is daily ſurrounded by the *Sun*, who in that *Quotidean* Courſe paſſeth through a multitude of *Meridians*, ſucceſſively one after another; ſo that he muſt viſit every Hour 15 *Meridians*, according to the Account of 365, being divided by 24. Moreover, it muſt be allow'd, that in every Country there is a *Mid-day*, or *Noon*, when the *Sun* makes its *Circle*, which is thence call'd the *Meridian-Hour*, the very midſt of the ſaid Place, and conſequently, that every 15 *Meridians* he paſſeth through, ſo many Hours he makes; and that the *Sun* makes at the ſame time both the ſame Hours, and alſo both new Hours and Seaſons reſpectively, according to the ſeveral Countries and Regions he paſſeth through; whence it may well enough be affirm'd, That that very Moment there is at one and the ſame time every Hour, and every Seaſon of the Year, throughout the ſeveral Countries of the World, inſo much that every Hour of the Day perpetually circuits round about the Earth, &c. Suppoſe therefore, that to a Man reſting under the ſame *Meridian* there is always a Natural Day of 24 Hours, becauſe there muſt needs be ſuch a ſpace of Time before the *Sun* can return again to the ſame *Meridian*.

Note alſo, That to a Man Journying Eaſtwards, the Day is leſs than 24 Hours; for the *Sun* will be ſooner in that *Meridian* in which he is to meet him, than in that from whence he departed. On the contrary, to one that makes a Journey Weſtwards, the Day becomes more than 24 Hours, becauſe the *Sun* will ſooner reach the *Meridian* from whence the Perſon departed, than to overtake the Perſon departing: Wherefore *Note* in the laſt Place, That it may ſo happen, that two *Ships* ſetting forth from the ſame *Port*, the one Eaſtwards, and the other Weſtwards, yet at length may meet in ſome part of the World. In like manner, Admit *Peter* go hence Eaſtward, and *Paul* at the ſame time Weſtward, and both of them having ſurrounded in their Travels the World, after ſome Years, return on the ſame Week to *John*, who remains all this while at Home; it may happen that altho' every one of them obſerve the ſame way of counting the Time, yet *John* may reckon *Tueſday*,

Peter

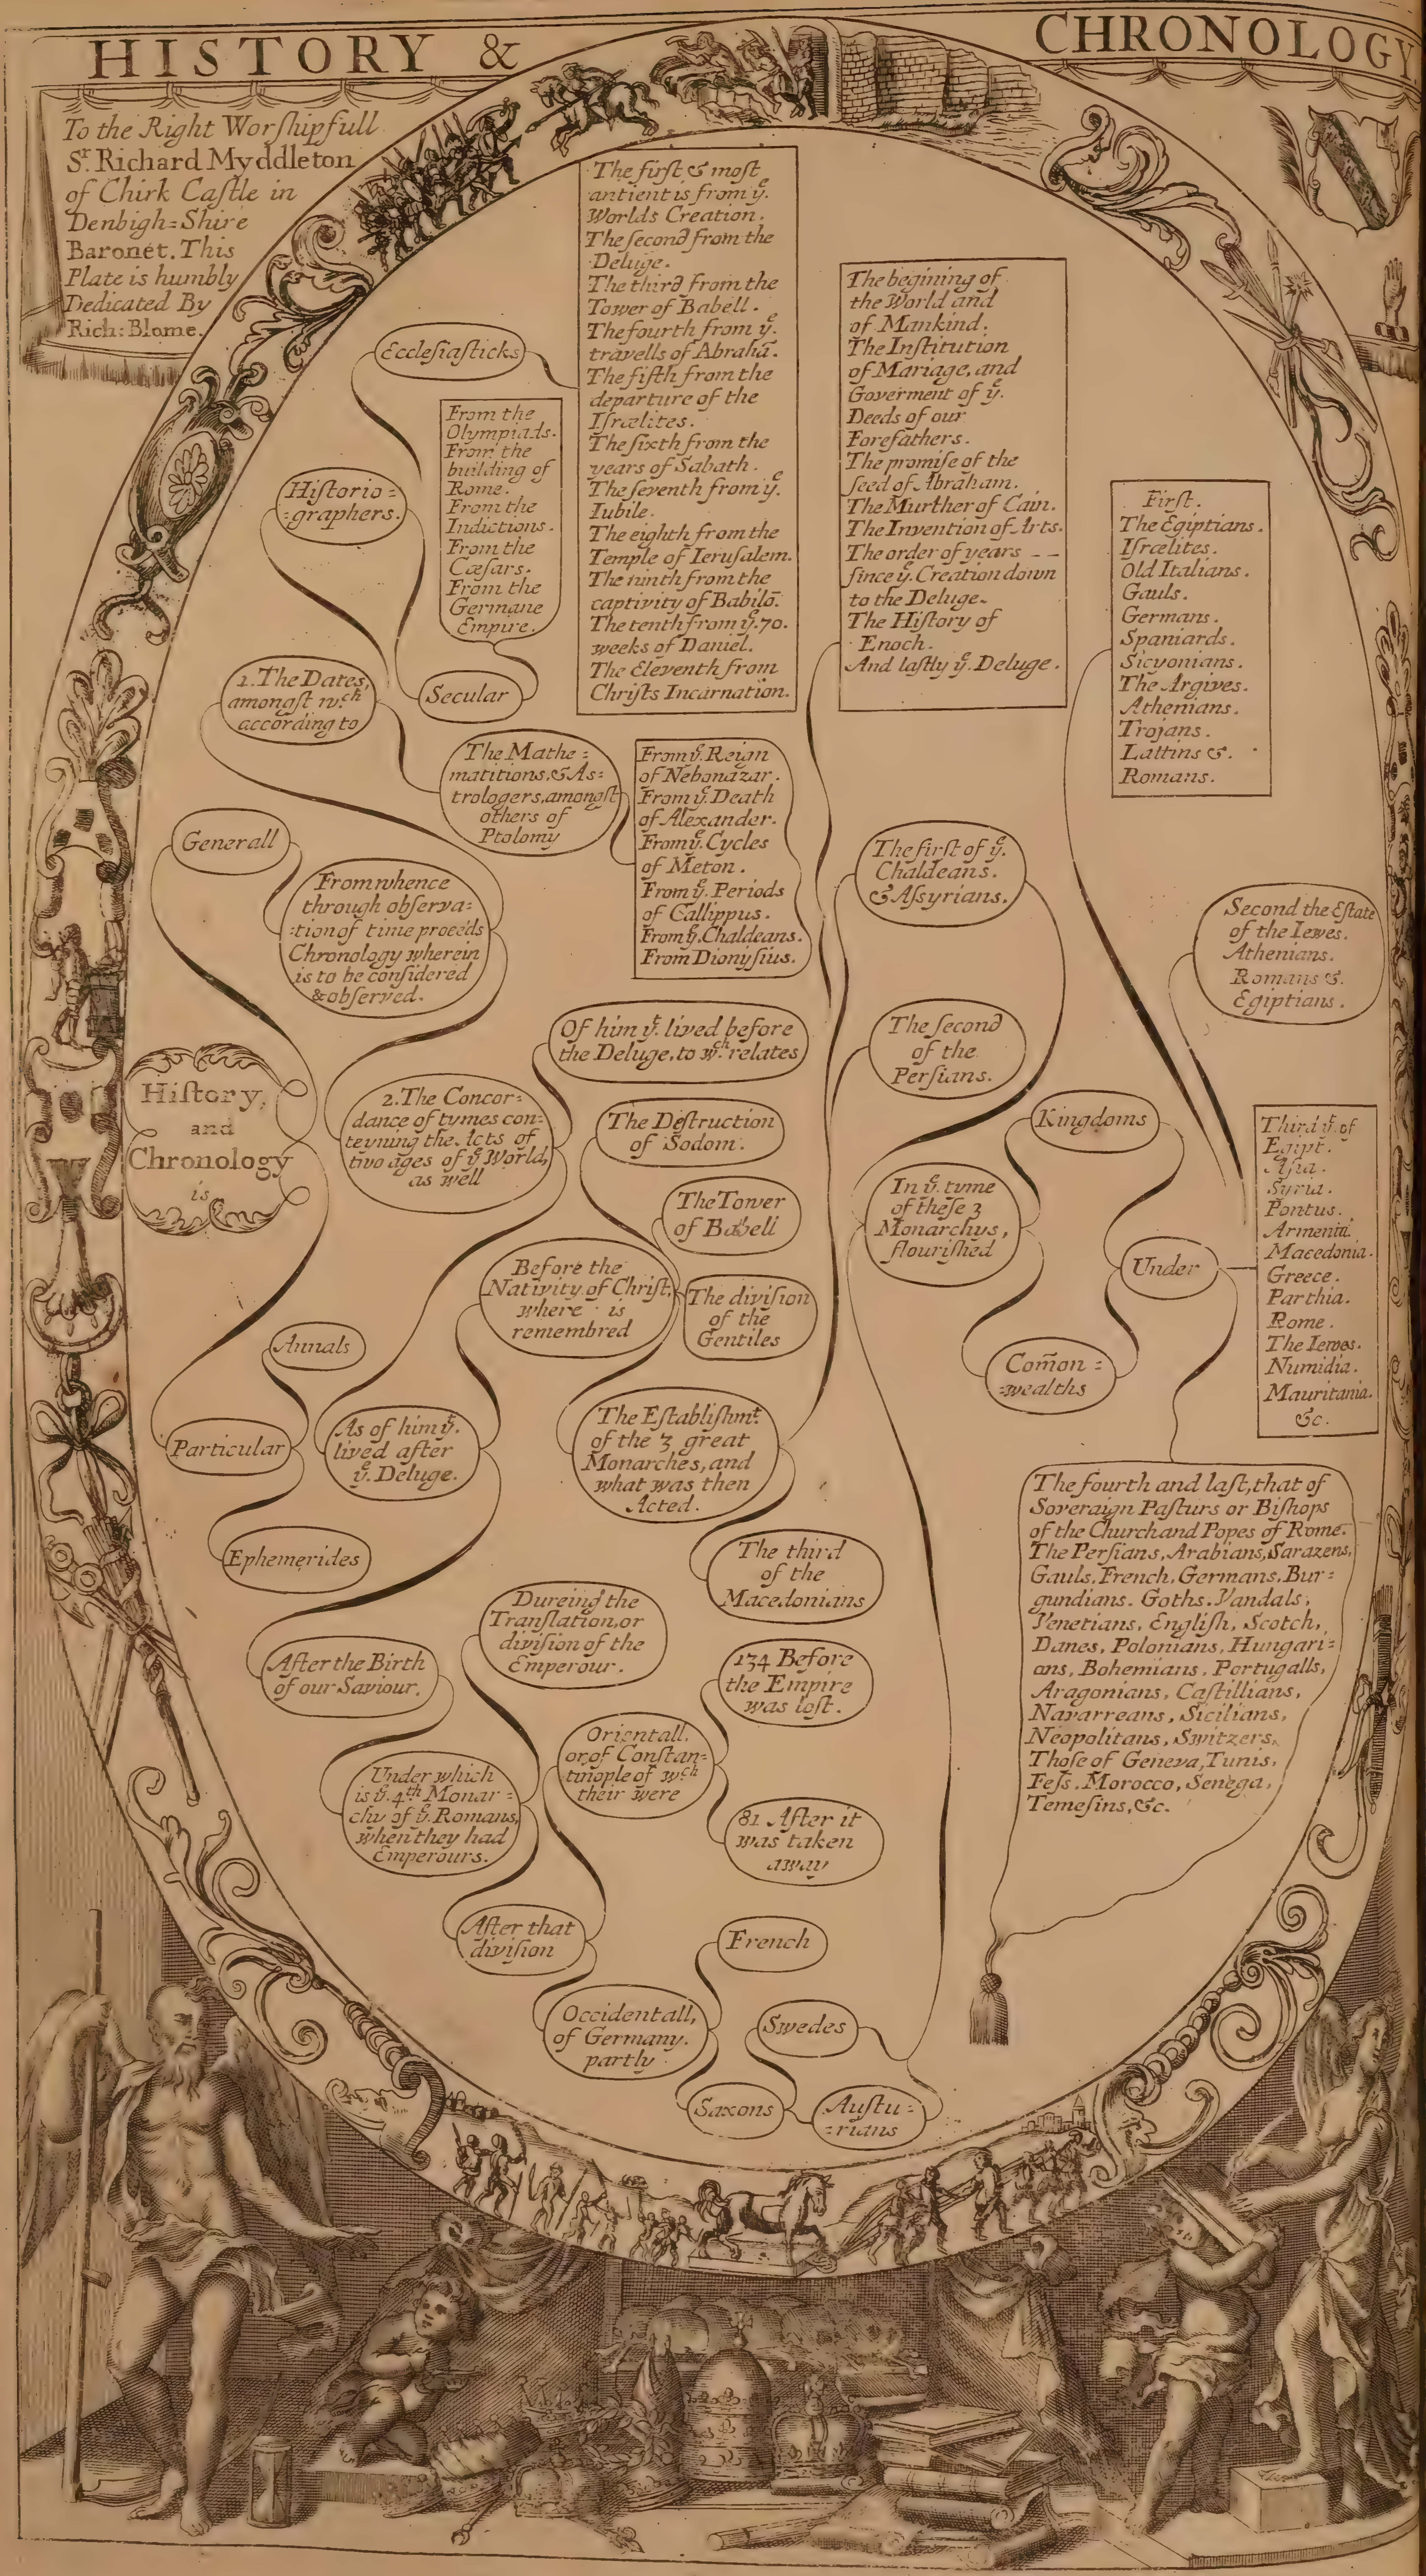
HISTORY & CHRONOLOGY

To the Right Worshipfull
Sr. Richard Myddleton
of Chirk Caſtle in
Denbigh-Shire
Baronet. *This*
Plate is humbly
Dedicated By
Rich: Blome.



History, and Chronology is

Generall

From whence through obſervation of time proceeds Chronology wherein is to be conſidered & obſerved.

1. The Dates, amongſt wch according to

Eccleſiaſticks

The firſt & moſt antient is from ye Worlds Creation.
The ſecond from the Deluge.
The third from the Tower of Babell.
The fourth from ye travells of Abrahã.

Peter, *Wedneſday*, and *Paul*, *Monday*; then the next Day after, *Peter* may have *Thurſday*, *John*, *Wedneſday*, and *Paul*, *Tueſday*: Laſtly, on the Day following, *Peter* may reckon *Friday*, *John*, *Thurſday*, and *Paul*, *Wedneſday*, and ſo of the reſt; ſo that in one and the ſame Week in reference to 3 Men, *Thurſday* will be thrice reckoned.

Hence comes the Solution of a common *Paradox*, maintaining, That it may ſo happen, that two *Brothers* Born at the ſame time, ſhall alſo die together, and yet one live longer than the other, becauſe he hath numbred more Days.

HISTORY.

AS the ancient *Philoſophers* have very properly Defin'd Time to be *Menſura Motus*, the the Meaſure of Motion; ſo *Hiſtory* may not unfitly be Defin'd *Menſura Temporis*, the Meaſure of Time. But to give a more exact Definition, *Hiſtory* is the written Account of Memorable Things tranſacted, and of Perſons tranſacted, and of Perſons tranſacting, from the Creation of the World to this Time. It is by *Cicero* more Elegantly and Rhetorically ſtyl'd *Teſtis Temporis, Lux veritatis, Vitæ Memoriæ, Domina Vitæ, Nuncius Antiquitatis, &c. The witneſs of Time, the Light of Truth, the Life of Memory, the Miſtreſs of Life, and the Meſſenger of Antiquity.*

The Diviſion of *Hiſtory* is according to many Authors, threefold, *viz. Eccleſiaſtical* and *Prophane*; *Ancient* and *Modern*; and *Univerſal* and *Particular*: But ſince there is no Eſſential difference between *Ancient* and *Modern*, I ſhall only make uſe of a twofold Diviſion, *viz.* Firſt into *Eccleſiaſtical* and *Prophane*; next into *Univerſal* and *Particular*; the laſt of which is included in each Branch of the Firſt, that is to ſay, both *Eccleſiaſtical* and *Prophane*, is ſubdivided into *General* and *Particular*.

Eccleſiaſtical Hiſtory is that which treats moſt peculiarly of the Affairs of the *Church*; that is, of the Adminiſtration of Affairs by Perſons who profeſs an *Eccleſiaſtical Function*.

The Firſt, and principal part of *Eccleſiaſtical Hiſtory*, is that of the *Holy Scriptures*, viz. The *Old* and *New Teſtament*: The *Old Teſtament* contains the Creation of the *World*; the Tranſgreſſion and Fall of *Adam*; the univerſal *Deluge*; the Re-peopling of the *World* by the Sons of *Noah*; the Off-ſpring of *Abraham*, multiplied according to God's Promiſe, from the Twelve Tribes of *Iſrael*, into a numerous People; God's deliverance of the Children of *Iſrael*, by the Hands of *Moſes* and *Aaron*, from the *Ægyptian* Bondage; their ſlow Marches, and long Sojourning in the Wilderneſs; their ſeveral Victories under *Joſhua*, and the reſt of their Judges, until that compleat Conqueſt of the Land of *Canaan*; the riſe of their Kingdom under *Saul*; the progreſs thereof under *David* and *Solomon*; the Diviſion thereof into two diſtinct Kingdoms, *viz.* of *Judah* and *Iſrael*, with the double Race of Kings from *Rehoboam* King of *Judah*, and *Jeroboam* King of *Iſrael*, to the *Aſſyrian*, and *Babyloniſh Captivity*; the return of the *Jews* from *Captivity*; the rebuilding of the *Temple*, and of the *Walls* of *Jeruſalem*, by the Intereſt of *Ezra*, and *Nehemiah*, with the Kings of *Perſia*.

The *New Teſtament* contains the Incarnation and *Nativity* of *Jeſus Chriſt*; the Addreſs of the *Eaſtern Magi* to Him with their Preſents; His conveyance into *Egypt* from *Herod*'s Tyranny; *John* the *Baptiſts* Preaching, Baptiſm and Execution; *Chriſt's* Temptation by *Satan* in the Wilderneſs, and his Conqueſt over him; His diſputation in the Temple, his Preaching to the Multitude and his Diſciples; his ſeveral Miracles; His laſt Supper; His apprehenſion through the Treachery of *Judas*; His Trial, Crucifixion and Reſurrection; His appearing amongſt his Diſciples after his Reſurrection. His Aſcenſion into *Heaven*, and his ſending down the Holy Ghoſt upon the Apoſtles in cloven Tongues; the firſt planting of the Chriſtian Religion by the Preaching, Sufferings, Miracles and Writings of St. *Peter*, St. *Paul*, after his Converſion, and other Apoſtles, and Miniſters of the Goſpel.

The reſt of the Eccleſiaſtical Hiſtory continuing from the time where the Holy Scriptures end, contains all matters relating to the State of Chriſtianity from that time until this: The antient Fathers, what Times they flouriſhed, with an Account of their Writings: The Exemplary Lives of the Primitive Chriſtians, and their patient ſuffering under the *Ethnick Roman* Emperours, particularly the Ten cruel Perſecutions, firſt under *Nero*, laſtly under *Diocleſian*; The Chriſtian Faith firſt openly poſſeſs't, and aſſerted by *Conſtantine* the Great in the Year of our Lord 306: The Succeſſion of the *Popes* of *Rome*, from *Linus* to this preſent *Clement* XI. The Tranſactions of the 20 General Councils from the firſt General Council at *Nice*, *Anno.* 318, to the Council of *Trent*, *Anno* 1563; The Conteſt betwixt the Catholicks of the *Latin*, and the *Arrians* of the *Greek* Church, as alſo about Image-Worſhip; The firſt Commencement of the Biſhop of *Romes* claiming Supremacy over all the reſt of the Chriſtian Biſhops, and Patriarchs in the time of the Uſurping Emperor *Phocas*, *Anno* 601. The 26 Antipapal Schiſms or Factions of one Pope ſetting up againſt another from *Novatianus* againſt *Cornelius*, *Anno* 255, to *Felix* againſt *Eugenius*, *Anno* 1439. The Reformation of Religion in *England*, *Germany*, *Denmark*, *Sueden*, *Switzerland*, part of *France*, and elſewhere in *Europe*; and the great Animoſities betwixt thoſe of the Romiſh-Party, and thoſe of the Reformation.

Prophane Hiſtory contains the various Accidents, Events and Occurrences in the World in Secular Matters; The Acts and Deſigns of eminent Men, whether good or bad, both in Peace and War; The ſtrange alterations and viciſſitudes of human Affairs; The Fall and decay of Empires, Kingdoms and States, with the riſe and growth of others.

Moſt of our late Writers of univerſal Hiſtory agree in this one Method, that is, of carrying on the main Stream or Current thereof through the 4 chief

Empires, or, as ſome call them, Monarchies of the World, *viz.* the *Aſſyrian*, *Perſian*, *Grecian* and *Roman*.

The *Aſſyrian* Monarchy or Empire, which may alſo be called the *Babilonian*, in regard the chief Seat of the Empire was for the moſt part at *Babilon*, until the Empire came to be divided into a double Empire, *viz.* that of the *Babilonians*, and that of the *Medes*, which was begun by *Belus*, vulgarly called *Jupiter Belus*, and is thought by many to be the ſame with *Nimrod* mentioned in Holy Scripture; others account *Ninus* the Son of the ſaid *Belus*, to be the firſt *Aſſyrian* Monarch; however there are named (and for the moſt part only named) about 37 Monarchs from the original thereof to *Sardanapalus*, who being totally overthrown, by his two Vice-Roys *Beloch* of *Aſſyria* and *Arbaces* of *Media*, the Empire was divided, and there Sprung up a double Race of Kings, *viz.* of *Babilon* from *Belochus*, and of *Media* from *Arbaces*. The laſt of this *Median* Race was, *Aſtiages*, whoſe Grand-Child *Cyrus* by the Daughter of *Mandana* a *Perſian* by the Fathers ſide, got the Kingdom from his Grand-Father, and United the *Perſian*, and *Medes* into one Empire.

This Grand Monarchy began about the Year of the World 1820. contemporary with which was, firſt the *Sicyoninan* Kingdom, much of the ſame origen begun by *Ægialus*; next the *Argive* Kingdom begun, *Anno Mundi* 2100, by *Inachus*, whence deſcended the Family of the *Inachidæ*, after whom ſucceeded the *Dardanidæ*, and laſtly the *Mycenæans*. The Kingdom of *Athens*, began by *Cecrops*, *Anno Mundi* 2426, and of *Lacedamon* by *Leles* about the Year 1500, the antient Kings of *Latium* from *Janus*, *Anno Mundi* 2700, and after them of the *Silvian* Race from *Æneas*, *Anno* 2803; and after them the *Roman* Kings from *Romulus*, *Anno* 3231, to *Tarquinius Superbus*, *Anno* 3446. The Kings of *Troy* from *Dardanus*, *Anno* 2600, to King *Priamus*, in whoſe time, *Troy* was Burnt and Sack't by the *Greeks*. The *Corinthian* Kingdom from *Siſyphus*, *Anno* 2573. The antient *Macedonian* Kings from *Caranus*, *Anno* 3170.

The ſecond Grand Empire called the *Perſian* Monarchy, was begun by *Cyrus*, *Anno* 3425, and rendred the more potent by the Addition of the *Median* Kingdom, which he got by conqueſt from his Grandfather *Aſtiages*, as beforementioned. This Empire laſted not very many Ages, for it was not much more than 250 Years from its firſt Riſe, before it was brought to a Period by the Conqueſt of *Alexander*, Son of King *Philip* of *Macedon*, commonly ſirnamed the Great. Contemporary with this Monarchy, were the Great and Noble Actions of the *Athenian* and *Spartan* Common-Wealth. The Original of the *Roman* Republick, after the Expulſion of their Kings, *Anno Mundi* 3475, under the Annual Government of *Conſuls*, and Victorious Progreſs thereof.

The third Pancraſtick Dominion, called the *Greek* Empire, is liable to ſome diſpute as to its Exiſtence, Original, and Duration; for the heighth of the *Grecian* Glory, and ſucceſs was under the *Athenians*, and *Lacedemonians*; but theſe two People being in thoſe Days both Republick, the time of their Flouriſhing could not properly be ſaid to be one of the ſaid Monorchies; beſides in their higheſt pitch of their Glory and Grandure, they were Contemporary with the *Perſian* Monarchy, to which at firſt they were a Terror, afterwards by turns, an Aid and Aſſiſtance againſt each others dreaded Power; whereas all the 4 Empires muſt needs be reckoned each Succeſſive to the other; ſo that we may juſtly reckon this *Greek* Monarchy to be a mighty Blaſe of an Empire, riſing out of the *Macedonian* Kingdom; being raiſed to its heighth of Splendor, by the Great Succeſs of King *Philip*, who ſubdued the reſt of *Greece*, and the great Succeſs of his Son *Alexander*, who about the Year 3650 and odd, with a ſmall Army quickly overthrew the whole Power of *Perſia*, and carried Terror to the remoteſt parts of the Eaſtern World; but the Pride of this Great Conqueror was ſoon laid low, and ſmall was the Fruit Reap'd of all his mighty Conqueſt; for he was taken out of this Life in the Flower of his Age, and both his Paternal and ſubdu'd Dominions parcel'd out into ſeveral Kingdoms and Principalities, by his Succeſſors the Grand Captains of his Army; the chief whereof were, Firſt, the Remnant of the *Macedonian* Monarchy, from *Caſſander*, the Son of *Antipater*, *Anno Mundi*, 3663, or thereabouts, to *Perſeus*, who was overcome by the *Romans*, 3816. Secondly, The Race of the *Ptolemies* in *Ægypt*, from *Ptolemæus Lagi*, *Anno Mundi*, 3660, or thereabouts, to *Cleopatra*, the Siſter of *Ptolemeus Bacchus*, and Miſtreſs of the Great *Roman* Captain *Marcus Antonius*, with whom ſhe died, to avoid being carry'd in Triumph to *Rome*, *Anno Mundi*, 3954. Thirdly, the Kingdom of *Syria*, from *Seleucus Nicanor*, *Anno* 1672, to *Antiochus*, 12th Son of *Euſebes*, Sirnam'd the *Aſian*, *Anno* 3718. Contempory with this Renowned, but ſhort liv'd Monarchy, was the growing greatneſs of the *Romans*, under their Conſular Government, during thoſe above-mentioned *Dynaſtys*, which Sprung out of the *Greek*, or *Macedonian* Empire. The moſt noted Kingdom beſides, was that of *Pergamus* in *Aſia*, from *Phileratus* the *Eunuch*, *Anno* 3700, to *Attulus* Son of *Eumeches*, who dying, made the Common-Wealth of *Rome* his Heir.

The 4th and laſt great Predominant Power of the World, the Greateſt without all doubt of all the reſt, and of the longeſt continuance by far, eſpecially ſince to this Day (in Name and Title at leaſt) it remains in being, is called the *Roman* Empire; for it may very well deſerve the Name of an Empire, long before it could be called a Monarchy; which was not until the *Cæſars* had wreſted the Supream Power from the Senate of *Rome*, and aſſumed the Title Imperator, attended with Regal Authority and Dignity; whereas *Romes* Dominions were extended to their utmoſt Bounds, under the Influence of a Common Wealth; and *Julius* was but the Senates Servant when he Conquered *Gallia*, and a great part of *Germany*; however ſince our Writers of Univerſal Hiſtory, have for the moſt part thought fit to commence that *Roman* Empire from its Imperial Monarchy; it will be convenient to ſubſcribe to the general Opinion, both as to the beginning, and continuance thereof; by which it will appear, that the greateſt part of the *Roman* Empire by far hath been Excluded out of *Rome*, having undergon ſuch an Alteration, and ſuch a Tranſplantation from one Seat to another, as no other Monarchy beſide, either before, or ſince. From *Julius Cæſar*, to *Conſtantine*, *Rome* was the Seat, which was about 350 Years, and in that time it ſuffered much of Alteration and Diminution. The choice of the Emperor was all this while, and for the moſt part long after, at the Armies pleaſure; and it remained in the *Julian* Race but till *Coccius Nerva*. *Conſtantine* the Great, the firſt Chriſtian Emperor, at leaſt that openly profeſs't himſelf ſo, removed the Seat of the Empire from *Rome*, to a new City of his own building upon the *Thracian* Coaſt, called from thence *Conſtantinople*,

nople, or *Conſtantine*'s City; ſo it continued all the time of *Theodoſius*, ſirnam'd the Great, who divided the Empire between two Sons, *Arcadius*, and *Honorius*, whence ſprung a double Race of Emperors, *viz.* the Eaſtern of the Line of *Arcadius*, Reigning at *Conſtantinople*, and the Weſtern of the Line of *Honorius* Reigning at *Rome*; but this Weſtern Empire was ſoon brought to a Period by the incurſion of the *Goths*, *Huns*, and *Vandals* into *Italy*. Three times in one Age was *Rome* taken, and ſack't by theſe Invaders, but the third time it was taken, *viz.* in the Year of our Lord 475, by *Odoacer* King of the *Heruli*, the Imperial Line was totally expelled *Rome*, and ſhortly after a new Kingdom erected by the *Goths* in *Italy*. Thus *Rome* which had been the Miſtreſs of the World for ſo many Ages, and the Seat 'till of late of the greateſt Monarchs of the World; had now loſt all its Glory, and become a common City; but that it ſeems it was from its firſt Foundation to the Worlds end, deſign'd for an Empire in ſome ſort or other; and now a greater Empire ſeems to attend it, by how much the Spiritual Sword aws more than the Temporal, for not long after the time now mentioned, the Biſhop of *Rome* began to claim Superiority over all other Biſhops; and by that means hath ever ſince kept under his Obedience and Subjection all the Princes and Potentates of *Europe* (ſome few only excepted ſince the Reformation) more than ever any Emperor kept the leſſer Kings his Tributaries. The Empire thus overthrown, however the Eaſtern Emperor kept a kind of Vice-Roy in *Italy*, with the Name of *Exarch*, who held his chief Seat at *Ravenna*. In this Eſtate continued the Succeſſion of the Eaſtern Emperors, till *Charles*, ſirnam'd the Great of *France*, had the Title of *Roman* Emperor given him by Pope *Leo* III. for the Aid given his Succeſſor *Adrian*, againſt the *Exarchs* of *Ravenna*, and *Deſiderius* King of the *Longobards*; ſo that a new *Roman* Empire was raiſed again in the *Weſt*, if it may be truly ſtiled a *Roman* Empire; which neither had its Seat at *Rome*, nor any continual claim from the firſt *Roman* Emperors, but was only grounded upon a Title given by a Pope of *Rome* to a *French* King. For ſome Ages the Imperial Title continued to the Succeſſor of *Charles the Great*, and had reſidence ſometimes in *France*, and ſometimes in *Germany*; but from the time of *Henricus Auceps*, to this preſent *Leopoldus Ignatius*, the Imperial Seat hath been continually in *Germany*. From the Inauguration of *Charles the Great*, to the time of *Frederick* of *Habſpurg*, there ſtill remained a Series of Eaſtern Emperors at *Conſtantinople*, ſo that all this while, namely for the ſpace of about 650 Years, there was again a double Succeſſion of *Roman* Emperors, Eaſtern and Weſtern, though the truth is, which cannot be well underſtood how either of them could pretend to much more than a bare name, or Title of *Roman* Emperors, excepting that the *Conſtantinople* Succeſſion was more clearly Built upon the old Foundation; ſince all the old *Roman* Conqueſt was fall'n in piecemeal, and was now almoſt reduced to nothing; ſo that no wonder the riſing Greatneſs of the *Ottoman*, ſo eaſily overpower'd the fallen Greatneſs of the *Roman*. It was in the Year of our Lord 1453, that *Conſtantinople* was taken by *Mahomet* I. and *Conſtantine* the Emperor, Son of *Joannes Emanuelis* ſlain. In a *Conſtantine* this *Dynaſtie* began, and in a *Conſtantine* it ended; and with it according to the Opinion of ſome, all that can rightly be ſtiled the *Roman* Empire, the *Ottoman* Power ſucceeding as a Fifth Monarchy in the room thereof.

Contemporary with this great *Roman* Power, and Name, have been ſeveral other great Kingdoms, States, and Principalities, namely, with the virile Age of the Common-wealth: The Kingdoms of *Pontus* and *Bithynia*, and the Remnant of the *Macedonian* and *Syrian* Kings, all ſubdued by the *Romans*; Great *Mithridates* of *Pontus*, *Perſeus* of *Macedon*; and *Antiochus* of *Syria*: The *Carthaginian Common-wealth*, ſubdued alſo by the *Romans*, after the total Overthrow and Deſtruction of *Hannibal*: The Kingdoms of *Mauritania*, and *Numidia* in *Africa*; the latter overthrown by the *Romans* after the Vanquiſhing of *Jugurth*; with the Weſtern and Eaſtern *Roman* Emperors, from firſt to laſt. The ſeveral Succeſſions of the *Perſian* Kings, *viz.* the *Arſacidæ*, or *Parthian Race*: The *Perſian* Line reſtored, the *Saracens*, the *Tartars*, the *Armenian Turks*, and of late years the *Sophies*, with the Succeſſors of *Conſtantine*. The Kingdom of the *Goths* erected in *Italy*, from *Theodorick* to *Tejas*; afterwards of the *Longobards*, from *Albovin* to *Deſiderius*, *Anno Dom.* 774. The *Merovingian* Race of Kings in *France*, from *Pharamond* (*Anno Dom.* 400) to *Childerick* III. *Anno Dom.* 750, or thereabouts. The *Viſigoths* in *Spain*, from *Athaulphus* the Brother of *Alaricus*, *Anno Dom.* 415, to *Alphonſus* II. *Anno Dom.* 800. The *Saxon Heptarchy* in *England*, from *Hengiſt* King of *Kent*, *Anno Dom.* 457, to *Crida* King of the *Mercians*, *Anno Dom.* 1626. The Ancient Kings of *Scotland*, from *Fergus*, *Anno Dom.* 422, to *Achajus*, about the Year 800. The *Vandals* in *Africa*, from *Geiſerick*, *Anno Dom.* 427, to *Gilimer*, taken Priſoner by *Beliſarius*, *Anno* 534; and after them the *Saracens*. The beginning of the *Venetian Common-wealth*; with the *Weſtern Empire*, entituled from *Charles the Great*, the Succeſſors of the ſaid *Charles*, who from him had the Imperial Title themſelves; and after them the other Line of *French* Kings, from *Hugo Capet*, *Anno Dom.* 987, to this preſent King *Lewis* the 14th. The Remainder of the ſaid Succeſſion of the Kings of *Spain*, from *Ramirus* the Firſt (about the Year 800) to this preſent *Charles* the Third. The *Saxon Monarchy* in *England*, from King *Egbert*, *Anno Dom.* 800, or thereabouts, to King *Harold*, *Anno* 1066; and after that the Succeſſion of the Kings of *England*, from the *Norman* Conqueſt by Duke *William*, to her preſent Majeſty Queen *Anne*. The Remainder of the *Dynaſty* of *Scotland*, from *Achajus* to her preſent Majeſty *Anne* Queen of united *Britain*. The Remainder of the *Dynaſty* of the Kings of *Spain* from *Alphonſus* the Second, *Anno* 800, to this preſent King *Charles* the *III*. The Kingdom of *Portugal*, as taken out of the reſt of *Spain*, from *Henricus Burgundus* (*Anno* 1090) to the preſent King. Not to mention the Kingdoms of *Denmark* and *Sweden*; the ſeveral States and Principalities of *Italy*, ſince the decay of the *Roman* Monarchy there, as the Common-wealths of *Venice*, *Genua*, &c. The Dutchies of *Ferrara*, *Parma*, and *Placenza*, *Modena*, *Mantua*, *Savoy*, the Kingdom of *Naples*, which with the Dutchy of *Milan* is now under *Spain*; And the Dukedom of *Florence*. Thus you have a general view of Hiſtory from the Creation to this preſent Time, as far as our deſign'd Brevity will allow.

OPTICKS and PERSPECTIVE.

OPticks is a mathematical Science that treats of the *Sight* in general, and of every thing that is ſeen with *direct Rays*; and explains the ſeveral Properties and Effects of Viſion in general, and properly of that which is direct and ordinary. So that the direct Method to handle *Opticks*, is to conſider the two parts of it, which are *Sight* and its *Object*. *Sight* may be conſider'd either as to the *Subject* or *Manner*.

The *Subject* of *Sight* is the *Eye*, which is the wonderful Organ or Inſtrument of *Sight*. The *Eyes* are plac'd in two large Cavities, hollow'd out of the Bones of the Scull on each ſide of the Noſe. The Eye has four Tunicles, of which one is call'd *Common*, and the other three *Proper*.

The common Tunicle is call'd *Adnata*, and ſprings from the *Pericranium*, and is ſpread over all the White of the Eye, above the *Sclerolica*, reaching as far as the *Iris*. By this the Eye is kept firmly within its Orbit, from whence it is alſo call'd *Conjunctiva*. It is of very exquiſite Sence, and has many capillary Veins and Afteries creeping thro' it, which are moſt conſpicuous in an Ophthalmy, or Inflammation of the Eyes. Under this Tunicle are the Tendons of the Muſcles extended and expanded to the Circumference of the *Iris*, which increaſe its Whiteneſs.

In order to diſcover the proper Tunicles of the Eye we muſt firſt look into the *Optick Nerves*.

The *Optick Nerves* are the ſecond Pair, which beſtow on the Eyes the faculty of Seeing. They ſpring from the upper ſide of thoſe unequal Protuberancies of the *Cura* of the *Medulla oblongata*; from whence being carry'd forward, and ſomewhat downwards, after having fetch'd a compaſs, they meet one another about the *Infundibulum*, where they are united by the cloſeſt Conjunction, but not Confuſion of their Fibres, which run parallel lengthways in theſe Nerves, as they do in all others.

They are obſcurely hollow until they be united; but after their hollowneſs cannot be diſcern'd. This hollowneſs may be ſhew'd in a large Beaſt newly kill'd, and in a clear light. They are very ſoft ſo long as they are within the Skull; but having paſs'd the *Os ſphenoides*, they become ſomewhat more firm and hard. The reaſon of which Alteration ſeems to be; that within the Skull they are only clad with the *Pia mater*; but as they go out they aſſume a ſecond Coat from the *Dura mater*.

From the whole Subſtance of theſe Nerves, *viz.* from their two Membranes, and the inner Medullar, and fibrous Subſtance, are the three [proper] Tunicles of the Eyes fram'd; for the *Cornea* or *Sclerolica* proceeds from the *Dura mater*, the *Choroides*, or *Uvea* from the *Pia Mater*, and the *Relina* from the marrowy Subſtance.

From the *Dura mater* ſprings the utmoſt Coat of the Nerve; and from this the Tunicle that is ſpread next under the *Adnata*, call'd *Sclerolica* from its hardneſs; but in its forepart where it covereth the *Iris* and *Ripilla*, it is nam'd *Cornea* from its tranſparency, tho' ſometimes this latter name includes the whole Tunicles, as well behind and on the ſides, as before.

That which lies under the *Cornea*, is much thinner than it, and is called *Choroides*, from its reſembling the Membrane *Chorion*, wherein the *Fœtus* is included in the Womb. Its fore part is otherwiſe call'd *Uvea*, becauſe it is ſomewhat the colour of a Grape. This ſprings from the *Pia mater*, and is ſpread from the bottom, or centre of the Eye behind, all over the Eye to the *Pupilla*; to whoſe Circumference when it is come, 'tis grown double, making with one part the *Iris*, with the other the *Ligamentum ciliare*.

On the inſide it is of a duskiſh Colour [in Man] but blacker on the outſide. But where it makes the *Iris*, it is of divers Colours reſembling the Rainbow, from whence it borrows its name. Yet in ſome it is more Blew, in others Black, in others Grey. This Tunicle is perforated before as wide as the *Pupilla*, or Sight of the Eye, to permit the Rays of viſible Species, to paſs into the Cryſtalline Humour.

Next unto which Cryſtalline Humour lies the *Ligamentum ciliare*, the ſecond part of the duplicated *Uvea*. This conſiſts of ſlender Filaments, or Fibres, like the Hairs of the Eye-lids, running like ſo many black Lines drawn from the Circumference of the *Uvea* to the ſides of the Cryſtalline Humour, which they encompaſs; and widen, or conſtringe as there is occaſion, by contracting or opening the *Foramen* of the *Uvea*.

The third Tunicle is made of the Medullar Subſtance of the Optick Nerve, and is called *retina*; this ſeems to be the principal Organ of Sight. For as Dr. *Briggs* well argues, neither the Cryſtalline, nor the Tunicle *Choroides*, are at all fit for this uſe. This latter part, riſing from the *Pia mater*, cannot communicate the Impreſſion of the Rays to the medullar part of the Brain which it does not at all touch: Whereas the medullar Fibres of the *Retina* have communication with it, as ſpringing from it, and therefore can well perform that Office. The Fibres of this Tunicle are extended from the bottom or inner Centre of the Eye, where the Optick Nerve enters it as far as the *Ligamentum ciliare*, to which it affords animal Spirits for the continuance of its motion. If one take this *Retina tunica*, and put it into warm Water, ſhaking it a little, to waſh off the mucous Subſtance which cleaves to it, and then hold it up to the Light, theſe Filaments will appear very numerous like the Threads of the fineſt Lawn.

Next to the Tunicles of the Eye are the Humours contain'd in them to be conſider'd; and theſe are three in number, *Aqueus*, *Cryſtallinus*, and *Vitreus*. The ſecond weighs as much again as the firſt, and yet not ſo much as the third by a ſixth part. The Cryſtalline is moſt denſe of Conſiſtence by much; and the Glaſſie more denſe than the Watry.

The *Aqueous* Humour is outermoſt, being pellucid, and of no Colour, as neither are the other two. It fills up that ſpace that is betwixt the *Cornea*, and the Cryſtalline Humour before. If any thickiſh Particles ſwim in it, then Gnats, Flies, Spiders, and the like will ſeem to be flying before the Eye.

But if thoſe Particles grow ſtill thicker, and cloſe together, ſo as to make a Film, and this be ſpread before the Hole of the *Pupilla*, then is the Sight quite taken away, which Diſeaſe is called a Cataract.

This Humour is very clear and thin, and therefore eaſily diſſipible; but by which way its Expence ſhould be ſupply'd, is difficult to determine. Some think it is fed by the Arteries, out of which this Water iſſues thro' they know not what Glands, others derive it from the Nerves, and a third ſort from the Lympheducts.

The *Cryſtalline Humour*, ſo called from its being as clearly tranſparent as Cryſtal, is placed betwixt the Aqueous and the Vitreous, but not exactly in the Middle or Centre of the Eye, but rather towards its fore-part. It is incloſed as it were in the boſom of the vitreous Humour; and is flattiſh on the foreſide, but rounder behind. It is more bright and thick than either of the other two.

It has been the common Opinion, That it is inclos'd in its proper Membrane, which is called either *Cryſtallina* from its tranſparency, or *Aranea* from its moſt fine Contexture. But Dr. *Briggs*, a very accurate Anatomizer of the Eye, denies any ſuch Tunicle, affirming, that it is meerly adventitious when the Humour is expos'd for ſome time to the Air, or is gently boild.

As to the Collection or Reception of the Rays of things viſible, this Humour is the primary Inſtrument of Sight, tho' the *Tunica Retina* is the Principle as to Perception, becauſe thro' it the Rays are communicated to the common Senſory.

The *vitreous Humour*, ſo called becauſe it is like to molten Glaſs; is is thicker than the Aqueous, but thinner than the Cryſtalline; and much exceeds them both in quantity, for it fills up all the inner or hinder Hemiſphere of the Globe of the Eye, and a pretty deal towards the lateral Superficies of the former. It is round behind, but hollow in the middle forwards, to receive the Cryſtalline into its Boſom.

The *Manner of Seeing* is call'd *Viſion*; which is a Senſe, whereby from the various motions of viſible Rays collected in the Cryſtalline and Vitreous Humours, and darting from the *Tunica Retina*, the Colours of viſible Objects are perceived, with their diſtance, greatneſs, figure, and number. As to the manner how this noble Senſe of Seeing was produced, there were many Hypotheſis among the Ancients.

1. The *Stoicks* imagined, that certain viſual Rays went from the Brain thro' the optick Nerve and Eye, and from thence to the Object; and there, juſt like a blind Man's Staff, feel out the figure, colour, and dimenſion of the Object.

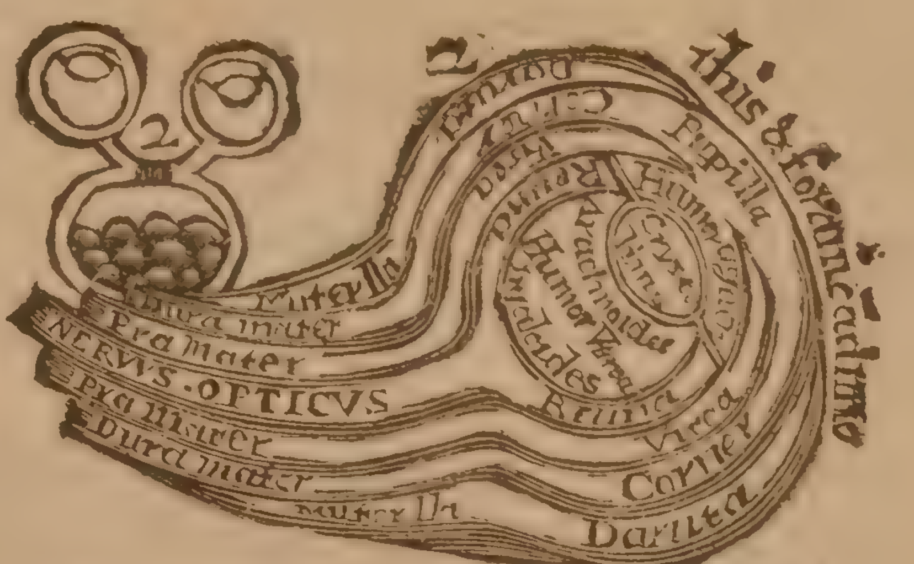
2. The *Pythagoreans* thought, that there went ſome viſual Species from the Eye to the Object, which were immediately reflected back again from thence to the Eye, and ſo produced *Viſion*.

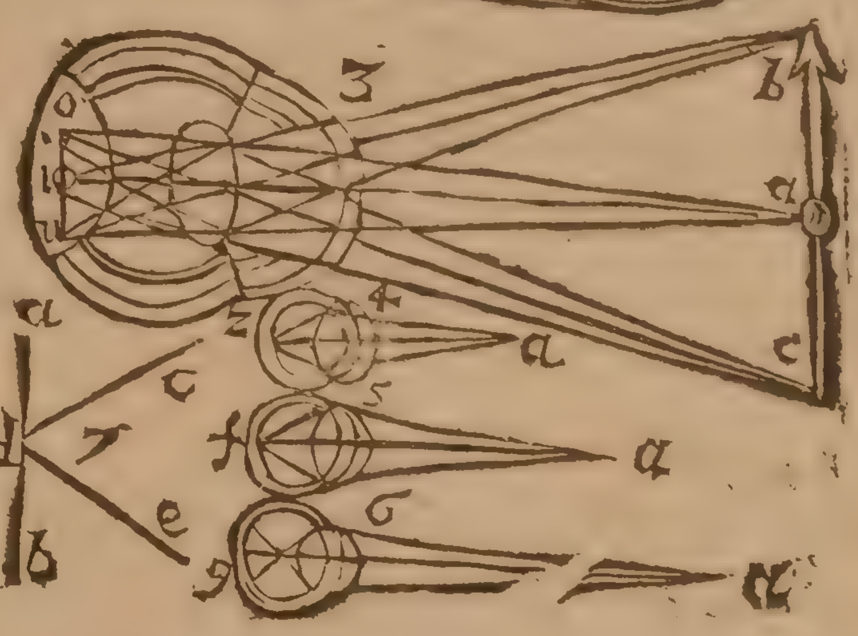
3. *Plato* ſuppoſed, That both from the Eye and the Object there came ſubſtantial Effiuvia, which meeting half way, and encountring the ocular Effluvia, the latter were beat back again to the Eye, and there communicated the Impreſſion they had received from thoſe Effluvia which came from the Object; and ſo cauſed the Senſe of Seeing.

4. *Ariſtotle* aſſerted, that the Colours of all Objects did move the tranſparent Medium, as that did the Eye, and thereby communicate their Images to the Brain, or the *Commune ſenſorium*.

5. *Epicurus*, judiciouſly rejecting the notion of any Emanation of viſible Species from the Eye, and not thinking the Action of the intermediate Air or Medium ſufficient to account for Viſion, righly concluded, That the Senſe of Viſion was produced by a ſubſtantial material Efflux from the Object to the Eye.

6. *Cartez*, ſuppoſes Viſion performed by bare motion only, without any material Emanation from the Object; but only, that the Light (which with him alſo is not a Body, but the motion of the finer Parts of the *Medium*) moves the Eye juſt after the ſame manner as the Object is ſuppoſed to have determined it; which motion is continued along the optick Nerve, up into the Brain, where it moves the *Conarion* or *Glandula Pinealis*, with him, the ſeat of the Soul; and by that means produces internal Senſation, and enables the Soul to judge accordingly.





How Viſion is perform'd we may learn from this *Diagram*, fig. 3. Suppoſe *b*, *a*, *c*, an Object, 3, 4, *u*, *i*, *o*, the Globe of the Eye, furniſhed with all its Coats and Humours.

1. From each Point of the Object we may conceive Rays flowing to the Pupil of the Eye 3, 4; theſe by means of the Coats and Humours of the Eye, and eſpecially by the cryſtalline Humour, are refracted and brought together on the *Retina* or Fund of the Eye in the point *i*, and there the point *a* is repreſented.

What is here ſaid of the point *a*, and its repreſentation at *i* may be underſtood of all the other points of the Object, as of *b* and *c*, and their repreſentations at *o* and *u*. For according to Sir *Iſ. Newton*'s beſt Hypotheſis of Light, each Ray hath its innate Colour and ſo will repreſent it where it falls.

2. As in a dark Chamber that has a Hole furniſh'd with a convex Glaſs, if the Paper which is to receive the Image in the diſtinct Baſe, be either nigher to, or farther from the Glaſs, than its due diſtance, the repreſentation thereon is confuſed: For then the radious Pencils do not exactly determin with their Apices on the Paper; but thoſe from one Point are mixt and confuſed with thoſe from the adjacent Points: So in the caſe of *plain Viſion*, 'tis requiſite that the Pencils ſhould exactly determin their Apices at *o*, *i*, *u*, on the *Retina*, or elſe Viſion is not diſtinct. Therefore Nature has ſo contriv'd the Eye, that it ſhould have a Power of adapting it ſelf in ſome meaſure to nigh and diſtant Objects, for they require different confirma-

firmation of the Eye, becauſe the Rays proceeding from the luminous Points of nigh Objects, do more diverge than thoſe from remote Objects. But whether this variety of Conformation conſiſts in the Cryſtallines approaching nigher to, or removing farther from the *Retina*: Or in the Cryſtallines aſſuming a different Convexity, ſometimes greater, ſometimes leſs, according as is requiſite, is left to the ſcrutiny of others; and particularly the curious Anatomiſts. This only may be ſaid, that either of theſe Methods will ſerve to explain the various *Phænomina* of the Eye: And that both theſe may attend each other, *viz.* A leſs Convex-Cryſtalline requires an Elongation of the Eye, and a more Convex-Cryſtalline requires a ſhortning of it; as a more flat Convex-Object Glaſs, or of a larger Sphere, requires a longer Tube; and one Protuberant, bulging, or of a ſmaller Sphere, requires a ſhorter Tube.

3. We perceive the Rays from each point of the Object, are all confuſed together; but by means of the Humours and Coats, each Cone of Rays is ſeparated, and brought by itſelf to determin on its proper Point on the *Retina*, there painting diſtinctly the vivid Repreſentation of the Object, which Repreſentation is there perceived by the ſenſitive Soul.

4. We are likewiſe to obſerve that the repreſentation of the Object *b*, *a*, *c*, on the Fund of the Eye *o*, *i*, *u*, is inverted: For ſo likewiſe it is on the Paper in a dark room; there being no other way for the radious Cones to enter the Eye, but by croſſing the Axis in the Pole of the Cryſtalline, or Glaſs.

But how it comes to paſs, that the Eye receiving the repreſentation of a part of an Object on that part of its Fund which is lowermoſt, or nigheſt the Centre of the Earth, perceives that part of the Object as uppermoſt, or fartheſt from the Centre of the Earth? In anſwer to this let us imagin that the Eye in the point *u* receives an impulſe or ſtroak by the Protruſion forward of the luminous Axis *b*, *u*, from the point of the Object *b*: Muſt not the viſive Faculty be neceſſarily directed hereby to conſider this Stroak as coming from the top *b*, rather than from the bottom *a*, and conſequently ſhould be directed to conclude *u* the repreſentation of the top.

Therefore we may be ſatisy'd, by ſuppoſing a Man ſtanding on his Head: For here, tho' the upper part of Objects are painted on the upper parts of the Eye, yet the Objects are judged to be erect. And from this poſture of a Man the reaſon appears, why the words *fartheſt from*, and *nigheſt to the Centre of the Earth*, rather than *upper*, and *lower*, are generally uſed. For in this poſture, becauſe the upper parts of the Objects are painted on that part of the Eye nigheſt the Earth, tho' really the upper part of the Eye, they are judged to be fartheſt from the Eye. What is ſaid of *Erect* and *Reverſe*, may be underſtood of *Siniſter* and *Dexter*.

5. The Image of an erect Object being repreſented on the Fund of the Eye inverted, and yet the ſenſitive Faculty judging the Object erect, it follows, That when the Image on an erect Object, is painted on the Fund of the Eye erect, the Senſe judges that Object to be inverted.

6. The magnitude of an Object, is eſtimated by the Angle the Object ſubtends before the Eye, and this is called the *optick Angle*. The point which is the Vertex of the optick Angle, is variouſly aſſign'd by various Authors; others in the Vertex of the Cryſtalline; others in the Vertex of the outward Coat or Cornea of the Eye; but 'tis a matter of no great conſequence wherever we place it; for according to the bigneſs of the Angle, the Image on the Eye is bigger or leſs.

7. The fault of their Eyes who are *Purblind* or Short-ſighted proceeds from hence, that in them the Cryſtalline is too convex, as in Figure the 6, uniting the Rays before they come at the *Retina*. And therefore they are helped by *Concave-glaſſes*, which take off from the too great Convexity of their Cryſtalline, ſome part of its refractive Power: Or rather theſe Concaves make the Rays diverge ſo, that their Cryſtalline ſhall be ſufficient only to bring them again together, ſo that they be not touched 'till they arrive at the Fund of the Eye.

Myopes are alſo helped, by holding the Object very near; for then the Rays that fall on their Eye from any ſingle point, and conſequently their too Convex-Cryſtalline does but ſuffice to bring together on the *Retina*.

8. On the contrary the Eyes of old Men have their Cryſtayine too flat, to make them meet on the *Retina*, but beyond it as in Figure 4. Wherefore for their help it is requiſite, that they add the adventitious Convexity of a Glaſs; that both it and the Cryſtalline together, may be ſufficient to unite the Rays juſt at the *Retina*. And from hence it appears, that Spectacles help old Men, not by magnifying an Object, but by making its appearance diſtinct; for old Men cannot read the largeſt point without Spectacles, and yet with Spectacles they read the ſmalleſt; tho' theſe with Spectacles do not appear ſo large, as thoſe without Spectacles.

9. What is ſaid of the confuſed or diſtinct repreſentation of a Point in the Object, may be underſtood of the confuſed or diſtinct repreſentation of the whole Object; at leaſt, for thoſe parts that lie pretty nigh adjacent to that Point that is looked at. For here we do not ſee a Point in the ſtrict Senſe of the Mathematicks, but in the Phyſical Senſe, for the ſmalleſt part imaginable; and the whole Object conſiſting of ſuch Points, what is ſhewn in one Point, may be underſtood of every Point in the Object.

Diſtinct Viſion, is cauſed when the Pencils of Rays from each Point of an Object, do accurately determin in correſpondent Points of the Image on the *Retina*.

Confuſed Viſion, is cauſed when the Pencils do intermix one with another.

Clear Viſion, is cauſed by a great quantity of Rays in the ſame Pencil, illuminating the correſpondent Points of the Image ſtrongly and vigorouſly.

Faint Viſion, is when a few Rays make up one Pencil. And tho' this may be *diſtinct*, yet 'tis *dark* and *obſcure*: at leaſt, not ſo *bright* and *ſtrong* as if more Rays concurred.

The Object of *Sight* is *Light* and *Colours*, of which an account wou'd be more juſtly given under the Article of *Phyſicks* or *Natural Philoſophy*. All that ſhall be ſaid here is only an Abſtract of Sir *Iſ. Newton*'s Doctrin concerning them.

1. Light conſiſts of an infinite number of Rays right-lin'd and parallel, but of different degrees of Refrangibility when meeting with a different *Medium*.

2. Each Ray according to its degree of Refrangibility, when ſo refracted, appears to the Eye of a different colour.

3. The leaſt refrangible Rays appear of a deep Scarlet, the moſt refrangible of a Violet-bleu, the Intermediate proceeding from Scarlet to Yellowiſh, then to Light-green, and ſo to Bleu.

4. The Colours ariſing from the different refrangibility of Light are not only the more noted Colours of Red, Yellow, Green, Blue, but alſo all the intermediate degrees of Red to Yellow, of Yellow to Green, *&c* differing as the degrees of Sound from Grave to Accute; in which there are not only the Notes of common Denomination, but alſo indefinite intermediate degrees of Sound, which are as diſtinct different Sounds as the other.

5. Whiteneſs, ſuch as the Sun's Light appears, containing all the Degrees of Refrangibility, is conſequently made up of all the above mentioned Colours.

6. Simple or homogenial Colours are ſuch as are produced by homogenial Light or Rays, that have the ſame degree of Refrangibility; and mixt Colours are ſuch as are produced by Rays of different Refrangibility.

7. Rays of the ſame Refrangibility produce the ſame Colour, which Colour is not alterable by repeated Refractions, only made more ſtrong or faint as the Rays are united or ſcattered.

8. All Bodies appear of this or that Colour, according as the Surfaces are adapted to reflect only the Rays of ſuch a Colour, at leaſt, in more plenty than the reſt.

Of PERSPECTIVE.

BY *Perſpective* we behold, and draw the likeneſs of all *Magnitudes* in the manner and form as they ſhew themſelves to the Eye. The Matter to be ſeen is Magnitude, and the manner of Seeing is by Radiations of Light, either direct, reflected, or refracted. Likewiſe, a Magnitude is that which has form, and is either a Complication of Points, Lines, or Superficies, of which we have treated in *Geometry*.

To draw the Appearance in Lines is the chief part in this Art, by which the *Idea* conceiv'd in the Mind by Sight, or otherwiſe, is brought to Light.

A Radiation is a Beam of Light, conveying the likeneſs of the thing to the Sight, and the knowledge of it to the Underſtanding. Direct Radiations are thoſe which conſider the direct or ſtrait Beams, that paſs between the Eye and the Object. Reflected Radiations are thoſe that conſider the reflection of Beams, with their ſhape upon any poliſh'd Body, which properly belongs to *Catoptricks*. Broken Radiations are thoſe that conſider the breaking of Beams, as they are to be ſeen through a Glaſs, or a Criſtal cut into ſeveral Plains or Superfices: And this part properly belongs to *Dioptricks*.

The active part of *Perſpective* is either Ichnographical, Orthographical, or Scenographical. Ichnography, is the deſcription of the plain Baſe, or the bottom of any Body, or Building, and is either Geometrical, or Scenographical; the Geometrical is that which gives the Sight of the Bottom, or Baſe of any Body, or Building; the Ichnography-Scenographical is the appearance of the ſame Baſe in Section, or through a Mirror erected upright on the ſame Plain on which the Baſe ſtands. Orthography is the Viſion of the fore-right Side of any Plain, or Superficies which lies Equidiſtant to a right Line paſſing through the outward or convex Centers of both Eyes continued to a due length; ſo that Perſpective Orthography is the delineation of the apparent right Plain. Scenography is the deſcription of a Plain, or other Figure, that declines from that Plain which makes Angles with a fore-right Plain. Between the Orthograpick and Scenographick Viſion there is this differenee; the Orthographick repreſents the Side of a Body, or Building, as it is beheld, when the Plain of the Glaſs is plac'd Equidiſtant to that ſide; but the Scenographick expreſſes the Side of a Body, or Building, as it appears through a Glaſs raiſed obliquely to the ſaid Side, or making an Angle with it.

The Baſe of any thing is the Plain, Flat, or Floor, on which any ſolid Body or Object is plac'd or rais'd.

The Altitude is the perpendicular ſpace of place, betwixt the Baſe and the Eye, or height of the Viſual Point above the Baſe. The Viſual Point is a Point in the Horizontal Line, in which all the Beams of the Eyes unite. The Horizontal-Line is a Line that proceeds from the Center of the Eye, to the Viſual Point, parallel to the Horizon of the Earth.

The Diſtance is the ſpace on the Baſe, between the Glaſs and Point in the Baſe, that lies directly under the Eyes.

The Section is a Plain of tranſparent Matter (as of Glaſs) rais'd upright on the Plain of the Baſe ſtanding before you, parallel to a ſtrait Line, paſſing through the Convex-Centers of both Eyes. Now without the underſtanding of this Section or Glaſs, 'tis impoſſible to attain to the Knowledge of Perſpective, and by Conſequence to give a reaſon for the difference betwixt the Orthographick, and Scenographick Figures.

If the Glaſs is plac'd near the Viſual Point, and remote from the Object, the Figure which is ſeen will be very ſmall; becauſe all Rays comprehending the Orthographical, and Scenographical Figures fall into the Viſual Point, as their Common Center. If the Viſual Point be more rais'd (tho' at the ſame Diſtance) the Scenographick Figure or Form will appear much larger. And by reaſon the Viſual Radiations are higher, the various Perpendiculars rais'd on the Section, or Glaſs, cut them in wider diſtances, as being more remote from the Glaſs. If the Glaſs incline to the Viſual Point, the Scenographick Viſion will be longwiſe between the Viſual Point and the Object; But if the Glaſs recline from the Viſual Point, the Scenographick Figure will appear rounder, and begin to reſemble the Orthographick. But if the Glaſs is fix'd Equidiſtant to the Baſe, or Plain the Object ſtands upon, the Scenographick and Orthographick reſemblance will be one and the ſame.

Diagonals, or Lines of Diſtance, are ſuch as are drawn from the Point of Diſtance, to any other Point higher, or lower than the Horizon.

The Object is that Form, Body, Figure, or Building intended to be expreſs'd in Perſpective Proportions.

The General Practice of Perſpective.

LET the Object you are to draw, ſtanding on your right Hand, be alſo plac'd on the ſame Hand of the Viſual Point; and that on the left on the ſame ſide of the ſaid Point, and that which is oppoſite before in the middle of it.

Let every Line which in the Object is Strait, Parallel, or Perpendicular to its Baſe, be alſo ſo in its Scenographical Delineation.

Let thoſe Lines that are in the Object Equidiſtant to the returning Line, be drawn in the Scenographical Figure, from that Point found in the Horizon.

Let the Lines which in the Object return at right Angles from the fore-right ſide, be drawn Scenographically from the Viſual Point.

The Center in any Scenographical Regular Figure, is found by drawing croſs Lines from oppoſite Angles, for the Point where the Diagonals croſs in the Center.

In Drawing a Perſpective Figure, where many Lines come together, for the directing your Eye, you may draw the Diagonals in Red; the Viſual Lines in Black, and the Perpendiculars in Green, or any other different Colour.

A Ground Plain of Squares is alike, as well above, as below the Horizontal Line; However, the more it is diſtant above or below the Horizon, the Squares will be ſo much the wider and larger.

Let all Strait Lines which in the Object return from the fore-right ſide, run in a Scenographical Figure into the Horizontal Line.

In Drawing Arches, Circles, Croſſes, Ovals, Spirals, or the like Figures in the Roof of a Room; firſt drawing Ichnographically, and ſo with Perpendiculars from the moſt eminent Points, carrying it up to the Ceiling; from which ſeveral Points carry on the Figure. And in ſetting off the height of Pedeſtals, Columns and meaſure the Height from the Baſe-line upward, in the Front or fore-right ſide; and a Viſual Ray drawn, that Point in the Front ſhall limit the Altitude of the Column all the way, behind the fore-right-ſide, even to the Viſual Point.

Thus having conſider'd the Diſtance, Height and Poſition of the Figure, and drawn it accordingly, with the Side or Angle againſt the Baſe; raiſe Perpendiculars from the ſeveral Angles, or deſign'd Points in the Figure to the Baſe, and transfer the length of each Perpendicular from the place where it touches the Baſe, on the ſide oppoſite to the Point of Diſtance; and ſo will the Diametrals drawn to the Perpendiculars in the Baſe by Interſection, with the Diagonals drawn to the ſeveral transferr'd Diſtances, give the Angles of the Figure: And ſo Lines drawn from Point to Point, will Circumſcribe the Scenographical Figure.

If in a Landskip there be any ſtanding Waters or Rivers, place the Horizontal Line level with the fartheſt ſight of it. In deſcribing things at a great Diſtance, the proportion as to Magnitude, and Diſtance muſt be obſerv'd, which appears from the Object to the Eye. And if there be any Houſes or other Edifices, conſider their Poſition, to find from what Point in the Horizontal Line, to draw the Fronts and Sides of them.

In Colouring and Shadowing of every thing, obſerve the ſame in your Picture, which you do by your Eye, eſpecially in Objects that are near; but according as the Diſtance grows greater and greater, ſo the Colours muſt be fainter and fainter, till at laſt they loſe themſelves in a Darkiſh Sky-colour.

Of Catoptricks *and* Dioptricks.

THE Catoptricks are beſt ſeen in a common Looking-Glaſs, where if the Glaſs be exactly flat, the Object is in all reſpects like its Original, or Patern; but if it is not flat, the reſemblance alters from its Original, and that more or leſs, as the Glaſs differs from an exact Plain.

In Drawing of Catoptrical Figures, the Surface of the Glaſs is to be conſider'd, upon which the Reflection is to be; for this you muſt make a particular Ichnographical Draught, which on the Glaſs muſt appear to be a Plain full of *Squares*; on which Projection transfer what ſhall be drawn, on a Plain, divided into the ſame Number of like Squares; where though the Draught may appear very confuſed, yet the Reflection of it on the Glaſs, will be very proportional and regularly compos'd.

The Dioptrick, or Broken Beam may be ſeen in a Tube, through a Cryſtal, or Glaſs, whoſe Surface is cut into many others, by which the Rays of the Object are broken.

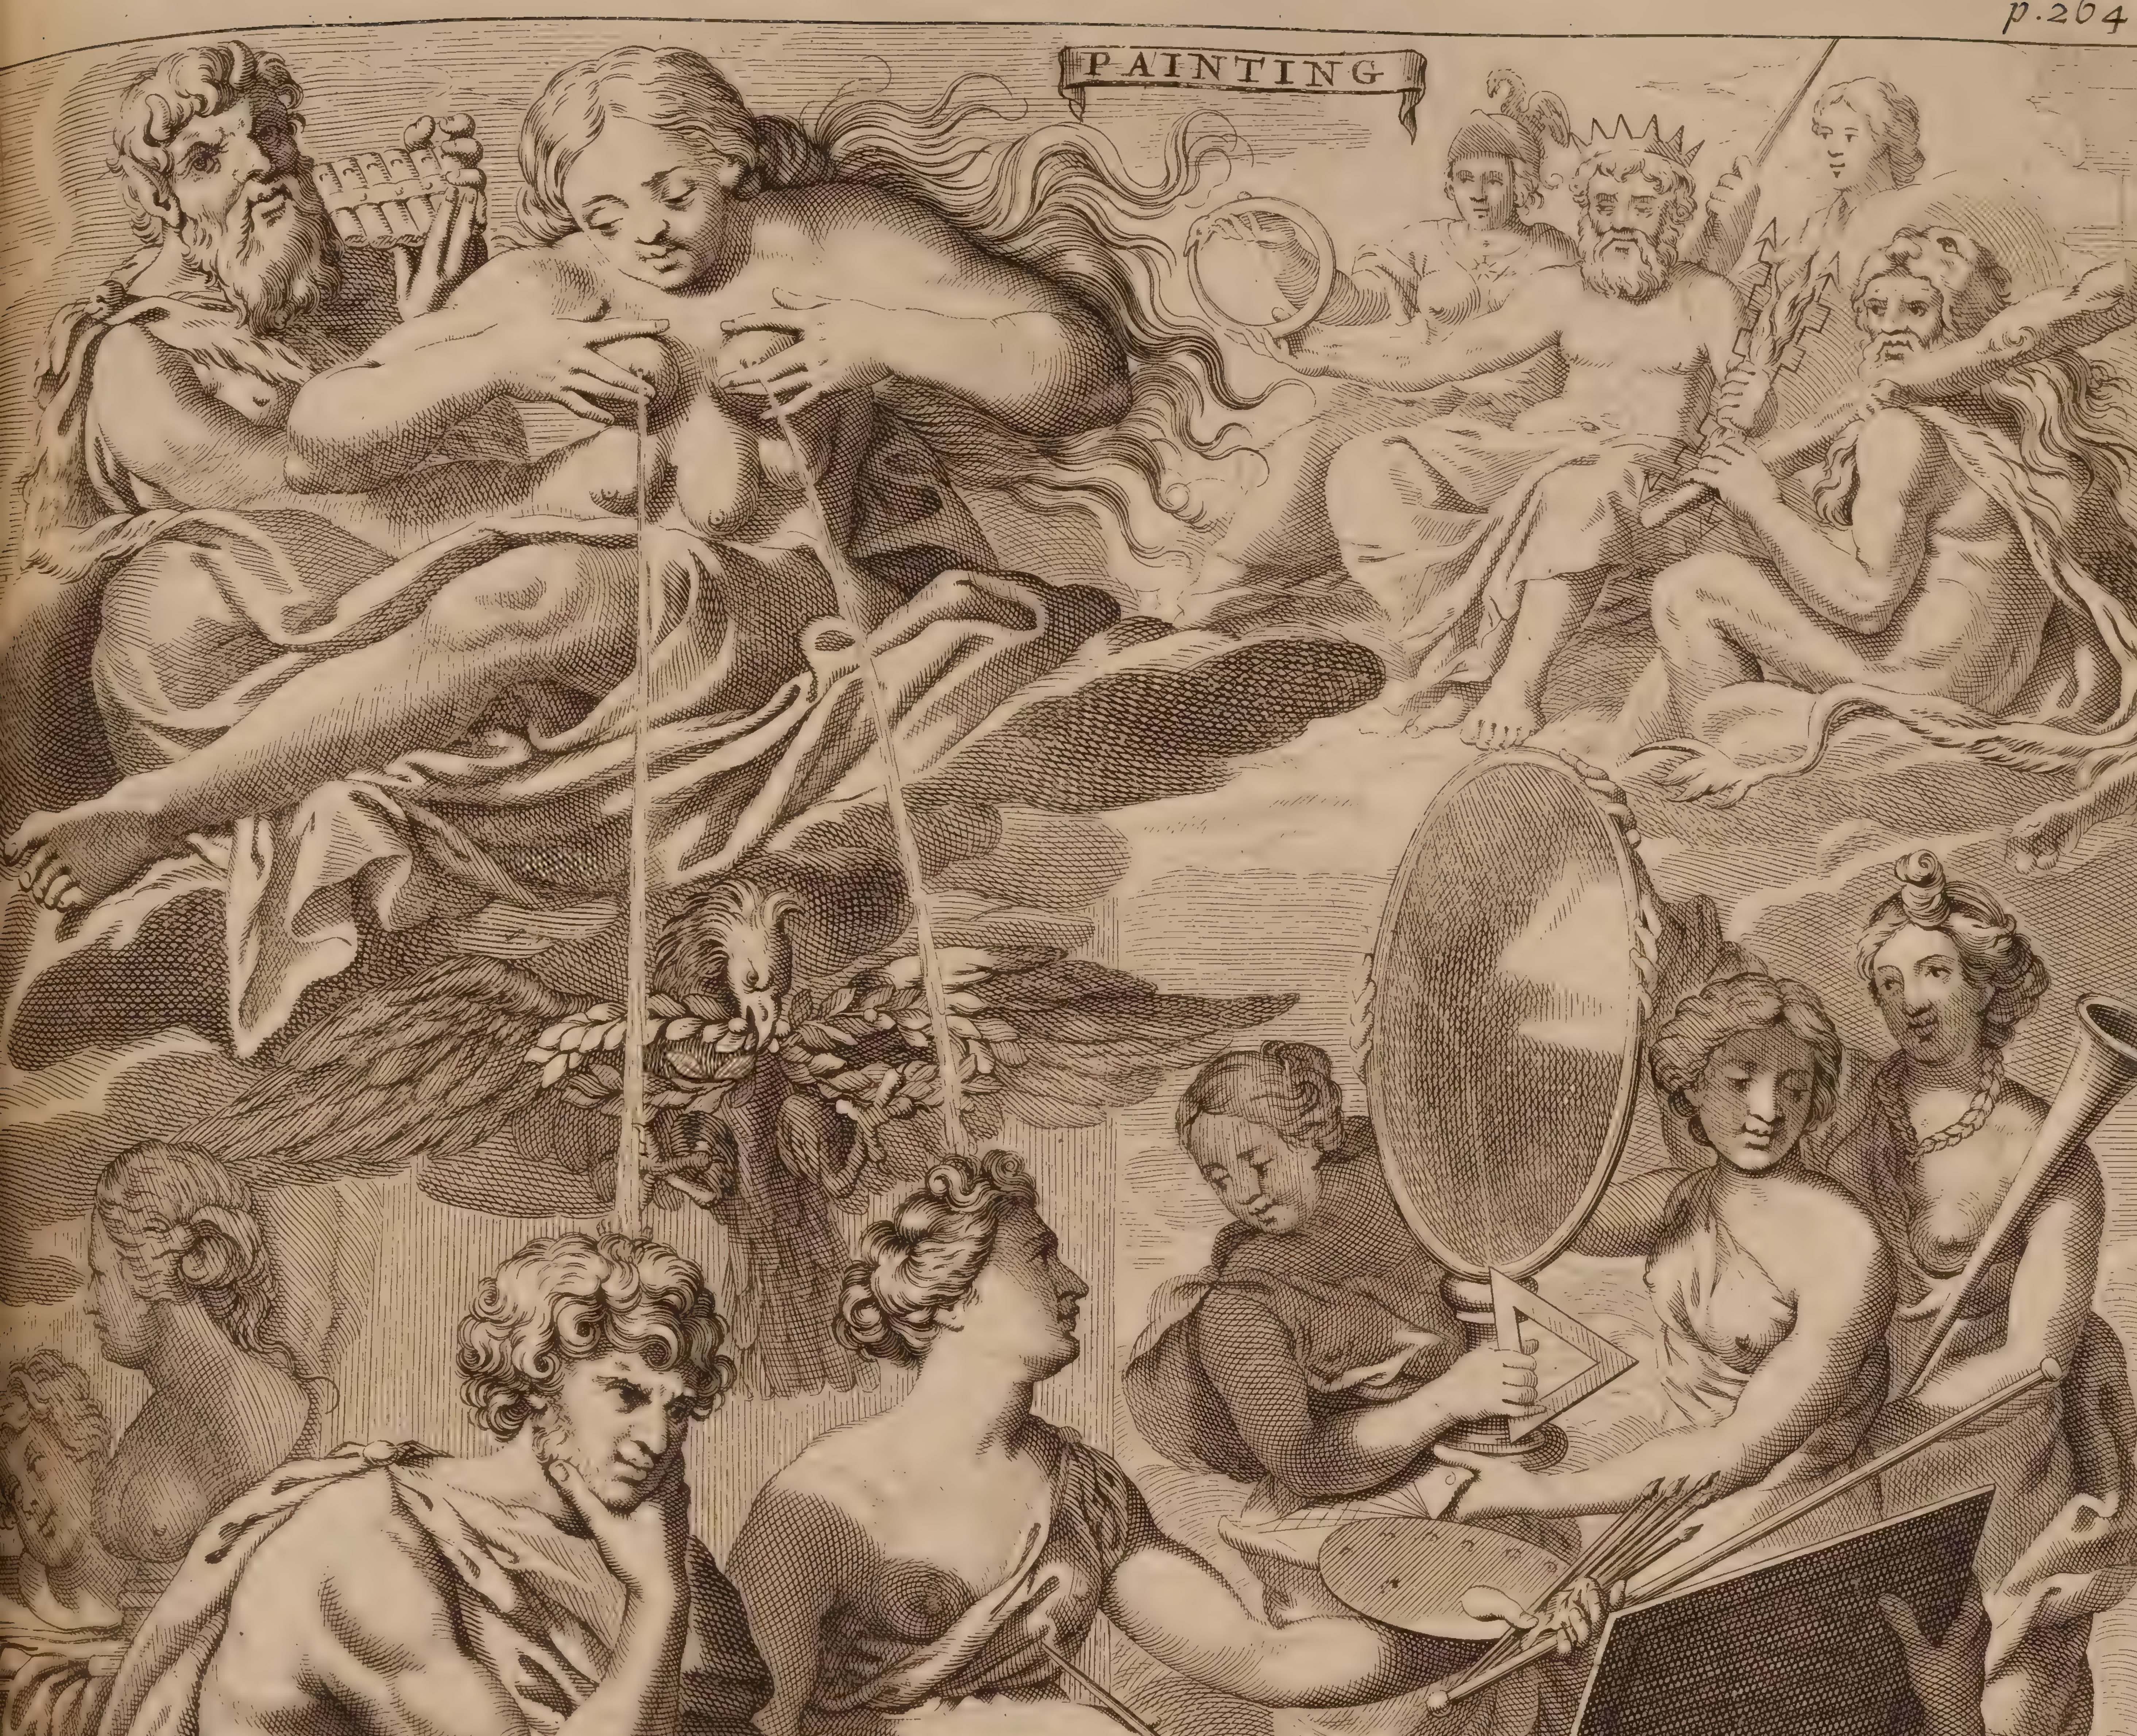
Of SCULPTURE in General.

SSulpture is an Art, by which, in taking away, or adding to Matter, all ſorts of *Figures* are form'd; either in *Clay*, *Wax*, *Wood*, *Stone*, or *Metal*. This ſort of Work is done either by *Hollowing*, as in *Metals*, *Agats*, and other Stones, or working in *Relievo*, as in *Statues* and *Baſs-Reliefs*. *Statues* are Figures which are ſeen on all ſides, and *Baſs-Reliefs* are never ſeen entirely. The Ancients Invented them to repreſent Hiſtories, and make a kind of *Pictures* to adorn their Theaters, Triumphal Arches, and other Edifices.

There are three ſorts of *Baſs-Reliefs*; in ſome the Figures appear ſo rais'd, that they ſeem to be almoſt diſſever'd from their Ground: In others, they are half out, and the *Relievo* is much leſs: And in the laſt Kind, they are ſtill leſs rais'd, and have very little *Relievo*; as in *Urns*, *Medals* and *Coins*.

'Tis very difficult to find out the *Inventers* of *Sculpture* in the Obſcurity of paſt Ages: Its Antiquity appears in Scripture, where we read of *Laban's Idols*, which *Rachael* carry'd off with her, and the *Golden Calf* the *Iſraelites* erected in the Wilderneſs. As to the Profane Authors who have Written of it, ſome will have it, that a Potter of *Sicyone*, Nam'd *Dibutades*, was the firſt *Sculptor*, and that his Daughter gave a Beginning to *Painting*, in drawing the Picture of her Lover on the *Shadow*, which the *Light* of a *Lamp* mark'd againſt a Wall. Others maintain, that this Art had its Origin in the Iſle of *Samos*, where a certain *Idoneus* and his Contemporary *Theodorus*, Invented and Work'd in it along Time before *Dibutades* was hear'd of: And that *Damaratus*, Father of the firſt *Tarquin*, bryught it into *Italy*, when he fled thither; for bringing with him *Eucirapes* and *Eutigrammus*, two Excellent Workmen in this Art, they Communicated it

par-



PAINTING
F. H. Van Hoven sculp.

To the Right Honble Charles Bodvell,
iſcount Bodmyn Grandſon and
heyre to the Right Honourable
ohn Earle of Radnor &c.^{a}
This Plate is humbly dedicated by Richard Blome.

QVÆ SUPRA

particularly to the *Tuſcans*, who apply'd themſelves to it, and ſucceeded in it.

They add, That *Tarquin* afterwards, ſent for one *Taurianus*, a Celebrated Sculptor, to make the Statue of *Jupiter* in Molten Earth; as alſo four Horſes of the ſame Matter, to be plac'd in the Frontespiece of the Temple of that Idol. 'Tis thought the ſame Sculptor made an Image of *Hercules*, which was a long while to be ſeen at *Rome*, and was call'd *Hercules of Molten Earth*, on account of its Matter.

There were ſeveral *Sculptors* at that time in *Greece* and *Italy*, who wrought in Earth. We Read of one *Caleoſtenes* an *Athenian*, who made his Name and Houſe Famous, for the great Number of *Earthen* Figures with which it was fill'd; and of one *Demophilus* and *Gorſamus*, who were alſo *Painters*, and Embelliſh'd the Temple of the Goddeſs *Ceres* with Pictures and Earthen Images: For all the Images of the *Pagan* Deities were, at firſt, made only of *Clay*, or *Wood*; and 'twas not ſo much the Brittleneſs and Cheapneſs of the Matter, as the Luxury and Riches of the People, that brought Marble and other Precious Metals into Uſe in its Place.

However, as Rich as the Matter was which the *Sculptors* made uſe of, they never left off working in *Earth*, for they have always form'd their Models of it; and whether they cut their Statues in Marble, or caſt them in Metal, they have ever made a Model with *Clay* before they undertook ſuch ſort of troubleſom Works. 'Twas doubtleſs this which gave occaſion to *Praxiteles* to ſay, That the Art of making *Earthen* Figures was the Mother of the Art of making Figures in Marble and Braſs, which did not begin to appear in Perfection, till about Three hundred Years after the Foundation of *Rome*.

Phidias of *Athens*, who Flouriſh'd then, Surpaſt all that went before him, as well in working in Marble, or Ivory, as in all ſorts of Metals. But ſoon after there aroſe ſeveral Excellent Artiſts, who carry'd the Art of *Sculpture* to the greateſt height it ever cou'd Boaſt of; For in *Sicyone* liv'd *Polycletes*, whoſe Figures were Admir'd by all the World, and the *Models* of all that Study'd in this Art. Then appear'd *Myron*, who was Inimitable in every Thing he did. *Lyſippus*, whoſe Name will Live as long as *Alexander*'s, and who alone had the Favour to Caſt the *Figure* of that Prince in Braſs. *Praxiteles* and *Scelas*, who made admirable Figures; and the Horſes that are at this Day to be ſeen at *Rome*, before the Pope's Palace of *Montecavallo*. This *Scepas* had ſeveral Competitors, as *Briaxis*, *Timotheus*, and *Levehares*, who was employ'd about the Famous Tomb of *Mauſolus*, King of *Caria*; *Ceſeſidorus*, *Canaclius*, *Dædalus*, *Buthieus*, a Diſciple of *Myron*'s; *Newratus*, *Euphranor*, *Theodorus*, *Xenorales*, *Phiromachus*, *Stralenieus*, *Antigonus*, who Wrote a Treatiſe of his Art; thoſe incomparable Workmen who made the *Laocoon*, *Ageſandes*, *Polydorus*, and *Athenedorus*, Three worthy of Immortal Praiſe for ſo Fine a Piece of Work; and an infinite Number of other Artiſts, the Names of ſome of whom are ſtill remember'd, and the reſt are Periſh'd with their Works. For tho' formerly there were ſo great a Number of *Statues* in *Greece* and *Italy*, that in *Rome* only there were thought to be more than living Men, yet a very ſmall quantity are now left, eſpecially of Fine nes.

When *Marcus Scaurus* was *Edile*, his Poſt obliging him to prepare every thing for the Publick Spectacles, he Adorn'd the Pompous Theatre which he Built, with 8000 Statues, and tho' *L. Mummus* and *Lucullus*, brought a great quantity with them out of *Aſia* and *Greece*, there were left above 3000 at *Rhodes*, as many at *Athens*, and more at *Delphos*. But what is more Surprizing is the greatneſs of the *Figures*, which the Ancient Artiſts had the boldneſs to undertake. Among thoſe *Lucullus* brought to *Rome*, there was one of *Apollo* 30 Cubits high: The *Coloſſus* which the *Rhodians* erected to the Honour of the *Sun*, and was the Workmanſhip of *Caroles*, Diſciple to *Lyſippus*, ſurpaſt this *Apollo* very much, for it was 70 Cubits high. The Statue of *Nero*, which *Zenodorus* made, after he had done that of *Mercury* in *France*, muſt alſo be of a prodigious Bigneſs, ſince it was 110 Foot high. Nevertheleſs, 'tis obſervable, that *Sculpture* did not remain above 150 Years after *Phidias*'s Time, when it began inſenſibly to Decline: Not but that there have been ſeveral Excellent Pieces of *Sculpture* made in *Greece* and *Italy*, but not of ſo great a *Gout* and ſuch excellent Beauty.

Beſides that, the *Greek Statues* are moſt Eſteem'd for the Excellence of the Workmanſhip: There's this difference between them and the *Roman*, that the greateſt part of the former, are almoſt always Naked, after the manner of thoſe that exercis'd themſelves at Wreſtling, or other Bodily Exerciſes; in which the Glory of Youth, in thoſe Days, conſiſted; whereas, the *Roman Statues* are cover'd with Habits, or Arms, and particularly the *Toga*, which was the greateſt Mark of Honour among the *Romans*.

The beginnings of *Sculpture* were in *Clay*, not only to make Statues at firſt, but when the Sculptor undertook any thing conſiderable, to make *Models*; which, as I have obſerv'd, was, and is ſtill, always done in Clay, or Wax.

How to make Figures of Clay, *or* Wax.

There's no need of many Tools to make Figures of *Clay*, or *Wax*; the Clay is plac'd on an Eaſel, and the Sculptor begins and finiſhes the Work with his Hands. Thoſe that are uſed to it, never make uſe of any thing but their Fingers, except three or four pieces of Wood, which are Roundiſh at one End, at the other Flat, with a ſort of Claws and Teeth; the Name they give them, is *Ebauchoir.* * They are about 7 or 8 Inches long; thoſe with Claws are to ſmooth the Stuff; the other, which have Teeth, are to ſcratch it, the Workmen not affecting to let it appear ſleek.

*A Hatchet.

They are made of *Wax* thus; Take a Pound of Wax, half a Pound of Oaker, or Scammony, ſome mixt Turpentine and melt it together with Oil of Olives: Put more or leſs, according as you would have the Matter harder or ſofter; a little Vermilion alſo ſhould be mixt with it to give it a ſofter Colour. When the Compoſition is made, the Figure is work'd up with the Hand, and thoſe *Ebauchoirs* that the *Sculptors* make uſe of in their *Earthen* Figures. *Practice* is the principal Miſtreſs in this ſort of Work, which at firſt is not ſo eaſie as that in Clay.

Of Sculpture in Wood.

The firſt Thing that a Sculptor in Wood is to do, is to chuſe the beſt Wood he can, and that which is moſt proper for the Work he undertakes. If 'tis ſomething Great, requiring Strength and Solidity, he ought to take the hardeſt Wood and that which keeps beſt, as *Oak* and *Cheſnut*; but for things of moderate bigneſs, *Pear* or *Apple-Tree* will do. And becauſe the latter are alſo very hard, when the Artificers is to make Ornaments that ſhould be Delicate, they chuſe tender Wood, but however firm and cloſe, ſuch as the *Linden-Tree*, which Work is excellent for ſuch, becauſe the *Chizel* cuts more neatly and eaſily than any other Wood.

As to *Statues*, we find the Ancients made of all ſorts in Wood: There was one of *Apollo* of *Box* at *Sicyone*: That of *Diana* at *Epheſus* was of *Cedar*. As theſe two ſorts of Wood are very hard and uncorruptible, and chiefly *Cedar*, which according to *Pliny*, ſeems to be deſign'd never to have an End; the Ancients frequently made the Images of their Gods of it. In the Temple built in Honour of *Mercury*, on Mount *Cyllene*, there was an Image of that God made of *Citron* Wood, which was very much in Eſteem; the Image was 8 Foot high.

Cypreſs being a Tree which is not apt to Corrupt, nor be damag'd by Worms, *Statues* were alſo made of it; as alſo of the *Palm-Tree*, *Olive-Tree*, and *Ebony*, of which there was a Figure of *Diana* at *Epheſus*; as alſo of ſeveral other ſorts of Wood. In like manner there were *Images* of *Jupiter*, *Juno*, and *Diana*, made of the *Vine-Tree*, in other Places. About 100 Years ago, there was a French *Sculptor* at *Florence*, Nam'd *Maiſtre Janni*, who Carv'd in Wood to that Perfection, that he made as compleat Images in it as in *Marble*. *Vaſſari* mentions a Rock of his doing, which was look'd upon as a Wonder.

When a Figure or Piece is well wrought, the Sculptors ſay, 'tis well *Cut*. The Beauty of it conſiſts in its being cut tenderly, and when their appears neither dryneſs, nor ſtiffneſs in it.

If a *Sculptor* would undertake any great Work, tho' it be but of one Figure, he had better make uſe of ſeveral pieces of Wood than of one whole Piece, which, as well in Figures, as Ornaments, is apt to *Crack* and *Cleave*, for an entire piece of Wood may not perhaps be dry at Heart, tho' the Out-ſide ſeems very dry. It ought to have been cut 10 Years before the Sculptor works upon it in ſuch Performances.

A *Sculptor* in Wood uſes the ſame Tools as a *Joyner*.

Of Sculpture in Marble and other Stone.

Sculptors who work in *Marble* or *Stone*, make uſe of good Steel Tools, Strong and well Temper'd, according to the hardneſs of the Matter. The firſt Thing to be done, is to ſaw out of a great Block of Marble another Block, of the bigneſs the Workman has occaſion of, which is done with an Iron Saw, very ſmooth and without Teeth; and according as the Marble is ſawn, he throws Water and *Freeſtone-Duſt* † upon it. The *Freeſtone-Duſt* ſerves to ſaw the Marble, and the Water makes it fall off in ſoft Mire when its Strength is gone: it alſo hinders the Iron from heating itſelf.

Then the *Sculptor* ſmooths the Marble he intends to work, by taking away its Superfluities by main Blows with a *Beel* and *Point*. When he has ſmooth'd it fit for his Work, he goes over it again with a finer *Point*, call'd *Dogs-Tooth*, having two Points, but not ſo ſharp as the other.

He after that, makes uſe of his *Gradine*, which is a flat cutting Tool with three Teeth, but not ſo ſtrong as the *Point*: With this Tool, the Artificer works on to advance his Work: He then takes off with a ſmooth Chizel, the Scratches which the *Gradine* left on the Marble, and uſes it with Dexterity and Delicacy, to give ſoftneſs and tenderneſs to his Figure; till at laſt taking a *Raſp*, which is a ſort of File, his Work is in a condition to be Poliſh'd.

There are ſeveral ſorts of *Raſps*, ſome Strait, ſome Crooked, ſome Harder, ſome Softer the one than the other.

When the Sculptor has ſo far finiſh'd his *Sculpture*, there being certain Places and particular Pieces that require Poliſhing, he uſes *Pumice-Stone* and *Putty*, to make all the Parts ſmooth and ſleek: Then he goes over it with the *Tripoli*; and when he wou'd give it more luſtre, rubs it with Leather, and Straw-Aſhes. Beſides the Tools before-mention'd, Sculptors uſe the *Pick*, which is a ſort of *Hammer*, Pointed and ſharp at one End; at the other are Teeth made of good Steel and Squar'd, that they may be the ſtronger. It ſerves to break the Marble, and is us'd in thoſe Caſes where the Workman can't make uſe of his two Hands to manage his Mallet and Chizel.

The *Bouchard* is a piece of Iron well Steel'd at the Bottom, and Pointed at both Ends like a Diamond; 'tis us'd to make an Hole of equal bigneſs, which can't be done with Cutting Tools. The *Bouchard* is beaten down with the *Beetle*, and the *Points* breaking the Marble, reduce it to Powder. Into the Holes Water is thrown from Time to Time, in proportion to the depth that is made, to waſh out the Duſt of the Marble and hinder the Iron's heating, which would ſpoil the Temper of the Tool, for the *Free-ſtone-Duſt* on which the Tools are Edg'd, is moiſten'd only to prevent their Heating, and that they may not loſe their Temper by being rubb'd when dry; for this Reaſon they wet alſo the *Trepands*, which otherwiſe are apt to grow hot in Trepaning, The *Sculptors* make uſe of them to drive into and pierce ſuch Places of their Figures as they cou'd not reach with their Chizel without endangering the ſpoiling of it, and breaking ſomething or other. When they work with the *Bouchard*, they put it through a Hole made in a piece of Leather, which is put over the Place they are hollowing, to prevent the Water's ſpirting up in the Workman's Face.

The other Tools neceſſary in *Sculpture*, are the *Roundel*, which is a ſort of Chizel made round. The *Hongnet*, which is a ſort of Pointed ſquare Chizel. Beſides which, the Sculptors muſt have a Compaſs to take all the Meaſures in their Figures.

When the *Sculptors* undertake any conſiderable piece of Work, whether *Statues*, *Baſs-Relieves*, or the like, they always make a *Model* in *Clay*, of the ſame bigneſs they intend their Figure ſhall be; and becauſe *Earth* or *Clay* ſhrinks as it grows dry, and is apt to break, it ſerves only for a Mould of Plaiſter, in which is made Figures of Plaiſter alſo. This they repair, and afterwards uſe for a Model, from which they take all their Meaſures, and govern themſelves in cutting the Marble. For their good Guidance in their Work, they put on the Head of this Model an *Immovable* Circle divided into Degrees with a *Movable* Rule fix'd in the midddle of the *Centre*, and divided alſo into Parts: At the end of the *Rule* hangs a Line with a Lead, by which they take all the Points that are to be the ſame on the Block, a Top of which hangs a Line in like manner as in the Model: However, there are excellent *Sculptors* who don't approve of this way, ſaying, if the Model ſtirs never ſo little, their Meaſures may vary, and ſo they make uſe of the *Compaſſes* in meaſuring all the Parts.

As to Figures made of hard Stone, ſuch as that of *Leu*, &c. the Artificers do the ſame as in working in Marble, excepting that the Matter not being ſo hard, their Tools are not ſo ſtrong, and ſome of them are of a different Form, as the *Raſps*, the *Hand-Saw*, the

the *Ripe*, the *Streight Chizel* with three Teeth, the *Roundel*, and the *Grater*.

Sculptors have commonly a Bowl-Diſh in which they temper Plaiſter with the ſame Stone their Figures are made of, and make a Powder of it, with which they fill the little Holes, and repair the Defects they meet with in the Stone. That of *Tonnerre* is ſo plain, that it has no occaſion of it.

If they work in *Free-Stone*, they have Tools on purpoſe, for the *Free-Stone* is apt to Scale, and does not work like Stone or Marble.

How to Caſt Figures in Braſs.

I ſhall not treat here of the manner of the Ancients Caſting their Metals and making Figures, one may ſee by what *Pliny* ſays of it, That they ſometimes made a ſort of *Moulds* of Stone. *Vitruvius* mentions a kind of Stone which was found near the Lake of *Volſene*, and in other Parts of *Italy*, that wou'd endure the violence of the Fire, and *Moulds* were made of it to Caſt ſeveral ſorts of Works in.

Lib. 37. *c.* 4.

Lib. 2. *c.* 7.

The *Moderns*, who have work'd in *Italy* and elſewhere, have proceeded in it after different ways: Every Age has diſcover'd eaſier means of doing it; and it may be affirm'd, that never was a more eaſie Way found out to come to Perfection in theſe Things than what is now practis'd in *France*, where the Artificers know how to Caſt and Repair all ſorts of Figures after as Beautiful a manner as any thing that we ſee or have heard of in the *Antiques*.

The firſt Thing to be done towards Caſting a Statue, or any other Piece of Work in Braſs, is to make a Model of *Clay* prepar'd by the Potters, who mix Sand amongſt it, to prevent the Models cleaving or breaking in Drying. The beſt Clay that is made uſe of for this purpoſe at *Paris*, is dug at *Artueil*, and the Sand at *Belleville*.

When the Model is finiſh'd, a Mould of Plaiſter is put over it while 'tis freſh, becauſe the Parts are apt to ſhrink with Drying. He begins at the bottom of the Figure, which is made up of ſeveral Pieces from the Foot to the Knee, according to the bigneſs of the Model; for when the Pieces are too big, the Plaiſter is apt to Chap. Upon the firſt Piece another is plac'd always proportionable to the Figure, and ſo continued from one to another as high as the Shoulders, on which the Head is put.

'Tis to be obſerv'd, that if it is a Naked Figure whoſe Pieces, which form the Mould, being pretty big, may be peel'd off eaſily; there's no need of covering them with a *Shape.** But if the *Figure* is with *Drapery*, or accompany'd with Ornaments, which oblige the Artificer to make abundance of little Pieces to be the more eaſily peel'd off, he muſt then make great *Shapes*; that is, he muſt Cloath all thoſe little Pieces with other *Plaiſter* in great Bits, to encloſe the other, and Oil the great as well as the little Joynts, that they may not ſtick to one another.

* *Chappe.*

Shapes are great Pieces, diſpos'd in ſuch a manner that each of them encloſe ſeveral little ones, to which are fix'd little Rings of Iron to help peal them off the more eaſily, and to make them keep in the *Shapes*, by means of little Cords ty'd to the Rings, and put into the *Shapes*. The great and little Pieces are mark'd with Cyphers, Letters, and Cuts, to know them and ſet them the better together.

When the *Mould* of *Plaiſter* is thus made, it muſt lie by a little, and as ſoon as it is dry, and the Sculptor is about to uſe it, if he is Curious, he will not be contented with rubbing it with Oil, bnt will heat all the Parts of his Model, and then fill them with Wax, which de does, that the Wax-work may be the more Beautiful and more Perfect: For when they are only rubb'd with Oil, the Waxen Figure will commonly look mealy, becauſe the Wax always ſinks in ſome part of the Plaiſter; or rather the Plaiſter ſucks in part of the Wax, which will ſtill cauſe a more viſible Defect in the Picture, and the *Caſt* will never be ſo Fine.

The *Mould* being thus Oil'd, or rather Wax'd, when the Workman is about to Caſt a Figure in Braſs, he gathers all the little Pieces that are in each great piece of the *Shape*, which he preſently Oils all over with a Pencil, then with another Pencil he takes his Compound-Wax; that is, to ſix Pound of Wax, is put half a Pound of Hogs-Greaſe, and one Pound of *Burgundy-Pitch*, according to the Seaſon; for in Summer the Wax may be work'd up alone, the other Drugs being only to render it the more pliant and manageable: Of this ſort of Wax, either Simple, or Compounded, the Workman lays on to about the thickneſs of a Silver Penny on all the parts of the *Mould*; after which, he takes the ſame Compoſition and makes Cakes of it of an equal thickneſs, according as he deſires the Braſs ſhould come, which is generally the fourth part of an Inch. The Cakes he puts into the Cavities or Moulds, and Incorporates them with his Fingers, with the Wax that was lain on with the Pencil, in ſuch ſort, that they fill them all equally: He then takes an Iron *Grate*, which ſhould be three or four Inches broader than the Baſis of the Figure that is to be made, in which *Grate*, he raiſes once more Bars of Iron, turn'd according to the Altitude of the Figure, and pierc'd in ſeveral Places, to put Rods of Iron through of what Length ſhall be thought neceſſary to bear up the Soul, or *Nuclæus*, as *Vitruvius* calls it, of the Piece to be Caſt.

The Ancients made all the *Souls** of their Figures of *Potters Earth*, of Horſe-Dung and Chaff well beaten together, of which they form'd a Figure like to that of the Model. When they had well furniſh'd this Soul with Pieces of Iron along and athwart; according to its Altitude they Flea'd it; that is, they took off as much of the Thickneſs as they deſign'd for the Braſs. After they had let this *Soul* dry, they cover'd it all around with pieces and bits of Wax, which they took out of the *Mould*, and diſpos'd of them as I ſhall ſay hereafter.

* *The firſt rough Figure made by Stone-cutters ſo call'd.*

This way of forming *Souls* of Figures is practis'd by ſome Founders, eſpecially for great Braſs Figures, becauſe the Earth endures the force and violence of the Fire better than Plaiſter, which is commonly us'd in midling Figures, and ſuch as are Caſt in Gold and Silver.

However, Sculptors having ſeldom occaſion to make Figures of an exceſſive bigneſs, they uſe it alſo for thoſe in Braſs, but mix Brick-duſt well pounded and Sifted with it; and in working after this manner, they proceed thus.

They take the firſt Layes of the *Mould* fill'd with Wax, as has been ſaid, which they ſet from Bottom to Top on the *Gate*, about that Bar of Iron that is to ſupport the *Soul*, tying them faſt together with Cords, for fear the Pieces ſhould ſeparate from each other when the *Soul* is to be made. In order to make which, as ſoon as the firſt Lay of the *Mould* is diſpos'd of, the reſt are rais'd one after another, the Sculptor pours fine Plaiſter mixt with Brick-duſt ſifted; for the Brick-duſt helps the Plaiſter to reſiſt the Fire, and hinders its ſpreading. When the firſt Lay of the Mould is fill'd, the ſecond is done; and ſo the reſt one after another, till they are all rais'd; and the *Soul* is made of Brick-duſt and Plaiſter as high as the Figure is to be.

The Parts are rais'd up thus Piece by Piece, that the *Soul* may be the better manag'd; and to bear it up, Iron Rods are from time to time, put through the Principal Parts before-mention'd.

When all the Parts of the Mould are ſet together, and all the Cavities fill'd, the Shapes and all the Parts of the Mould are clear'd, beginning at the Top, and ending at the Bottom. And then the Figure appears entire, covering the Soul which is within it.

The Figure muſt be adjuſted and made like the Model after which it was form'd, and to make it the more perfect, the Workman may add to or diminiſh as is convenient in all the Parts, to give the more Grace and Expreſſion to certain Lines, for as to the *Altitudes* and the *Diſpoſition* of the Members, he cannot alter any thing without deſtroying the Work.

When 'tis in its Perfection the *Caſts* and *Eſvents* are laid. Theſe *Caſts* are Pipes of Wax made about an Inch thick, for Figures as big as the Life, they being always proportion'd to the bigneſs of the Work, and even to the Parts of the Body where they are plac'd. The *Events* are alſo Waxen Pipes, but a little leſs. Theſe Pipes are made in Moulds of Plaiſter, of what ſize the Artificer pleaſes, then they are cut to about four or five Inches in length. Thoſe that are to ſerve for the *Caſts* are plac'd one above another at ſix Inches diſtance in a right Line the length of the Figure, and ſome times nearer when there are *Draperies*, and there is occaſion of a great deal of Matter. When theſe Pipes are apply'd to and ſodder'd with the Wax on the Figure, ſo that the End which is not Sodder'd is erected, there's a great Pipe of equal Bigneſs faſten'd to the end of theſe little Pipes, from the Top of the Figure to the Bottom; all theſe Pipes great and ſmall ſerve for the Caſting the Matter; and thus three or four are made about a Figure, according to its Bigneſs and Diſpoſition; but at the ſame time, that theſe Pipes are made to ſerve for the Caſts, the Sculptor muſt apply overagainſt, and at the Side that is on the ſame Line, and at four Inches diſtance, leſs Pipes to ſerve for *Eſvents*, which are to be ſodder'd to the Figure, and a great Pipe which paſſes from Top to Bottom, like thoſe of the *Caſts*; and becauſe all the Wax, as ſoon as it melts, runs out of the Mould, as will be ſhewn hereafter, he is very careful to ſupply all the extremities of the Parts, ſtretching out from the Body of the Figure with theſe Pipes, as the Arms, Fingers, Drapery, and other Things, from whence the Wax muſt run. All theſe Pipes are hollow for their Lightneſs only, otherwiſe they might be fill'd, but then they would be too heavy: A ſufficient Quantity of them muſt be plac'd about the Figure; and the Workmen ſhould take care as mnch as poſſible, to put them in thoſe Places which he would have moſt ſupply'd with Metal, and which will be moſt eaſily fill'd up: Thoſe that are to ſerve for the Face, ſhould, as I have hinted, be much leſs than thoſe that are to ſerve for the Hands.

After having rang'd all theſe different Pipes the whole depth of the Figure, the great elevated Pipes deſign'd for the *Caſts*, meet at the Top two together, 5 or 6 Inches above the Figure, at a Bowl or Cup of Wax four Inches deep, and as many Diameter, to the Bottom of which they are fix'd. This Cup ſerves to receive the Metal, which communicates itſelf at the ſame time to the two Pipes. Thus if there are four elevated Pipes for *Caſts*, there are two ſorts of Cups, more or leſs, as the Artificer pleaſes, to carry the Metal to all parts of the Figure.

As to the Parts which ſerve for *Eſvents*, they run up to the height of the Figure, higher than the others, for there is no need of their being joyn'd together, nor of their having Cups.

The Waxen Figure being thus prepar'd and furniſh'd with *Caſts* and *Eſvents*, the *Sculptor* takes a Compoſition made of *Putty* and the Cement of *Crucibles*, well cleans'd and Pounded, which he tempers in an Earthen Pot, to the conſiſtence of a Colour for Painting, and a pretty bright one, then with a Pencil he carefully covers all the Figure with it, as alſo the Pipes, both thoſe for the *Caſts*, and thoſe for the *Eſvents*. This muſt be done ſeveral times, and the little Cracks which will happen in this Compoſition, muſt from time to time be fill'd. When all the Wax is well cover'd, he puts another ſort of Compoſition upon it with a Pencil; it is thicker, and has more ſubſtance; 'tis made of the ſame Ingredients as that before-mention'd, mingled with ſome Mould and Horſe-Dung. After ſix or ſeven of theſe *Lays*, another thicker than any of the reſt is laid on with the Pencil, made of Mould and Horſe-Dung: That being dry, another is put on, and then another, till Seven or Eight: At laſt a thicker ſtill is laid on with the Hand, compos'd alſo of Mould and Horſe-Dung; and this is follow'd by another; but the Workman muſt be ſure that every Lay is dry before another is laid on, and take care not to leave any Part of the *Naked*, or the *Drapery*, but what ſhall be equally cover'd with every Lay.

After this, he takes ſeveral flat Iron Bars of the height of the Figure, which at Bottom is faſten'd to Hooks that ſhould be at the ſide of the *Grate*, on which the whole Figure is plac'd; theſe Bars muſt be at 6 Inches Diameter from each other, and turn'd according to the *Altitude* of the *Figure*, in ſuch ſort, that they may joyn to the Mould, and coming from the Top, meet in a kind of Iron Circle, or Bands of Iron, which catches in the Hooks of each Bar. Then the Figure is girded from Space to Space, with other Iron Bands at the diſtance of 7 or 8 Inches; theſe Bars ought to be turn'd according to the diſpoſition of the Figure, and joyn'd with Iron Threads to the Bars that mount a-Top. When they are all joyn'd together and in a condition to bear up the Mould, the Artificer takes ſome heavy Mould mix'd with Horſe-Dung and Chaff, and covers all the Mould and Bars with it, inſomuch, that it appears to be only a Maſs of Earth of about five Inches thick: But it muſt be obſerv'd, That when a Naked Figure is to be Caſt which is only to be plac'd on its two Legs, the Right of the Legs and Thighs muſt be better ſupply'd than that of the Body with Earth, becauſe when the Mould begins to be ſeeth'd the lowermoſt part being ſooner heated than the middle of the Body; before the *Soul*, which is to the Right of the Belly and Shoulders, is ſeeth'd as it ought to be, the Legs and Thighs, which are not ſo big, will be burnt and conſum'd with the Fire before the Trunk is hot through: And this Caution is neceſſary in all the different Pieces of Work that can be made, if the Workman wou'd perform it with Judgment, and prevent ſuch ill Accidents as may happen on the like Occaſions.

When the Mould is finiſh'd after the manner I have been treating of, the Artificer orders a Hole to be dug four ſquare, large enough to contain the Figure

Horton in ye County of Northampton Esq
This Plate is humbly dedicated by Ric: Blome

Figure, but it muſt have a wide Space of at leaſt a Foot, or Foot and half about it, and be deeper than the Mould is high; for at the Bottom it ſhould have a ſort of an Oven, whoſe Mouth muſt be on the outſide for the putting in of the Fire, and above that a ſtrong Iron Grate, ſtrongly ſupported by the Arch and Walls of the Oven, which ſhould be made of Free-Sone or Brick, as well as the four Sides of the Hole from Bottom to Top.

After the Grate is plac'd on the Oven at the bottom of the Hole, the Mould is let down with Engines, and the neceſſary Proviſion made for it, Pans are put under the Pipes that ſerve for *Caſts* and *Eſvents*, to receive the Wax that runs out of 'em; Then the Hole is cover'd with Plank, and by lighting a moderate Fire under the Figure, that and all the Place in which it is, is heated with a moderate Heat, till the Wax melts and runs out of the Mould, there remaining none behind, for if there was, it would cauſe a Deformity in the Figure, when the Metal ran into it. The Mould muſt not be ſo hot as to make the Wax boyl, which might hinder its running out entirely. When 'tis thought all the Wax is melted, which may be ſeen by the Quantity that comes out (for it muſt be weigh'd before it is put in) the Pans are taken away, and the Mouths of the Holes, at which the Wax ran out, are cover'd with Earth: All the void ſpace of the Hole between the Mould and the Walls, are fill'd with pieces of Brick thrown down ſoftly and without ranging in Order; and when that is done to the Top, a good Wood-Fire is made under the Furnace, the Flame being intermix'd with theſe pieces of Brick, cannot aſcend with Violence nor damnify the Mould, but communicates a Heat only in paſſing through thoſe pieces of Brick which it heats, ſo that it grows Red, as does alſo the Mould. After the Fire has burn'd about Twenty four Hours, and 'tis ſeen that the Bricks and Moulds are lighted from Bottom to Top, that Fire is let out, and the Mould grows cold again, all the Bricks being taken away that were about it; when the heat is quite gone, Earth is thrown into the Hole to fill up the Vacancy left by the Bricks, and as the Earth is thrown down, 'tis trod upon and preſt againſt the Mould; but it muſt be a little moiſt to be the better preſt and made a ſolid Body; yet not ſo moiſt as to communicate any of its humidity to the Mould, which therefore ſhould not be hot; for if there remains any Heat in it, 'twill imbibe the Moiſture, which will cauſe many Inconveniencies when the Metal comes to be caſt.

For the melting the Metal a Stove muſt be made by the ſide of the Hole, in which the Mould is: The Area of this Stove ſhould be two or three Inches higher than the top of the Hole, that it may be ſloping: It ſhould be built in the form of a Furnace, of good Tile-ſhards and Mould, bound with good Iron Hoops, and big enough for the intended Work. The Stove being finiſh'd deep enough to contain the Metal, two Mouths are made above it, one to throw the Wood into, and the other to fan and give it Air. When the *Stove* is very dry, a great Wood Fire is made, into which is thrown the Metal the Figure is to be Caſt in. There ſhould be a third Mouth at the ſide of the Hole, which muſt reach to the *Area* of the Stove; this Mouth ſhould be well ſtop'd with Earth while the Metal is melting, but ſo that it may be open'd when the Workman pleaſes, and by a Canal of Earth it has communication with a ſort of great Baſin made of Mould, and plac'd above the Figure, the middle of which Baſin is to anſwer exactly to the Cups, to which the *Caſts* I have mention'd are fix'd. The Workmen call this Baſin *Eſcheno*; it muſt be firm and made of good pounded Eerth very dry, for which End 'tis put into a Coal-Fire, well Dry'd, and afterwards Pounded. And to prevent the Metal running into the Cups, as ſoon as the Oven is open'd, there are Men ſet to cover them with a long Iron Bar thick at the End, and turn'd there like the Cup: There are as many of theſe Bars, and theſe Men, as there are Cups; that is, one or two, according to the Nature of the Work.

When the *Metal* is melted, the Workmen open the Iron Door, or rather unſtop the Hole, which is at the right of the *Canal*; this is done with a piece of Iron at the end of a long Pole; the Metal running out, immediately falls into the *Eſcheno*, where, when it is come, the Cover is taken off the *Cups*, the Metal enters into the Mould, and the Figure is form'd in an Inſtant.

When the Mater has thus fill'd the Mould, 'tis left three or four Days; then the Earth that was put about it, is taken off, by which means the Mould grows quite Cold; and when the Workman finds it has no more Heat in it, he breaks it, and diſcovers the Figure in Metal, with the *Lays* and *Eſvents* of the ſame Metal with itſelf: 'Tis Saw'd on the Place, to clean and get the Figure out the more eaſily: After that, 'tis cleans'd and ſcour'd with Water, and with pieces of Fir or other ſoft and ſpungy Wood, he rubs the Cavities of the Drapery and other Parts of the Figure. When 'tis a little Figure, he waſhes it with *Aqua Fortis*; and when that Water has had its effect, he waſhes it with common Water; after 'tis very well cleans'd, he Repairs it, if 'tis neceſſary to be Repair'd, for great Figures are never Repair'd at all.

The Tools he does it with are the *Burin*, the round and flat *Graver*, a little *Chizel*, Bodkin and *Riffloirs*, which are a ſort of File.

When the Figure is well cleans'd and repair'd, the *Sculptor* Colours it if he pleaſes: There are ſome who do it with Oil and Red Oaker; others make it turn Green with Vinegar; but in time the Braſs takes a Varniſh that bears upon the Black.

Thoſe that Gild them do it two ways, either with Leaf-Gold, or temper'd and mix'd with Quick-ſilver, which is the firſt and moſt excellent way, and made uſe of in little Figures; for this the Workman takes one part Gold, and the other Part *Quick-ſilver*, heats the Figure and puts on this Compoſition, which whitens it; and Reheating it, the Fire Exhales the *Quick-ſilver*, and the Figure remains Gilt. The other way is us'd in great Figures, and where Perſons would not be at much Expence, the Figure is ſcrap'd all over with little Files and other Tools, to make it Freſh and Clear; then 'tis heated and Leaf-Gold laid upon it, which is done four times.

Baſs-Reliefs are Caſt after the ſame manner as *Statues*; that is, the Mould is firſt fill'd with Wax, after 'tis laid on as thick as neceſſary, 'tis temper'd with Plaiſter or Earth, which is put on the Wax, to keep it in one Piece at coming out of the Mould, and to repair it the more eaſie; then 'tis cover'd as the Mould of Statues, with ſeveral *Lays* of Compoſition and Earth, but the Pipes for the *Caſts* and *Eſvents*, are put behind and on the edge of the *Baſs-Reliefs*, and ſome on the Figure. The reſt is done after the ſame manner as is mention'd for Statues.

As to the Metal which is us'd, that depends on the Founder's Choice, only to take care, that for one Pound of Wax, there be ten Pound of Metal, without allowance for Waſte, which may be conſiderable in great Figures. For fine Statues, the Allay of

The Metal is half Red Copper, and the other half Yellow. The *Ægyptians*, who are ſaid to be the Inventers of this Art, put two Thirds Yellow Copper, and one Third Red.

Yellow Copper is made with Red Copper and Calamine; a Hundred of Calamine increaſes Forty *per Cent.* Calamine is a Stone that gives a Yellow Colour, and is found in *France* and the Territory of *Liege*.

Good Red Copper ought to be Beaten, and not Melted, before 'tis us'd in Statues, neither ſhould it have any Allay of Lead.

Red Copper is Forg'd Hot and Cold; Yellow Copper when 'tis Cold only, it breaks if Hot. There's a ſort of *Metallick* Stone coll'd *Speller*, which comes from *Ægypt*, and gives Red Copper a finer Yellow than *Calamine*, but being ſcarcer and dearer than the latter, is rarely made uſe of.

We may ſuppoſe the *Oricalcum* was made of this ſort of Stone; for tho' ſome Authors talk of *Oricalcum* as a Simple and Natural Metal, yet all that have Written of it have talk'd ſo differently, that they have ſtill left room to believe 'tis a Compoſition of Copper, and another Metal or Earth, which *Feſtus* calls *Cadmea Terra*. And *Stephanus* de *Urbibus* in *Andira* ſays, there's an Earth in that Country which being mingl'd with Copper, makes *Oricalcum*.

There was another Compoſition of Metal, which the Ancients call'd *Electrum*, and was the fineſt of all; 'twas compos'd of two Thirds Silver, and one Third Copper. The Stones in *Corinthian* Copper was very much in Eſteem, becauſe 'twas held, that among that Copper there was a good mixture of Gold and Silver; but this Metal was never in uſe, till after *L. Mummius* burn'd the City of *Corinth*, and the *Statues* and other Works of different Metal, melting and mingling together, made a Compound Metal, which was very rich and known by the Name of *Corinthian* Braſs. For Bell-Metal twenty Pound of Tin is put to one hundred Pound of Copper; and for Pieces of Ordnance, ten Pound only: But this Compoſition is not proper for Figures, becauſe 'tis too hard and crumbly.

If the Sculptor wou'd make little Figures of Braſs, he melts the Wax which he puts into the *Mould* of *Plaiſter*: The Waxen Figure is taken out of the Mould in one Piece and hollow, which Cavity is fill'd with *Plaiſter*, and left to dry, that it may ſerve for the *Soul*; all the reſt is done as for great Figures.

Of Figures in Lead, Plaiſter and Stuck.

There are not ſo many Precautions neceſſary when Figures are Caſt in *Lead*, as when they are done in *Braſs*, becauſe *Lead* is not ſo ſtrong. The Workman only fills the Cavities with Earth well manag'd, of what thickneſs he pleaſes; then he fills all the Mould with *Plaiſter* or *Tile-duſt*, with which the *Soul* is made.

When the *Soul* is finiſh'd, all the Pieces of the Mould are taken aſunder to take off the Earth, and then being clos'd together again, they are put about the *Soul*, but at four or five Inches diſtance: That Interval is fill'd with *Coal* from Top to Bottom; all the Gaps between the Pieces of the Mould are fill'd with *Brick*, and the *Coal* being ſet fire to, 'tis all lighted: This is to ſeeth the *Soul* and dry the *Plaiſter Mould* which the Earth had wetted. When all the Coal has been well lighted, and after 'tis gone out of itſelf, the Workman takes a pair of Bellows and blows off the Aſhes that may have got into the Pieces of the Mould; then thoſe Pieces are joyn'd together again as before, about the Mould; all the *Chapes* are well ty'd with Cords, and cover'd with *Plaiſter*; after which the melted Lead is pour'd into the Mould, which Lead fills the Space that was taken up by the Earth; nor is it neceſſary to Earth the Mould as in Caſting in Braſs, unleſs 'tis for great Figures.

The Tools in Caſting in Lead are the ſame the *Plummers* uſe.

After what has been ſaid of making a Cavity for Caſting Wax, 'tis no hard matter to conceive how Figures are made of *Plaiſter*; for, it being eaſily temper'd and running as eaſily, 'tis pour'd into the Mould, and ſometimes the Figures are taken out all in one Piece, eſpecially when the Founder is Maſter of his Buſineſs and well Experienc'd in it. All the Art is to chuſe good *Plaiſter* in Stone, that there may be no Coal among it: It ought to be well Burnt, well Pounded, very White, ſifted thro' a fine Sieve: However, if 'tis a Great Figure, 'tis Moulded at ſeveral times, and even ſeveral Parts of the Figure in each piece of the Cavity are half fill'd before they are ſet together, that they may hold the better, and the better form all the Parts.

We ſee by what *Pliny* Writes, that the Cuſtom of making *Moulds* of *Plaiſter* is very Ancient, and that 'twas made uſe of about Earthen Figures and Plaiſter Figures a long time before 'twas known how to Caſt in Metal. He mentions the Works of *Arceſilaus*, a moſt excellent Artiſt in this kind of Work, who made the Model of a Cup for a *Roman* Knight, which by what he ſays, muſt be of very precious Matter, and a conſiderable Price.

Lib. 35. *c.* 3.

Several Statues are made in *Stuck*. Theſe Figures are for the Ornament of Cielings, Frieſes and Cornices. As to the making *Figures*, the firſt Thing is to form the *Soul* of Plaiſter or Lime-Mortar, and a Cement of Tile-Duſt, putting Bars of Iron into thoſe Parts of the *Figure* that have need being born up. When the Soul is form'd, 'tis then cover'd with *Stuck* to work out the *Figure*, for which the Workman has his proper Tools. In the Compoſition of *Stuck*, one Pound muſt be Marble-Duſt, and two Thirds Lime. There's a ſort of *Stuck* made of *Plaiſter-Stone*, manag'd as Marble; inſtead of which, ſometimes *Alabaſter* is made uſe of. As for Ornaments of *Baſs-Taille*, Moulds are us'd, that they may the more readily be made. The Artificer takes a Mortar compos'd of Lime and Sand, or Tile-Duſt, for the firſt Aſſay, and before 'tis quite dry, the *Stuck* is temper'd to a Compoſition that's neither too hard, nor too ſoft: When 'tis laid on the Place where the Workman would make an Ornament, he applies the *Mould* which the Artiſts call *Moulette*, made of *Plaiſter*, or a Compoſition of Wax, Roſin and Brick-duſt, more durable than *Plaiſter*. The Mould muſt be firſt powder'd with Marble Powder, and being put upon the *Stuck*, the Artificer ſtrikes it with a Mallet, and the Figure of the Mould remains on the *Stuck*; after this the Work is clean'd, that it may appear the more ſmooth.

Waxen Figures for *Portraits*, are alſo Caſt in *Moulds* of *Plaiſter*, and Colour'd afterwards as the Artiſt Pleaſes. 'Tis no new Invention, *Lyſiſtrates* of *Sicyone*, *Lyſippus*'s Brother, was the firſt that thought of making *Moulds* even on the Faces of *Perſons*. But neither *Ancients* nor *Moderns* valu'd much thoſe that apply'd themſelves to this ſort of Work, if they were not beſides excellent Sculptors, or able Painters:

Pliny L. 35. *c.* 12.

ters: For there's a great deal of difference between what is made in Wax from a Model, and what is only caſt in a *Mould* and Painted over; the firſt is a real Sculpture, and the other ſhould be look'd upon as a very indifferent Performance, and, if I may ſo ſay, the Work of a meer Labourer, and not an Artiſt.

Figures are not only made in Wax, but all ſorts of Fruits, which are painted according to their Natural Colours.

How to Engrave in Relievo, *or in* Concave.

There are ſeveral ways of Engraving in Metals and upon precious Stones, for *Relievo's* are made in both the one and the other, as well as Graving in *Concave*.

When an Artiſt would Engrave on Steel to make Medals, be begins with Deſigning his Subject whether an Effigies or Device, which he cuts out on Wax in *Baſs Relievo*: Then he makes a Punchion, and on one of the Ends, which ought to be of Caſe-harden'd Steel: He cuts out in *Relief* the ſame thing he made in Wax.

When the Punchion is in its Perfection, he tempers it to harden it, and then with a Mallet, or ſome ſuch Inſtrument, ſtrikes upon it to make the Impreſſion in a ſquar'd Piece, form'd like a Dye of Steel, before which he puts the ſquar'd Piece into the Fire to ſoften it, and make it the more eaſily receive the Impreſſion with the Punchion; for being ſtruck Hot and Cold, it receives in *Concave* what is in *Relievo*, on one end of the Punchion. The ſquar'd Piece not taking all the delicate Strokes of the Punchion, which commonly is us'd only for the Riſing of the *Relievo*, there's a great deal more to be done to finiſh the Concave, which is perform'd with Steel Tools, as little Chizels, Burins, ſharp Gravers, Echops, Rifflois, little Chizels with Files at the end, and ſeveral other Tools, ſome to Cut, ſome to Hew, ſome Streight, ſome Crooked, which the Artificer provides himſelf with, and tempers and rubs on a Pumice Stone. As the Punchion is made uſe of, 'tis from Time to Time bruſh'd with a ſort of Braſs Wyre.

When the Figures are finiſh'd, he Engraves the reſt of the Medal, as the Moulding of the Borders, the Letters, *&c.* for which he uſes the *Tracer*, the *Ingraler*, and other Punchions, well Steel'd and Temper'd; thoſe that are us'd for the Mouldings and Letters, are ſtruck and impreſt on the Punchion with a Hammer; for neither the *Burin* nor the little Chizel, can Engrave Letters to the ſame Perfection as theſe Punchions. There are abundance of other little Things neceſſary to be done in Medals, according to the Nature of the Deſign, which muſt be ſtruck alſo as well as Letters. As for the little Chizels, they are to be touch'd lightly with a Mallet, more or leſs, as the Work requires.

The ſame Tools are us'd in making Coins as in working with Punchions: They are Smaller or Greater, according to the Quality of the Work, as are little Hammers, or *Flatters*, which are us'd on the ſame Occaſion. *Dyes* are ſometimes Engrav'd without a Punchion; and when they have been Temper'd, Punchions may be made for 'em of the ſame form as the *Dyes*, and theſe *Dyes* are call'd *Matrices*.

Two things muſt be done to Work on Dyes for Medals; the firſt is an Impreſſion on Common Wax mix'd with Turpentine and blacken'd with Smoak. The ſecond is on Lead thus; The Lead being melted, is pour'd on a piece of Paper; then the Dye is ſtruck down upon it, and leaves the Figure on the Lead: By this means an Impreſſion of all the Concave is viſible, which is not ſeen in the Wax but in part.

When the *Dyes* are leſs Hollow, as are thoſe for Mony, beſides theſe two ways of making Impreſſion there's a third, which is thus; Put a ſquare Piece on the *Dye* of the ſame bigneſs, cover it with a Plate of Lead, upon which ſtrike with a Hammer, and the Impreſſion will remain on the Piece. When the *Dye* for a Medal is finiſh'd it muſt be Temper'd as the Punchion is, rub'd with Pumice-Stone Duſt and Water, and then bruſh'd with an Hair-Bruſh; after this, 'tis Poliſh'd with *Emery* and Oil, and when the Medal is ſtruck the Coyner makes uſe of Pincers, in which one *Dye* is plac'd on one ſide, and another on the other, to make the two ſides of the Medal; the *Dyes* ought to be plac'd directly above one another, with an equal Circumference: Inſtead of Pincers a Steel Box is ſometimes us'd, in which *Dyes* are put and held faſt, being faſten'd in with Vizes.

When the Pincer, or Box, is well prepar'd, the Coyner takes a piece of Lead or Tin, as big and as thick as the Medal, which he impreſſes between the two *Dyes*; when he makes Gold, Silver, or Copper Medals, he uſes this Impreſſion of Lead or Tin, which he Caſts in Sand, to mould Medals of what Metal he pleaſes; and becauſe they don't come very clean off the Sand, to perfect them, they are put again into the *Dyes*, and with a Machine, as a Preſs, or the like, the Matter is preſs'd between the two *Dyes*. This is done till the Coiner ſees they are Finiſh'd, which is try'd by feeling if they do not ſtir in the *Dyes* with the Hand, but are every where equally fill'd. Theſe Medals are not perfected till they are harden'd in the Fire, and put in the ſame *Dyes* ſeveral times, according to their *Relievo*, there being ſome that muſt be put in the Fire twenty times; and care muſt be taken every time to waſh off the Filth; and as the Medals ſpread out by the force of the Machine, the Matter that exceeds the due Circumference muſt be clipp'd or cut off; and that every time the Medal is put into the Fire till 'tis Finiſh'd, and has taken all the Impreſſion, as I have ſaid already.

When there is nothing more wanting to render it Perfect, 'tis put in the Fire the laſt time to give it a Colour, if 'tis of Gold, which is done by putting it into a Skillet over the Fire, with ſome *Saltpetre*, *Alum*, and *Vrine*; and becauſe the Colour is apt to Unpoliſh the Field, it muſt be put again in the ſame *Dye*, and the Men that work at the Preſs, pull it moderately, that the Medal may be Poliſh'd in the Field, and the Profils of the Figure be diſtinguiſh'd; for the Field of the Medal having been Poliſh'd with *Stone* and *Emery*, and the Figure-Work not Poliſh'd at all, but preſerving its roughneſs by the Temper, the Figures of the Medal remain Unpoliſh'd, in which the Beauty of the Work conſiſts,

The Inſtruments for preſſing the *Dyes*, are Preſſes or Ballances us'd in Coining: The difference between the Preſs and the Ballance is, that the force of the latter conſiſts in the two ends of an Iron Bar, where are two great Balls of Lead pull'd by two Men with Ropes, which acts the Vize of the Ballance that preſſes the *Dyes* and performs the Work.

The Preſs is the ſame Vize with one Bar of Iron pull'd by one End only without Ball or Ropes.

The Coin is made with the ſame Machines; 'tis however done after another manner than Medals. Mney *Dyes* are Engrav'd with the ſame Tools and after the ſame manner as Medals, but 'tis not neceſſary to mould the Species in Sand, as is done in Medals, becauſe of the difference in the *Relievo*; which is the reaſon that *Coin* is Stamp'd at once, and Medals are not ſufficiently impreſt till after ſeveral Stampings.

The Workmen begin with the Matter which is caſt in Plates, whether Gold, Silver, or Copper: The Plates are as broad as the circumference of the Species, but thicker then it ought to be when they are taken out of the Font. The Gold and Silver Plates are bruſh'd with Bruſhes made of Braſs Wire, the Copper are ſcrap'd with a Scraper, and Care is taken that there be no Sand nor Filth on them, for fear the Sand ſhould incorporate with the Matter. Theſe Plates are put between two Rollers which are in a Machine call'd a *Thinner*, to extend or lengthen them, then they are put into the Fire, and paſt through another Machine call'd a *Plater*. 'Tis in this *Plater* the Plates are brought to the thickneſs that the Species to be Coin'd ſhou'd have, then they are Cut with a *Cutter*, which is fix'd to the lower end of an Iron Tree, the higher end of which is a Vize, and turns with an Iron Barr mov'd by one Man only; and this at one Blow of the Hand, the Vize bending the Tree, and the Cutter which is as big as the Species, and fix'd as I have ſaid at the end of the Tree, reſting on a Plate of Iron which is call'd *Under-Cutter*, round and of the bigneſs of the Species, cuts off Pieces of the Plate or Metal to be Coin'd as large and as thick as they ought to be. The Surplus that remains in this Plate is call'd *Cizailles*, and is melted again into a Plate to continue the Work till it is all us'd.

When the Pieces are Cut, they are carry'd to the Scale to ſee which are Heavy and which Light, for the *Platers* thro' which the Plates paſs cannot be ſo juſt but there will be always ſome inequality, and ſome Pieces heavier than others, which are clip'd and reduc'd to the weight they ought to have; the lighter Pieces are re-melted, becauſe Matter cannot be added to them.

It muſt be conſider'd that the inequality which is found in theſe Pieces might ariſe as well from the quality of the Matter as that of the Machine, becauſe there will be Pores and void Spaces in melting the Matter, which will render theſe Parts Lighter; wherefore let the Machine or Mill be never ſo juſt, there will ſtill be difference in the weight of the Pieces, which obliges the Coiner to adjuſt them with the other, and when they are adjuſted, they are whiten'd if they are Silver, or a good Colour given 'em if Gold, which is done by Boyling in the ſecond Water, or with the Aſhes of Tartar and Salt: Silver may alſo be whiten'd after the ſame manner, but commonly 'tis boil'd in *Aqua Fortis* and with common Water, and being then thrown into freſh Water, all the Pieces are ſanded and rub'd in an Iron Sieve to take off what ſticks to them.

After this they are Coin'd as Medals are, by pulling, the difference is that Coins are ſtamp'd by putting one of the *Dyes* in a Box at the end of the Vize of the Ballance, and the other below in another Box, and under the *Dye* there's a Shell which ſerves to raiſe it up more or leſs as there is occaſion to ſtamp the Medal or Coins in theſe Places, where they were not enough Stamp'd. There's alſo a Spring at the Bottom of the Vize of the Ballance, which ſerves to lift it up when it has ſtamp'd the Metal. There's another little Spring on the Box, where the lower *Dye* is put for the Coins, and this is to take off the Species when it has receiv'd the Impreſſion, and to punch out the *Dye*. Coins are Stamp'd without Firing or Filing, ſo are Counters.

When Mony or Medals are made with a Hammer, they are call'd Coins properly, as alſo Piles and *Trouſſeaux*, but ſince the uſe of Mills has been found out, Hammering has not been practic'd.

Of Graving on Precious Stones, and on Chriſtal.

As to Graving on Precious Stones and Chriſtal, the Invention is very Ancient as well for the *Concave* as the *Relievo*; ſeveral Pieces in both kinds are to be ſeen, which ſhews us the wonderful Skill of the Ancient *Sculptors*, both for the *Beauty* of the *Deſign*, and the Excellency of the *Work*.

Tho' they Engrave upon almoſt all ſorts of Precious Stones, yet the moſt Finiſh'd Figures which we meet with are upon *Onyx*'s and *Cornelians*, becauſe they found theſe are more proper than others, on account of their being more firm, more equal, and Engraving cleanly, alſo on account of the ſeveral Colours that are in *Onyx*'s in rows one above another, by which means in their *Relievo*'s they ſo order it that the Ground is of one Colour, and the Figure of another, as we ſee in ſeveral fine Pieces, which is done with the Wheel and Emeril of Powder of Diamond, and the Tools we ſhall ſpeak of hereafter.

As to thoſe that are Engrav'd in *Concave*, they are the more difficult becauſe 'tis a ſort of Work in the Dark, and 'tis neceſſary to Judge aright of what is done to take Proofs every Moment by Impreſſion in Paſt or Wax. This Art which was loſt with others, did not begin to appear again till the time of Pope *Martin* V. the beginning of the fifteenth Century. One of the firſt that undertook to Engrave upon Stones was a *Florentine*, call'd *John*, and Sirnam'd *Deelle Corgnivole*, becauſe he uſually work'd on theſe ſort of Stones, others came after him who Engrav'd all ſorts of Precious Stones. In this way was the *Dominican*, Sirnam'd *de Camei* a *Milaneze*, who Engrav'd the Portrait of *Lewis* the *Moor* Duke of *Milan*, on a Ruby. Others afterwards repreſented greater *Figures* on fine Stones and *Chryſtal*.

To Engrave on Precious Stones or Criſtal, the Artificer makes uſe of the Diamond; for the Diamond, which is the moſt Perfect and hardeſt of all Precious Stones, cannot be Cut but by itſelf. The Workman begins by ſoddering two rough Diamonds at the end of two Sticks, big enough to be held firm in the Hand, and rub the Diamonds one againſt another, which is call'd *Egriſer*, and thus he gives 'em what Form and Figure he deſires.

In rubbing the two rough Diamonds, there falls off a Powder into a kind of Box, which is what the Jewellers make uſe of afterwards to poliſh their Diamonds, and they do it with a Mill turn'd by an Iron Wheel; on this Wheel is laid an Iron Pincer, to which anſwers a Shell of Copper: The Diamond is ſodder'd into this Shell with Tin Sodder; and that the Pincer may bear the harder on the Wheel, a great Plate of Lead is put upon it: The Wheel on which the Diamond is plac'd, is ſprinkled with the Powder that came from it and Oil of Olives: When the Jeweller cuts with *Facets*, he changes his Tools from time to time, according as his VVork Finiſhes, till 'tis in its laſt Perfection, as may be ſeen every Day at the Jewellers and Lapedaries. VVhen a Diamond is to be ſaw'd in two or more Pieces, the VVorkman takes the Diamond Powder well pounded in a Steel

Mortar and a Peſtle of the ſame ; 'tis Alloy'd with Water and Vinegar, or ſomething elſe, which is thrown on the Diamond as it is cut with Iron or Copper Wyre as fine as Hair. There are Diamonds cut with Tools made on purpoſe.

As to *Rubies*, *Saphires* and *Topazes*, they are cut and form'd on a Copper Wheel ſprinkled with Powder of Diamond and Oil of Olives: The Poliſhing is done on another Copper Wheel with *Tripoli* temper'd in Water. The Workman turns a Wheel with one Hand, and with the other he forms the Stone fix'd to a Stick faſten'd in an Inſtrument of Wood, call'd a *Quadrant*, becauſe 'tis compos'd of ſeveral Pieces that Quadrate together, and is mov'd by a *Vize*; which turning the Stick, forms regularly the different Figures the Lapidary would make on the Stone. As for *Rubies Ballais*, *Eſpinelles*, *Emeralds*, *Jacinths*, *Amethiſts*, *Granats*, *Agats*, and other ſorts of Stones which are not ſo hard, they are cut on a Leaden Wheel, ſprinkled with *Emeril* Duſt temper'd in Water; afterwards they are Poliſh'd on a Tin Wheel with *Tripoli*, in the ſame manner as above mention'd.

There are other ſorts of Stones, as the *Turquois*, the *Giraſole* and the *Opale*, which are poliſh'd on a Wooden Wheel with *Tripoli*.

To make and Engrave a *Vaſe* or Urn of *Agat Cryſtal*, or hard Stones, the Lapidary makes uſe of a Machine, which he calls a *Tower*, the ſame as the Pewterers uſe, excepting that inſtead of the Pewterers being diſpos'd to hold the Pots and Veſſels, which they work with Tools, this is commonly made to hold the different Tools that are apply'd to it: Theſe Tools as they turn, Form or Engrave the Veſſels that are preſented to them, to be faſhion'd and adorn'd in *Relievo* or *Deep*, as the Workman pleaſes, who changes his Tools according as he has occaſion: He alſo ſprinkles Powder of Diamond and Oil of Olives, or ſome other ſuch Duſt upon his Tools. There are ſome Stones that are hardly worth the Diamond Powder, and work better with other Duſt, as the *Jacinth*, the *Giraſole*, the *Turquois*, and ſeveral others, which ſeem to be of a Fat Nature.

When the Stones are Poliſh'd and are to be Engrav'd, either in *Relievo* or *Deep*, if they are in little pieces, as Medals or Seals, the Lapidary uſes a Machine call'd a *Little Tower*, which is nothing elſe but an Iron Wheel, the two ends of whoſe Axis turn, and are faſten'd in two pieces of Iron like Turner's Spectacles, which open and ſhut as one pleaſes, being half clove for that purpoſe, and joyning again at the Top by a *Traverſe*, which holds 'em, or made after any other manner. At one end of the Axis of the Wheel are put the Tools, which are lock'd and faſten'd in with a *Vize* and held ſo by it. This Wheel is turn'd with the Feet, and the Hand guides the Work againſt the Tool, which is of Iron; but if the Work be Great, 'tis ſometimes of Braſs: All Tools Great and Small are made of Iron or Braſs; ſome are like little Whirligigs, and are call'd *Saws*; ſome are term'd *Scabbards*, and have a little round Head like a Button; thoſe call'd Hinges are made in the form of an Iron Ring, and ſerve to lift up the Pieces: There are ſome Flat, and other different Sorts, which the Artificer cauſes to be Forg'd of ſeveral Sizes according to the Quality of the Work. The Tool is apply'd to the Stone, to be work'd not directly oppoſite to the end of the Tool, but ſide-ways, ſo that the Saw takes it off in turning againſt and as it were cutting it. The ſame way is practis'd in making Figures, Letters, or Cyphers, by ſprinkling Diamond Duſt and Oil of Olives; and ſometimes when the Workman would pierce any thing through, little Iron Bodkins are fix'd to the *Tower*, at the end of which there is a Diamond Enchac'd. When the Stones are Engrav'd in *Relievo* or *Deep*, they are Poliſh'd on Wheels of Bruſhes made of Hogs Briſtles and *Tripoli*, on account of the delicacy of the Work. And when there is a large Field, Copper or Tin Tools are made on purpoſe to Poliſh it with *Tripoli*, which are apply'd to the little *Tower* after the ſame manner as the Graving Tools.

Of Graving in Wood and Copper.

One of the greateſt pieces of Work which the Art of Imagery has found out to Eternize itſelf with, is Graving in Wood and Copper, by means of which, a great number of Stamps are taken off, that will multiply the ſame Deſign almoſt to Infinity, and ſhew the Artiſts Thoughts in different Places, which before could be only known by the Labour of his Hands.

'Tis to be wonder'd at, that the Ancients, who Engrav'd ſo many excellent Pieces of Workmanſhip on hard Stones and *Cryſtal*, never diſcover'd ſo fine a Secret, which did not indeed appear till after Printing; For the Impreſſion of Figures and Stamps, were not in uſe till about the end of the Fourth Century, when a Silver-ſmith of *Florence* found it out. *Albert Durer* and *Lucas*, were the firſt that brought Graving in Wood and Copper to any Perfection; and *Etching* was Diſcover'd about the ſame Time.

One *Hugo de Carpi* invented a way of *Graving* in *Wood*, ſo that the *Stamps* ſeem'd to be as if they were waſh'd with the *Claro Oſcuro*: To this End he made three ſorts of Plates of the ſame Deſign, which were pull'd one after another in the Preſs, to print the ſame Stamp: They were ſo Grav'd, the one ſerv'd for the great Lights, the other for the *Demi Eteintes*, and the third for the Out-Lines and ſtrong Shadows.

This Art of Graving in Copper or Wood, is brought to that Perfection, and become ſo Common, that the Quantity of Pieces done in it, is almoſt Innumerable. We may judge of it by the Collection of the Abbot *des Marolles*, which is now in the King's Library.

'Tis true, Graving in Wood is now-adays fallen to Decay, and there are no Artiſts capable of performing in it what was done a hundred and a hundred and twenty Years ago; becauſe doubtleſs they have found a greater facility in Engraving in Copper: However Wooden Plates are very uſeful, and much more convenient than others, on ſeveral Occaſions, eſpecially when the *Cuts* are for Hiſtories, to explain the Subjects; for as they are Printed with the Letter, ſo they ſave a great deal of Time and Expence, which Copper-Cuts and *Etching* take up.

Nevertheleſs *Etching* and Engraving in Copper, are now moſt in uſe; and there are an infinite Number of Excellent Pieces to be ſeen in both Kinds: *Etching* ſeems moſt proper for Great Deſigns, where the Workman wou'd ſhew more Art than Delicacy and Softneſs.

Thoſe that Engrave in Wood, begin with preparing a Plate of a bigneſs ſuitable to their Deſign, and very ſmooth on the ſide to be Engrav'd; they generally make uſe of Pear-Tree or Box: The laſt is beſt, becauſe more ſolid, and leſs ſubject to be Worm-eaten. On this Plate they Deſign their Subject with a *Pen*, in the ſame manner as if it were to be Printed. Thoſe that don't underſtand very well how to Deſign, as there are many that don't, make uſe of the ſame Deſign that is given them, which they

Paſte on the Plate with a Paſte made of good Flower, Water, and a little Vinegar: The *Lines* muſt be paſted to the Wood, and when the Paper is dry, the Graver waſhes it gently, and with Water and the top of his Finger, takes it off by little and little, till there remains nothing on the Wood but the Strokes of the Pen that form the Deſign, which mark on the Plate all that ſhould be ſav'd, and the reſt is cut off either with the point of a ſharp Cutting-Knife, or little Chizels, or Gouges, according to the Size and Fineneſs of the Work; for there's no need of any other Tools.

As to Engraving on Copper with the *Burin*, there is alſo no need of many Preparations: When the Plate, which ſhould be of red Copper, is well Poliſh'd and the Graver has made his Deſign upon it with his Drawing-Point, or otherwiſe, he wants nothing but a *Burin* well Sharpen'd and Temper'd, to Grave what he wou'd have repreſented on his *Stamp*, to which he gives more or leſs Force, according to his Work and the Figures he would repreſent.

He has alſo a Steel Tool ſix Inches long, at one End of which is a *Scraper* of a Triangular Form, ſharp at the three Edges to ſcrape the Copper, when 'tis neceſſary; at the other End is the *Burniſher* in the ſhape of a *Heart*, the Point of which is longiſh-round and a little flat; 'tis to poliſh the Copper, repair the Faults, and ſoften the Lines: To know how he goes on, and whether his Work is Good, he has a *Tampon* made of Felt or Cloth-Liſt blacken'd, with which he rubs his Plate as he Graves. Beſides this, he has a Sand-Bag made of Leather, on which he rubs the Copper as he works it.

As to *Etching*, there's more to be done: 'Tis requiſite that the Plate ſhould be well Poliſh'd and Clean; after which, the Graver heats it by the Fire, covers it with a hard or ſoft Varniſh, for there are two ways of Varniſhing; he then blackens the Varniſh, by holding the Plate on that ſide over the Smoak of a Candle. This being done, his next Work is to mark out his Deſign on the Plate, which is eaſier than when 'tis to be Engrav'd with the *Burin*, for he only rubs under the Deſign with Red Lead, or otherwiſe, and then putting it on the Copper to mark it out with the point of a Needle, the Red Lead that is behind the Deſign, being eaſily ſeen on the Varniſh, is the cauſe that the Graver follows better in this ſort of Work, the ſame Lines of the Deſign, and is more Correct in the Out-Lines and Expreſſion of the Figure than in the other: For which Reaſon the Painters, who have themſelves Engrav'd their own Works, Labour frequently to form the firſt Lines of Figures to preſerve the Force and Beauty of the Deſign. In *Etching* alſo more Art may be ſhewn, than in Stamps Engrav'd with the *Burin*, in which the Out-Lines are ſometimes Etch'd to render them the more Correct.

There is this further Advantage in *Etching*, That 'tis not only a more expeditious way of Engraving than with the *Burin*, but 'tis commonly a more Beautiful one in *Landskips*, where the *Trees* and *Fields* being touch'd with the greater facility, appear the more Natural.

'Tis alſo true, that there's ſometimes occaſion for touching certain Parts of an *Etching* which have not Force enough, over again with a *Burin*, where the *Aqua Fortis* has not eaten in enough; for 'tis difficult in a great Plate, to have all the Parts ſo equally eaten that there's nothing wanting in any of them.

The Engraver muſt not only with the point of his Needle, work up all the Parts of his Work, with the Force and Tenderneſs neceſſary to his Deſign, both in the *Diſtances* and the neareſt Places: He muſt alſo take care when he puts his *Aqua Fortis* on the Plate, that it does not eat in all Places alike; and this is done with a mixture of Oil and Candle-Greaſe.

For which purpoſe he has a ſort of a Wooden Caſe Pitch'd, to which he fixes his Plate a little *Sloping*, and throws *Aqua Fortis* upon it; ſo that it only runs over it, and falls again into an Earthen Pan which is under it: He is alſo careful when the Parts that ſhould be leaſt Eaten, have had enough of this *Aqua Fortis*, to take off the Plate and waſh it with clean Water; then he dries it gently by the Fire, covers the moſt diſtant Parts, and the Cutting, which he would have weakeſt, with Oil and Candle-Greaſe, that the *Aqua Fortis* might penetrate no farther, and covering it thus ſeveral times, and as often as he thinks it neceſſary, for thoſe Places which he wou'd have weakeſt, he always lets his foremoſt Figures be waſh'd with the *Aqua Fortis*, till he perceives it has eat in enough to expreſs the Force he deſign'd ſhou'd be expreſt in thoſe Parts of his Work.

Gravers make uſe of two ſorts of Varniſh, one ſoft, and the other hard: There are alſo two ſorts of *Aqua Fortis*, one call'd *White-water* and the other *Green*: The latter is made of *Vinegar*, *Common Salt*, *Sal Armoniac*, and *Verdegris*; this runs over the Plate, as I have ſaid, and may be made uſe of with both Varniſhes: On the contrary, the other is good only with the ſoft Varniſh, and is not thrown as the other: The Plate is put flat on a Table, and being border'd round with Wax, is cover'd with this *White-water*, which is temper'd more or leſs with Common Water.

As to the *Drawing Points*, the Engraver takes great or midling Needles, ſome ſharp at the Ends, and the others thicker, cut at the Point in the form of an Oval; theſe Tools, which are made of different Shapes and Sizes, are all that are neceſſary for this ſort of Work. Engravers have a Stone to whet them, and a Pencil made of a Weaſel's Tail, or a Feather, to wipe them, that they may take off from the Plate the Filth, or Varniſh, which comes off as it is Grav'd.

If the Reader's Curioſity ſhou'd carry him farther as to what relates to Engraving in Copper, and the Compoſition of Varniſhes for *Aqua Fortis*, he need only read *Abraham Boſs*'s Treaty, for the Author to the *Theory* joyn'd an admirable Experience of the Art, and omitted nothing that ought to be known in it.

This, as well as what follows concerning Painting, is Tranſlated from Monſieur Felibien's *Treatiſes on theſe Subjects. The* French Tongue *abounds more in Terms of Art, than ours; and our Artiſts are very often oblig'd to make uſe of 'em in the Sciences; which is the Reaſon they will often be found here in* French. *Perhaps ſome of 'em might have been render'd in* Engliſh, *but it muſt have been by an Artiſt only.*

Of the ORIGIN and Progreſs of
PAINTING.

'TIS not to be doubted but *Painting* is as old as *Sculpture*, both having the ſame Principle, which is *Deſign*: But 'twill always be difficult to find out the certain Time and Place where this Art firſt appear'd: The *Ægyptians* and *Greeks*, who pretend to be the Inventors of all the *Fine Arts*, did not fail to aſſume the Glory of being the firſt *Sculptors* and firſt *Painters*. However, it being hard to ſee clear into a Matter, which is obſcur'd by ſo great a number of Years, which hides its Origin, we muſt be ſatisfy'd with knowing concerning Painting, That after having as well as other Arts, had ſmall Beginnings, it arriv'd at Perfection among the *Greeks*; and that the Chief Schools of this Illuſtrious Science, were at *Sicyone*, *Rhodes*, and *Athens*. From *Greece*, it paſt into *Italy*, where it was in great Eſteem towards the End of the *Common-wealth*, and under the firſt *Emperors*; till Luxury and War having at laſt diſſolv'd the *Roman* Empire, it remain'd entirely Extinct, as well as the other Sciences and other Arts, and did not begin to appear again in *Italy*, till two or three Centuries ago, when the *Italians* ſet about recovering it, and from the Hands of certain *Greeks*, got the deplorable Remains of it. The *Florentines* were the firſt who acquir'd any Reputation in it; nevertheleſs, 'twas a long while before there aroſe any conſiderable *Painters*; *Ghirlandio*, *Michael Angelo*'s Maſter, got the greateſt Eſteem, tho' his Manner was very dry and *Gothick*; but his Diſciple *Michael Angelo*, appearing afterwards under *Julian* the IId. Eclips'd all that went before him, form'd the *Florentine* School, and bred many Diſciples.

Pietro Perugino, had alſo *Raphael Urbin* for his Diſciple, who ſurpaſt his Maſter by much; and even *Michael Angelo* himſelf Re-eſtabliſh'd the *Roman* School, compos'd of the moſt Excellent Artiſts that have yet appear'd. At the ſame time roſe that of *Lombardy*, and grew into Credit under *Giorgioni* and *Titian*, whoſe Maſter was *Giovanni Bellini*.

There were in *Italy* other Particular *Schools* under different Maſters, as *Leonard di Vincis* at *Milan*; but the three firſt are only reckon'd *Schools* as being the moſt Illuſtrious, and the others became ſo from them. Beſides theſe, there have been Painters on this ſide the Mountains, who had no Commerce with thoſe of *Italy*, as *Albert Durer* in *Germany*, *Holben*'s in *Swiſſerland*, and ſeveral others of different *Names*, who Work'd in *France* and *Flanders*; but *Italy* and *Rome* particularly were the Places where this Art was practis'd in its greateſt Perfection, and where Excellent Artiſts have riſen from Time to Time.

To *Raphael*'s *School* ſucceeded that of the *Carrache*'s, which has laſted almoſt to the preſent Time in their Diſciples. 'Tis true, there are few Great Painters now in *Italy*, and their Art ſeems at laſt to be tempted, if we may believe Monſieur *Felebien*, by the Careſſes of the *French*, to paſs into *France*, ſince the King erected *Academies* for ſuch as Practiſe it, which, continues he, gives us room to hope, that we, in *France he means*, ſhall ſee Painting Flouriſh as much with us as it has done elſewhere, and be carry'd to as high a degree of Perfection.

The French *are eternally Vain, and Monſieur* Felebien, *whom we have been all along Tranſlating, there being no Author who has Treated ſo well of the Sciences in ſo little a Compaſs, adds ſomething which wou'd have look'd leſs Vain, had it been Engliſh'd when 'twas Written*; tho' it being the Nature of the *French* to Study War more than the Arts, we have Reaſon to doubt, Whether they can apply themſelves enough to Painting to excel in it, as other Nations have done. *From their Succeſs in their late Wars, they ſeem to have as good a Genius for Painting, and may eaſily arrive to as much Glory by the Pencil, as they have done by the Sword. What he adds afterwards is to the Purpoſe, ſo we proceed.*

Of PAINTING in General.

PAINTING is an Art which by Lines and Colours repreſents on an equal Surface all the Objects in Nature, inſomuch that there is no Body but what it takes cognizance of, and is known in it. The Image it makes, whether it conſiſts of ſeveral Bodies together, or of one in particular, is call'd a *Picture*, in which there are three Things to be conſider'd, *Compoſition*, *Deſign* and *Colour*, all which Three depend on Underſtanding and Execution, term'd the *Theory* and *Practice*; *Underſtanding* is as the *Father* of *Painting*, and *Execution* as the *Mother*.

Compoſition, which others call alſo *Invention*, comprehends the *diſtribution* of *Figures* in the *Picture*, the Choice of the *Attitudes*, the Adjuſting the *Drapery*, the Convenience of the *Ornaments*, the Situation of *Places*, *Buildings*, *Landſkips*; the ſeveral *Expreſſions* of the Motions of the Body, and the *Paſſions* of the Soul: In ſhort, every thing the Imagination can form to itſelf, and which cannot be imitated from Nature.

Deſign has for its Object the Figure of the Body to be repreſented, and ſhews it ſuch as it appears ſimply by *Lines*. This Part concerns *Painters*, *Sculptors*, *Architects*, *Gravers*, and generally all the *Artiſts* whoſe Works require *Grace* and *Proportion*. For this the Knowledge of *Anatomy* is neceſſary, which is to underſtand *Bones*, *Muſcles*, and *Sinews*, as they appear outwardly in Humane Bodies. 'Tis Deſign that ought to place *Figures* on a Center and Poiſe, either by their proper *Weight*, or by one that's accidental, that they may appear firm in all the Actions the Painter wou'd repreſent to imitate well the ſeveral *Motions* that are in *Nature*.

Colouring has for its Object *Colour*, *Light*, and *Shadow*; for 'tis in putting on the *Colours* that the *Friendſhip* or *Antipathy* between them is obſerv'd, as alſo their *Union* and *Sweetneſs*, that the Painter conſiders how much force *Relievo*, Boldneſs and Grace he ought to give to his Pictures, that he makes Remarks on the *Lights* more or leſs evident. In ſhort, by *Colours* he manages all his *Lights* and *Shadows*, which are the Life of *Painting*.

The *Habitude* a Man acquires in theſe three principal Parts of *Painting*, is called a *Manner*, which is either Good or Bad, according as the *Painter* has practis'd more or leſs after the Truth with Judgment and Study. But the beſt Painter is he who has no *Manner* at all, the good or bad Choice he makes is call'd a good or bad *Gout.* Thus in the Compoſition of a Hiſtory, when the *Figures* are well diſpos'd with fine *Groupes*, and a good Choice of *Attitudes*, according to the neceſſity of the Subject, when the Situation and the Plan of Places are agreeable to Nature, and nothing is omitted of every thing neceſſary to the *Expreſſion*, 'tis ſaid, *That is well Invented.*

If all the Parts are beſides of a great *Deſign*, well Finiſh'd, and pronounc'd with Force and Purity; if nothing appears Mean, Obſcure or Doubtful in it, 'tis ſaid, *That is well Deſign'd*, and of a *Great Manner*.

If the *Light* is well choſen to put the foremoſt *Figures* forward; if 'tis well ſpread o'er the whole; if it diminiſhes by little and little, and with Sweetneſs, and terminates in a large Shadow, and is at laſt Inſenſible and of no Colour, 'tis ſaid that is of *Great Relievo*, and there's a *great deal* of Force in it, *That the* Clairo Oſcuro *is well Perform'd.*

If among the *Lights* and *Shadows* we ſee the true *Teint* of Nature; if we meet with Maſſes of Colours where the Painter has carefully obſerv'd that Friendſhip, and that Simpathy which ought to be between them, whether between the Fleſh and the Drapery, or one Drapery with another, or in the true *Teint* of Landskips; ſo that all appears ſo artfully bound together, that there's no ſeperating them, but there's ſuch a Union, that the whole Picture ſeems to be Painted at once, and with the ſame Pallet of Colours; 'tis then ſaid, *That is well Colour'd.*

Beſides this there are certain Elegancies that ſhine by Places in theſe three Parts of Painting, as Figures ſhine in the parts of *Rhetorick*, which advance, and make the Works of the greateſt Painters ſo very much above others. But above all *Proportion* ſhou'd be minded, and an Agreement of all the Parts one with another.

Grace is a Divine Part, which few Perſons have poſſeſt, and cannot be defin'd, but in ſaying that 'tis a *Graceful* Beauty in a *Figure*, which proceeds from a certain turn, and a nobleneſs of *Attitude*, eaſy and proper to the Subject, and Charming to the Eyes.

Of DESIGN.

What is commonly call'd *Deſign* in *Painting*, is an apparent *Expreſſion*, or viſible *Image* of the Thoughts of the Mind, and that which is firſt form'd in the Imagination. As this *Image* of our Thoughts are *Expreſt* after different Manners, the *Artiſts* have given it ſeveral Names, according as 'tis more or leſs Finiſh'd. *Sketches* are *Deſigns* of the firſt Productions of the Hand, Miſhapen and Imperfect, ſet down only with the Pen, or the *Crayon*: And thoſe where the *Out-lines* of the *Figures* are Finiſh'd, are term'd properly *Deſigns*.

The Art of Drawing the *Out-lines* of Figures is the Foundation of *Painting*; for when the Figures are well *Deſign'd*, there's nothing to be done, but to add *Lights* and *Shades*, and apply the Colours according to the Nature of the Body, which is alſo a great Secret in this Art; but *Deſign* goes a great way in diſcovering its Myſteries, and without it, let a Painter know ever ſo much of *Lights* and *Shades*, and of the Nature of *Colours*, 'tis impoſſible for him to do any thing Perfect.

When a Man wou'd *Expreſs* a Subject, if he makes uſe of nothing but a *Crayon* or Pen, tho he finiſhes the Work in all its Parts and obſerves *Lights* and *Shades*, yet it is call'd a *Deſign*, only diſtinguiſh'd by the Colour of the *Crayon*, or the *Ink* that is us'd. Some with the Pen make uſe of Tallow temper'd, others of Red Lead, others of Black Oaker; and thus each to his Fancy. Nothing is ever properly call'd Painting be it what it will, but when Colours ground up with Oil or otherwiſe, are us'd; for tho' very Beautiful Figures are made with *Paſtels*, or *Crayons* of different Colours, which have almoſt the ſame effect as *Painting*, 'tis however never call'd *Painting*, tho' to expreſs the Beauty of the Work, it may be ſaid, *That is well Painted.*

Of Painting in FRESCO.

Of all the ſeveral kinds of *Painting* practis'd at this time, 'tis certain that an excellent Artiſt can ſhew his Art moſt in that of *Freſco*; and no piece of Work will admit of ſo much *Vivacity*: But to perform it well, the Painter muſt be a good *Deſigner*, be very Experienc'd and Skilful in what he ſets about, otherwiſe his *Painting* will appear Dry and diſagreeable, becauſe the Colours do not mix as in Oil, as I ſhall ſhew hereafter.

This *Painting* is againſt Walls and Cielings newly Plaiſter'd with Mortar made of Lime and Sand, but the *Plaiſter* muſt not be laid on faſter than the Painter can Paint it, and no more be prepar'd than can be painted in a Day while the Plaiſter is freſh and moiſt.

Before the Painter begins to Work he makes *Cartoons* or *Deſigns* upon Paper as big as the Painting he intends, which he ſticks to the Wall, one part after another as he carries on his Work, and half an Hour after the Plaiſter is made, well beat, and refin'd with the Trowel.

The *Plaiſter* muſt be made of River-Sand well ſifted, or other good Sand temper'd with old Lime, which he will ſift alſo, for fear there ſhould be little Stones among it as it often happens, when the Lime is not Good, well Burnt, and well Cool'd. At *Rome* they make uſe of *Pozzolano*, a ſort of Sand dug out of the Earth in digging of Wells. The Body of the Wall on which this *Plaiſter* is to be laid, ſhould be rough Caſt with *Plaiſter* made of Lime and Sand; and when the Place is expos'd to the Weather, all the Maſon's Work muſt be of *Brick* or *Rubble* well Dry'd.

When the *Plaiſter* is to be laid on *Free-ſtone*, there ſhou'd be a ſort of little Wall made two or three Inches thick of Grind-ſtones faſten'd together with Cramps of Iron in all the Joints of the great Stones. As for the Mortar us'd by the Maſons and to rough Caſt them, the Cement of Lime is Good, but the Plaiſter ſhould be of Lime and Sand.

The Ancients Painted upon *Stuck*; and it may be ſeen in *Vitruvius* what Care they took to have good *Cruſts* or *Plaiſters* in their Buildings, as well to make 'em Beautiful as Durable. However, the Modern Painters have found out, that Plaiſter of Lime and Sand is the moſt convenient for *Painting*, becauſe it does not Dry ſo ſoon as *Stuck*; and further, becauſe being Grayiſh, 'tis more proper to lay the Colours on than ſo white a Ground as *Stucco*.

Lib. 7. *c.* 3.

In this ſort of *Painting*, the Painter rejects all Compounded and Artificial *Colours*, and moſt part of Minerals. He hardly uſes any thing elſe but *Earths* that will keep their Colours, and defend themſelves againſt the burning of the Lime by reſiſting the Salt in it, which *Pliny*

Lib. 37. *c.* 7.

call

calls the *Bitterneſs*; and that the Works may be always *Fair*, it muſt be done with Diſpatch while the *Plaiſter* is moiſt, and never touch'd over again Dry, with a temper of Whites of Eggs, Size, or Gum, as a great many Painters do, becauſe thoſe Colours grow Black, and have not that Vivacity which appears in thoſe that were put on at the firſt Stroak; but eſpecially when the Painter works in the open Air. This touching over again is to no purpoſe.

The Colours us'd in FRESCO.

White is made of old Lime and white Marble Duſt, near as much of one as of 'tother; ſometimes a Fourth part of the white Marble-Duſt will do, which depends on the Quality of the Lime, and is found out only by Practice. If there is two much Marble, the White blackens.

Oaker, a Browniſh Red, is a Natural Earth.

Oaker Yellow, is a Natural Earth which turns Red by burning.

Yellow-Dark, or *Ruth-Oaker*, is alſo a Natural and ſlimy Earth, and is taken up in the Water in Iron Mines; when 'tis Calcin'd, it takes a fine Colour.

Yellow of Naples is a kind of Slime, which gathers about Sulphur-Mines, and tho' 'tis made uſe of in *Freſco*, 'tis not of ſo good a Colour as that which is made of *Earth*, or *Yellow Oaker* with White.

Red Oaker is a Natural Earth found in *England*, and ſerves inſtead of *Lake*. The Ancients had a Colour which it now loſt; 'twas as lively as *Lake*; for in *Titus*'s Baths at *Rome*, there's a Chamber, where there ſtill remains in the Cieling, ſome Ornamental Works in *Stuck*, enrich'd with Bands of Gold, Azure, and a Red which ſeems to be *Lake*.

Earth Green, of *Verona* in *Lombardy*, is a Natural Earth hard and Dark.

Earth-Green, another that's Lighter.

Lapis Lazuli is a very hard Stone and difficult to be Prepar'd; 'tis Calcin'd in the Fire, then pounded very ſmall in a Mortar, mix'd with Wax and Roſin, of which a ſort of Paſte is made, which is moulded and waſh'd in clean Water: What comes out firſt is beſt; and its Beauty diminiſhes till it is reduc'd to a Gravel like *Lees*. This Colour ſubſiſts and keeps better than any other. 'Tis to be temper'd on the *Pallet* when us'd with Oil, and not Ground: 'Twas formerly ſcarcer than at preſent; however, being ſtill Dear, it may be ſpar'd in *Freſco*, where *Amel* has the ſame Effect, eſpecially in Cielings.

Amel is a Blue Colour, has a little Body; 'tis us'd in great Landskips; it muſt be calcinated in an Iron Box, to make it the more Brown and Beautiful.

Earth of *Cologne*, is a Ruſſet-Black, apt to turn Red.

Earth Black of *Germany*.

There's another Earth of *Germany*, which is a Natural Earth with a bluiſh Caſt, like the black of a *Coal*; *Printers* make uſe of this Black.

There's another Black us'd made of the *Lees* of burnt Wine, which the *Italians* call *Feſcia di Botta*.

Theſe are the beſt Colours for Painting in *Freſco*. All thoſe that are of Natural Earths are Good; they are ground and temper'd with Water. Before the Painter ſets to Work, he prepares all the chief *Teints*, and puts them in ſeparate Earthen Pots. It muſt be obſerv'd, that all the Colours brighten as they grow dry, except Red Varniſh, which the *Italians* call *Pavonazzo*; the *Browniſh Red Oaker*, *Ruth-Oaker*; and the *Blacks*; particularly thoſe that paſs through the Fire.

The *Painters* generally try their Colours on a dry ſmooth Tile; for the Tile preſently imbibing all that is moiſt, in them, and drying them, they ſee by it what Effect they will have when they are us'd.

Of Painting in DISTEMPER.

Before a *Fleming*, Nam'd *John Van Eyck*, but better known by the Name of *John* of *Bruges*, found out the Art of *Painting* in Oil, all *Painters* work'd in nothing but *Freſco*, *Temper*, and *Diſtemper*, as 'tis commonly call'd, whether it were on Walls, or on Boards, or any where elſe. When they made uſe of Boards, they often paſted on ſome fine Cloath with good Paſte, to hinder them from parting; they then laid on a *Layer* of *White*; after this they temper'd their *Colours* with Water and Paſte; or rather Water and Yolks of Eggs beat together with little Fig-Tree Branches, the Milk of which mixing with the Eggs, with this Mixture they painted their Pictures.

All *Colours* are proper in this ſort of Work except the white of *Lime*, which is never us'd but in *Freſco*. *Azure*, and *Ultramarine*, muſt be us'd, with a Paſte made of *Glove-skin*, or *Parchment*, for the Yolks of Eggs will make the Blue Colours turn Green, which they do not with Paſte nor Gum, neither on Walls, nor Boards. If the Work is on Walls, care muſt be taken that they be dry: The *Painter* muſt even lay on two *Layers* of Paſte quite hot before he applies the Colours, which if he pleaſes he may alſo temper with Paſte, for that Compoſition of Eggs, and the Milk of the Fig-Tree Branches, is only to touch the Work over again the more conveniently, and that he might not be oblig'd to uſe Fire, which is neceſſary to keep the Paſte hot. However, 'tis certain, that the Colours with Paſte keep better. And thus have all the *Deſigns* or *Cartrous* for Tapiſtry, been painted on Paper. This Paſte, as has been ſaid, is made of Glove-skin or Parchment.

When a *Painter* wou'd work upon Cloath, he muſt chuſe that which is Old, half us'd, and very ſmooth; then preſs pounded *Plaiſter* with Glove-skin Paſte, and when that Compoſition is dry, put another *Layer* of the ſame *Paſte* over it.

All the *Colours* are pounded with Water, each by itſelf; and as the Painter wants them for his Work, be tempers them with *Paſte-water*; or if he will only make uſe of the Yolks of Eggs, he takes Water to which he puts one Glaſs of Vinegar to the ſame Quantity of Water, the Yolk, White, and Shell of an Egg, with ſome ends of Fig-Free Branches cut into ſmall Pieces, and beats them well together in an Earthen Pan.

If he wou'd Varniſh the Picture when 'tis finiſh'd, he need only rub them with the white of an Egg well beaten, and then put one Layer of Varniſh over it; but this is ſeldom done, unleſs 'tis to preſerve it from Water: For the greateſt advantage of *Diſtemper* is that it has no glittering, and all its *Colours* look dead, by which means they appear in all ſorts of *Lights*, which Oil *Colours*, or Colours in *Diſtemper* when Varniſh'd, do not do.

Of Painting in OIL.

The Ancients knew nothing of the Art of Painting in *Oil*; 'twas, as has been hinted, a *Flemiſh* Painter who found it out, and practis'd it in the beginning of the fourteenth Century. We may truly ſay, that *Painting* then receiv'd a very great Help, and a wonderful Conveniency, for by this means, the *Colours* of a Picture keep a long while, and a Luſtre and Union are added to them, of which the Ancients were Ignorant, what ever *Varniſh* they made uſe of to ſpread over their *Painting*; and yet all this Secret, which lay hid ſo long, conſiſts in nothing but in grinding the *Colours* with Oil of Nutts or Linſeed Oil: 'Tis true, this ſort of Work is very different from thoſe in *Freſco* and *Diſtemper*; for the Oil not drying ſo ſoon, the work muſt be touch'd over ſeveral times. Thus however the Painter has the Advantage of more Time to finiſh his Picture, and touch over again all the Parts of the *Figurss*, which he that works in *Diſtemper* and *Freſco* has not. The Oil alſo gives the Work a greater Force, becauſe the Black becomes more *Black* when 'tis temper'd with Oil, than when 'tis temper'd with Water. All the *Colours* runs better together, are more Soft, more Delicate, and more Agreable, there being a Union and Tenderneſs in this *Manner*, which is not in any other.

One may Paint in *Oil* againſt Walls, on Wood, on Cloath, on Stones, and all ſorts of Metal. The thing on which the *Painter* intends to Paint, muſt in the firſt Place, be prepar'd by a *Primer*, as the Artiſts call it, which ſeems to make the Ground, and renders the Field very equal and ſmooth. If he is to Paint againſt a Wall when 'tis very dry, he muſt lay on two or three *Layers* of boyling hot Oil; and that as often as he thinks requiſite, even till he perceives the Plaiſter is greaſie and imbibes no more Oil. He then takes *White Chalk*, *Red Oaker*, and *other Earths*, and grinds them to a Conſiſtence, of which he lays a *Layer* on the Wall; when that is dry, he *Deſigns* his Subject, and aftewards Paints upon it, mixing a little *Varniſh* among his *Colours*, that he may not be oblig'd to Varniſh them when Painted.

Some prepare the Wall otherwiſe, to dry it the more, that the Moiſture may not make the *Colours* ſcale off, as it often happens, by the Oil's oppoſing it and hindring its coming out, they make a Plaiſter of Lime and Marble-Duſt, or a Cement of pounded Tiles, which they beat with a Trowel to fine it, and then lay on the Linſeed Oil with a great Bruſh. After this they prepare a Compoſition of *Greek Pitch*, *Maſtic*, and *Varniſh*, which they boil together in an Earthen Pot, and then ſpread it over the VVall with a Bruſh, and Chafe it in with a hot Trowel, to extend and ſmooth it the better: Afterwards they lay on *Chalk*, *Red Oaker*, &c. as above-mention'd, before they *Deſign* any thing.

Some have ſtill another way; they make a Plaiſter of Lime-Mortar, with a Cement of Tile and Sand, and when that is dry, they make another of Lime and Cement well Sifted and droſs of Iron, as much of one as of 'tother; all which being well pounded and incorporated together with Whites of Eggs and Linſeed Oil, they make one of the fineſt *Plaiſters* in the World: But Care muſt be taken not to leave the *Plaiſter* while 'tis freſh laid on, nor till well ſpread all over with the Trowel, and ſmooth every where; for otherwiſe 'twill cleave in ſeveral Places. When 'tis dry, they lay on the *Colours*, as before is mention'd.

When the *Painter* would Paint upon *Wood*, he bruſhes it firſt very well with a Bruſh, and then lays on a *Layer* of *White*, temper'd with *Paſte*, before he covers it with *Oil*: Now-a-days Cloth is moſt made uſe of, eſpecially for great *Pictures*, becauſe 'tis more eaſily carry'd from one Place to another than Wood, which is heavy, and beſides apt to Crack. The *Painters* generally choſe *Ticking*, or the ſmootheſt Cloth they can get; and when 'tis well ſtretch'd upon a Frame, they lay on a *Layer* of *Paſte-water*, and then rub it over with a Pumice-Stone to take off the Knots; the *Paſte-water* ſerves to ſmooth down all the little Threads in the Cloth, and fill the little Holes, that the *Colours* may not paſs over them: When the Cloth is dry, they lay on a Colour that will not kill the other Colours; as *Red Oaker*, which is a Natural Earth of Subſtance, and with which they ſomtimes mix a little white Lead, that it may dry the ſooner. This Colour is firſt ground with Oil of *Nut*, or *Linſeed Oil*, and to lay it on of what thickneſs they pleaſe, they have a great Knife on purpoſe for that uſe. When it is dry, they rub it over again with the *Pumice-Stone* to ſmooth it; then if they pleaſe, they lay another *Layer* compounded of *White-Lead*, and a little of the *Black* of *Coal*, to make the Ground *Greyiſh*; and in both ways they put on as little Colour as they can, that the Cloth may not break, and the Colours that are to be laid upon it may keep the better. If the Prim'd Cloth is not thus at firſt Oil'd, but the Painter falls to *Painting* at once, the *Colours* will look better, and remain more Beautiful. In ſome Pieces of *Titian* and *Paulo Veroneſe*, 'tis obſerv'd, that their firſt Lay was of *Diſtemper*, on which they afterwards painted with Oil Colours; by this means their Works look'd the more Lively and Freſh; for the *Diſtemper* attracted and imbib'd the Oil that was in the Colours, and was the cauſe that they remain'd more Beautiful, the Oil taking off a great deal of their Vivacity: For which Reaſon, thoſe that would have their Pieces keep freſh, make uſe of as little *Oil* as they can, and keep their Colours the firmer by mixing with 'em a little Oil of *Spike*, which ſoon Evaporates, but ſerves to make them Run the better, and renders 'em the more pliable in Working. Another Cauſe of *Colours* loſing their Beauty, is when the Painter works 'em too much in mixing them; for being jumbled together, they Change and Corrupt one another, and take away their Vivacity: Wherefore he muſt be careful to uſe them properly, and lay the *Colours* each in its Place, without mingling them too much with the Pencil or Bruſh; alſo nor to temper Adverſe Colours together, as *Blacks* with others, particularly *Smoak Black*, but uſe them apart as much as poſſible: And when he wou'd give the more Force to his Work, he ſhou'd ſtay till 'tis dry to touch it over again with Colours that will not damnify the others. Practice teaches this, and *Painters* may obſerve it if they have not thought of it before, being taken up with the main of their Subject. 'Tis a conſiderable Thing towards the preſervation of the Beauty of their *Pictures*; for there have been ſome which have been much upon the Eaſel and yet the Colours have not been laſting, becauſe thoſe who us'd 'em work'd and jumbled them too much together with the Bruſh and Pencil through too much *Fire*. Thoſe who Paint with Judgment, lay 'em on with leſs Precipitation, put them thicker, cover and recover their Carnations ſeveral times, which the Painters call *Well Kneading*.

As for Painting the Cloth at firſt with a Lay of *Diſtemper*, 'tis true, that is not often done, becauſe it may then ſcale and will not roll up but with difficulty; for which Reaſon *Painters* have been contented to make a Print of Colours in Oil, But when the Cloth is good and very Fine, the leſs Colour is put on it in *Priming* is the better, and the Painter muſt always be careful that his Oil and Colours be good. Thoſe who to ſave Mony, make uſe of bad Oil and bad Colours in laying on their Primes, that they may be the ſooner dry, find their Pictures very much damnify'd by it, and the Beauty of the Colours ſoon Effac'd.

When a Painter is to work on Metal, Marble, or aay other Stone, he ueed only lay on a thin *Layer* of Colours before he *Deſigns* any thing, and not at all on Stones, where he would have the Ground appear as in Marble, when it is of an extraordinary Colour.

All the Colours us'd in *Freſco*, are good in Oil, except *Lime-White* and Marble-Duſt; but what follow may be made uſe of, as

White-Lead taken from Common Lead that has been bury'd. After it has lain in the Ground ſeveral Years, Scales come upon the Lead, which changes Colour, and turns to a beautiful *VVhite*. Tho 'this White ſubſiſts in Painting, it has ſtill a very bad Quality, but the Oil Corrects it by grinding it on a Stone.

Cerus, is alſo the ruſt of Lead, but fouler.

Maſticot Yellow and White, is made of Lead calcinated.

Red Arſenick is us'd with Calcinating and without: to Calcinate it, 'tis put into an Iron Box, or in a Pot well ſtopp'd: But few People Calcinate it, or indeed uſe it, becauſe the Vapour is Mortal, and 'Tis very dangerous to make uſe of it.

Red-Lead taken out of Lead Mines, 'tis not much us'd, becauſe 'tis, an Enemy to other Colours.

Vermilion taken out of Silver Mines, it being a Mineral, does not keep in the Air.

Lake, which is made with *Cochineal* or *Brazil* Wood, or other Woods, there being ſeveral kinds of it. This Colour keeps not in the Air.

Aſh Blues and *Aſh Greens*, ſeldom made uſe of but in Landskips.

Indico is alſo us'd in *Skies* and *Draperies*: when 'tis well us'd, it keeps beautiful a long time: Too much Oil muſt not be mix'd with it; lay it a little brown, becauſe 'tis apt to Change; 'tis made uſe of in Painting with Succeſs, it being good for *Greens*.

The *Avignon* Grain, which is temper'd and boilt. Then the Aſhes of Vine-twigs or Chalk, are thrown in to give it a Snbſtance, as is done in *Lake*; and after that, 'tis all ſqueez'd thro' fine Lawn.

Smoak-Black, which is a bad Colour, but eaſie to Paint black *Draperies*.

Bone-Black and burnt *Ivory*, which according to *Pliny*, was Invented by *Apelles*.

Verdigreaſe is the Plague of all Colours, and enough to ſpoil a whole Picture if the leaſt part of it enters in the Priming of the Cloth, yet 'tis a beautiful and agreeable Colour; ſometimes 'tis Calcinated to take off its malignity; but 'tis dangerous to Calcinate as well as red *Arſenick*; and let it be ever ſo purify'd, it muſt be us'd alone, for 'twill ſpoil All the Colours that are mix'd with it: 'Tis made uſe of becauſe it dries very much, and only a little of it is mixt with *Blacks*, which never dry alone. The Painter muſt take care he does not uſe the Pencil with which he painted *Verdigreaſe*.

There are other ſorts of compounded *Colours* that are not made uſe of in Oil.

As to *Oils*, the beſt that can be us'd in Painting are Oil of *Nuts* and *Linſeed* Oil.

Oil of *Spike* ſerves to make the Colours run better, and renders the touching the Picture overagain the more eaſie; it alſo takes off the glittering of a Picture, and is proper to do the ſame by the Filth, and to clean it; but the Painter muſt have a care it does not take off the Colour. 'Tis made of *Lavender* Flowers.

There's another Oil drawn rom Roſin, which the *Italians* call *Aquadi Raſa*; and We, *Oil of Turpentine*. 'Tis good to touch the Picture over again with; but eſpecially to mix with *Ultramarine* and *Amels*, becauſe it helps ſpread 'em and evaporates immediately. When the Artiſt would make uſe of it, 'tis not neceſſary he ſhould uſe much of other Oil, which will only turn the Colour Yellow.

The Painters uſe alſo *Oil* of *Nuts* boil'd up with the Scum of *Lead*, in which Silver has been melted by a quick and great Fire. To this is added an Onion whole and peal'd, which is taken away after it has boil'd. This takes away from the Oil its greaſie Quality and makes it clearer.

There's ſtill another ſort made by boiling *Oil of Nuts* with Powder of *Azure* and *Amel*: When it is all Boil'd, the Oil is let ſtand a little and the Top taken off. This is to temper *White* and the other *Colours* which the Painter wou'd have keep clean.

As to *Varniſh*, there are ſeveral ſorts, ſome of *Turpentine*, others of *Spirit of Wine*, *Maſtick*, *Gum Lake* and *White Amber*. This Varniſh is us'd on Miniatures and Stamps. The Painter muſt chuſe the whiteſt Gums he can get.

If he wou'd make a Varniſh to dry preſently, he takes *Turpentine* in a Viol, and puts to it an equal quantity of *Spirit of VVine*, then ſhaking them together Varniſhes what he has occaſion of.

The Painters principal Tools are the *Grind-ſtone* and *Muller*, the *Amazette*, a piece of Wood, Horn, or Braſs, with which the Painter takes up the Colours when he grinds 'em on the Grind-Stone; a *Knife*, an *Oil-Cup*, a *Penciller*, in which he cleans his Pencils, a *Pallet*, a *Porte-Crayon*, a *Reſting-Stick*, a *Chevalet* and Cloth.

Of the different manner of Colouring.

Few *Colours* are us'd when the Painter wou'd have all the *Figures* of his Picture appear of one Colour only, as in the way of *Claro Oſcuro*; or when he wou'd imitate the *Baſs Relievo's* of Marble, Stone or Braſs: Several Pieces in this kind may be ſeen at *Rome* in *Freſco*, upon the Walls of Houſes, done by *Polydore* and other Great Painters. When theſe ſort of Paintings are of a *Yellowiſh* Colour, 'tis call'd *Waxwork*, becauſe 'tis in imitation of Wax. In all Painting where the *Lights* and *Shades* are obſerv'd, the Picture ſeems to be but of one Colour. The little Pictures made to imitate Emboſt Work, whether in *Freſco*, *Diſtemper*, or *Oil*, are ſometimes term'd *Camayews*, becauſe they repreſent thoſe ſorts of Stones.

There's ſtill another way of Painting in *Black* and *VVhite*, but 'tis only done in *Freſco*, to keep in the Air; the *Italians* call it *Sgrafitto*, or *Scratch'd Work*, becauſe 'tis indeed a *Deſign* ſcratch'd out only, which is done thus, Make a Mortar of *Lime* and common Sand, and give it a blackiſh Caſt by mixing burnt Straw with it, make a ſmooth Plaiſter of it, and cover it with a Layer of Lime-white, or any ſmooth and white Plaiſter; after that, put on the *Cartoons* to Deſign what you intend upon it, and Engrave it afterwards with a ſharp Iron Bodkin, which diſcovering the plaiſter of Lime white that hides the firſt Black *Plaiſter*, cauſes the Work to appear as if Deſign'd with Pen and Ink. When that is done, go over all the White, which ſerves for the Ground, with a Water Tint a little dark, to make the Figures appear like thoſe that are waſh'd on Paper; but if the *Painter* does *Groteſque* Figures only, or *Foliages*, he only Shadows the Ground a little with that Water, near the *Out-lines* that are to bear the Shadow.

There being nothing that agrees better together than *Sculpture* and *Painting*, the *Painters* not only adorn their *Pictures* with *Statues* and *Baſſo Relievo*'s, but *Sculpture* is alſo ſometimes mix'd with *Painting*; this is commonly done for *Groteſque* Work, part of which will be of *Relievo* in *Stuck*, and the other of ſeveral Colours, or of *Black* and *White* only, for a *Groteſque* is a Licentious Repreſentation, in which the Workman takes all ſorts of Liberty, and all ſorts of Ways are to be ſeen in it, as *Relievo*, painting in *Freſco*, and in *Oil*. A great part of the Ornamental Work of the Ancients was of this kind, as may be ſeen in ſome Remains of it at *Rome*, and at *Pouzzuolo* near *Naples*.

Of MINIATVRE.

As to thoſe who work in *Miniature* and upon *Vellum*. Thoſe Colours that have the leaſt Body are beſt and moſt convenient: Thus they very happily uſe *Carmine*, Beautiful *Lakes* and *Greens*, made of the *Juice* of Herbs and ſeveral ſorts of Flowers. This kind of *Painting* takes up more time than any other, and is done only with the point of the *Pencil*. There are ſome *Painters* who uſe no White, but to heighten their Pieces, make the Vellum Ground ſerve inſtead of it. The *Lakes* appear in proportion to the Colour and Force in the Figures. Others, before they go to Work, ſpread a very thin *Layer* of White-Lead on the Vellum, on which they afterwards paint by *Dotting*: For ſuch is the way of painting in *Miniature*. When the Colours are laid on flat without Dotting either in Vellum or Paper, 'tis call'd *VVaſhing*. The Colours are temper'd with Gum *Arabick*.

They work alſo with Light Colours on Silk and Silver, as in the *French* King's Tapiſtry and other Pieces at the *Hotel* of *Conde*, *Deſign'd* by *Nicolo*. Thus far Monſieur *Felebien*. *What follows is taken from the Old Edition concerning working in Miniature.*

Take an ordinary plain Card, or a pure thick and ſmooth Vellum, poliſh them well, and with thin white Starch paiſt on what you Paint a piece of an *Abortive*, the Outſide outwards, and when 'tis dry, poliſh it as follows. Make the Grinding-ſtone clean, and lay the Parchment Side downwards, then poliſh it with a Tooth on the Back-ſide; after which that ſide towards the Stone will be ſmooth: Lay on your Card a primer of Fleſh-Colour before you begin to Work, temper'd according to the Complexion of the Party, whoſe Picture is to be drawn: If Fair, let it be white *Lake* and red *Lead*: If Brown, mix a little *Red Oaker*: Let this Primer be Fairer than the Natural Complexion, becauſe you may darken it in Limning, but not lighten it; for the general way is to work them down whole. Lay the Ground or Primer, with a greater Pencil than ordinary, ſmooth, and clean of Spots, Hair, or duſt; fill your Pencil full of Colour, rather thin than thick; lay it on very thick with two or three ſweeps, and cover rather more than leſs, leſt you be not able to follow the ſame Colour afterwards. Beſides, if you are long in laying on your Primer, the *Abortive* will become rough, and riſe from the Card. Next take a large Shell of Mother of *Pearl*, and before you begin to Work, temper certain little heaps of Shadows for the Face, and lay them handſomly round about the borders of the Shell; in all theſe Shadows mix a little White: For the Red in the Cheeks, Lips, *&c.* temper Lake, Red-Lead, and a little White together; for the Blue, Indico and White, not Black, is us'd in the Face. For the fine blewiſh and greyiſh Colour, take White, a little *Engliſh* Oaker, and a little Indico; to theſe add ſome *Maſticot* or *Pink*, which will give the Shadow a good Grace, provided 'tis not too Green; for the deeper Shadows, white *Engliſh Oaker* and *Vmber*: For the dark and hard Shadows, *Lake* and *Pink* mixt with *Vmber*, they make an excellent Fleſhy Shadow.

Of Painting upon GLASS.

The Artiſts paint in Oil upon *Glaſs*, as well as upon *Jaſper* and other Precious Stones; but the fineſt way of doing it, is to paint under the Glaſs; that is, to do it ſo, that the Colours may ſeem through it: In order to this, the Workman goes to Work in a manner quite different from the Common ways, for he at firſt lays on the Light Colours, and thoſe which are laſt laid on when the Painters work on Cloth or Board, and that which ſerves for the Ground, is laid on the other Colours.

After the ſame manner is the painting on Glaſs with *Gum* or *Glue*; and this way is brighter than that with *Oil*. When the Work is done whether in *Oil* or *Diſtemper*, the Colours are cover'd with *Leaf Silver*, which gives a greater Luſtre to thoſe that are Tranſparent as *Lakes* and *Greens*. There is alſo a way of painting upon Glaſs with the uſe of Fire, but that belongs rather to the Glaſiers Trade than the Noble Art of *Painting*.

Of ENAMELLING.

There's another ſort of *Painting* which is done on Metals, and upon Clay, with *Amells* melted down. The way of Enamelling upon Clay is very Ancient, for in the time of *Perſenna*, King of the *Tuſcans*, there were Enamel'd *Vaſes* made of different Figures in his Territories which however, were not to be compar'd with thoſe made ſince at *Faienza* and *Caſtello Duzanti*, in the Dutchy of *Vrbin* in *Raphael* and *Michael Angelo*'s Days.

Several of theſe *Vaſes* are to be ſeen, the *Deſigns* of which are much more conſiderable than the *Colouring*; becauſe the Art of painting Figures in Colours was not then diſcover'd no more than painting them on Metal, of which *Vaſes*, Baſins and other Works, were then made that are only Black and White, with a light touch of Carnation, for the Face of the Figures and other parts of the Body, as is to be ſeen in thoſe call'd *Emaux de Limoges*: In which neverthele ſs fine pieces of Work were made in *France* in the Reign of *Francis* I. as to what relates to the *Deſign* and *Claro Oſcuro*; for as to the other Colours, the Enamelling even on Gold, was not better than that on Copper.

In thoſe Days all Enamelling, as well on Gold, as on Silver or Copper, was commonly nothing but of clear and tranſparent Amells, and when thick Amells were us'd; the Artificer only laid on Earth-Colour flat and ſeperately, as is now ſometimes done in Enamelling ſome Pieces of *Relievo*: But the way of Painting with thick and Opake *Amell* as 'tis practis'd in our Time, was not known, nor the Secret of Compoſing all the Colours, as is done now-a-days.

In uſing Clear *Amells*, the Workman only grinds them with Water, for they can't bear Oil, as thick *Amells* can; they are laid on flat and harden'd with the Metal on which they are put: Pieces are ſometimes made, in which all the Field is in *Amell*, and without a Border, which is difficult becauſe clear *Amells* in melting are apt to mix together, and the Colours to be confounded, eſpecially when the Pieces are ſmall. There are ſeveral little Remains of this ſort of Work that were made in the Reigns of

Charles IX. and *Henry* II. of *France*, was of a midling bigneſs: But the leaſt piece of Work ever made in this ſort of Painting, was for the Lid of a Box, done by *Pierre Chartier de Blois*, which I have ſeen; the Figure is a Garland of Flowers.

All ſorts of *Enamelling* cannot be made uſe of indifferently on all ſorts of Metal; Copper, which takes thick *Amells* very well, will not endure clear; a Layer of Glaſs, or Black *Amell*, muſt be firſt laid on, and on that a Leaf of Silver, which takes the *Amells* that are apply'd: Nevertheleſs, of all thoſe that are proper for Silver, with which all ſorts of Amell, as well Clear as Opake, do not well agree; there are none of the Clear ones, but the *Sea-green*, *Azure*, Green and Purple, that have a very good Effect: But Gold takes all the Kinds of them, as well Clear as Opake. 'Tis true, the clear *Purple* does not look ſo well on Gold as Silver, becauſe the Yellow Colour changes that of the Purple, and gives it a Fading Caſt.

The Workman muſt alſo make uſe of the fineſt Gold, for clear Amels put on baſe Gold grow dim, that is, there will be a certain black Miſt upon it, which obſcures the Colour of the Enamelling, takes away its Vivacity, and gathers all about it as if it was of Black Lead.

Red Amell to be fit for uſe ſhou'd be very hard, and as the Workman ſay, *hard to Burn*; that which is ſoft and eaſy to Burn is not good, 'twill grow foul in a very little time; the Red are Red only by Accident, and never come out of the Fire but Yellow, and not Red when they are apply'd to the Gold, but they redden as ſoon as they are taken out of the Fire.

The moſt beautiful clear Reds are made with calcin'd Copper, the Ruſt of Anchor Iron, Orpiment and calcin'd Gold, which are prepar'd and put with proportion into a Melter made of Cryſtal, *&c.*

As to working with thick and opake Amels, 'tis an Invention of latter Times, and yet admirable Pieces have been done in this manner, Portraits, and even Hiſtorical Compoſitions as well Painted as in Oil; having this advantage, that their Varniſh and Luſtre never wear off.

Before the Year 1630. this ſort of Painting was unknown, it being five Years after that *Jean Toutin* a Goldſmith of *Chaſteaudun*, who Enamell'd perfectly well with common and tranſparent Amels, ſet himſelf to find out a way of uſing Amells for dead Colours, to expreſs ſeveral *Teints*; accordingly he try'd them in the Fire, and finding they preſerv'd their Luſtre he at laſt diſcover'd the Secret, communicated it to other Artificers, who afterwards contributed all to bring it more and more to Perfection.

Dubie a Goldſmith, who work'd in the Galleries of the *Louvre*, and *Gribelin*, *Toutin*'s Diſciple, were two of the firſt; *Morliere*, a Native of *Orleans*, who liv'd at *Blois*, follow'd them, and apply'd himſelf particularly to Enamelling Rings, in which he got a great deal of Reputation. He had for Diſciple *Robert Vauquer* of *Blois*, who ſurpaſt all the others in *Deſigning* and *Colouring*, he Died in 1670. *Pietre Chartier* of *Blois* contriv'd to make Flowers, in which he ſucceeded to Perfection. Soon after ſeveral Perſons at *Paris* apply'd themſelves to this ſort of Painting, of which kind abundance of Medals and other little Pieces were made. They began even to make Enamell'd Pictures, inſtead of thoſe in *Miniature*; the firſt that appear'd finiſh'd and in lively Colours, were thoſe that *Jean Petitot* and *Jacques Bordier* brought from *England*, upon which *Louis Hance*, and *Louis du Guernier*, both excellent Painters in *Miniature* attempted to do the ſame, to which the latter apply'd himſelf with ſo much Care and Application, that his Succeſs was extraordinary, and the more for that of all the Painters in *Miniature*, none cou'd *Deſign* like him. He even ſought after and found ſeveral *Tints* for the Beauty of *Carnations*, which had not been diſcover'd before, and if he had liv'd longer, he wou'd perhaps have had the Honour of carrying this ſort of Work to its higheſt Degree of Perfection.

However, thoſe that are made at preſent are ſo fine, that if the Ancients cou'd have any Knowledge of them, they wou'd envy us the Glory of this rare *Invention*; even they who were the *Inventers* of ſo many Things, and left us hardly any thing new to *Invent* in the *Arts*.

This Painting to be perfect ſhou'd be done on Golden Plates, becauſe other Metals want its Purity. Copper Scales and caſts forth Vapours, and Silver turns the White Yellow, for tho' the Amell ſticks to red Copper, 'tis but imperfectly, it being very apt to crack and break, and the Colours looſe their Force and Beauty, becauſe of the Impurity of the Copper as I have already obſerv'd. Theſe Golden Plates ought to be a little Hollow on one ſide, and rais'd on t'other, for which reaſon they are almoſt always of a Round or Oval Figure; for if they are Flat, the Gold is apt to work in the Fire, and make the Amell ſplit; neither alſo ſhou'd they be too thick, 'tis ſufficient if they can ſuſtain the Amell which is at the bottom and a top of it. They are only ſtrengthned all round by a Circle a little thicker.

When the Plate is entirely even, the Workman puts at the top and bottom a white Amell, tho' he is not to work but one ſide; if there was Amell but on one ſide, it might ſwell in the Fire, and make Unevenneſſes, becauſe it always works there, eſpecially in large Pieces: And when it has not been properly apply'd, there will appear on it little Bubbles, which the Artiſts call *Eyes*. But when there's Amell on both ſides, the upper ſide being beſt ſupply'd, keeps its Ground, and the Amell works out equally at Top and Bottom. Thus this firſt *Lay*, which is White, being even and ſmooth, ſerves for a *Ground* to all the *Colours* that are laid on afterwards.

The *White Amell* is Common enough, and what all Goldſmiths make uſe of. When it has been well Ground and purg'd with *Aqua Fortis*, and afterwards well waſh'd with Fair Water, 'tis pounded in a Mortar as much as is neceſſary, to temper it with the Water and put it to the Fire, which is done generally by the Goldſmiths, who prepare the Plates for thoſe that Enamell Gold.

On ſuch a Plate Enamell'd with White, the Artificer chalks out his Deſign, and then he deſigns it over again very neatly with a Red Colour, made of the Lees of *Vitriol* and *Salt-Petre*, that is, the groſſeſt Parts that remain in the Horn after the *Aqua Fortis* is Extracted, or elſe of Iron ruſt, it muſt be well ground on *Flint* or *Agat*, with the beſt ſort of Oil of *Spike*. The Draft being finiſh'd and Correct, the Workman prepares the Picture, by putting it to the Fire, and the Colours are afterwards painted, as will be mention'd hereafter.

The *Black* is made with *Mangeneſs*, which, as well as all the other Colours, muſt be Calcin'd and Ground with Oil of *Spike*; an eqnal Quantity of the Goldſmith's Black Amel muſt be added to it.

The *Yellow* is had alſo at the Gold-ſmiths, and is call'd the thick Yellow.

The *Blue* is made of the Amel of *Azure*, the ſame the Painters uſe. It muſt be Purg'd and Prepar'd by putting it in a Glaſs-Bottle of good Brandy ſtopp'd well and expos'd to the Sun five or ſix Days, and ſtirr'd twice or thrice a Day, becauſe all the Filth of the Amel will ſtick to the bottom, and what ſwims a-top will be very Fine and Even: Painters may uſe it in their Pictures. It muſt afterwards be ground on Flint or *Agat*.

When the Workman wou'd have a very Beautiful *Azure*, he takes *Safre* and Grinds it, then he mixes a third Part *Rocaille*, another very clear *Cryſtal*; which Compoſition he puts between two Crucibles Clay'd well, and when the Clay is dry, puts it into a Glaſs-Houſe Fire, and leaves it there twenty four Hours; then he takes it out, lets it cool, and has a very fine Blue, which he mixes with his other Colours.

The *Red*, very much like *Vermilion*, is made of *Vitriol* Calcin'd between two Clay'd Crucibles: It wants but an Hour's moderate Fire. Then 'tis done with *Aqua Fortis* waſh'd with fair Water, and Ground as the reſt.

The Red, which is like *Lake* the Painters uſe, is made of fine Gold diſſolv'd in *Aqua Fortis* and *Sal Armoniac*, or Common Salt, and dry'd in a Shovel; to a Dram of fine Gold, is put eight Drams of *Aqua Fortis*, &c. in a Viol: When the Metal is diſſolv'd, 'tis all put into a Gourd with a Pint of Spring-Water and about ſix Grains of *Mercury*: This Gourd is left in hot Sand twenty four Hours; after which, the Gold will be found to be in a ſmall Duſt of a Tan Colour, Red at the bottom of the Veſſel: The Water is thrown off carefully, and the Duſt dry'd by a ſlow Heat: And becauſe there will ſtill be ſome *Mercury*, 'tis ſqueez'd through a piece of Linnen, and then the Gold Duſt is ground with twice the Quantity of Powder of Sulphur, which Mixture is put into a Crucible on a gentle Fire, where the Sulphur Exhales, and a Duſt remains a little Redder than the former, which if the Workman pleaſes, he may grind with *Rocaille*, and ſo uſe it.

Here are other ways of Vitrifying, every Artificer has his manner and Secret to himſelf: For the compoſition of theſe ſorts of Colours, *White Coperas* Calcin'd, makes juſt ſuch another Colour as *Umber-Earth*. In thoſe Colours that are not of Amel, if you wou'd Vitrify them, you muſt put *Rocaille*, to ſome more, and leſs to ſome, as the Occaſion requires, which will be known by trying them in the Fire on a little Plate Enamell'd with *White*, which muſt be ready for that purpoſe. By this means all the Colours may be brought to the ſame degree of Hardneſs. The *Rocaille*, of which I have ſpoken, is nothing elſe but the Sands which the *Paterno triers* make: You muſt try the cleareſt and thoſe that have the leaſt Colour. However, good Workmen, inſtead of *Rocaille*, make Meltings themſelves, which are more Clear and more Beautiful, becauſe in the *Rocaille* there's two much Lead, which is not enough Purify'd.

Bead-ſellers.

The *White Ground*, on which they Paint ſerves for the White to all the Colours, for from the beginning to the end of the Work, you muſt ſave Places where the Riſings and Lights ought to be, as is done in *Miniature*. Nevertheleſs, there's a *White* which may be made uſe of to heighten the other Colours; tis compos'd of Calcin'd Tin, which to render it Meltable, is mix'd with *Rocaille*, or white tranſparent Glaſs.

The Colours I have been ſpeaking of, are as it were the Baſis, or rather the Matter, of which all the reſt for Enamelling are Compos'd, the Workman having nothing to do to make divers *Tints*, but to mix them together, as Painters do on their Pallets; Blue and Yellow mixt together make Green; Blue and Red, Violet; and ſo with other Colours.

As the Painters touch their Pictures in Oil over ſeveral times, leaving them to dry, ſo this kind of Painting, or Enamelling, may be touch'd over as often as you pleaſe, putting the Picture each time to the Fire to reverberate, and minding to take it from the Fire as ſoon as you ſee the Amel is ſufficiently Poliſh'd.

The Reverberating is made in a little Oven, with Fire above and all about it, and a void Space in the middle, to place your Work in; or elſe you may uſe a Gold-ſmith's Crucible: Put it into an Earthen Pan and cover it a-top and all round with good lighted Coal; under the Crucible put the Picture on a little Iron Plate.

Becauſe the Artiſts have given over Enamelling on Copper, like thoſe Pieces which in *France* are term'd de *Limoge*. Some imagin the Art is loſt, and that they cannot now paint thoſe Figures on a black Ground, which were done formerly: But this is not true; for 'tis known, that the Black which made the Ground of thoſe Pictures, was nothing but the black Glaſs of which the long Trunks to Shoot in were made; and that the White of the Figures was the ſame which ſerves at this time for the Field of ſuch Things as are Enamell'd in Gold, which the Gold-ſmiths prepare upon Plates, as I have ſaid, but are ſoften'd when they are to be painted upon. *Henry Toutin*, Son of the before-mention'd *Jean Toutin*, after the Death of the laſt King, *Louis* XIII. made a Watch-caſe for the Queen-Regent, of Gold Enamell'd, with White Figures on a Black Ground, much finer than any thing that ever was done on Copper, which can't endure the Fire, as Gold can. The ſame Man, at the ſame time, did abundance of Things in the latter, which are not to be Parallell'd; for on a Gold Plate of ſix Inches long he repreſented, from the fine Picture that's in the King's Cloſet, the Queens of *Perſia* at *Alexander*'s Feet, with all their Trains: And beſides that, he has nicely obſerv'd the Colours, the Airs of the Head, and all the fine Expreſſions in the Original. The Poliſhing is ſo Beautiful, and the Luſtre ſo Bright through all the Work, that 'twill be hard for Enameling ever to arrive at a higher degree of Perfection.

This ſort of Work is done, as I have hinted, with the point of a Pencil, and after the ſame way as *Miniature*, excepting that Oil of *Spike* is us'd inſtead of *Water* and *Gum*.

Of Moſaick PAINTING.

As the Mind of Man is never contented, and has no ſooner diſcern'd one Secret, but it is ſearching after another; ſo as ſoon as the Art of Painting was found out, and Men knew the true way of repreſenting all the Objects of Nature with the Pencil and Colours, they try'd other Means to make their *Paintings* more Solid and Laſting.

Perceiving that the different ſorts of Marble made uſe of in Pavements of Rooms, had a very good Effect when they were diſpos'd of with Diverſity, and form'd a kind of Figure, the Artiſts thought of taking ſome of all Colours, and in little bits, with which they at firſt made *Compartments*, that by their odneſs, and variety, had ſomething in 'em very agreeable, they apply'd theſe little Pieces to a Ground of *Stuck* made of Lime and Marble-duſt, ſo ſtrong and thick as to joyn them well together, inſomuch, that all being dry, they cou'd ſmooth and poliſh it. This made ſo glit'ring a Body, that nothing cou'd be more beautiful, nor even more ſolid; for tho' 'twas continually trod upon and Weter fell upon it, this ſort of Work receiv'd no manner of Damage.

Such a fine Invention put the Painters upon contriving ſomething more conſiderable; and as Arts ſoon come to Perfection after they are once diſcover'd they form'd out of all thoſe ſorts of little Stones, Branches, Leafs, and other odd Figures of various Colours, which they laid on a Ground of white or black Marble. At laſt, ſeeing how Beautiful they look'd on Pavements, and how this Painting bore the Water, they imagin'd if they cou'd repreſent after the ſame manner Objects to be ſeen at a diſtance and full againſt the Spectator, they wou'd look much more Beautiful. They then undertook to adorn Walls with ſuch Pieces; to make ſeveral Figures for the Decoration of Temples and other Edifices. Thus this kind of Work, which at firſt was done only with the Natural Stones, brought the Artificers to Counterfeiting Stones of ſeveral Colours, that they might have more *Tints*, and Imitate *Painting* better. This they did by means of Glaſs and Amels, of which they made an infinite Number of Pieces of all Sizes and Colours, and thoſe Pieces glittering from afar, had the deſir'd Effect, enduring as well as Marble the Water and Weather, in which this ſort of Painting ſurpaſſes all the reſt, for time will waſte the others, whereas it on the contrary Embelliſhes *Moſaick*, which laſts ſo long, that it may be ſaid to have no End.

Beſides the *Antique* Pieces of *Moſaick*, which we meet with in ſeveral parts of *Italy*, as in the Temple of *Bacchus* at *Rome*, now call'd St. *Agnes* Church, at *Piſa*, *Florence*, and many other Cities, there are ſome Modern ones that are very Fine: One of the moſt Conſiderable is that great Picture in St. *Peter*'s Church at *Rome*, which goes by the Name of *La Nave del Giotto*, where our *Saviour* and St. *Peter*, are repreſented upon the Waves: But thoſe that *Joſeph Pin*, and the Chevalier *Lanfrance* did in the ſame Church, are much more Beautiful. There are alſo ſome Pieces in this Kind at *Venice* done after the Deſigns of ſeveral excellent Modern Painters,

In executing Works of this Nature, the Artiſt begins with little pieces of Glaſs, with which he makes as many different Colours as he can. To this End, when the Glaſs-maker's Stoves are prepar'd, and their Pots full of Matter which make the Glaſs, or rather of Glaſs ready made, he puts in each Pot what Colour he would have, beginning always with the Brighteſt, and encreaſing the ſtrength of the *Tints* from Pot to Pot, till he comes to the Browneſt and deepeſt; as when the Painter mingles thin Colours on his Pallet for Painting in Oil. When the Glaſs is ſufficiently melted, and all the Colours are in their Perfection, he takes out the hot Glaſs with Iron Ladles, and puts it on a ſmooth Marble-Stone, and with another ſuch Marble-ſtone he flats and plains the Glaſs, which he afterwards cuts into bits of equal bigneſs, about an Inch and an half; but then he makes others with an Iron Inſtrument call'd *Bocca di Cane*, which is Four-ſquare; and then others of different Figures and leſs Bigneſs, as he has occaſion. Theſe he puts into Boxes plac'd in Order, as when the Artiſt Paints in *Freſco*, he ranges the different *Tints* in Shells or Cups.

If he would put Gold either in the Ground of the Picture, or in the *Drapery*, he takes ſuch bits of Glaſs as I have before mention'd, moiſtens them on one ſide with Gum, and after that, puts on Leaf-Gold; then he places this bit of Glaſs, or ſeveral at a time, on an Iron Shovel, which he puts at the Mouth of the Stove; but firſt covers them with another piece of Glaſs ſhap'd like a Viol, he leaves this Shovel at the Mouth of the Stove, till the Glaſs a-Top turns all Red; after which, he takes it away at once, and finds the Gold ſo well apply'd underneath, that 'twill never come off, let him expoſe it in what Place he will.

To uſe all theſe different Pieces and make a Picture of them, he in the firſt Place forms a *Cartoon* or *Deſign*, which he traces out upon Plaiſter by little and little, and even by Parts, as in *Freſco* Painting. This Plaiſter muſt be laid thick on the Wall, which will keep it freſh a long time; and he may be three or four Days in preparing it, but he ſhould conſider the Seaſon; 'tis made of Lime, and that of a hard Stone, or of Tile-Duſt well ſoften'd, Gum *Dragon* and Whites of Eggs. When 'tis well Prepar'd, and apply'd to the Wall, he wets it with Linnen to make it look freſh; and having by his *Cartoon* Deſign'd what he wou'd repreſent, he takes the bits of Glaſs with little Pincers according as they come in Order to obſerve the Lights, Shades, and different Colours, as they are repreſented in the *Deſign* which he has before him. Thus with Time and Patience he finiſhes his Work, which will appear ſo much the more Beautiful, by how much the pieces of Glaſs are laid on ſmooth and even; ſome of theſe Pieces are ſo well form'd, that they are as ſmooth as a Marble Table, and as perfect as *Freſco*, Painting having this Advantage of it, that they are the more Shining and Laſting.

How to Inlay STONES.

Beſides this way of making *Moſaick* Work with little Pieces of Stone, Glaſs, or Amel, which the Ancients made uſe of, the Modern Artificers have another way, and repreſent Amels, Fruits, Flowers, and all ſorts of Figures in general, as if they had been Painted. There are Pieces of this Kind of all Sizes, in which Painters have repreſented even Entire Hiſtories, that the Beauty and Excellence of their Work might be preſerv'd by the durableneſs of the Matter. One of the moſt conſiderable and greateſt Pieces is in the fine Pavement of the Cathedral Church of *Sienna*, wherein *Abraham's Sacrifice* is Painted. 'Twas begun by a Painter Nam'd *Duccio*, and Finiſh'd afterwards by *Dominico Becafumi*: 'Tis compos'd of three ſeveral ſorts of Marble, one very White, another Gray with a darkiſh Caſt, and the third Black. Theſe three ſorts are ſo well cut and joyn'd together, that they look like a Picture painted Black and white: The White Marble ſerves for the Riſings, and the ſtrong Lights; the Second for the *Demy Teints*; and the Third for the Shades, There are Strokes and Openings fill'd with Black Marble, or *Maſtick*, which joyn the Shadows with the *Demy Teints*, for in theſe ſorts of Works the Painter ſets the different Kinds of Marble near one another, according to what Deſign he is executing, When they are joyn'd and well Cemented, the ſame Painter, after he has diſpos'd his Subject, takes ſome blacking, and with his Pencil traces the Out-Lines of the Figures, and by *Strokes* and *Openings*, obſerves the Lights and Shadows after the ſame manner as if he was Deſigning upon Paper or Card. Then the Sculptor cuts with a Chizel all the Lines the Painter has trac'd; after which, all that the Chizel has cut is fill'd up with other Marble, or a Maſtick made of black Pitch, or other Pitch, boyl'd up with Black-Earth. When this Maſtick is Cold, and has acquir'd a Body, the Workman goes over it with a piece of Grez or Brick, and rubbing it with Grez and Water, takes off the Superfluities and ſmooths the Marble. Thus are ſeveral Floors in *Italy* Pav'd; and with two or three ſorts of Marble, the Painters have found out the Art to Embelliſh thoſe Works with different Figures.

But they have done more than all this, for Duke *Coſmo de Medicis* having Diſcover'd about the Year 1563, a Place in the Mountains *Pietra Sancta*, the top of which was white Marble, proper for Statues, another Marble was found underneath of a mixt Colour, Red and Yellow; and as they dug deeper into the Quarry, the Workmen found a variety of Marble of all ſorts of Colours, which were ſo much the more hard and Beautiful, by how much the more deep they lay hid in the Mountain. 'Tis with this Marble the Dukes of *Florence* have ſince that Enrich'd their Chappels, and afterwards the Artificers made Tables and Cabinets of Inlaid Work, in which were repreſented Flowers, Fruits, Birds, and a Thouſand other Things: Nay, they have made ſome Pieces that look like Painting itſelf; and to encreaſe the Beauty and Worth of them, have us'd *Agats* and the moſt Precious Stones. Some Pieces of this ſort are in the *French* King's Apartments, and New ones are daily made.

The Ancients alſo work'd after the ſame manner, for as *Vaſart* tells us, there was formerly in St. *Peter*'s *Portico* a very Antique Table of *Porphiry*, in which were fixt other Stones that repreſented a Cage; and *Pliny* ſpeaks of a Bird made of different Marble, and ſo well done in the Place he deſcribes, that the Bird ſeem'd to drink out of a Baſon that was near it.

The manner of doing this Work is thus: The Workman ſaws a piece of *Agat* or other Precious Stone he wou'd make uſe of into Leafs; 'tis fix'd ſtrongly to a Stand, and with an Iron Saw without Teeth, the Stone is cut, by pouring on it *Emeril* temper'd with Water, according as the Work goes on. There are two Iron Pegs on the ſides of the Stone, againſt which the Saw reſts, and which guides it in its ſawing. When theſe Leafs are cut off, If the Workman wou'd give them any Figure to make uſe of them in any Work, he faſtens them in a wooden *Eſtal*, and with a little Saw made only of Wyre, he cuts them by little and little, according to the Out-lines of the *Deſign* he wou'd form with them, wetting 'em with Water and *Emeril*.

The Tools he makes uſe of beſides, are *Wheels* and *Drills*, Tin *Platines*, and others us'd by the Lapidaries, or Gravers in Stone, as well to make Figures, as to Pierce and Poliſh them. He takes his Meaſure with a Compaſs, thins the Edges of the Stone with Pincers, and has Braſs Hand-Files without Teeth, and other Files of all ſorts, neceſſary for his Work.

Of Rocaille *Pieces.*

Moſaick Work brought in the uſe of *Rocaille* and Shells for *Grottoes*, which are embelliſh'd with different Figures: 'Tis a Modern Invention, and it muſt be own'd there is nothing in this Kind Finer, either for the Beauty, the diſpoſition of the Place, and Ornaments, or the choice of every part of the Compoſition, than the *Grotto* at *Verſailles*.

The Artificer makes uſe of Graiſſeries and Mill-Stones for the inſide of *Grottoes*; their Unevenneſs makes them more proper for this uſe than any other Stone, and they may be made of different Colours, either by burning them in the Fire, which turns 'em Red, or turning 'em Green with *Verdigreaſe*, *Aqua Fortis*, or very ſtrong Vinegar.

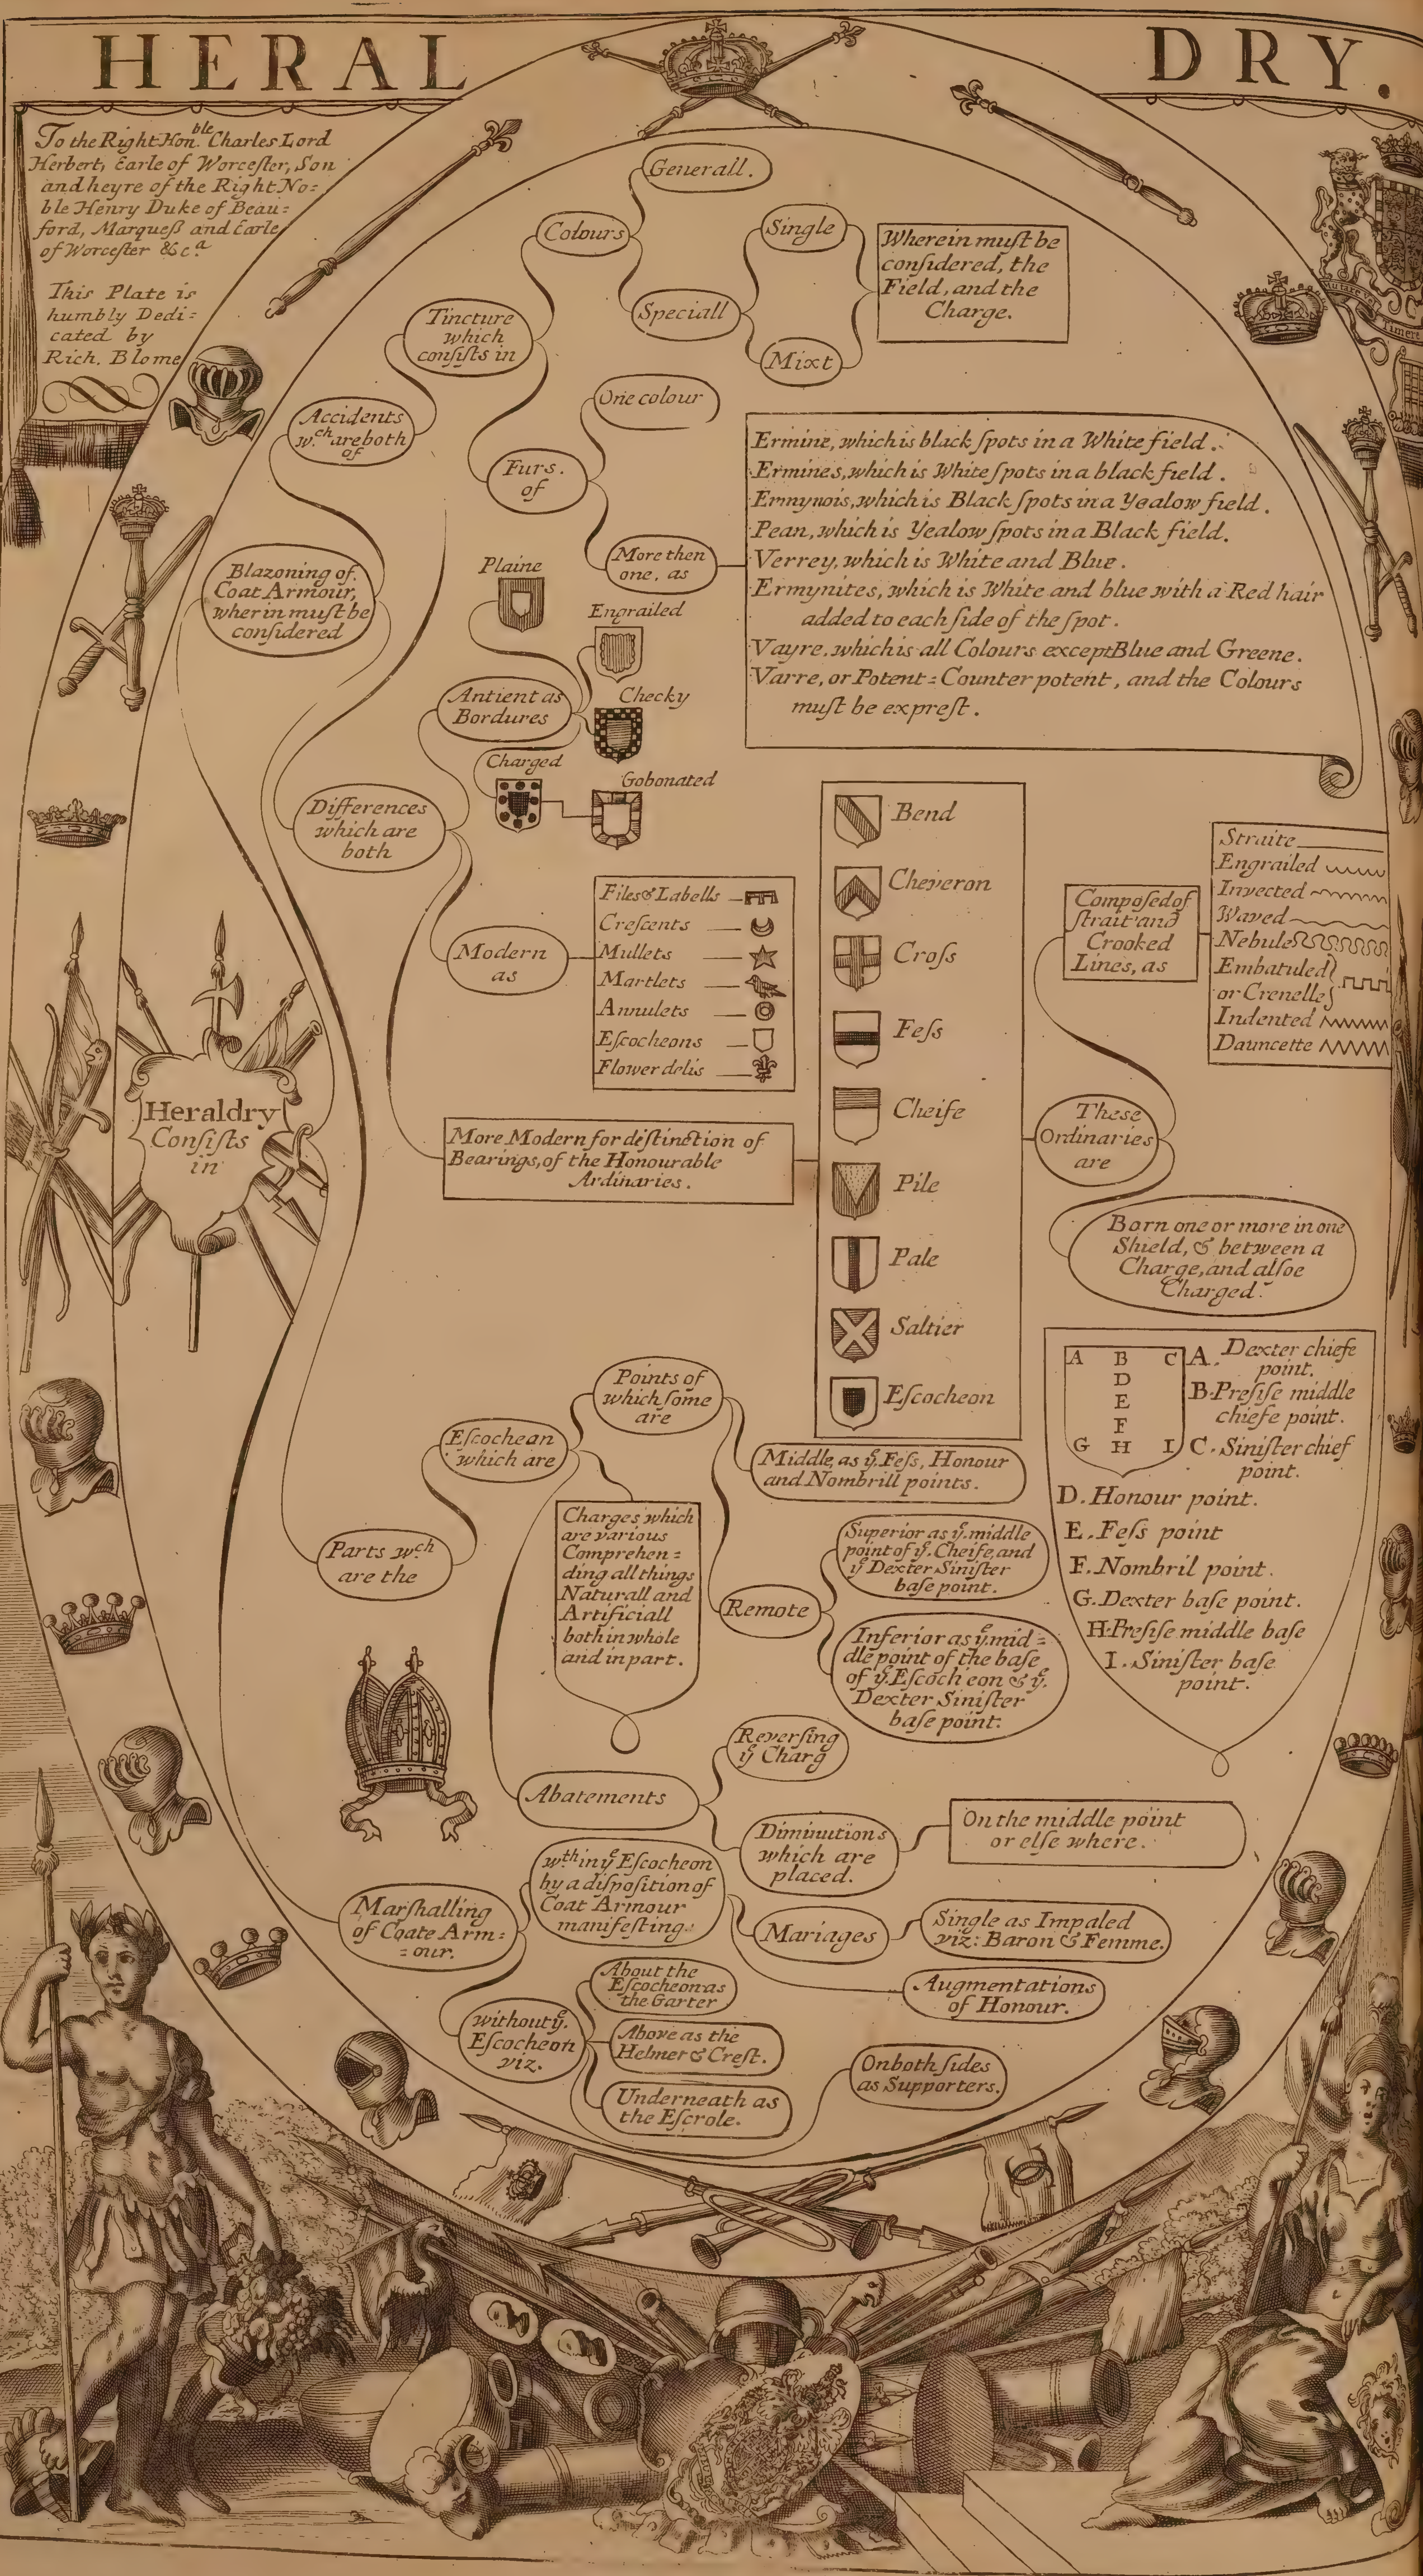
They alſo uſe Congelations, Marcaſſites, Cryſtal, Amethiſts, Petrifications, Red, White, and Black Coral, *Indian* Croiſſanſes, of which, ſome ſhap'd like a Cock's Comb, have a very good Effect. They alſo make uſe of Droſs of Iron, Amells, that come out of Glaſs-works and Forges, call'd *Forge-Blew*, but eſpecially *Naker*, and all Sea and River Shells of different Names; ſome are in *France* call'd St. *Michel-Shells*, others St. *James*'s, large and flat: Thoſe that are ſpeckel'd like a Tyger's Skin are term'd *Purcilains*. There are little ones call'd *Black-Peaſe*, becauſe they are no bigger than Peaſe, and when open'd like *Naker*, and look like Pearl. There are Yellow ones of the ſame Nature, tem'd *Yellow Peaſe*. Beſides theſe, there are Sea and River *Moulds*, little white *Moulds*, admirable for *Relievo*'s. The *Vignols* glitter like *Naker*. The *Bretons* are white uneven Shells. *Golfriches* glitter alſo like *Naker*. when they are quite Open. *Petoneles* are little greeniſh flat Cockles. There are alſo great Naker Shells of *Indian* Pearl, which go by ſeveral Names, and are us'd in this ſort of Work, as may be ſeen in *Thetis*'s Grotto.

Of INLAYING.

There's another ſort of *Moſaick* Work, which conſiſts of ſeveral Pieces of Wood; this is call'd Inlaying, The *Italians* call it *Tauſia* and *Tarſia*. The Ancients had various ways of doing it, and with it Beautify'd their Tables, their Beds, and other Moveables, making uſe of *Ivory* and the ſcarceſt Wood.

Plin. lib. 16. *c.* 43.

When the *Romans* began to Enrich themſelves with the Spoils of their Conqueſts in *Aſia*. They brought from thence the fineſt Movables they cou'd find, and learn'd of thoſe *Eaſtern* People the way of making theſe ſorts of Work. However, 'tis to be doubted, whether they arriv'd at ſuch Perfection in this Art as has appear'd ſince *Raphael*'s Time, and as is at preſent practis'd. *Philippo Bruneleſco* and *Benedetto de Maia*, began to ſhew ſomething admirable in it; yet their Works were only in *White* and *Black*. Friar *John* of *Verona*, who work'd in the *Vatican* contemporary with *Raphael*, render'd this Art much more Perfect, for he found out the Secret of making the Wood of all ſorts of Colours, by boyling Tints, and Oil which Penetrated it. Thus he got Wood of different Colours to imitate Painting, and began to repreſent Buildings and Perſpectives. Thoſe who came after him, us'd the ſame Means, and ſought after others to ſurpaſs him. Some to get a blackiſh Colour proper to imitate Shadows, found out the way of burning Wood, without waſting it, either by putting in hot Sand ſet over the Fire, or with Lime-Water ſublimated. Others made uſe of Oil of *Sulphur*. The moſt Curious collected all ſorts of Natural Wood, of which they found ſeveral of different Colors, and very lively and beautiful ones; not only ſome brought from the *Indies*, but alſo growing in *Europe*, whoſe Roots are very uſeful in this Art, which requires Artificers rather Patient than Learned, becauſe it takes up a great deal of Time, and they work after other Mens *Deſigns*. Thoſe however who underſtand



HERALDRY.

To the Right Hon.ble Charles Lord Herbert, Earle of Worceſter, Son and heyre of the Right Noble Henry Duke of Beauford, Marqueſs and Earle of Worceſter &c.a

This Plate is humbly Dedicated by Rich. Blome

Heraldry Conſiſts in

- Blazoning of Coat Armour, wher in muſt be conſidered
  - Accidents wch are both of
    - Tincture which conſiſts in
      - Colours
        - Generall.
        - Speciall
          - Single
          - Mixt
          - Wherein muſt be conſidered, the Field, and the Charge.
    - Furs. of
      - One colour
      - More then one, as
        - Ermine, which is black ſpots in a White field.
        - Ermines, which is White ſpots in a black field.
        - Ermynois, which is Black ſpots in a Yealow field.
        - Pean, which is Yealow ſpots in a Black field.
        - Verrey, which is White and Blue.
        - Ermynites, which is White and blue with a Red hair added to each ſide of the ſpot.
        - Vayre, which is all Colours except Blue and Greene.
        - Varre, or Potent = Counter potent, and the Colours muſt be expreſt.
  - Differences which are both
    - Antient as Bordures
      - Plaine
      - Engrailed
      - Checky
      - Charged
      - Gobonated
    - Modern as
      - Files & Labells
      - Creſcents
      - Mullets
      - Martlets
      - Annulets
      - Eſcocheons
      - Flower de lis
    - More Modern for deſtinction of Bearings, of the Honourable Ardinaries.

To the R^t: Worſhipfull S^r:
Iuſtinam Iſham of Lamport
in Northamptonſhire Baronet.
This Plate is Humbly D.D. by Ric: Blome

Deſign beſt, and have a little Skill in Painting, will ſucceed beſt in it. The firſt thing to be done, is to cleave and ſaw the Wood into Leaves about the ſixth part of an Inch thick; then the *Deſigns* are paſted upon thoſe Leaves, and with a little Iron or Steel Saw made very ſtrait, thin, and to turn eaſily as the Workman wou'd have it, he cuts the Wood according to the *Profils* of his *Deſigns.* He ſaws only three or four of thoſe Leaves at a time, and to forward his Work, joyns them together: Sometimes he makes uſe of but two at once, becauſe in ſome Pieces, the empty Spaces of one of thoſe Leaves, are fill'd only with Pieces of the other; as when he is to make *Mareſques* of two ſorts of Wood.

When all theſe Pieces are ſaw'd off, he Shadows them, by putting 'em into hot Sand, or otherwiſe, uſing his Diſcretion in Shadowing them more or leſs, as is neceſſary. After this, he puts 'em each in his Place on a Ground of other Wood, and Glews 'em together with good ſtrong *Engliſh* Glew. The Grounds are generally of very dry Fir or Oak, that they may not Warp: He alſo takes care that his Pieces be not too Long. Good Workmen make their Ground of ſeveral Pieces, being leſs apt to Jet out than when 'tis of one long Piece: But Heads, and the like Wood, not apt to Warp, are beſt for this purpoſe, when they repreſent any Natural Figures, either Humane or Animal, Flowers, Prints, or any thing elſe, by Inlaying of ſeveral Pieces of Wood of different Colours. They call it *Painting in Wood*; and thoſe that do it, pretend their Pieces are ſo many Pictures, ſetting themſelves up for *Painters* and *Sculptors* in *Moſaick*, with this difference, that they call ſuch as perform only in *Black* and *White*, Eboniſts and Inlayers.

Theſe *Moſaick Painters* draw the Deſign of their Picture on Paper, and ſometimes waſh and Colour it. On this *Deſign* they place the greateſt pieces of Wood, with which they form the principal Parts o their Figures. As to little Ornamental Parts, or others more fine and delicate, they Deſign them on the greater Pieces, by taking off the Wood, and filling up the void Space with whatever they would have there. This Work requires a Patient Workman, and one who is acquainted with *Deſign* and *Colouring*. *John Mace* of *Blois* in *France*, who was employ'd by the King, did the beſt in this Way of any of his Country-Men or Contemporaries.

Beſides the common Tools us'd by Joyners, the *Inlayers* have ſome particular to themſelves, as a *Preſs* to ſaw their Wood into Leaves, as when the Pieces are very long; there's a *Hole* in the Board to put them in and lift them up, according as they are ſaw'd off. The Artificers have all ſorts of Saws fit for their purpoſe. When they are ſaw'd off of the thickneſs before mention'd, they are Plain'd, that they may take the Colour better.

Thus we have given the Reader in our Tongue, what Monſieur *Felibien* has written on *Architecture*, *Sculpture*, *Painting*, &c. in which we have been often forc'd to make uſe of *French* Terms, there being in many Caſes, none that anſwer directly to 'em in *Engliſh*: And not pretending to be our ſelves Maſters of theſe *Sciences*, we cou'd not ſupply 'em with others, at leaſt not without many Words or Explanations. There's no Author who has ſo good a Character for underſtanding the *Arts* we have juſt mention'd, at leaſt who has written better on them. Gentlemen will be Pleas'd to find an Idea of Things ſo Artificial, compriz'd in ſo little Room; and 'tis hop'd they will make us ſome Atonement for the Difficulties of ſo General an Undertaking, eſpecially ſince we have taken all poſſible care not to ſtand in need of it often.

HERALDRY.

ARMS, according to their Original uſe, are Tokens, or Reſemblances ſignifying ſome Act or Quality of the *Bearer*, either Military or Civil, and of ſundry Forms of Bearing, for the adorning their *Shields*, *Banners*, *Coaches*, *Houſes* and the like. And there is (as it were) a kind of *Sympathy* between the *Arms* and their *Bearers*, inſomuch that he that Diſhonourably uſeth the *Arms* of any Man, ſeemeth to offer an Affront to the Perſon of the *Bearer*.

The Skill of *Armory* conſiſts in *Blazoning* and *Marſhalling*. By *Marſhalling* is underſtood the joyning of divers *Arms* in one *Shield*: By *Blazoning* is meant the *Diſplaying*; or expreſſing a *Coat* of *Arms* in its proper *Colours* and *Metals*; for to lay *Colour* upon *Colour*, and *Metal* upon *Metal*, is a great fault, and a different Form of *Blazon* makes the *Arms* not the ſame; And you muſt avoid Repetition of Words, a Conciſe way being the beſt.

In *Blazoning*, firſt begin with the *Field*, and then proceed to the *Charge*; and if there be ſundry things charged in the *Field*, whether of one, or of divers kinds, you muſt name that firſt which is moſt Predominate.

The *Blazon* of *Arms* conſiſts in their *Accidents* and *Parts*, and ſuch Accidents are *Tincture* and *Differences*.

Tincture (as *Guillim* noteth) is a variable Hew of *Arms*, and is as well common to Differences of *Arms*, as to *Arms* themſelves, and the ſame is Diſtributed into *Colours* and *Furs*.

Colour is an External Dye, wherewith any thing is Coloured, or Stained; or elſe is the Gloſs of any Body beautified with Light; and *Colour* here mentioned, is both General and Special; by General, is underſtood the Proper and Natural *Colour* of each particular Thing, whether Natural or Artificial, of what kind ſoever they are, Illuſtrated in their External and proper Beauty.

Things Born in their Natural *Colours*, are to be *Blazoned* proper, and not to mention the *Colour*.

Other things there are in *Armory*, that have only Name attributed to them, and no *Colour* Specified in the *Blazon* thereof, the Name being ſufficient to expreſs the ſame, although the Form is all one and the ſame; and that is, the Reſemblance of a *Ball* or *Bullet*, the Names of which, as alſo the *Colours* appropriated unto them, are as followeth. 1. *Beſants* whoſe *Co-*

lour is *Or*. 2. *Plates* are Argent. 3. *Harts* are Azure. 4. *Pellets* or *Ogreſſes* are Sable. 5. *Torteauxes* are Gules. 6. *Pomeis* are Vert. 7. *Goſpes* are Purpure. 8. *Orenges* are Tenne, and 9 *Guzes* are Sanguine; and in theſe 9 are all the *Colours* uſually made uſe of in *Blazonry*.

Arms are *Blazoned* by *Metals* and *Colour*, by *Precious Stones*, and by *Planets*. By *Metals* and *Colours* when belonging to *Gentlemen*, under the Degree of *Nobiles Minores*, as *Baronets*, *Knights*, *Eſquires*, and *Gentlemen*; By *Precious Stones*, when to thoſe of *Nobiles Majores*, as *Dukes*, *Marqueſſes*, *Earls*, *Viſcounts* and *Barons*; and by *Planets* when to *Emperors*, *Kings*, and *Soveraign Princes*.

Metals and Colours.	Precious Stones.	Planets.
Or.	*Topaz.*	*Sol.*
Argent.	*Pearl.*	*Luna.*
Gules.	*Ruby.*	*Mars.*
Azure.	*Saphir.*	*Jupiter.*
Sable.	*Diamond.*	*Saturn.*
Vert.	*Emerald.*	*Venus.*
Purpure.	*Amethiſt.*	*Mercury.*
Tenne.	*Jacynthe.*	*Dragons Head.*
Sanguin.	*Sardonix.*	*Dragons Tail.*

Theſe *Colours* are diſtinguiſhed from each other, by ſeveral *Hatches* or *Marks* in Graving, as are Repreſented in the Plate of *Arms*, for Examples of *Bearings* Number 1 ſignifying *Or*, Number 2 *Argent*, 3 *Gules*, 4 *Azure*, 5 *Sable*, 6 *Vert*, and for the three laſt *Purpure*, *Tenne*, and *Sanguin* being ſeldom uſed, are expreſt by Stroaks overthwart the *Shield*, as in Number 7.

From *Metals* and *Colours*, I ſhall proceed to *Furs*, uſed as well in *Doublings* of the *Mantles* appertaining to *Coat-Armour*, as in the *Coat-Armour* themſelves.

Furs conſiſt of one *Colour* alone, or of more than one.

- *Furs* that are Compounded of two *Colours* only, are ſorted either
  - with *Black*, and are either
    - *Black* mixt with *White*, as *Ermine.* and *Ermines.*
    - Or
    - *Black* mixt with *Yellow*, as *Ermeneis.* and *Pean.*
  - Or
  - without *Black*, ſuch are according to *Leigh*
    - *Vairy*, *Argent* and *Azare*, and *Verry*, *Or* and *Gules*, or the like *Colour.*

For your better Explanation, *Ermine* is when the *Field* is *Argent*, and the *Powdring* is *Sable*, as Number 8. *Ermines*, when the *Field* is *Sable* and the *Powdring* is *Argent*, as Number 9. *Ermenois* when the *Field* is *Or*, and the *Powdring Sable*, as Number 10, and *Pean* is wheu the *Field* is *Sable*, and the *Powdring Or*, as Number 11. *Vaire* is repreſented by Numb. 12; and for *Vairy Copy*, or *Potent-Counter-Potent*, which is another ſort of *Fur*, where the *Colours* muſt be expreſt in the *Blazoning*, as in Number 13.

BORDURS.

Bordurs were firſt deviſed for diſtinction of *Coat-Armour* of particular Perſons of one and the ſame Family each from other amongſt themſelves; and of theſe there are ſeveral ſorts, as born *Plain*, *Engrailed*, *Invected*, *Indented*, *Checky*, *Gobonated*, *Vaire*, *Counter-Compony*, and alſo *Charged*; Examples of ſome of which are taken notice of in the *Table*, which may ſerve as Examples for any other.

More *Modern Differences*, and now uſed in *Coat-Armour*, are *Labels*, *Creſcents*, *Mullets*, *Martlets*, *Annulets*, and *Flower-de-Lis*. Examples of which are ſet down in the *Table*, under the Head of *Modern Differences*, by which every Houſe ought to be diſtinguiſhed from the Elder; the ſecond Brother, or Houſe, bearing the *Creſcent*, the third the *Mullet*, the fourth the *Martlet*, the fifth the *Annulet*, and the ſixth the *Flower-de-Lis*. The *Label* being the diſtinction of the Elder Brother, during the Life of his Father. But as to *Daughters*, they bear their *Fathers Coat Armour* without any diſtinction.

Parts of Arms.

The *Parts* of *Arms* are the *Eſcocheon*, and the *Ornaments* without it.

The *Accidents* in the *Eſcocheon* are *Points* and *Abatements*. *Points* are certain Places in the *Eſcocheon* diverſly named, according to their ſeveral Poſition, whereof ſome are in the *Middle*, and ſome *Remote*; thoſe in the *Middle*, are in, or near the *Center* of the *Eſcocheon*, and ſuch are the *Honour*, the *Feſs*, and the *Nombril Points*.

The *Feſs Point* is in the exact *Center* of the *Eſcocheon*; the *Honour Point* is next above the ſame in a direct *Line*; and the *Nombril Point* is next underneath the *Feſs Point*.

Remote Points are thoſe placed at a further diſtance from the *Center* of the *Eſcocheon*; and of theſe ſome are *Superiour*, and ſome *Inferiour*. The *Superiour* are thoſe that have their being in the Upper part of the *Eſcocheon*, and of theſe there are *Middle*, and *Extreams*; the *Middle* is the preciſe *Middle* of the *Chief* between the two *Extreams*: The two *Superiour Extream Points* do poſſeſs the *Corners* of the chief part of the *Eſcocheon*, and are called *Dexter*, and *Siniſter*.

The *Inferiour Points* do poſſeſs the *Baſe* of the *Eſcocheon*; and of theſe there are alſo both *Middle*, and *Remote*. For the Explanation of all which there is an *Eſcocheon* in the *Table* with *Letters* ſhewing the ſame. And the knowledge of theſe *Points* are of great uſe and concernment, and ought to be well obſerved.

ABATEMENTS.

An *ABATEMENT* is an Accidental Mark annexed to *Coat-Armour*, ſhewing ſome diſhonourable Quality in the *Bearer*, whereby the Dignity of the *Coat* is abated.

They conſiſt of *Diminution*, and *Reverſing*.

Diminution is the blemiſhing of ſome particular Point of the *Eſcocheon* by ſome *Staynard Colour*, as *Tenne*, *Sanguine*, or *Purpure*; or by reverſing the *Charge* in the *Coat*. But not knowing any that bear any *Abatements* in their *Arms*, it will be to little purpoſe to tell what they are.

REWARDS of HONOUR.

There are ſeveral Forms of *Charges*, on which *Rewards* and *Additions* of *Honour* are oft-times placed in *Coats*, as *Cantons*, *Quarters*, *Eſcocheons*, *Girons*, *Flaſques*, and *Voiders*; but thoſe in moſt uſe are the three firſt, according to Num. 14, 15, 16, as *Sable* a *Canton Or*; *Argent*, a *Quarter Azure*; and *Or*, an *Eſcocheon Gules*.

Eſcocheons, and the Honourable Ordinaries.

Eſcocheons are either of one *Tincture*, or more than one: Thoſe of more than one, ſome are more predominate, and that is ſaid to predominate, when ſome one *Metal*, *Colour*, or *Fur*, is ſpread, or underſtood to be ſpread all over the Surface of the *Eſcocheon*, which is termed the *Field* or *Shield*. And in ſuch *Eſcocheons* as have in them more *Tinctures* than one (as moſt have) the *Field* and *Charge* muſt be obſerv'd: And in your *Blazoning* firſt name the *Field*, and then proceed to the *Charge* thereon; and if there be ſeveral *Charges*, then name that firſt which is moſt predominate and neareſt the *Field*.

The *Charge* is that which poſſeſſeth the *Field*, whether it be *Senſitive*, or *Vegetable*; *Natural*, or *Artificial*; and is plac'd either throughout all the *Superfices* of the *Eſcocheon*, or elſe in ſome ſpecial part of the ſame.

The common *Accidents* of *Charges*, are *Adumbration*, or *Tranſparency*, or they are *Tranſmutation*, or *Counter-changing*.

All *Charges* of *Arms*, are either Proper, or Common; and in theſe the making and manner of *Bearing* muſt be conſider'd.

The making of the *Ordinaries* conſiſts of *Lines* diverſly compos'd, which is the Matter whereof they are form'd; and according to the divers tracts and forms of *Lines*, they receive their Shape and variation of Names; and the property of theſe *Lines* are their *Rightneſs*, or *Crookedneſs*, which are ſet down in the *Table*, being *Strait*, *Engrail'd*, *Invected*, *Waved*, *Nebule*, *Embatuled*, or *Crenelle*, *Indented*, and *Dauncette*.

The *Honourable Ordinaries*, are the *Bend*, *Cheveron*, *Croſs*, *Feſs*, *Chief*, *Pale*, *Pike*, *Saltier*, and *Eſcocheon*; and were Modernly invented for the Diſtinction of *Coat-Armour*: You will find their Forms or Shapes, ſet down in the *Plate* of *Arms*.

Theſe *Ordinaries* are born ſometimes of themſelves in plain *Fields*; ſometimes between a *Charge*; ſometimes *Charged*; ſometimes two or more of them joyn'd together in one *Shield* with a *Charge*, and ſometimes *Counter-changed*: Examples of all which are at large ſet down in a Volume of *Heraldry* Publiſhed by me.

The *BEND* doth contain the Fifth part of the *Field* in breadth, if Uncharg'd, but if Charg'd, then the third. It is ſaid to repreſent a *Ladder* ſet ſlope, to ſcale the Walls of a City. This *Ordinary* is divided into a *Bendlet*, which is limited to the Sixth part of the *Shield*, into a *Garter*, which is the *Moity* of a *Bend*, into a *Coſt*, which is the fourth part of a *Bend*; and into a *Ribbon*, which is the *Moity* of a *Coſt*. In the *Plate* of *Arms*, number 17, repreſents a *Bend*, which is Charged with *Pellets*. Number 18 a *Bendlet*. Number 19, a *Garter*. Number 20, a *Coſt*. And Number 21, a *Ribbon*.

There is alſo a *Bend Siniſter*, which goeth thwart the *Eſcocheon* from the *Siniſter Chief*, to the *Dexter Baſe*, which is quite contrary to the other *Bend*: And this *Bend* is ſubdivided into a *Scrape*, which is the *Moity* of the *Bend*, and into a *Batune*, which is the Fourth Part of the *Bend*; and this is the uſual Badge of Illegitimacy. The *Eſcocheon*, Number 22, ſheweth the *Bend Siniſter*. Number 23, the *Scrape*. And Number 24, the *Batune*. Which muſt not extend to the extreme Points of the *Eſcocheon*, but only to be as a *Bar* over the *Charge*.

Two *Bends* are alſo Born; alſo *Bendy* of 6 or 8, and a *Bend* between two *Cottizes*, according to the Examples, Number 25, 26, and 27.

The *CHEVERON* Repreſents the *Rafters* of a Houſe, and was anciently the Head-Attire of *Women-Prieſts*. It takes up the Fifth part of a *Shield*, and is ſub-divided into the *Cheveronel*, which is half the *Cheveron*; and into a *Couple-cloſe*, which is the Moity of the *Cheveronel*; and this is not Born, but by Pairs, except there be a *Cheveron* between them.

The *Cheveron* is ſundry ways uſed in *Bearings*, as well as the *Bend*, and other of the *Honourable Ordinaries*; Examples of which are in the *Table* of *Arms*, which are thus *Blazoned*; Number 28, *Gules* on a *Cheveron Argent*, three *Mullets Sable*. 29. *Ermin*, a *Cheveron Couped Sable*. 30. *Azure*, a *Cheveron* in *Chief Argent*. 31. *Sable*, a *Cheveron Rompe Argent*. 32. *Vert*, a *Cheveron Engrailed* voided *Argent*. 33. *Gules*, three *Cheveronels*, reverſed *Argent*. 34. *Or*, three *Cheveronels* braced in the Baſe of the *Eſcocheon Sable*. 35. *Vert*, a *Cheveronel Argent*. 36. *Or*, two *Cheverons Gules*, and commonly 3 *Cheverons*, are born in one Shield, and compoſed of ſtrait, or crooked *Lines*.

The *CROSS* taketh up the 5th Part of the *Eſcocheon*, but if charged, then the third: There are divers ſorts of *Croſſes*, but thoſe moſt uſually Born among us, are ſet down in the *Plate* of *Arms*, and are thus Blazoned, Number 37 *Argent*, a *Croſs Pierced Gules*. 38. *Or*, a *Croſs Couped Sable*. 39. *Azure*, a *Croſs Potence Argent*. 40. *Vert*, a *Croſs Pattee Fitchee Or*. 41. *Or*, a *Croſs Molin Sable*. 42. *Gules*, a *Croſs Betony Argent*. 43. *Axure*, a *Croſs Croſlet Argent*. *Croſs Croſlets* are Born more than one in a *Shield*, and likewiſe as well on, as between any of the *Ordinaries*. 44. *Or*, a *Croſs Flory Sable*. 45. *Argent*, a *Croſs Voyded Sable*. 46. *Argent*, *Croſs Wavey Voyded Sable* between 4 *Torteauxes*. 47. *Ermin*, a *Croſs Ragule Gules*.

Note, that any of the *Croſſes* may be Born *Fitchee*, as alſo *Pierced*, or *Quarter Pierced*; alſo between or upon any of the *Ordinaries*.

The *FESS* containeth the Third part of the *Eſcocheon* in breadth, and doth Occupy the *Center* of the *Shield*. This hath formerly been taken for the *Belt*, or *Girdle* of Honour, as dividing the *Shield* into two equal Parts.

The *BAR* differeth not from the *Feſs*, but only that it contains the Fifth part of the *Shield*, whereas the *Feſs* doth poſſeſs but the Third. It is divided into the *Cloſet*, which contains the *Moity* of the *Bar*, and into the *Barulet*, which is half the *Cloſet*. The *Bar* is generally Born two in one *Shield*.

The Examples of the *Feſs* and *Bar* in the *Plate* of *Arms*, are Number 48 *Azure*, a *Feſs Wavey* between 3 *Flower-de-Lis Argent*. 49. *Argent* a *Feſs Humid Sable*. 50. *Argent*, a *Feſs per Feſs*, indented *Gules* and *Sable*, between two *Cottizes Counterchanged*. 51. *Per Feſs Sable*, and *Argent* a *Feſs Batile*, *Counter-Batled*, *Counter-changed*. 52. *Per Feſs Or*, and *Sable*, a *Feſs Nebule Gules*. 53. *Azure* 4 *Fuſils* in *Feſs Argent*. 54. *Gules*, two *Bars Or*. 55. *Barry* of ſix *Or* and *Gules*. 56. *Ermin* a *Cloſet Vert*. 57. *Sable*, a *Barulet Argent*.

The *CHIEF* doth contain the Third part of the *Eſcocheon* in depth. It is divided into the *Fillet*, which contains the Fourth part of the *Chief*, and ſtandeth in the *Chief Point*. This *Ordinary* is alſo ſubject to a *Charge*, and is Born with ſtrait and crooked *Lines*: The Examples of which are Number 58 *Azure*, a *Chief Indented Or*. 59. *Ermine*, a *Chief* quarterly, *Or*, and *Gules*. 60. *Or*, a *Chief Checky Argent*, and *Azure*. 61. *Gules*, a *Chief Argent* ſurmounted by another, *Or*. 62. *Argent*, a *Chief Sable*, in the neather part a *Fillet Argent*. 63. *Azure* three *Bars Argent*, in *Chief* as many *Bezants*.

The *PALE* contains the third part of the *Field*; It is ſub-divided into the *Pallet*, which is the *Moity* of the *Pale*, and is never to be charged with any thing, neither muſt it be parted; and into an *Endorſe*, which is the Fourth part of the *Pale*, and is not uſed but when the *Pale* is between two of them.

If the *Pale* be upon any *Beaſt*, that is the *Beaſt* as it were behind it, then the Term of *Blazoning* it is, he is *Debruſed* with the *Pale*; but if the *Beaſt* be on the *Pale*, then he is ſupported by the *Pale*. The Examples for *Pales* in the *Plate* of *Arms*, are Number 64 *Or*, on a *Pale Azure* 3 *Bezants*. 65. *Argent*, a *Pale Gules*, between two *Endorſes Sable*. 66. *Vert*, a *Pallet Argent*. 67. *Party Per Pale Argent* and *Sable*, a *Pale Counter-changed*. 68. *Argent*, 3 *Pallets Wavy Azure* 69. *Paly* of ſix *Argent* and *Gules*.

The PILE, conſiſts of twofold *Lines*, formed like a *Wedge*, and was a *War-like Weapon*, uſed among the *Romans*. It is by ſome not allowed to be one of the *Ordinaries*. It is Born ſeveral ways, and more than one in a *Shield*, according to the Examples, Number 70 *Or*, on a *Pile Vert*, 3 *Garbs*, or *Wheat-Sheaves* of the *Field*. 71. *Ermin*, two *Piles Sable*. 72. *Argent*, 3 *Piles*, one iſſuing out of the *Chief*, between two others reverſed *Azure*. 73. *Gules*, a *Pile waved* iſſuing out of the *Dexter Corner Bendways Or*. 74. *Argent*, a *Triple Pile-flory* on the *Tops*, iſſuing out of the *Siniſter Baſe* in a *Bend Sable*.

The SALTIER, contains the fifth Part of the *Shield*; but if charged, then the third. This is ſaid to be about the height of a *Man*, and was uſed to Scale the Walls of a Town, being driven full of *Pins*, which ſerv'd for Steps.

It is born with ſtrait or crooked *Lines*, with a *Charge*, or *Charged*, *Counter-changed*, one *Saltier* ſurmounted by another; parted *per Saltier*, a *Saltier Counter-changed*, and *Quarterly quartered*, &c. according to the Examples in the Plate of *Arms*, Number 75, *Vert*, a *Saltier Engrailed Argent*. 76, parted *per Saltier Argent* and *Gules*, a *Saltier Counter-changed*. 77. *Azure* a *Saltier Quarterly quartered*, *Or* and *Argent*. 78. *Gules*, on a *Saltier Or*, another *Sable*. 79. *Gyrony* of four *Argent* and *Gules*, a *Saltier* between four *Mullets Counter-changed*.

An ESCOCHEON contains the fifth part of the *Shield*, and muſt be placed in the *Feſs Point*. This is alſo termed an *Eſcocheon* of *Pretence*, and is ſo Born by thoſe that Match with an *Heireſs*, giving therein her *Coat* of *Arms*.

About an *Eſcocheon* is uſually an *Orle* of ſomething, as *Martlets*, *Cinquefoils*, or the like, as in the Example 83. Sometimes it is born as an *Orle* itſelf, as Example 81. Sometimes an *Orle* of two pieces, that is, one within another, as Example 82. Sometimes three plain *Eſcocheons* without any *Charge* in them. Sometimes double, or ſingle *Treaſures* (a *Charge* much us'd in *Scotch Coats*) as Example 84.

PARTITIONS.

Partitions are ſuch in which there is no *Tincture*, that is, *Metal*, *Colour* or *Fur* predominating in them, and are formed of ſundry ſorts of Lines of Partition, occaſioning oft times *Counter-changing* and *Tranſmutation*; and theſe kind of *Bearings* are ſometimes born *Engrailed*, *Indented*, *Wavey*, *Invected*, *Embattuled*, *Nebule*, or the like; *Examples* of which are in the Plate of *Arms*, viz. 85 *per Pale Argent* and *Sable*. 86, *per Feſs Indented Or* and *Gules*. 87. *Quarterly Ermine* and *Vert*. 88. *per Bend Embattuled Argent* and *Gules*. 89. *per Cheveron Engroiled Gules* and *Argent*. 90. *per Pile*, *Or* and *Sable*. 91. *per Saltier*, *Gules* and *Ermine*. If the *Field* is divided into 6, 8, or more *Pieces*, then it is *Blazoned Gyrony* of 6, 8, or more *Pieces*, and name the *Colours*, as *Example* 92, *Gyrony* of 6 *Pieces*, *Or* and *Azure*. 93. *Gyrony* of 8 *Pieces Azure* and *Argent*.

COUNTER-CHANGES.

Counter-changes are commonly Born where the Field hath a *Charge*, which is always *Counter-changed* according to the *Examples*. 94. *per Pale*, *Argent* and *Gules*, a *Bend Counter-changed*. 95. *per pale*, *Or* and *Gules*, 3 *Rundles* Counter-changed. 96. *per Feſs Argent* and *Gules*, a *Bar* between 3 *Creſcents Counter-changed*. 97. *Paly Bendy Argent* and *Sable*. 98. *Checky*, *Argent* and *Azure*, a *Chief Gules*. 99. *Barry* of 6 parted *per Pale Indented Argent* and *Gules Counter-changed*.

There are ſundry Bearings of 2 or 3 *Ordinaries* in one *Shield*, as on a *Cheveron* 3 *Bars Gemele*. A *Pile* Surmounted on a *Cheveron* on a *Saltier Engrailed* an *Eſcocheon* charged with a *Croſs*. A *Feſs* between 2 *Cheverons*. Two *Bars* and a *Chief* indented. *Pale* of 6, a *Cheveron*, a *Saltier*, and *Chief* vary, *per Pale* a *Cheveron Counter-charged*. A *Cheveron* within a *Border Engrailed*. A *Croſs* and *Chief*, &c. *Examples* of which are in the *Plate* of *Arms*, from Number 100, to 109.

For the better Methodizing a Body of *Heraldry*, all ſort of Bearings may be comprehended under theſe Heads, viz. *Civil Artificial Things*, *Military Things*, *Celeſtials*, *Vegetables*, the *Parts* of *Man's Body*; *Animals*, as *Beaſts* and *Inſects*, *Fowl* and *Fiſh*.

CIVIL ARTIFICIAL THINGS are ſuch that are made by *Man*, and for his uſe; which may be reduc'd under ſeveral Heads, as they relate to the uſe of Civil Life, as the *Enſigns* of Dignity, both *Temporal* and *Eccleſiaſtical*; or of *Profeſſions* both *Liberal*, *Mathematical*, and *Mechanical*, as they relate to *Military Actions*, as well for *Land* as *Sea*: and ſuch are *Scepters*, *Crowns*, *Mounds*, *Caps* of *Maintenances*, *Mantles* of *Eſtate*, *Maces*, *Garters*, *Taſſels*, *Swords of Eſtate*, *Croſiers*, *Annulets*, *Billets*, *Wheels*, *Maunches*, *Purſes*, *Rural Inſtruments*, *as Plows*, *Harrows*, *Scythes*, &c. *Barrels* or *Tuns*, *Carpenters Tools*, as *Squares*, *Mallets*, &c. *Bells*, *Horns*, *Fiſh*, *Wheels*, and *Nets*, *Cards*, *Dice*, *Tables*, *Cups*, *Lozenges*, *Fuſils Maſcles*, and *Torteauxes*, with divers other *Artificial Things* uſed in *Armory*, too tedious to Name.

MILITARY THINGS, are ſuch, that are as well for Offence as Defence, as *Halberts*, *Spears*, *Swords*, *Daggers*, *Croſs-Bows*, *Launces*, *Bows*, *Arrows*, *Darts*, *Pheons*, *Clarions*, *Battering-Rams*, *Shackbolts*, *Scaling-Ladders*, *Beacons*, *Murthering Chain-Shot*, *Trumpets*, *Drums*, *Tents*, *Caſtles*, *Towers*, *Arches*, *Helmets*, *Morions*, *Saddles*, *Horſhoes*, *Gantlets*, *Armour*, *Water-bougets*, *Horſes*, *Chaplets*, *Anchors*, *Sails*, *Maſts*, *Ships*, *Gallies*, *Ruthers*, &c.

CELESTIALS are of ſundry ſorts, ſome are Natural and meerly formal, as *Angels* and *Spirits*, and others, both Formal and Material, as the *Sun*, *Moon* and *Stars*, and alſo ſuch Natures as are *Sublunar*, as all kind of *Minerals*, which have Life after a ſort, as *Angels*, *Cherubs*, the *Sun*, *Moon*, *Stars*, *Blazon-Stars*, *Meteors* and *Comets*, *Flames* of *Fire*, *Creſcents*, *Mullets*, *Clouds* and *Rays* of the *Sun*, *Jupiter's Thunder-bolt*, *Rainbows*, &c.

Note, that *Stars* are born of ſeveral *Rays*, as 6, 8, 14, and the like; alſo the *Sun* is born *Eclipſed*, likewiſe the *Moon Eclipſed* as alſo in her *Increſcent* and *Decreſcent*. *Mullets* are alſo born of 6 or 8 *Points*; bnt generally of 5, and then you need not expreſs the number of *Points*; likewiſe *Mullets* are Born pierced.

VEGETABLES do comprehend *Trees*, *Fruits*, *Flowers*, *Plants* and *Leaves*; as Trees growing with Fruit, *Stems* of *Trees* Radicated, *Limbs* of *Trees Raguled*, *Stocks* or *Stumps* of *Trees*, *Leaves* of ſundry ſorts of *Trees*; and that born diverſly, as *Slipped Pendant*, *Bendways*, *Barways*, *Saltier Wiſe*, &c. *Treefoyls*, *Quaterfoyls*, *Cinquefoyls*, which are alſo ſlipped; *Roſes*, *Flowers-de-Lis*, with other Flowers and Fruits, as *Pears*, *Plums*, *Pumgranets*, *Grapes*, *Sheaves* of *Corn*, *Wheat-Ears* and *Stalks*, &c.

The ſeveral Parts of Man's Body, as *Heads, Couped* and *Erazed* at the *Shoulders*, as well *Sarazens* and *Blackamores*, as others: Alſo *Arms, Legs*, and *Hands, Dexter* and *Siniſter*, both *Couped* and *Erazed*; likewiſe three *Arms* or *Legs* conjoyned and flexed in Triangle in the *Feſs Point*. *Hearts*, which are ſometimes born Wounded and Stuck with *Darts, Deaths-Heads, Shin-Bones*; *Drops*, as *Gutta-de-Sang, Gutte-de-Eau, Gutte-de-Poix, Gutte-de-Carmes*, &c.

ANIMALS are Born both whole, and that in ſeveral Poſtures, as alſo in Parts. Thoſe of Prey, as *Lyons, Tigers, Bears, Wolves*, &c. are in moſt Eſteem, and whole *Animals* more than parts thereof.

All *Quadruped Beaſts* are eſteem'd more worthy of Bearing than *Fowl* or *Fiſh*, in regard they contain in them more worthy and commendable Significations of Nobility, and the *Males* are always eſteemed the more worthy than *Females*; but it is otherwiſe with Fowl of Prey, the *Female Hawks* being the beſt. And all *Savage Beaſts* muſt be Armed

The *Lion* being the nobleſt Beaſt, I ſhall chiefly make uſe of him for expreſſing the *Blazon* of moſt Beaſts, as to the ſeveral Poſtures. They are Born *Rampant, Rampant Guardant, Regardant*, and *Coward*; ſometimes with two *Heads*, and ſometimes with two *Tails*: They are alſo born two together, as *Rampant Combatant*; that is, *Faces* together, and *Rampant Endorſed*, that is, *Back* to *Back*: They are alſo born *Paſſant*, and *Paſſant-Guardant*, and *Regardant*; alſo *Seiant, Couchant*, and *Dormant*. But inſtead of uſing the Term *Rampant*, to a *Buck* or *Unicorn*, ſay *Springing*; and to a *Fox, Saliant*. *Dogs* are generally born *Currant* or *Paſſant*.

As to the parts of *Beaſts*, whether *Lions* or other ſorts, their *Heads* are either *Erazed, Couped*, or *Caboſed*; and ſometimes the Face only of the *Lion* or *Leopard*, is born. The *Attires* or *Horns* of a *Buck* are uſed in Wearings; alſo the *Paws* and *Tails* of *Lions* and *Bears* are uſed both *Erazed* and *Couped*.

There are ſeveral *Monſtrous Animals*, ſuch as are exorbitant from the general courſe of Nature, either for Qualities, or Eſſence, that are Born in *Armory*; and ſuch are *Amphibious Beaſts*, as *Otters* and *Beavers*, that live both on the Land and in the Water. Alſo thoſe of a prodigious Shape, being formed or rather deformed with the confuſed Shapes of Creatures of different Kinds and Qualities; and ſuch are *Bats, Harpres, Wiverns, Cockatrices, Mermaids* and *Dragons*,

There are divers Creeping things that are born in *Coat-Armour*, as *Tortoiſes, Moles, Hedg-Hogs, Snails, Scorpions, Adders, Emmets, Graſs-hoppers, Spiders, Toads*, &c.

AREAL ANIMALS, as *Fowl* and *Birds*, are much uſed in *Heraldry*, which may be conſidered by their *Feet*, which are either whole and webby, as the Palm of a Man's Hand, as the *Swans, Geeſe, Ducks*, &c. or divided, as the *Eagles, Falcons, Ravens, Herns, Peacocks*, and other *Fowls*, and *Birds* of the *Air*.

All *Fowl* and *Birds* of what kind ſoever, muſt be Born in their Natural Actions of Going, Sitting, Standing, or Flying.

Cocerning the *Beaks* or *Bills*, as alſo the *Feet* of *Birds*, all thoſe that are either *Whole-footted*, or have their Feet divided, and yet have no *Tallons*, ſhould be termed *Membred*; but the *Cock*, and all Birds of *Prey* muſt be termed *Armed*. It is generally obſerv'd, that the *Females* of Birds of Prey, are the nobleſt and the moſt hardy; which Nature hath ſo ordered, for that ſhe takes care of her Young.

The Parts and Members of *Fowl* are uſually Born both *Couped* and *Erazed*.

The more fierce the Bird is the better it is eſteem'd in *Heraldry*; ſo that the *Eagle*, which is the Prince of the Air, hath the Preheminence of all others.

Fiſh are not of that Eſteem as *Beaſts* or *Fowl*, yet much us'd; and as Birds have their *Plumes, Wings*, and *Trains*, for cutting their Paſſage through the *Air*; ſo have Fiſh their *Fins*, by which they guide themſelves, cutting the Current of the Streams, their Courſe being directed by their *Tail*, which ſerveth as the Helm or Ruther of a Ship.

Fiſh are Born after a diverſe manner, *viz.* directly *Upright, Imbowed, Extended, Indorſed*, Reſpecting each other, Surmounting one another, *Fretted*, and *Triangled*, &c.

All *Fiſh* that are Born Feeding, muſt be Termed *Devouring*, expreſſing what they Feed upon. All *Fiſh* raiſed directly Upright, that have Fins, muſt be Blazoned *Hauriant*; and all born Tranſvers, muſt be Blazoned *Naiant*, or *Swimming*. *Fiſh* are likewiſe born in Part, as the *Claws* and the *Shells*:

All theſe ſundry ſorts of *Bearings* aforeſaid taken Notice of, are born in the *Fields* ſingle, or more than one: 3 or 6 are the uſual Number. They are alſo born between, and Charged upon the *Honourable Ordinaries*; Examples of all which are given in ſome Volumes of *Heraldry* publiſhed by me, Entituled, *Guillim's Diſplay of Heraldry*, in Folio. An *Eſſay to Heraldry*, in Octavo; and in a *Map of Heraldry*, Entituled *Heraldry Royal*, comprehending the Body of the ſaid Art, Illuſtrated with apt and proper *Figures*.

But I have given ſome Examples thereof in the ſaid Plate of *Arms* here inſerted, beginning at Number 100, which are thus Blazoned; *Gules* 3 *Katherine-Wheels* Or. 111, Sable, 10 *Billets*, 4, 3, 2, and 1, Argent. 112, Or, a *Maunch*, Gules. 113, Gules, 3 *Mallets* Or. 114, Azure, a Cheveron between 3 *Bells*, Or. 115, Gules, a *Fret* Argent. 116, Argent, *Fretty Sable*. 117, *Ermin*, on a Croſs-Quarter pierced Argent 4 *Ferdemolius* Sable. 118, Azure 3 *Lozenges* Argent. 119. Gules, a *Muſcle* Argent; 120, Argent on a Mount Proper, a *Tower triple Towered* Sable. 121, Azure, a *Cheveron* between 3 *Tents* Argent. 122, Gules, 3 *Clarions* Or. 123, Azure, 3 *Banners* diſplay'd in *Bend* Gules. 124, Ermine, a *Croſs-Bow* in pale *Bent* Gules. 125, Gules, 3 *Trumpets* Or. 126. Argent, a *Culverin Diſmounted* in *Feſs* Sable. 127, Argent 3 *Battering Rams* Barways Proper, headed Azure, Armed and Garniſhed Or. 128, Argent, 3 *Scaling-Ladders* in Bend Sable. 129, Ermin, 3 *Long-Bows* in *Pale* bent Gules. 130, Azure, 3 Arrows Argent. 131. Gules, 3 *Pheons* Argent. 132, Azure, 3 *Spears-Heads* Argent. 133, Gules, 3 Anchors Or. 134, Azure, 3 *Helmets* Argent. 135, Azure, 3 Left-handed *Gauntlets* Or. 136, Gules 3 *Water-bougets* Or. 137, Argent, a *Sword* erected in *Pale Sable*. 138, Azure, 3 *Swords* in *Pale*, two with their Points downwards, the middlemoſt upwards, Argent. 139, Gules, 3 *Swords Barways* their Points towards the ſiniſter Point of the *Eſcocheon* Argent, pomeled Or. 140, Azure, a *Sun* in his Glory. 141, Or, a *Sun Eclipſed*. 142, Gules, an *Increſcent* Or. 143, Azure, a *Moon* in her *Complement*, or *Glory*, Argent. 144, Azure, a *Moon Decreſcent* proper. 145, Argent, a *Moon* in her Detriment Proper. 146, Azure, 3 *Creſcents* Argent. 147, Argent, 3 *Stars* of 6 *Rays* Sable. 148, Or, 3 *Mullets pierced* Sable. 149. Argent, 3 *Oaken Leaves pendant* proper. 150, Or, 3 *Laurel Leaves ſlipped* proper. 151, Argent. 3 *Holly-Leaves Bendways* Azure. 152, Or, 3 *Fig-Leaves barways* proper. 153, Argent, 5 *Vine-Leaves* in *Saltier* proper. 154, Gules, a *Limb* of a *Tree Raguled* and *Trunked* in *Bend* Argent. 155, Azure 3 *Cinquefoils* Argent. 156, Gules, a *Garb*, or *Wheat-Sheaf*, Or. 157, Azure, a *Flower-de-Lis* Or. 158, Ermin, 3 *Roſes Gules*, *ſeeded* and *barbed* proper. 159, Argent, a *Man's Leg Erazed* at the *Thigh*, Sable. 160, Gules, 3 *Dexter-Arms conjoyned* at the *Shoulders*, and *flexed* in *Triangle*, Or. 161, Azure, 3 *Siniſter-Hands* couped at the *Wriſts*, Argent. 162, Argent, an *Arm Siniſter* iſſuing out of the *Dexter Point*, and extended toward the *Siniſter Baſe* in form of a *Bend*, Gules. 163, Or, a *Man's Leg* couped at the *Thigh*, Azure. 164, Gules, a *Sarazen's Head erazed* at the *Neck*, Argent, and environed about the *Temples* with a Wreath of the Second, and Sable. 165, Argent, on a *Cheveron* Gules 3 *Deaths Heads* of the Field. 166, Sable, a *Shin-bone* in *Pale*, ſurmounted of another in *Croſs*, Argent, 167, *Gutte*; Theſe *Drops* are of different Natures, according to the *Colour*, for they ſtill retain their Shape. If *Gules*, they are *Gutte de Sang*, that is, *Drops of Blood.* If *Azure*, *Gutte de Larmes*, which are *Tears.* If *Argent*, *Gutte de Eau*, which are *Drops of Water.* If *Sable*, *Gutte de Poix*, which are *Drops of Pitch*: And if *Yellow*, *Gutte d'Or*, or *Drops of Gold.* 168, Or, a *Lion Rampant* Gules Crowned, Argent. 169, Argent, a *Lion Rampant Gardant* Sable. 170, a *Lion Rampant* Regardant, Or. 171, Gules, a *Lion Saliant* Argent. 172, Argent, a *Lion Rampant Coward* purpure. 173, Or, a *Lion Rampant double Teſte*, Azure. 174, Azure, a *Lion Rampant double Queve*, Argent. 175, Or, 2 *Liocels Rampant Combatant*, Sable. 176, Gules, a *Lion Paſſant* Argent. 177, Azure, a *Lion Paſſant Gardant* Or. 178, Vert, a *Lion Seiant* Argent. 179, Or, a *Lion Couchant* Sable. 180, Gules, a *Lion dormant*, Or. 181, Vert, a *Grey-Hound* currant in *Bent*, Argent; *Collered, Gules.* 182, Vert, a *Buck tripping* Or. 183, Argent, a *Lion's Head erazed* Gules. 184, Gules, a *Horſe's-Head Couped* Argent. 185, Azure, a *Buck's-Head Caboſed* Or. 168, Vert, a *Cheveron* between 3 *Leopards Faces* Or. 187, Gules 3 *Lions Paws erazed* Argent. 188, Sable, 3 *Bears Paws couped* and *erect*, Argent. 189, Azure, an *Eagle diſplayed* Argent. 190, Argent, an *Eagle diſplayed* with two *Heads* Sable. 191, Argent, a *Raven* proper. 192, Azure, 3 *Cocks* Argent; *Armed*, *Creſted*, and *Vellopped* Or. 193, Or, 3 *Martlets Sable.* 194, Azure, a *Harpre* Or. 195, Azure, 3 *Burſtarts riſing* Argent. 196, Gules, 3 *Bees volant en Arriere* Argent. 197, Or, 3 *Eagles Heads erazed* Sable. 198, Sable 3 *Eagles Legs erazed a la Quiſe Argent.* 199, Or, 2 *Eagles Legs Barways erazed a la Quiſe* Sable; *Armed Gules.* 200, Vert, a *Tortoiſe paſſant Argent.* 201, Azure, a *Tortoiſe erected* Argent. 202, Sable, 3 *Houſe-Snails* Argent. 203, Azure, 3 *Dolphins Naiant* Argent. 204, Vert, a *Dolphin Naiant Imbowed* Argent. 205, Gules, 3 *Salmons Hauriant* Or. 206, Azure, 2 *Barbels Hauriant Regarding* each other, Argent. 207, Gules, 2 *Pikes Hauriant Endorſed* Or. 208, Sable, 3 *Scallop-Shells* Argent.

Marſhalling and Impailing of Coats in one Shield.

By *Marſhalling* of *Coats*, is to be underſtood, an orderly diſpoſing of ſundry *Coat-Armours* pertaining to diſtinct *Families*, and ſome have their place within the *Eſcocheon*, and ſome without: Of thoſe within, ſome have their Occaſions obſcure, and others manifeſt, as are thoſe whoſe Marſhalling (according to ancient form) do betoken *Marriage*, or ſome Gift of the *Sovereign*: Such as do betoken *Marriage*, repreſents either a Match Single, or Hereditary: By a ſingle Match is meant the *Conjoyning* or *Impaleing* the *Coat-Armour* of the Man with that of the Woman; but if ſhe be an Heireſs, then her *Coat* is to be born in an *Eſcocheon* of *Pretence* in the midſt of his Shield. It is alſo accuſtomary for *Biſhops* to *Impale* on the *Dexter-ſide* of the Shield, the Arms belonging to their Biſhoprick; and if a Man hath had more than one Wife, the way of Bearing them is to *Impale* them betwixt his own Coat, which is to be in the middle part of the Shield.

External Ornaments.

External Ornaments are *Helmets*, *Torces*, *Caps Crowns*, *Creſts*, *Mantlings*, *Eſcroles*, and *Supporters* to *Noble-Men.*

The *Helmet* is placed next above the *Eſcocheon*, or *Shield*, to all under the Degree of a Noble-Man, and to thoſe there is a *Crown* according to the Quality of the Bearer, and the Helmet iſſueth out of the ſaid Crown. The Helmet doth diſtinguiſh the Dignity of the Bearer; for to a Gentleman and Eſquire, the Helmet is placed Side-ways with the Beaver cloſe: To a Knight, or Baronet, (which is all one) the Helmet is placed Fore-right, with the Beaver open. The Full-fac'd, or Fore-right Helmet, doth ſignifie *Direction* and *Command*; the Cloſe, *Attention* and *Obedience.*

The open *Helmet* placed ſideways, with *Bars*, belongs to all the Nobility under the Degree of a King, except *Sovereign Dukes*, or of the *Royal Blood*; and to thoſe the Helmet is placed Fore-right with open Bars; all which doth appear in the Circle of the *Eliptical Table*, as doth ſeveral ſorts of *Crowns* and *Coronets*, born by the Nobility, of which a Word or two.

The *Baron's Coronet* is of ſix *Pearls* of an equal height and diſtance from each other.

The *Viſcount's Coronet* is compos'd only of *Pearls* ſet cloſe together, and of an equal height.

The *Earl's Coronet* is compos'd of *Points* and *Flowers*, and the Points are ſpiry with *Pearls* on the top above the Flowers.

The *Coronet*, or *Crownet* of a Marqueſs, is of *Leaves* and *Points*, with the Leaves or Flowers above the Points.

The *Coronet* of a Duke is only Floral.

The *Coronet*, or *Crownet* of a *Prince* is the ſame with the Crown of a King, only the *Arches*, *Mound*, and *Croſs*, are omitted.

The Crown of a King is as a Duke, but with *Arches*, a *Mound* and a *Croſs*.

To a Biſhop, inſtead of a *Coronet* belongs a *Mitre.*

Next above the *Helmet*, is the *Wreath* or *Torce*, which is always of the principal *Metal* and *Colour* in the Bearer's *Paternal Coat*; and on this *Torce* the *Creſt* is placed, except to thoſe Coats that have no *Wreath*, and then there is always inſtead thereof a *Mount*, *Hill*, *Cheapeau*, or Coronet, on which the *Breaſt* is placed.

About the *Shield* is the *Mantle*, which doth admit of ſeveral Forms; thoſe moſt uſed are the *Cloak-Mantles* and the *Folding-Mantles*; and the Colours are generally *Gules* and *Argent*; that is, *Mantled Gules*, doubled *Argent*: But to Noble-Men, inſtead of *Argent*, the Doubling is *Ermins.*

On each ſide of the *Shield* of *Noble-Men*, are the *Supporters* which ſtand on an *Eſcrole*, or on a *Hill.* The *Eſcrole* is at the Bottom of the *Shield*, in which is placed the Motto of the Bearer, which is altogether according to the Fancy, and alterable at pleaſure.

THE GENTLEMAN'S RECREATION:

TREATING OF

HORSEMANSHIP, HAWKING, HUNTING, FOWLING, FISHING, and AGRICULTURE.

WHICH

Are Collected from the moſt Authentick AUTHORS, and the many groſs Errors therein corrected; with great Enlargements made by thoſe well-experienced in the reſpective RECREATIONS.

And for the better Explanation thereof, great variety of uſeful SCULPTURES, as NETS, ENGINES, TRAPS, *&c.* are added for the Taking of BEASTS, FOWL, aud FISH; not hitherto publiſhed by any.

The whole illuſtrated with divers Ornamental SCULPTURES, Engraven in Copper, relating to the ſeveral Subjects.

PART II.

The Second Edition, with large Additions and Corrections throughout.

HORSEMANSHIP.

PART I.

Wherein is treated of Horſes, *their Kinds, Breeding, Keeping, Uſes, &c.*

CHAP. I.

The INTRODUCTION.

A *Horſe* is a Creature ſo excellent in his nature, and ſo generally uſeful, that all Ranks and Degrees of Men, either for pleaſure or profit, are glad to make uſe of his Service. If you have ſeen a *General* at the head of his *Army*, and taken notice of his *Horſe* under him, I need not tell you what an Air of Majeſty and Greatneſs that Noble Creature has; and if you have been in a *Battle*, to give you an account of his Vigour, Activity, and Courage is as needleſs: But if you are a ſtranger to theſe ſort of things, and ſeek not a *Horſe* for any ſuch Imployment, go to the *Huntſman*, the *Traveller*, and the *Huſbandman*, they will all tell you what pleaſant Companions and neceſſary Servants *Horſes* are. It would be endleſs to give a particular Account of their admirable Nature and great Uſefulneſs; but if you conſider what long Journeys are performed on *Horſback*, and in *Coach*; what heavy Loads and Burthens are drawn and carried from place to place in *City*, *Camp*, and *Country*; what delight and pleaſure is taken in *Hunting*, *Hawking*, *Racing*, &c. to the increaſing of Health and Vigour: In a word, if you conſider that to the moſt glorious *Triumphs* and ſolemn *Pomps*, in buſineſs of all ſorts, and in our pleaſanteſt and moſt Manly Recreations, a *Horſe* is ſome way or other aſſiſting; you cannot but conclude, That of all thoſe Creatures that are made for the Profit and Delight of Mankind, a *Horſe* is the moſt excellent, and conſequently, That *Horſemanſhip* is a very great Accompliſhment in a Perſon of Quality, or Gentleman.

The Deſign therefore of this Diſcourſe is to lay down the Principles of *Horſemanſhip* in a ſhort and clear method; I think it may be called The *Knowledge* of *Horſes*, and the *Art* of *Riding* well. I ſhall ſpeak only of ſuch things as are moſt uſeful and neceſſary to be known by the Gentry; as the ſeveral Parts and Kinds of *Horſes*, the Rules for *Breeding* and *Keeping* them, what uſes ſeveral ſorts of *Horſes* are fitteſt for, and the like; avoiding the impertinent humour of too many *Authors*, who endeavour nothing more than to make a ſhow of their own Knowledge, and nothing leſs than the benefit and advantage of thoſe for whom they write. If I ſhould treat at large, ſome parts of this Diſcourſe would require Volumes; and therefore where I ſpeak in general, and give only the Grounds of things, I hope it will not offend the *Reader*. It may be of uſe to him who is a good Proficient, and not an improper *Grammar* for one that is beginning to learn; and I doubt not of its Approbation by the Judicious and experienced Horſeman.

CHAP. II.

Of the ſeveral Parts of a Horſe, *and how they ſhould be framed.*

TO begin with the Bars, which are the Ridges, or the higheſt parts of that part of the Gum that never bears any Teeth, they are ſituated between the Grinders and the Tuſhes; and the outward ſides of them are always called the Gums. The hollow part betwixt the two Bars, or Nether Jawbones, is called the Channel. The Pallate is the Roof: As for the Teeth, there are five ſorts, *viz.* The Jaw-Teeth or Grinders in Number 24. twelve in the upper, and as many in the lower-Jaw. 2. The Foal Teeth, that come forth when he is about Three Months Old, which he Caſts at about Two Years and an half after. 3. The Tuſhes placed in the Bars betwixt the Fore-teeth and the Grinders: *Mares* have ſeldom any; and when they have, they are ſmall: It's alſo thought an Imperfection in thoſe that have them. 4. The *Gatherers*, growing before in the Place of the *Fore-Teeth*, are Six above, and as many below, being divided into *Nippers*, *Middle-Teeth* or *Separaters*, and the Outward or Corner ones. The *Nippers*, being the Two foremoſt Teeth above and below, are thoſe which a *Horſe* firſt changes: The *Separaters* are the Two next to them, and alſo change next: The *Corner ones* are thoſe by which the Age of a *Horſe* is known, and laſt caſt. A *Horſe* in all hath Forty Teeth, and a *Mare* but Six and Thirty. The *Withers* begin where the *Mane* ended, are join'd to, and end at the Tip of the Shoulder-blades. The *Loins*, or *Fillets*, begin where the Hinder-part of the Saddle reſteth. The *Extremities* of the Belly, where the Ribs are wanting, are called the *Flanks*. The *Flank* is part of the Foreleg, betwixt the Knee and the ſecond Joint, next to the Foot; and the *Paſtern-joint* is next the Foot. That Part round the very Top of the Foot is named the *Coronet*. The *Foot* it ſelf conſiſts of a *Hoof* and *Coffin*; the *Quarters* are the Two Sides of the

Foot; the *Fruſh*, or *Frog*, ariſes in the Middle of the Sole, and at ſome Diſtance from the Toe. It is divided into Two Branches, running towards the Heel like a Fork. As for the *Sole* it ſelf, it is a kind of a Nail or Horn under the Foot, much tenderer than the other Horn that encompaſſes the Foot. The *Coffin-bone* is a kind of a Spongy Bone, encloſed in the midſt of the Hoof, and poſſeſſing the whole Form of the Foot.

In the Hind-legs you have the *Stiffle*, or great *Muſcle*, which advances towards a Horſe's Belly, being a moſt dangerous Part to receive a Blow upon. The *Thigh*, or *Gaskoni*, begins at the Stiffle, and reaches to the Ply, or beginning of the Ham; which *Ham*, or *Hough*, is the Ply or Bending of the Mid-leg, and comprehends alſo the Point behind and oppoſite to the Ply, called the *Hock.* That Part of the Fore-leg which lies between the Knee and the Paſtern-joint or Fetlock, is term'd the *Shank*, but *Inſtep* in the Hind-leg.

As to the Formation of the Parts of a *Horſe*; the *Head* ſhould be ſmall, narrow, lean and dry; the *Ears* little, narrow, ſtrait and hardy, with the whole Subſtance fine and delicate. The *Forehead* ought to be ſomewhat broad; ſome would have it a little rais'd. A *Horſe* ſhould have that which we call a *Feather* in it; being a natural Frizling of the Hair. The *Eye-Pits* muſt not be too much ſunk, if otherwiſe they make the *Horſe* appear old. Thoſe *Eyes* are moſt eſteem'd which are bright, lively, full of Fire, pretty large and full; but neither very big, gogling, nor ſtaring. The *Jaw-bones* are to be narrow and lean, but the Diſtance large and hollow betwixt them and the Throat. The *Muzzle* ſhould be very ſmall, and indeed nothing but Skin and Bone. The *Head* ought not to be long. The *Noſtrils* are to be large and extended, the Wideneſs of which does not a little contribute to eaſie Breathing.

As for the *Mouth*, an indifferently well cloven one is beſt; ſo is a ſmall *Tongue.* The *Bars* are to be ſharp, ridged and lean; for if they be flat, round, and inſenſible, the Bit will not work its Effect. The *Channel* muſt be large enough to contain his Tongue: The *Pallate* lean, not full and high: The *Lips* thin and little: The *Beard* neither flat, nor too high rais'd, and ought to be nothing but Skin and Bone, without any Chops, Hardneſs, or Swelling.

The *Neck* ſhould be lean, well-ſhap'd, riſe with a Sloap upwards from the Withers, but diminiſh gradually towards the Head; and ought to have but little Fleſh upon it, tho' a groſs and fleſhy *Neck* be a good Quality in a *Mare.* A fine, long, thin and frizled *Mane* is beſt.

The *Withers* are to be well raiſed, and pretty long, but lean and not too fleſhy; for then they will be much more ſubject to Gauling. A large and full *Breaſt* and *Counter* is always valued in light or ſmall-ſiz'd *Horſes*; ſo 'tis alſo in *Horſes* for Draught. As for the *Shoulders*, they ought to be ſharp and narrow at the Withers, of a middle Size, flat, and not fleſhy. The *Shoulders* of a well-ſhap'd *Horſe* are compar'd to thoſe of a *Hare*, and the Diſtance between them ſhould be little more than half the Breadth of the Hinder-Quarters. A *Horſe* ſhould have *double Reins*, that is a little more elevate on each Side of the Back-bone, than upon it. The *Back* ought to be ſtrait, not hollow or Saddle-back'd; and the *Ribs* circular and full, taking their Compaſs from the very Back-bone. The *Belly* is to be of an ordinary Bigneſs, but the larger the better in *Coach-Horſes*, provided they be round, and well incloſ'd within the Ribs, and rather extending upon the Sides than downwards.

Let the *Flanks* be full, with a Feather on the Top on each Side near one another: The Diſtance of the *Flank* ſhould be ſhort and well coupled; the *Croup* large and round. It ought to have its Compaſs from the Haunch-bones to the very Onſet of the Tail, and be divided in Two by a Hollow all along to the very Dock. You are to chuſe a firm, ſtrong, and immovable *Tail*, well furniſh'd with Hair. Let the *Dock* be ſtiff, big, and pretty high.

The larger, broader, and more nervous the *Arm*, *Fore-thigh* and *Shanks* are in the Fore-legs, the better; and a flat or large *Knee*, without any Roundneſs or Swelling, is beſt. The *Back-Sinew* in a *Horſe*'s Leg ought to be big; and the greater the Diſtance between it and the Shank-Bone, the better. The *Paſtern*, eſpecially in middle-ſiz'd *Horſes*, ought to be ſhort; the *Coronet* more elevated than the Hoof, and the *Horn* of the *Hoof* of a dark Colour, ſomewhat ſhining, ſmooth and high. In ſhort, to be excellent, it ſhould be of the Colour of a Deer's Foot, and the whole Foot of a round Figure, but a little larger below than above. The *Heel* ought to be high and large; but one Side not higher upon the Paſtern than the other. The *Fruſh*, though little, ſhou'd be well nouriſhed.

The *Soles* are to be thick and ſtrong, and the whole lower Part hollow; the *Thighs* well furniſh'd and fleſhy; the *Hams* large, full, not much bent, dry, diſcharged of Fleſh, nervous and ſupple. The *Inſtep* ſhou'd be big and flat, and in a Perpendicular Line to the Ground. Laſtly, particular heed is to be taken that a *Horſe*'s *Legs* be not too long in Proportion to their Bodies. *Solleyſel. Guillet.*

CHAP. III.

Of the ſeveral Sorts of Horſes *moſt in Uſe.*

Of the Turkiſh Horſe.

THE *Turkiſh Horſe* has a great deal of Beauty and Fire, being extraordinary ſwift. With a good *Mare* he breeds very fine *Colts*, (eſpecially for the *Race*) of which ſome of our *Breeders* have had the Experience: But the *Turks* are ſo unwilling to part with their Breeds, that of thoſe that come into *England* there are but very few (if any) good in their Kind.

Of the Barb, *or* Barbary Horſe.

The *Barb* is very docile and gentle, being of all *Horſes* in the World the eaſieſt to be managed, having naturally a very graceful Action, and a good Diſpoſition: He is of himſelf ſo negligent and lazy in his Walk, that he is apt to ſtumble ſometimes in plain Ground; but when he is wakened, and rode upon his Mettle, no *Horſe* is more nimble, vigorous and adroit, and better for an Action of one or two Hours. He makes a good *Stallion* to breed *Running Horſes* out of, the *Colts* that he gets being generally well winded, fleet and good at Bottom. The Duke of *Newcaſtle* was of opinion, That a *Barb*, tho' a Jade, would get a better *Horſe* for a *Courſe*, than the beſt *Running Horſe* in *England:* And ſo was Sir *John Fenwick* of *Northumberland*, being a Man of great Experience, and eſteem'd to have one of the beſt Breeds of *Horſes* in this Kingdom. The Duke of *Newcaſtle* was likewiſe of opinion, and not without Reaſon, That the choiceſt *Barbs* are not brought over: And his Reaſons are, becauſe they are bought up by Merchants, or ſuch that buy the cheapeſt for Advantage; nor do they know how to chuſe thoſe that are good.

Of the Spaniſh Horſe.

This *Horſe*, if he be well choſen, is of a Noble Kind, his Shape being exact and curious, and not ſo thin and ſlight as the *Barb*, nor ſo groſs as the *Neapolitan*, but between both, being form'd by Nature for Strength, as well as Beauty. He is very docile, hath a great Spirit and Courage; and 'tis creditably reported of their beſt Breeds in *Spain*, that in their Exerciſe of *Riding* at the *Bull*, when a *Horſe* happens to be ſo ſharply wounded, that his Guts hang out, he will yet obey his *Rider*, and continue his Action to the utmoſt of his Strength, tho' at the ſame time he tramples upon his Bowels. He hath the proudeſt Walk and Trot, with the beſt Action in his Trot, the loftieſt Gallop, the ſwifteſt Careers, and yet the gentleſt *Horſe*; and if he be good in his Kind, is very proper for *Generals* and *Great Officers*, none being more graceful in a Day of *Triumph*, or uſeful in a Day of Battle.

Of the Dutch, *or* Flanders.

Where are a Sort of *Dutch*, or *Flanders Horſes* which we make uſe of in *England*, which are the fitteſt in the World for the Coach, eſpecially for the Town for a fine Equipage, where they muſt draw great Weight, and be continually upon the Stones; for they are large and beautiful in their Kind, and having a graceful and lofty Trot, they give a better Air to a Coach than any *Horſes* whatſoever; beſides that, they are ſtronger, and will endure the Pavement better

Of Engliſh Horſes, *&c.*

We have in *England* ſeveral good Breeds: our *Running Horſes*, *Hunters* and *Pads*, and our *Horſes* for all manner of Fatigue, of what Nature ſoever, are not to be match'd in all *Europe*; nor is any *Horſe* better for an *Officer* in the War, than one of thoſe which we call our *Twelve-Stone Horſes*, (ſuch as uſually run for *Plates*) if he be well choſen, and taken in time. He muſt be naturally of a good Diſpoſition (which, for the generality, our *Engliſh Horſes* are not) and one of the ſtrongeſt of that Sort, with good *Reins* and *Limbs*, and a *Head* well ſet on; and he muſt be put to the *Manage* before he is accuſtom'd too much to go upon his *Shoulders*, and to have his Will; for I believe that which ſpoils a great many of our *Engliſh Horſes*, rendring them ſo unfit for the *Great Saddle*, is the *Snaffle-Bridle*; and our particular Method of *Training* and *Galloping*, ſo that when they come to be Seven or Eight Years old, they are grown ſo head-ſtrong, and their Way of going is become ſo cuſtomary, that there is no poſſibility of putting them upon the *Haunch*, or bringing them into any manner of Subjection, either of the Hand or Heel.

There are ſeveral other Kinds of *Horſes*, which I omit, becauſe we meet with them but rarely in *England*, amongſt which may be reckon'd the *Arabian*, a *Horſe* of an excellent Nature, and very beautiful.

CHAP. IV.

Of Stallions.

If you chuſe a *Stallion* aright, you muſt conſider the Uſe you deſign to breed for: For Example; If you would breed for the *Manage*, (I mean the moſt uſeful Part, which is term'd *Manage de Guere*, of which I ſhall ſpeak in its proper Place) let your *Stallion* be a *Turk*, *Barb*, or *Spaniard*, one that is good in his Kind, and naturally of a docile and gentle Temper, though lively, vigorous and bold in Actions. His *Neck* and *Creſt* muſt be ſo turn'd, and his *Head* ſo ſet on, as not to hinder his Reining well; for which you muſt obſerve that his *Neck* be form'd like an Arch, his *Creſt* not too much charged with Fleſh, his *Head*, when he ſtands in his own natural Poſture, falling as it were perpendicularly towards the Ground; and his *Jaw-bones* ſtanding ſo wide, that his *Head* may not want Room to play.

A Modern and very Judicious Author objects againſt the *Spaniſh Horſes*, that they beget Colts of a leſs Size than themſelves; that the *Mares* do not ſo eaſily hold to them as to the *Barbs*; for often *Mares* cover'd with a *Spaniſh Horſe*, one half will not be with Foal; whereas they hold ſooner to the *Barbs*, if the *Stallion* be Six Years old; for being younger they deceive the *Mares*. He does not approve of covering *Mares* in one's Hand, or tied with Ropes, nor regards the Increaſe or Decreaſe of the Moon.

If you would breed for *Hunting*, or the *Race*, make choice of a *Turk* or *Barb*, or a well-bred *Engliſh Horſe*, that has given Proofs of his Goodneſs and Speed.

If you would breed for the *Road*, make choice of a good ſtrong *Hunter*, that has naturally good *Legs* and *Feet*, a ſhort *Back* and good *Quarters*, and let him be one that is not of a ſkittiſh or ſtubborn Temper; or if you are curious, and would have very fine *Padds*, you may take the ſame Meaſures which I told you before for the *Manage*, only geld your *Colts*; and when you break them, if they take it well, teach them to *Amble*.

'Tis needleſs to give Directions for Breeding any other Sorts of *Horſes*; as for the *Coach*, *Waggon*, *Cart*, *Servants*, and all manner of Drudgery, becauſe there is not that Nicety required in their Breed; and from the *Fairs* and *Horſe-Courſers* you may be ſupplied, and ſave that trouble.

When you have made choice of your *Stallion*, feed him at leaſt Three Months before he is to Cover, with good Oats, Peaſe, or Beans, or with coarſe Bread and a little Hay, but a deal of

Wheat-Straw; ſtepping him out twice a Da yto the Water; and after he has drunk, walk him up and down for an Hour; but don't make him ſweat; if otherwiſe he will grow purſie and broken-winded, or run a Riſk of being ſo. As for the Age of the *Stallion*, he ſhould not Cover before he is Six Years old, nor after he is Fifteen, tho' as to the laſt you may regulate your ſelf according to his Strength and Vigour.

CHAP. V.

Of Mares.

Having told you how to chuſe your *Stallions*, it will be neceſſary to give you ſome Directions about the *Mares:* And certainly none in the World are better to Breed on than our *Engliſh*, provided you ſuit them to your particular Deſign. For Inſtance; If you would Breed for the *Manage* or *Pads*, let your *Mares* have fine *Fore-hands*, with their *Heads* well ſet on, but not too long *Necks*; broad *Breaſts*, large and ſparkling *Eyes*, and great *Bodies*, that their *Foals* may have Room enough to lie; with good *Limbs* and *Feet:* Let them be of a gentle and good Diſpoſition, and their Motions naturally nimble and graceful. In a word, remember always, that the more good Qualities your *Mares* have, the better will your *Colts* generally prove.

If you would Breed for the *Race* and *Hunting*, your *Mares* muſt be lighter, with ſhort *Backs* and long *Sides*; their *Legs* muſt be ſomething longer, and their *Breaſts* not ſo broad; and always make choice of ſuch as you are ſure have good Blood in their *Veins*. If you have try'd the *Speed* and *Wind* of any particular *Mare*, and find it good, you may the ſurer expect a good *Colt*, provided ſhe be ſtill in her full Health and Vigour, and not above Seven Years old, or Eight at moſt; for the younger your Breeders are, the better your *Colts* will be.

Neither ought you to begin to Cover your *Mares* before they are Three Years old, though the Goodneſs of the *Mares* and *Foals* they bring forth ought to regulate you as to this Particular.

CHAP. VI.

Of a Soil *to Breed in, and of* Paſtures.

ONE of the firſt Things, (which you ought to conſider) if you deſign to Breed, is the Commodiouſneſs of the Place, and the *Paſtures* where your *Horſes*, *Mares*, or *Colts* are to run. For he that breeds in a Place unfit for it, loſes his Money and Pains, and will never have good *Horſes*.

The *Ground* muſt not be too rank of Graſs, nor too bare, but a firm and ſweet *Soil*, ſituate in a clear and wholſome Air, where there are Hills and running Waters, with Quick-ſets and ſpreading Trees to ſhelter them from the Wind, Rain and Sun. Nor muſt they be continued always in the ſame *Paſtures*, but often remov'd into freſh, obſerving ſtill to put them into the ſhorteſt Feedings in Summer, and the richeſt in Winter, at which time of the Year they muſt have a Hovel, a Hay-Rick, or ſome convenient Place to defend them from the Weather.

CHAP. VII.

Of the Time and Manner of Covering.

YOUR next Care muſt be about the Time and Manner of *Covering*. The beſt Time to have your *Mares* Covered is in *May*; for then your *Colts* will fall the *April* following, at which Time there will be ſweet and freſh Graſs for them; though others are of opinion, that *Mares* ought to be Cover'd in the Beginning of *June*, that ſo they may foal in *May*. *Mares* go with *Foal* Eleven Months, and as many Days as they are Years old. For Example, a *Mare* of Nine Years old will carry her *Foal* Eleven Months and Nine Days; ſo that you may ſo order your *Mares* to be Cover'd, that their *Foals* may be brought forth at ſuch time as there is abundance of Graſs. The manner of Covering is thus: Let your *Stallion*, having been ſo high fed, that he is full of Luſt and Vigour, be brought to the Place where the *Mares* are (his hinder Shoes being taken off;) there let him Cover a *Mare* in Hand twice or thrice to make him ſober, then pull off his Bridle, and turn him looſe to the reſt of the *Mares*, which muſt be in a convenient Cloſe, not without ſtrong Fences and good Food; and thus you muſt leave him till he has Cover'd them all, ſo that they will take *Horſe* no more, by which time his Courage will be pretty well cool'd. More than Ten or Twelve *Mares* is too much for one *Horſe* in the ſame Year. You muſt have ſome little Houſe or Hovel to defend him from the Rain, Sun and Weather, (which are very weakning) and a Manger to feed him in during the Time of Covering; and you would do well to have one to watch him all the while for fear of Danger, and the better to know how oft he Covers each *Mare*. All this being obſerv'd, when you have taken away your *Stallion*, remove your *Mares* into ſome freſh Paſtures.

We muſt not omit here to take notice, that when you Cover your *Mares*, either in Hand or otherwiſe, that the *Stallion* and *Mare* feed alike, *viz.* if the *Stallion* be at Hay and Oats, commonly called *Hard-meat*, the *Mare* ſhould be alſo at Hard-meat, otherwiſe ſhe will not ſo really hold. In like manner, if the *Stallion* be at Graſs, the *Mare* is alſo to be put to it. *Mares* which are very fat hold with great Difficulty, but thoſe which are in a middling Caſe conceive with the greateſt Eaſe: Thoſe that are hot, or in ſeaſon of them, retain a great deal better, the *Horſe* being excited by that Heat; and ſo on his part performs the Action with greater Ardour and Vigour. And when the *Mare* is to be Cover'd in Hand, that ſhe may the more certainly hold, let the *Stallion* and her be ſo placed in the Stable, that they may ſee each other, and ſo let them be kept for ſome time, which will animate them both, and Generation then can hardly fail.

The beſt *Recipe* to bring a *Mare* in Seaſon, and make her to retain, is to give her to eat, for the ſpace of Eight Days, before you bring her to the *Horſe*, about two Quarts of Hempſeed in the Morning, and as much at Night; but if ſhe refuſe to eat it, mix it with a little Bran or Oats, or elſe make her to faſt for a while; and if the *Stallion* eat alſo of it, it will contribute much to Generation. It's a Maxim, that a *Mare* ſhould never be horſed while ſhe is bringing up her *Foal*, becauſe the *Foal* to which ſhe is giving Suck, as well as that in her Belly, will receive Prejudice by it, and the *Mare* herſelf will be alſo ſooner ſpent: But if you will have your *Mare* Cover'd, let it be Seven or Eight Days after ſhe hath foal'd, that ſhe may have time to cleanſe; and if it may be conveniently done, do not give her the *Stallion* till ſhe deſire him, and alſo encreaſe by all means poſſible that Paſſion by ſtrong Feeding, *&c.* For the producing of Males, the *Mare* muſt be brought in Seaſon, and Cover'd very early in the Morning, any time from the Fourth Day of the Moon until it be Full, but never in the Decreaſe; and thus ſhe ſhall not fail to bring forth a Male Colt. *Solleyſell*'s *Compleat Horſeman.*

CHAP. VIII.

Of Colts.

WHEN your *Colts* are fallen, you may let them run with their Dams till about *Michaelmas* (ſooner or later, according as the cold Weather comes in,) then you muſt wean them; though others are for having them weaned about *Martinmas*, or the Middle of *November*, and that Three Days before Full-Moon: But the Author of the *Compleat Horſeman* is of Opinion, that the Reaſon why moſt *Foals* advance ſo ſlowly, and are not capable of Service till they be Six or Seven Years old, is becauſe they have not ſuck'd long enough; whereas if they had ſuck'd the whole Winter over, they would be as good at Four or Five Years old, as they are now at Eight. Let them be kept in a convenient Houſe, with a low Rack and Manger for their Hay and Oats, which muſt be ſweet and good, with a little Wheat-Bran ſometimes mix'd with the Oats, to cauſe them to drink, and keep their Bodies open. But whereas there are ſome who alledge, that Oats make *Foals* become blind, or their Teeth crooked: The ſame Author is of Opinion, that Oats will wear their Teeth, and make them ſooner to change and alſo raze; therefore he judges it the beſt way to break them in a Mill, becauſe that by endeavouring with their Jaws to bruiſe and chaw them, they ſtretch and ſwell their Eye and Nether-Jaw Veins, which ſo attract the Blood and Humours, that they fall down upon the Eyes, and frequently occaſion the Loſs of them: So that it is not the heating Qualities of Oats, but the Difficulty in chawing, that is the cauſe of their Blindneſs. Further, that *Foals* thus fed with Grain do not grow ſo high upon their Legs; but grow broader and better knit, than if they had eaten nothing but Hay and Bran, and will better endure Fatigue. Above all they muſt be kept from Wet and Cold, which are the hurtfulleſt things imaginable to them, nothing being more tender, as the Duke of *Newcaſtle* in his Book proves more at large. For Proof of this, take a *Spaniſh Stallion*, and let him Cover Two *Mares*, which for Age, Beauty and Comlineſs may admit of no Difference betwixt them, and if they be both *Horſe-Colts*, or both *Fillies*, (which is one and the ſame) let one run abroad until it be Three Years and an half old, and let the other be houſed every Winter, kept warm, and orderly tended, as aforeſaid; and that *Colt* that hath been kept abroad ſhall have great fleſhy Shoulders, flabby and gouty Legs, weak Paſterns with ill Hoofs, and ſhall be a dull and heavy Jade in compariſon to the other, which is houſed and orderly kept, as aforeſaid; which will have a fine Fore-hand, be well ſhaped, have good Legs and Hoofs, and be of good Strength and Spirit: By which you may underſtand, that to have the fineſt *Stallion*, and the beautifulleſt *Mare*, is nothing, provided you ſpoil them in [illegible] Breeding.

It is worth obſerving, that ſome *Foals*, under Six Months old, though their Dams yield abundance of Milk, yet decay daily, and have a Cough proceeding from certain Pollicles, or Skins that breed in their Stomachs, which obſtruct their Breathing, and at laſt totally deſtroy them. To remedy which, take the Bag wherein the Animal was foal'd, dry it, and give him as much of it in Milk as you can take up with Three Fingers; but if you cannot get the Bag, dry the Lungs of a young Fox, and uſe it inſtead of the foreſaid Powder.

It is not amiſs to let your *Colts* play an Hour or two in ſome Court-yard, or the like Place, when 'tis fair Weather, provided you put them up again carefully, and ſee that they take no Hurt.

When the Winter is ſpent, let them be turned into ſome dry Ground, where the Graſs is ſhort and ſweet, and where there is good Water, that they may drink at pleaſure; for it is not neceſſary that a *Colt* immediately fill his Belly like a Horſe that labours hard. The next Winter you may take them into the Houſe, and uſe 'em juſt as your other *Horſes*. But let not your *Horſe-Colts* and *Fillies* be kept together after the firſt Year. This Method you may obſerve every Summer and Winter till you break them; which may be done after Three Years old, and will be ſo eaſie a thing, if you obſerve the aforeſaid Method of Houſing them, and ordering them the ſecond Year, as you do other *Horſes*, that they will be ſo tame and gentle, that you need not fear their Plunging, Leaping, Kicking, or the like Coltiſh Tricks, for they will take the Saddle quietly: For all theſe ridiculous Ways of beating and cowing them to tame them, is in effect ſpoiling them, whatever they call it, in plowed Fields, deep Ways, or the like; inſtead of which let their Rider ſtrive to win them by gentle Uſage, never correcting them but when it is neceſſary, and then with Judgment and Moderation.

You need not a Cavezone of Cord, which is a Head-ſtrain, nor a Pad of Straw, but only an ordinary Saddle, and on his Noſe an ordinary Cavezone, as you ride other *Horſes* with; but it muſt be well lined with double Leather, as the reſt are; and if you think fit, you may put in his Mouth a Watering-Bit without Reins, only the Head-ſtall, and this but for a few Days, and then to put ſuch a Bit as he ſhould be always ride with: And be ſure uſe not Spurs for ſome time after Backing.

Obſerve, that Yearlings muſt be kept abroad together; ſo thoſe of Two Years old together; the like for thoſe of Three Yearlings, which Ordering is moſt agreeable to them.

CHAP.

CHAP. IX.

Of the ſeveral Uſes of Horſe to Men of Quality and Gentlemen.

THE ſeveral Uſes of *Horſes* to Men of Quality and Gentlemen, may be reduced to theſe Three Heads, *viz.* For the *Saddle*, *Burthen* and *Draught*. The Uſes of the Saddle are for the War, Hunting, the Race or Pad; of Burthen, for Sumpters, Packs, and ſuch kind of Baggage; and of Draught, for the Coach, Carriages, Waggons, Carts, Plough, and the like.

A Horſeman ſhould conſider theſe things, that every *Horſe* may be put to the Uſe he is fitteſt for, concerning which I refer you to the following Chapters, which treat of Riding the *Great Horſe*, of *Hunting*, of the *Race*, of the *Pad*, of the *Coach*, &c.

CHAP. X.

Of Riding the Great Horſe.

THERE is certainly no Exerciſe more noble and manly than this of the *Manege*; it makes a Man firm and eaſie on Horſeback, and vigorous and adroit in Action; it encreaſeth Health and Strength: for none under the ill Conſequences of a Debauch, be it of Wine or Women, can perform this Exerciſe as he ought, being as unfit for it in ſuch a Caſe, as to go to Bed to a fair Lady. It alſo gives a graceful and martial Air, which one may perceive in ſome fine Horſemen, (even when they are on Foot;) and therefore when the *French* would commend any Perſon that has a good Mien, they ſay, *Il a l'Air fort Cavalier.*

But before we come to the Parts of the *Manege*, we'll, out of *Solleyſell*, inform our curious Reader, what Stature and Age a *Horſe* ſhould be of, that is deſigned for it. The Middle-ſized ones are the beſt, as being commonly the ſtrongeſt, endued with more Spirit and Agility, and not one in a Hundred but proves good; when of large ones ſcarce one in a thouſand. Let him therefore be a ſhort truſſed one, well coupled, with good Feet and Legs, lively, full of Spirit and Action. And though great Maſters ſay, that if his Head is large, Neck thick and Shoulders fleſhy, he will be hard on the Hand: Yet the Duke of *Newcaſtle* had obſerved the contrary, and known more thick Heads, Necks and Shoulders to be lighter on the Hand, than he had known of fine ſhaped and ſlender Fore-hands; and that 'tis neither the one nor the other that cauſes it, but only the Strength of his Chine: And ſuch an one will be light on the Hand, provided there be no Imperfections in his Legs or Feet, eſpecially before; for then he will lean on the Hand, and eaſe the Grief of his Legs, and the Farrier muſt cure him, and not the Horſeman.

Then for the Age of a *Horſe* to be work'd for the *Menage*, you muſt not begin with him too young, not only becauſe, I may ſay, he is not yet ripe in his Underſtanding, but alſo that a *Horſe* of three Years old being but a Griſle, frequently ſtops, and goes back, and will be ſpoil'd by ſtraining his Back, and ſtretching his Ham: Nay, you are not to ride your *Horſe* above once a Day, though he be Six, Seven, or Eight Years old; and if you ride him twice the ſame Day, he will ſcarce recover it in two or three: For if he does oppoſe his Rider, which all *Horſes* do at firſt, he muſt receive ſound Correction, and be rid ſo long till he be brought to ſome meaſure of Compliance and Obedience; and by that time you will have rid him ſo violently, and ſo long, that he will hardly be fit for Riding next Morning, much leſs to be rid any more that Day; neither can you ever give him his Meat, Water, or Reſt in order; for want of which you will make him ſick, and ſubject to divers Diſtempers. On the other hand, in moderate Riding of him, when you find him compliant, then take but a little of him that Morning, that he may be encouraged to do the ſame; and he will then not only be found lively and vigorous, but take Delight in the Menage and his Rider, and learn more in a Month, riding him but once a Day, than he ſhall do in Three, riding him twice.

In like manner it will be expedient, that the Rider ſhould firſt exactly know the natural Paces or Motions of a *Horſe*'s Legs, *viz.* the Walk, Trot and Gallop; to which the Amble, as being natural to ſome *Horſes*, may be added. In the Walk, a *Horſe* lifts Two Legs of a Side one after another, beginning with the Hinder-Leg, as if he leads with the Legs on the Right Side; then the far Hind-foot is the firſt he lifts, and whilſt he is ſetting it down, (which in a Step is always ſhort of the Tread of his Fore-feet upon the ſame Side) he lifts up his far Fore-foot, and ſets it down before his near Fore-foot. Again, juſt as he is ſetting down his far Fore-foot, he lifts his near Hind-foot, and ſets it down again juſt ſhort of his near Fore-foot. When a *Horſe* trots, he has two Legs in the Air, and two upon the Ground at the ſame time, croſs-wiſe; but if your *Horſe* be walking, and you would have him to trot, ſlack your Bridle-hand, and preſſing him on with both your Calves at one and the ſame time, you will force him to advance the Hind-leg of the Side wherewith he did not lead ſooner than otherwiſe he would, and ſo move at the very ſame time with the Fore-leg of that Side wherewith he began to lead; which is the true Action of the Trot, that is, the Hind-leg of one Side and the Fore-leg of the other at one and the ſame time. A *Horſe* may lead with either of his Fore-legs, as he pleaſes, when he gallops ſtrait forwards; though moſt commonly they do with the Right: But, be it one or the other, the Hind-leg of the ſame Side muſt follow, otherwiſe their Legs are ſaid to be diſunited; and in this caſe to bring them to Rights again, you muſt ſtay your *Horſe* a little upon the Hand, and help him with the Spur on the contrary Side to that wherein he is diſunited. More particularly, if you find him to be diſunited on the Right, help him with the Left Spur; and if on the Left, unite him on the Right, by ſtaying him as before, and helping him at the ſame time with the Calves of your Legs. When a *Horſe* gallops in a Circle, he is confined always to lead with his Fore-leg within the Turn, otherwiſe he is ſaid to gallop falſe; but in both Caſes the Hind-leg of the ſame Side muſt always follow. Laſtly, As for the Amble, it differs only from a Walk, in that in the latter the *Horſe* lifts two Legs on a Side one after another, whereas the Ambler raiſes the two Legs of a Side at the very ſame time: For if your *Horſe* be walking, and you

Wyke delin: Soly sculp

you would have him amble, let him be ſtay'd well on the Hand, wrought forwards with your Calves one after another, and ſo force him to ſet down the Fore-feet of that Side wherewith he leads, ſooner than otherwiſe he would, which makes it exactly anſwer the Hind-leg's Motion on that Side. In ſhort, if with the far Side the *Horſe* leads, the Hind and Fore-leg on that Side are removed at the ſame time, whilſt the other on the near Side ſtand ſtill; ſo that there are Two of a Side in the Air, and the other at the ſame time on the Ground.

To the Natural we here add the Artificial Motions of a *Horſe*, which are ſeveral: 1. *Terra a Terra*, which is a Series of low Steps, made forwards, bearing ſideways, and working upon two Treads. He lifts both his Fore-legs at once, and when theſe are upon the point of deſcending to the Ground, the Hind-legs accompany them with a ſhort and quick Cadence, always bearing and ſtaying upon his Haunches; ſo that the Motions of the Hind-Quarters are ſhort and quick, and the *Horſe* being always well preſſed and coupled, his Fore-legs he lifts pretty high, but keeps his Hind-legs always low and near the Ground. 2. A *Demi-Air*, or *Demi-Volt*, an Air wherein the Fore-parts of a *Horſe* are raiſed more than in *Terra a Terra*: The Motion alſo of a *Horſe*'s Legs is quicker in *Terra a Terra*, than in the *Demi-Volt*. 3. *Curvets*, which are Leaps of an indifferent Height, made by firſt raiſing his two Fore-legs in the Air, and making the Two Hind-legs follow with an equal Cadence; ſo as the Haunches go down together, after the Fore-feet have touched the Earth, in continual and regular Reprizes. 4. *Caprioles*, otherwiſe call'd Leaps of *Firma a Firma*, are Leaps that a *Horſe* makes in one and the ſame Place, without advancing forwards, and that in ſuch a manner, when he is in the Air, and at the Height of his Leap, he yerks, or ſtrikes out with his Hinder-legs even and near. It's the moſt difficult of all the high Menage, or raiſed Airs. It differs from a *Croupade*, becauſe that in this laſt the *Horſe* does not ſhew his Shoes; and from a *Balotade*, becauſe he does not yerk out. 5. *Croupades* are higher Leaps than thoſe of *Curvets*, keeping the Fore and Hind-Quarters of the *Horſe* in an equal height; ſo that he truſſes his Hind-legs under his Belly, without jerking, or ſhewing his Shoes, as aforeſaid. 6. *Balotades* are Leaps between two Pillars, or on a ſtrait Line, made with Juſtneſs of Time, with the Airs of the Hand and the Calves of the Legs, and that in ſuch a manner, that when his Fore-feet are in the Air, he ſhews nothing but the Shoes of his Hind-feet, without yerking out. 7. *Step and Leap* is the high Menage of a *Horſe*, that between two Leaps, or *Caprioles*, marks a *Curvet*, that upon this Occaſion is called a *Step*, in ſuch a manner, that at every Leap, or *Capriole*, he raiſes his Fore-legs, and his Haunches follow, yerking or ſtriking out his Hind-legs at the End of every Leap. 8. *Peſades*, or *Poſades*, are the Motions of a *Horſe*, that in lifting or raiſing his Fore-Quarters, keeps his Hind-legs on the Ground without ſtirring; ſo that he marks no Time with his Haunches till his Fore-legs reach the Ground. This Motion is the true Means to make him ply and bend his Fore-Thighs, and to hinder him to ſtamp and clatter with his Feet. 9. A *Pyroet* or *Pyroite*; ſome are of one Thread or *Piſt*, ſome of two: Thoſe of one are otherwiſe called *Pyronets de le tete a la l'queue*, being entire and very narrow Turns, made by the *Horſe* upon one Thread, and at moſt in one time, in ſuch a manner, that his Head is placed where his Tail was, without putting out his Haunches. Thoſe of two *Piſts* or Threads, are Turns of two Threads upon a ſmall Compaſs of Ground, almoſt of the Length of the *Horſe*. 10. *Paſſade* is a Tread or Way that a *Horſe* makes oftner than once upon the ſame Extent of Ground, paſſing and repaſſing from one End of its Length to the other; which cannot be done without changing the Hand, or turning and making a *Demi-Tour* at each of the Extremities of the Ground. Hence there are ſeveral Sorts of *Paſſades*, according to the different ways of Turning, in order to part or put on again, and return upon the ſame *Piſt* or Thread, which is called Cloſing the *Paſſade*. A *Paſſade*, or *Demi-volt*, of Five times, is a *Demi-tour* made at the End of the ſtrait Line, one Hip in, in Five times of a Gallop upon Haunches, and at the Fifth ought to have cloſed the *Demi-volt*, and to preſent upon the *Paſſade* Line, ſtrait and ready to return. The *Demi-volts* of Five times or Periods, are the moſt common Airs of changing the Hand or Turning, that are practiſed in the Academies. The *Furious* or *French Paſſades*, are ſuch as are in Duels, wherein the *Horſe* is put ſtrait forwards, and towards the Extremity of the Line you make a Half Stop, keeping the *Horſe* ſtrait without traverſing; then you make the *Demi-volt* at Three times, in ſuch a manner, that the Third time the *Horſe* preſents ſtrait upon the *Paſſade* Line, and ready to ſet out again upon a ſhort Gallop. You continue this ſhort Gallop half the Length of the *Paſſade*; then you put on furiouſly at full ſpeed, and at the End of the *Paſſade* make a Half-ſtop, and then a *Demi-volt* of three times. A *Paſſade* of one time is a *Demi-volt* or Turn made by the *Horſe* in one time of his Shoulders and Haunches, and is the perfecteſt *Paſſade* of them all. Laſtly, The raiſed or high *Paſſades* are thoſe, in which the *Demi-volts* are made in *Corvets*.

Let us now return to our Author, who ſays, that the *Menage* is Twofold, *viz.* that which is proper for the *Cheval d'Eſcole*: Secondly, that which is proper for the *Cheval de Guere*. The *Cheval d'Eſcole* is taught ſeveral Airs and Leſſons, which as they require a great deal of Vigour and Addreſs, (as the *Gallopade-Relevée*, *Caprioles*, *Ballotades*, &c.) ſo they are neceſſary to be learn'd in Academies, to give young Men a firm and eaſie Seat, and a good Hand upon a *Horſe*; making them capable of humouring all manner of *Horſes*, according as it is requiſite; but are not in themſelves abſolutely neceſſary, nor of any Uſe in Action, unleſs in Carouſels, Triumphs, and the like. The *Cheval de Guere* is taught only ſuch Leſſons as are neceſſary in the Field, and without which one cannot attack a good Horſeman, but upon very great Diſadvantages.

The Confounding of theſe Two, and not being able to diſtinguiſh the one from the other, makes a great many talk very ignorantly about *Managed Horſes*, ſome deſpiſing the whole Art of *Riding* the *Great Horſe*, becauſe, for want of Education, they know nothing of it, whilſt others are ſuch formal Academiſts, that they pretend every Leſſon is as neceſſary in Action, as Stopping, Turning, and the like. Both theſe are in the Wrong, the firſt through Ignorance, the latter too often through Affectation; and I believe Miſtakes of this Nature have been partly the cauſe why the *Great Saddle* has been ſo ſlighted and neglected in *England* for ſome Years paſt:

But the late King, who was a Lover of Marſhal Exerciſes, was pleaſed to make choice of Monſ. *de Foubert* (for the Governing of an Academy) one of the beſt Maſters in *Europe*, a well-bred, good-natured and ingenious Perſon, who has a Stable of very fine *Horſes*, and the beſt Maſters for all ſorts of Exerciſes that are neceſſary for the Accompliſhment of a Gentleman. In a word, one that neither wants neceſſary Qualifications, nor ſpares any Pains to teach and improve the Youth committed to his Charge in all Things that are to be learn'd in an Academy.

But (to return to my buſineſs in Hand) the *Manege d' Eſcole*, and the *Manege de Guere* muſt both of them be learnt by every one that deſigns to be a good *Horſman*, though 'tis neceſſary to diſtinguiſh the one from the other, that a Man may know what *Leſſons* are only for the *Academy*, or the like, and what to make uſe of in the *Field*, or againſt an *Enemy*. A good *Maſter* will make you underſtand the Difference; ſo that I need not give you an Account here of any more of thoſe things, which belong to the *Manege d' Eſcole*; and indeed it would take up too much room for this deſign: Therefore when you have been long enough in an *Academy* to be firm, and eaſie, and have a good *Hand* upon a *Horſe*, remember to take notice of this diſtinction, that you may know how to chuſe a *Horſe* for the *Field*, or *Action*, (for amongſt fifty good *Academy-Horſes* 'tis hard to meet with Ten that are good for the *War*) and take in ſhort, the following Account of the *Qualifications* of a good *Horſe* for *Service*.

In the *Manege de Guere* a *Horſe* muſt be taught to Gallop true, and change readily; to go off from the hand like an *Arrow* from a *Bow*, and ſtop or turn at a Point; to obey the *Hand* and *Heel* in advancing or retiring upon a ſtrait *Line*, or otherwiſe; or in going Sideways to the Right or Left; to Riſe before (*a Courbets*) enough to keep him always upon the *Haunch*; to endure Fire, and to Charge up boldly againſt any thing: And all this muſt be done with willingneſs, eaſe, and ſubjection. For 'tis a Maxim in *Horſemanſhip*, That a *Horſe* muſt never do any thing of his own head, but in obedience to his *Rider*, and no more than he requires of him; as alſo, that a *Horſe* can never perform any Action gracefully or well, that he doth with an averſion and uneaſineſs. This is that which is neceſſary for a good *War-Horſe*, and in this the *Rider* muſt be as perfect as the *Horſe*, otherwiſe he will be ſo far from receiving any advantage from his goodneſs and addreſs, that he will not only find himſelf often out of order (by making his *Horſe* do things *mal a propos*,) but in a little time quite ſpoil him, and make him good for nothing.

But I will not undertake in this Diſcourſe to teach you to *Ride*, it being an *Exerciſe*, that as it is the fineſt and moſt uſeful of all (whatever ſome pretend that never could attain unto it) ſo it is the hardeſt to be perfect in, and is never learnt well without a great deal of Induſtry, as well in the *Practick*, as the *Theorick* part, and that under careful and diligent *Maſters*. It is as neceſſary for a Young Man, that deſigns to be a good *Horſeman*, to perform his courſe of Exerciſe in an *Academy*; as for him that would be a great Proficient in Learning, to run through his courſe of *Philoſophy*, *Logick*, &c. in the *Univerſity*. I ſhall therefore undertake only to give ſome general Directions which may be of uſe to ſuch as learn and practiſe this Noble *Exerciſe*. And I cannot imagine how a Young Man of Quality (when by reaſon of his Tender Years he is not ripe enough for Buſineſs and Action) can ſpend his time better, than in learning the Exerciſes of the Body, together with thoſe of the Mind; by which (provided he be under good *Maſters* and *Governours*) he will find ſo great an advantage, that he will not only be fitter to ſerve his *Prince*, when occaſion ſerves, with a vertuous Mind and a ſtrong and active Body; but avoid that lewd Effeminacy and thoſe unmanly Extravagances, which ſo many are ruined by through Eaſe and Idleneſs.

'Tis to be hoped therefore (how negligent ſoever ſome are Educated) that a great many of our Young *Nobility* and *Gentry* will be induced, by their *Parents* Care, or their own Inclinations, to follow the great Example of the *Roman Youth* (who were a glorious Inſtance of the advantage of good Education) and convince the World by their *Actions* and *Behaviour*, that they have ſpent their time as well in the *Academy*, as the others did in their *Campo Martis*.

For the Service of ſuch active and well diſpoſed Youth, I ſhall ſet down theſe following *Rules* and *Directions*; not that a good *Maſter* will omit them, but as they are fundamental Principles of *Horſemanſhip*, 'tis not amiſs to have them in Writing, that by Reading and Conſidering them, they may never fail to have them at command.

The firſt thing to be conſidered by a Young *Horſeman*, is how to Approach and Mount his *Horſe* with ſafety, gracefulneſs, and convenience; which muſt be as follows; If there be but one preſent to aſſiſt him (which may ſometimes happen to Perſons of great Quality in the *War*, or the like) let him place himſelf on the Right-ſide of the *Horſe*, holding his *Head* with one Hand and the *Stirrup* with the other; then let him that is to Mount, walk up to the *Horſe*, not directly before him, leſt if the *Horſe* be fearful of him he put him in diſorder, or if merry and wanton he ſhould ſtrike him with one of his Fore-feet; nor behind him for fear of the ſame Accident from his Hind-feet (for a Miſchance falls out ſometimes in a Minute, that has not hapned before in an Age;) but let him approach him on the Left-ſide over againſt the *Shoulder*, inclining ſomething more to his *Head* than his *Flank*: This done, let him examine if the *Bridle* be well placed in his Mouth, the *Curb* right, his *Girts* faſt, and every thing in good order; and then taking the *Reins* in his Left Hand, and the *Pummel* of the *Saddle* (or a Lock of his *Main*) and laying his Right Hand faſt upon the hinder part of the *Saddle*, let him place himſelf in the *Seat*: And let him endeavour to get a habit of doing this with ſo much eaſe and liberty, that his motion may not ſeem forced or painful, nor the Horſe receive any Inconvenience, or Apprehenſion by his ſwagging him, or falling heavy into the *Saddle*, or bruſhing his *Buttocks* with his right Leg, which are often the faults of unweildy, awkward and heedleſs People.

When he is mounted, having the *Reins* in his Left Hand, with his Thumb upon them, and his little *Finger* between to ſeparate the right from the left *Rein*, let him take the end, (or *Button*) in his right Hand, and lifting up his *Arm* with a looſe and careleſs *Air* adjuſt his *Bridle*, ſo that it be neither too long nor too ſhort, and ſo hold it faſt in its proper place, which muſt be three or four Fingers breadth above the *Pummel* of the *Saddle*, and exactly before him. Let him put himſelf from head to foot in the true poſture of a good and fine *Horſman*. He muſt be placed in the middle of the *Saddle*, (not touching, if poſſible, any other part of it) and reſt upon his *Twiſt*, not his *Buttocks*, keeping himſelf all over ſtraight and eaſie, as if he were on foot, his Shoulders juſt with the right, ſomething forward, his Stomach advanced, holding his Elbows (equally and unaffected) at a little diſtance from his Body; his right Hand at about three or four Fingers diſtance from the left, graſping the handle of his *Switch* or *Sword*, with the Point upwards, a little enclining to the Horſes left *Ear*, his *Legs* a little forward, with his *Toes* preſſing firm upon the *Stirrups* near his *Horſes Shoulders*, his Heels lower than his *Toes*, and turned outwards, his *Knees* faſt as if they were glewed, which with the Counterpoiſe of the Body, by obſerving time is all that makes a Man firm on *Horſeback*: Nothing ſhews a good *Horſman* more than to ſit Free and Airy, and nothing ſhews more ridiculous than to ſee one ſit in a ſtarch'd and formal way like a Statue.

This is the true poſture of the *Great Saddle*, that he muſt keep himſelf in, whatever *Airs* or *Leſſons* the *Horſe* performs, allowing only for different *Aids*, and the various Counterpoiſe of the Body, according as neceſſity requires.

The Counterpoiſe of the Body muſt be in *Galloping* ſomething backwards, both for the Gracefulneſs of the Poſture, and that the *Horſe* may with more eaſe keep himſelf upon his *Haunch*; the ſame is requiſite in a *Trot*, or any other *Pace*, and eſpecially always in ſtopping, for in that caſe it is not only graceful, and eaſie to the *Horſe*, but prevents great diſorder, which arrives ſometimes by a Man's jolting forwards almoſt touching his Horſes Neck. The like is to be obſerved in *Volts*, *Demy-volts*, *&c.* unleſs a Horſe be rough and Leaps; which if he doth, his Rider muſt obſerve to keep time with him, leaning backwards when his *Croup* is in the Air, and forwards when he riſes before, without confuſion, or diſorder.

And the better to know the different *Aids*, let him take notice and remember, that there is in the *Managed Horſe* two Motions, *viz.* that of the *Shoulders*, and that of the *Haunch*; now that of Shoulder is governed by the *Hand*, and that of the Haunch by the *Heel*.

The motion of the *Hand* is thus, if he turns to the right, he muſt turn his *Bridle-hand*, ſo that his Nails come upwards, removing it little or nothing out of the place: if to the left, he muſt keep it in its own natural poſture without turning, only moving it a little to the left. In both theſe motions he muſt feel his *Horſe's Mouth*, and work it inſenſibly as occaſion requires. When a *Horſe* carries his Head in the right place, and ſteady, his Neck pliant, and obeys theſe *Aids* readily, we ſay he is well in the *Hand*.

The motion of the *Heel* is as follows; when he is *Galloping* upon the *Volt*, *Demi-volt* or the like, and would have his *Horſe* keep his *Croup* inwards (which is neceſſary) he muſt ſtretch out his *Leg* on that ſide to which he turns, and move the other nearer to the *Horſes Belly*, ſo that he may feel the motion. If he would make his *Horſe* go ſide-ways upon a right line, he muſt firſt put his Shoulders in motion, and then give the ſame *Aids* with his *Legs* as before, and when ever his *Horſe* (of himſelf, as by any accident) throws his *Croup* this way or that way, by moving one of his *Legs* to him, and ſtretching out the other, he will rectifie him. A *Horſe* that is well *Managed* will obey theſe *Aids*, if rightly given, and then we ſay he is well in the *Heel*.

In theſe *Aids* of the *Hand*, and the *Heel*, lies the Art of making a *Managed Horſe* perform all his *Leſſons* with exactneſs, which is not ſo eaſie a thing as ſome imagine, who think if a *Horſe* be perfect, the *Rider* has nothing to do but ſit ſtill upon his Back; becauſe if he doth but ſit faſt, and keep in Action, they look after no more, not heeding whether he guides the *Horſe*, or the *Horſe* him. But let an ill Horſeman be upon never ſo good a *Horſe* and never ſo well managed, if he Rides before a good *Judge*, or Fights with a good *Horſeman*, his weakneſs will certainly appear. Let him therefore that begins to learn, make it his firſt buſineſs to get a good Seat, a true and exact poſture, without ſtifneſs, or affectation; to gain which, let him add his own obſervation to his Maſters directions, and making choice of ſome well ſhaped Perſon (who is known to be a fine *Horſeman*) let him obſerve his *poſture* and *motions*, endeavouring to imitate them, for we are apt to learn faſter from Examples before our Eyes, than from the beſt directions that can be given.

In the next place let him endeavour to get a juſt hand upon a *Horſe*, and to give his *Aids* true, and *a propos*, which muſt be done by a conſtant Application, and a good Memory; and by working with his *Head*, as well as his *Body*. And laſtly, I would adviſe him to ſtick to it till he is ſo far Maſter of a Horſe, that he is not only able to Ride one that is managed to his hand, but to teach a young *Horſe* himſelf. For though the teaching a young Horſe be too great a drudgery for a Perſon of Quality, ſo that it is not fit he ſhould practiſe it, yet unleſs he knows what belongs to it, he will not be capable of judging when his *Riders* commit Errors, and whether his *Horſes* be well managed or no. And when he leaves the *Academy*, let him be ſure to be eaſie, and unaffected on Horſeback, with a looſe and Manly Gaiety, free from ſcrued *Grimaces*, and ſtiff Poſtures. For ſome young Sparks upon their firſt leaving an *Academy*, have their Heads ſo turned with it, that they are for managing all Fleſh alive, even to the *Poſt-Horſe*, and are in the ſame Poſtures a *Hunting*, *Hawking*, and the like, that they ought to be in at the head of a *Squadron*: whereas a compleat *Horſeman* diſtinguiſhes always what *Horſe* he is upon, and what he is doing; If he is upon a *War-horſe* going to Charge, he puts himſelf in a firm poſture, and conſiders how he ſhall Attack, or Defend; If a *Hunting*, his *Stirrups* are ſhortned for the eaſe of his *Horſe*, and his Poſture is more negligent and looſe: If for *Riding* a *Courſe*, or *Heats*, his Feet are home in the *Stirrups*, his *Elbows* cloſe to his Body, lying ſnug upon his *Horſe*, that he may have the advantage of the Counterpoiſe, which doth not hinder the Running ſo much before: In a word, a good Horſeman knows how to make uſe of all Horſes for all uſes, and in all places.

CHAP. XI.

Of Terra a Terra, Demivolts, Corvets, Caprioles, Croupade, Peſade, &c.

OUR Author having omitted divers Leſſons that are uſeful for managing Horſes, we'll ſupply them here out of *Solleyſell*, and others; and ſhall begin with the Square, for a *Terra Terra*, which is to be preferr'd before a Circle; and therefore it ſhould be 24 or 30 Foot Diameter for you to work your Horſe in; ſit ſtrait on the Saddle, poiſe a little more upon the outward Stirrup, but do not lean too much, the outward Leg to be a little longer than the other; and the inward very little before it: Reſt upon the Twiſt and Stirrups, ſit near the Pommel, the Knee of the outward Leg cloſe to the Horſe, and turn'd inwards, be alſo ſtiff in the Ham: If you are going to the Right Hand, let the Bridle-Hand be put on the out-ſide of his Neck, turning up your little Finger to make it reſpect the Left Shoulder, which will pull the inward Rein that lieth above the little Finger, your Arm being a little oblique from your Body, and your Left Shoulder turn'd a little in, which will make your Body reſpect a little your Right-ſide: Your Horſe by this means will neceſſarily go a little couch'd upon his out-ſide; and the beſt means to keep your Hand ſteady, is to turn your Head aloof upon the in-ſide of the Turn, to the in-ſide of the Horſes Head: Note, that the Bridle-hand, in rounding the Corners, or Angles of the Square, muſt be carried circularly with the Horſe, and ſteadily, but yet only ſo as to feel him. The Poſture of your Body having thus brought the Horſe to Couch on his out-ſide; if you will pull the inward Rein of his Bridle, it enlarges him before, by pulling, as it were, his inward Fore-leg from his outward, and bringing his inward Hind Leg near to his outward, which narrows him behind; making him to bow in the Gambrels, eſpecially in his outward Hind-Leg, on which he reſts moſt, and thruſts his inward Hind-leg under his Belly, and ſo makes him go very much upon his Haunches: For the Horſe muſt neceſſarily, when preſs'd in this manner on the out-ſide, look within the Square or Turn, and his enlarged fore-part will make him the better embrace the corners of the Square he is to round: his Hind-legs alſo being within the lines of his Fore-legs, he muſt needs be upon the Haunches, and his inward Fore-leg, with which he leads, being pulled, in a manner, from his outward, it will look longer than the other, and ſo make the firſt and largeſt Circle, or Square, which is right; and ſo his outward Fore-leg the ſecond, his inward Hind-leg the third, and the outward the fourth and leaſt Square.

You muſt not keep your Bridle-hand too high, and the pulling the inward Rein of the Bridle, preſſes the Horſe on the out-ſide, weighs him up, and puts him upon the Haunches, eſpecially upon his outward Hind-leg, ſo that all his Body leaneth on the out-ſide, and he cannot bring in his inward Shoulder to give his Fore-leg, within the Turn, liberty to lead: The ſame Directions ought to be obſerved for the Left-hand as for the Right, only altering the Bridle-hand, Body and Legs: As for the Bridle-hand, when you go on the Left-hand, you muſt put your Hand on the contrary ſide of his Neck, which lies without, your Arm cloſe to your Body, and the Knuckles of the Bridle-hand turn'd towards his Neck, which will pull the inward Rein for the Left-hand, becauſe it lies under your little Finger, which will make both your and the Horſes Body oblique, and make every thing elſe anſwer.

Whenever you have a mind upon a *Terra a Terra*, to change Hands; your Body being in the ſame Poſture as before, let his Shoulders, to which Hand ſoever you go, come in a little before you change him, and then help him with that Leg that was inward, before you changed, and ſo put him forwards, holding him up with the Bridle-hand upon the out-ſide of his Neck: 'Tis to fix his Croup, that it may not go out, that his Shoulders ſhould come in a little before you change him: Be ever ſtiff in the Hams, and let your Heels be kept down.

In changing upon *Demivolts*, your ſitting muſt be oblique, the Hand on the out-ſide, the outward Leg cloſe to the Horſe, the Knuckles of the Bridle-hand towards his Neck, and let him go a little more than half a Turn, in making his *Demivolts*, to fix his Croup: After this be aſſiſtant to him firſt with the inward Leg, hold him up with your Hand, and a little on the out-ſide of his Neck: By a Wall it can be but juſt a half Turn, or *Demivolt*, which may be helped with the inward or outward Rein at pleaſure, ſo as he keeps his Line by your keeping his Croup to the Wall: the outward Rein ſhould always be made uſe of, when you would bring in his inward Shoulder.

As for the *Corvets*, there are ſeveral ſorts of them; the Seat muſt be the ſame as in *Terra a Terra*, tho' not quite ſo ſtiff and oblique, the Bridle-hand even with the Neck, Knuckles towards it, go on which Hand you will, but the Hand ſtill over the Neck, two or three Fingers above the Pommel, a little forwards, without any other help, but to ſtay him a little upon the Hand: the Horſe ſhould be quick from the Ground, and ſtay'd in the Air upon the Hand, the Body always going to that end of the Horſe that comes to you, that is, bending a little to him as he riſes: Sit forward to the Pommel, your Body being ſtrait, Thighs and Knees cloſe, Toes a little out and down, not helping him with your Legs at all, without he puts in his Croup too much: To make him *Corvet* ſtrait forwards, or along a Wall, the *Cavezons* Rein, which is from the Wall, ſhould be tied to keep that Hind-leg near to the other, which is next the Wall: Begin with two or three Peſades, then walk him forwards and *Corvet* him, and if he preſſes too much forwards, let him make his *Corvets* in one place, and then put him on again. To explain the thing more fully, you muſt tie the left Rein of the *Cavezon* to the Pommel, when the right Shoulder is next the Wall, and ſo *vice verſa*; and for the Bridle-hand in forward *Corvets*, you are always to help with the Rein next the Wall, to enlarge him before and narrow him behind: If he beats upon the Hand, you muſt raiſe him high upon the *Peſade*, hold him there, this will put him upon the Curb and make him endure it: But if this fails, gallop him upon a ſtrait Line by a Wall, or otherways, and from his Gallop ſtay him upon the Hand, and ſo let him go in *Corvets*, or let him gallop a ſhort Gallop forward: Then ſtop and raiſe him three very high *Peſades*, and when he is up hold him on the Hand;

but if this does not cure him, trot and ſtop him with good hard ſtops, and ſometimes pull him back : Your Stirrups muſt be an equal length, rather a hole too ſhort than too long.

In the ſide-way *Corvets*, you are to help with the Bridle only, and putting his Head to the Wall, help with the outward Rein, if you go to the right Hand, let him go ſide-ways and make three or four *Corvets* ſo ; then walk and *Corvet* him ſide-ways again ; diminiſh his Walks by degrees, and augment his *Corvets* : The like helps are to be uſed for the left as the right. Then for the backward *Corvets*, pull him back, let him make three or four *Corvets* in one place, thus by pulling him back, and augmenting the *Corvets*, he will at laſt perfectly perform the backward *Corvets* : And help him always with the Bridle Rein next the Wall, to narrow him before, and enlarge him behind, that his hind Parts may be more at liberty : Help not with your Legs at all, but with your Bridle-hand, pull him back every time he falls to the Ground, which will bring him to perform exactly well.

The *Cavezon*'s inward Rein in *Corvets* upon the *Volt*, muſt at firſt be tied to the Pommel, and his Croup not too much in : At firſt Teaching he ſhould rather go in Circles of one Thread, for to keep out the inward Hind-leg is the main Buſineſs : let him therefore be helped a little with the outward Rein by the Bridle, and be raiſed three or four *Corvets*, then walked upon the Circle and *Corveted* again, and ſo the Walk diminiſhed and the *Corvet* augmented, till he makes the whole Turn, or *Volt* upon *Corvets*. Being perfect in Circles of one *Piſt*, *Corvet* him with his Croup a very little upon the *Volts*, which is the perfection of this Exerciſe. Now to change upon *Corvets*, if your Horſe goes to the Right Hand, and you have a mind to change him, the inward, or Right-leg ſhould be gently put to him, let him be held up a little with the Bridle-hand, on the in-ſide of the Neck ; and as ſoon as he has changed, the Right-leg is to be taken from him. Help no more with your Legs, only the Poiſe of the Body upon changing, is to be a little on the out-ſide.

Laſtly, for the Croſs and Saraban upon *Corvets*, help with the outward Rein, that ſhould be pull'd firſt on the one ſide, then the other ; after every *Corvet* from ſide to ſide, helping with the Bridle-hand only, and the outward Shoulder always following, without the help of Legs. Dull or fiery Horſes are not at all proper for *Corvets*.

We come next to the *Caprioles*, wherein you muſt ſit ſtrait, your Thighs and Knees, as cloſe as if glued to the Saddle, Stirrups a little ſhorter than ordinary, your Toes a little down, and when you raiſe your Horſe, preſently put your Breaſt out, which will make your Shoulders go a little back : Walk him forward, let him make one Leap, then raiſe him high upon a *Peſade* or two, ſtaying him on the Hand ; then increaſing your Leaps, and diminiſhing your *Peſades*, he'll come by degrees to leap perfectly. When he is perfect upon a ſtrait Line forwards, he may be put upon Volts or Circles, and the ſame Method continued : When you raiſe him to leap, help him with the point of your Rod, and always cauſe him to make a *Peſade* or two, when you have done Leaping : you ſhould always work the outward Rein with your Bridle-hand, to narrow him before, and enlarge him behind, and to have the more freedom, eſpecially with his Croup, which if bound up, hinders him to leap ; therefore the outward Rein upon all Leaps whatever is to be uſed either ſtrait forwards, or upon Circles.

As for the *Croupade*, the only difference between it and the *Capriole*, conſiſts in the way of helping with the Rod, which muſt be by ſtriking him a little above the *Gambrels*, whereas in the other, you help him with the point of it on the ſetting on of his Dock, or by giving one or more ſtrokes with the great end of it juſt behind the Saddle. And in the *Balotade* it varies only, that you muſt ſtrike him with the Rod juſt upon the middle of his Croup. A *Step* and *Leap* is an Air wherein Horſes commonly go, when they have not a good *Apuy* : All Leaps are made upon the Hand, and therefore the Horſe ought to be well ſettled on the Hand before you try if he will leap, becauſe nothing diſorders a Horſes Mouth more than Leaping : Your Legs are not helpful here, only hold him up well with the Bridle-hand when he riſes before, that ſo he may riſe the higher behind ; and when he begins behind, put your Bridle-hand a little forward, to keep him up before, and ſtay him there on the Hand, as if he hung in the Air, and ſo time the Motion of your Bridle-hand, to take him, as if he were a Ball upon the Bound, which is the greateſt Secret of all in leaping a *Horſe* right.

The *Peſade* has been deſcribed, and ſo often mention'd before, that a farther Account of it ſhould not be omitted here, for the better underſtanding of other Matters. The *Cavezon*'s inward Rein being in your Hand, or tied to the Pommel, help your *Horſe* with the outward Rein, and raiſe him as high as you can in Paſſaging, holding him gently there, without giving him occaſion to fret : This done, walking him a little, raiſe him again, and that round the Volt you are working him upon. A *Peſade* ſhould never be taught a *Horſe* at firſt Riding, before he is pretty well advanced in the *Manege*, and pliant to the Hand and Heels. If the *Horſe* will not riſe eaſily before upon *Peſades*, then you are to put him between Pillars, helping him with two Rods upon the Outſide of his Fore-thighs, and he will ſoon come to do it. But as ſoon as you find him riſe eaſily, never make uſe of them any more ; for they ſubject his Croup too much, and make him go by rote ; and, in a word, never force or preſs your *Horſe* too much to any thing.

In the *Pyroite*, having your Hand upon the Outſide of the *Horſe*'s Neck, to make him look into the Turn, you muſt, before you begin it, in an inſtant work violently with the outward Rein of the Bridle, to ſtreighten his Fore, and give his Hind-parts more Liberty. In his going to the Right Hand he lifts his Hind-legs without the Turn, at the ſame time that he lifts his two Fore-legs, ſo that he has three Legs up together, his inward Hind-leg being then the only Support of his Body. When the other three come to the Ground, the outward Shoulder comes in ſo quickly, that it brings the inward Hind-leg to move at the ſame time almoſt in one Place, to ſupply the Place of a Center, and make an exact Turn : But when the *Horſe* is ſo giddy, that he can go no longer for fear of falling, he thruſts his inward Hind-leg forward beneath his Belly to ſtop himſelf. Note, That in this Exerciſe, as the *Horſe* is turning, you muſt take care to turn your Body well to the Turn, and alſo look on the Inſide of his Neck.

Having in like manner deſcribed the ſeveral ſorts of *Paſſades* before, in this Exerciſe you are to walk your

your *Horſe* ſtrait forwards, either by a Wall or Paliſade, at the end whereof ſtop and raiſe him two or three *Peſades*, turning him gently with the help of the outward Rein and Leg; but ſee he falſifies not his *Demi-volt* either with his Shoulders or Haunches in Paſſaging: Do as much on the other hand, then begin to trot him upon the ſame ſtrait Line, ſtopping, raiſing him before, and turning him as you did upon the Walk. Being perfect in his Trot, put him on a ſhort Gallop upon the ſtrait Line, ſtopping and advancing as you did before. After this put him to his *Demi-tour* or *Volt*; not by Paſſaging, but upon his Air; and when perfect herein, then let him make a Paſſade upon a ſhort Gallop, without either ſtopping, or raiſing before, but only turning when at the End of the ſtrait Line. His Head in Galloping muſt be always kept a little from the Wall; likewiſe you may, before he turns, let him make two or three *Falcades*, to firm his Haunches the better, and to turn with the better Grace. Whenever you intend to run your *Horſe* at his full Carrier, his Head ſhould be kept a little from the Wall, the Bridle-hand ſlacken'd; and at the End of the Paſſade let him be preſt with your Thighs, and ſtay'd a little upon the Hand, that he may make two or three Falcades before he is turned. The next thing, as in the *Pyroite*, is to cloſe him with the outward Rein, paſſading him from one Hand to the other, making commonly a ſtrait Line, when you do it at full ſpeed about five or ſix times, the *Horſes*'s length only; and ſo he will go perfectly upon Paſſades, which is the Touch-ſtone of a ready *Horſe*, and abſolutely one of the moſt uſeful things in the *Manege* for a ſingle Combat. You are to aſſiſt your *Horſe* always in Paſſades according to the Air with which he cloſes the End of it: For if with a *Terra a Terra*, then with the inward Rein and outward Leg; but if with the Half *Pyroite*, then with the outward Rein and Leg, and help always with the Rod upon the contrary Side to which he is going.

CHAP. XII.

Of a new Invention to dreſs Horſes *upon all Airs, by the Help of a ſingle Pillar: As alſo, the ſeveral Helps and Corrections of the* Spurs.

Though the Directions already given are, in the Opinion of moſt Men, eſteem'd to be the beſt; yet this that follows, being curious, extraordinary, and very good in its Kind, you are inſtructed firſt to bring your *Horſe* ſaddled and bridled to the Pillar, where put him under the Button of the Bridle-Reins, which is to draw down that little Leather Button, that moves up and down upon them, and ſo near to the *Horſe*'s Mane, that it may ſtay and fix the Branches of the Bridle at ſuch a degree of Straitneſs, that the *Horſe* at firſt may have but a very gentle feeling of the Bit, either upon his Bars, or the Place of the Curb. Now if you have a mind he ſhould go to the Right Hand, let the Groom put the inward Rein of the Cavezon about the ſingle Pillar, a little higher than the *Horſe*'s Head, keeping it very ſhort there, and let the long Rein of the Cavezon be held by another Perſon in one Hand upon the Outſide of the Turn, and a Stick and a Bodkin at the End of it in the other, to prick him in caſe he ſhould put out his Croup too much: To keep him from going backwards, let another Perſon ſtand behind him with a Rod in his Hand; and then, you being on foot, raiſe him in one Place, being content with very little from him at once. Having uſed him thus a little, help him with three Rods, your ſelf with two before, *viz.* one on each Fore-thigh, and let the third be uſed by another under his Belly; which will bring him very much upon the Haunches. When he can perform his Leſſon exactly in one Place, keep the inward Rein ſhort, as before; make him go upon Volts, with the help of the three Rods; but be you then on the Outſide of his Shoulders, to give him the more Liberty to turn; and ſo he will be quickly brought to go Corvets perfectly well upon the Volts forwards. Do the ſame thing, only go before and face him, and this will make him go Corvets backwards upon his Volts; and continuing the ſame Rein, you will bring him to Corvets ſideways.

Having brought him to Perfection for the Right Hand, then tye the Left Rein of the *Cavezon* ſhort about the Pillar, doing every thing as before; and when he goes perfectly, mount him, the ſame Rein of the *Cavezon* being ſtill very ſhort about the Pillar.

Having done with the Uſe of the Pillar, to dreſs a *Horſe* upon Airs, afford us room for a few Words concerning, *The Helps of the Spurs*; as, firſt, when a *Horſe* goes *Terra a Terra*, and your outward Leg cloſe to him, if he ſlacks, you are to turn your Heel to him, and pinch with the Spur, ſo as to draw Blood from him; and if while you ſtay on the Hand, he ſuffers and obeys this, you may juſtly allow him to be an excellent *Horſe*. Another and more gentle help of the Spur is, that when a *Horſe* gallops his Croup in, or *Terra a Terra*, if he does not enough obey your outward Leg, being cloſe to, or very near his Side, then make a Motion with your Leg, as if you intended to ſpur him; but let it be as gently as you can, juſt feeling it, and no more. So much as Spurs are Helps, now let us ſee how they ſerve for Corrections: And in the firſt place, if your *Horſe* rebels againſt what you would have him do, ceaſe not to ſpur till you find him begin to comply; and when he does that in the leaſt, alight and ſend him to the Stable. Try him again next Morning, and if he obeys, cheriſh him. The particular Caſes wherein, generally ſpeaking, you are to uſe your Spurs are theſe: Firſt, When he puts his Croup too much in or out, or if he refuſes to turn to that Hand you would have him, you are then to correct him with the oppoſite Spur: But when you find him reſty, and will not go forward, or be apprehenſive or ſkittiſh, or make an Offer of Biting or Striking, he muſt then receive the Correction of both Spurs. You have been already told on another Occaſion, that when your *Horſe* riſes too high before, or bolts upright, you are to give him both Spurs as he is falling down; but do not make uſe of them juſt as he is riſing, leſt they make him come over upon you. Again, if he will not advance, or riſe before, a good Stroke with both Spurs will make him do it, provided he be at the ſame time kept firm, and ſtay'd upon the Hand, and as it were ſupport him a little with the Bit. In like manner, if he be a dull Jade, or lazy and ſlack in his *Manege*, then ſpur to quicken him: But 'tis to be obſerved, that though the Spurs diſcreetly uſed, are ſo very uſeful, yet nothing makes *Horſes* more vicious and reſty, than when uſed unſeaſonably; and there are more *Horſes* become vicious by ill Riders and Bunglers, than are naturally ſo. The more unruly therefore the *Horſe* is, the more Judgment and Calmneſs is required in the Rider; and, in a word, it's more difficult to bring a *Horſe* that has been ſpoil'd by ill Riding, either correcting him out of time, or letting him have his Will at firſt too much, to obey, than the worſt-natured Jade in the World.

CHAP. XIII.

To correct and prevent Vices in Horſes.

YOU are to obſerve, in caſe a *Horſe* carries his Head and Neck awry, to which Side he inclines it, and ſtrike him twice or thrice with the contrary Spur; but if you find him very ſtiff-neck'd on the Right ſide, and plying or bending on the Left, then you muſt hold the Right Rein ſhorter than the other; and when you find him incline that way, give him ſudden Checks, having a ſharp Wire faſten'd in the Rein, that ſtriking in his Neck, he may be obliged to hold it ſtrait, obſerving to check him upwards, leſt he get a Habit of ducking down his Head. When a *Horſe* ducks his Head, check him ſuddenly with the Bridle, and put your Spurs into him, that he may be ſenſible of his Fault. If he be ſtanding, make him bring his Head into its right Place as he ſtands; if going, let it be whilſt he is moving; and being ſure to cheriſh him when he obeys, he will ſoon underſtand your Meaning.

A *Horſe* that is ſubject, upon every trifling Occaſion, to ſhake his Head and Ears, or move the latter when he intends to kick, or bite, or throw you, ſtrike him on the Head with your Wand, and at the ſame time give him a Check with your Bridle, and a Stroke with your contrary Spur, putting him ſuddenly out of his Pace, and then make him ſtop, that he may have leiſure to underſtand your Meaning. When he ſtarts or winches, a Sign of his intending to bite or kick, you are to do the like. When you find him reſty, that is malicious and unruly, ſhrugging himſelf ſhort, and will not go forwards, pull him backwards, and that ſeldom fails to put him on; if otherwiſe make uſe of your Spurs to the purpoſe, and let another on foot whip him forwards: And though he reſiſt for a time, the Whip and Spur, if ſharply and timouſly uſed, will at laſt bring him to it; and when once you begin, they muſt be continued till he yields, provided this Reſtineſs proceeds from Stubbornneſs.

A *Horſe* that rears an End, and riſes ſo high before, as to endanger his falling back upon his Rider, muſt have the Bridle given him, and leaning forward with your whole Weight, give him both Spurs as he falls down, but not as he riſes. When a *Horſe* is apt to fall down upon the Ground, or in the Water, a Pair of good Spurs applied as ſoon as you perceive him going about it, will divert him from thinking more of it: If he deſiſts, then correct him no more at that time; for bad Horſemen are the cauſe of moſt of theſe Vices, by giving unſeaſonable Correction, by which they are ſo far from making a *Horſe* ſenſible of his Fault, that they fright and put him into Confuſion, and make him at laſt reſty.

When a *Horſe* is apt to run away, uſe a gentle Bit, with a ſlack Curb, and keeping an eaſie Bridle-hand, walk him without ſtopping, only ſtay him upon the Hand by little and little; then trot him a while, reduce him from a Trot to a Walk, ſtaying him by degrees, and be ſure to cheriſh him always when he obeys. When he is become thus far tractable, bring him from his Trot to a gentle Gallop, and from that to a Trot; then to a Walk, ſtaying him with a gentle Hand by degrees: And if, with Judgment and Patience, this Method be uſed for a while, you may probably prevent his running away. But ſuppoſe after all he does run away, and that you cannot ſtop him; in that caſe, if you have Field-room enough, whenever you find him begin, let him go by ſlackning the Bridle, and ſo ſpur him continually and ſharply, till he begins to ſlack of his own Accord: And this has been ever found the beſt Remedy for a Run-away *Horſe*.

As to ſkittiſh and ſtarting *Horſes*, which puts a Man always in danger of being thrown off his Back, if the Defect proceeds from the Weakneſs of the Sight, by repreſenting things otherwiſe to him than they are, give him time to view them well, and then ride him up gently to them: But if your *Horſe* be naturally fearful, and apt to ſtart at the hearing of any ſtrange Sounds, uſe him to the Noiſe of Guns, Drums and Trumpets, in which he will take Delight in time.

CHAP. XIV.

Of the Saddle, *and its Appurtenances, Bits, Branches,* &c.

THE *Saddle* ſhould be made commodious for the Horſeman, as well as adjuſted to the *Horſe*, and that it may not gall him, it ſhould reſt ſo, as that no Part of it preſs his Back more than another; neither ſhould it any ways reſt upon his Withers, Reins, or Back-bone, which is term'd *Upon the Length of it*: For if the Toes, or Points of the Saddle's Fore-bow preſs too much the *Horſe*'s Sides, then the upper part of it will be void and hollow, and not cloſe enough to the *Horſe*'s Back, by which Inconveniency the *Horſe* may come to halt; but if the Points of the Saddle's Fore-bow be too wide and open, they will preſs him near to the upper part of the Saddle, and a little below the Withers, and ſo either hurt and pinch his Soulders, or occaſion Sitfaſts, that are difficult to cure. The Saddle will in like manner be faulty, if the Hind-bow do not exactly accompany the Shape and Circumference of the Body where it reſts, and will quickly ſpoil the *Horſe* where it preſſeth moſt.

The next thing to be conſider'd is the Stuffings of the *Pannels*, which ſhould not be above the Thickneſs of two Fingers, and ſhould be either of Deer's Hair, or the long Hair of *Horſes* Manes and Tails, or even that of Oxens Tails, which does not harden near ſo much with the Sweat, as the ordinary Hair of Oxen and Cows. Some ſtuff their

Saddle-Pannels with well dried Moſs, and ſay 'tis very proper for this Uſe.

The Saddle ſhould be placed exactly on the middle of the Back, the Fore-bow juſt at the Want of the Shoulders. If the Saddle is placed too forwards, the Skin and Fleſh of the Shoulders will be forced as it were forwards, and appear raiſed high at the Points of the Fore-bow. The ſame will happen if the Pannels are too much ſtuffed before, or that the Toes of the Fore-bow be too narrow and ſtrait.

That a Saddle may be commodious for the Rider, it ſhould be low, and not too much elevated above the *Horſe*'s Back; the Fore-bow of it ſhould not be made with a kind of raiſed Neck, but the Saddle-Withers ſhould be low, and but two or three Fingers Breadth above the Withers. The Fore-part of the Saddle ſhould alſo be but a very little elevated above the Hind. If you deſign a Saddle ſhould be low upon a *Horſe*, order the Saddler, when he is to fix the Bows upon the Bands, whether they be of Iron or Wood, to place the Bands near to each other, eſpecially upon the upper part of the Inſide of the Fore-bow, pretty near to the Withers of it. The *Engliſh* Saddlers are eſteemed even by *Solleyſel*, and other Foreigners, the beſt Artiſts in the World.

Having got your Saddle made very convenient for your *Horſe*, ſee in the next place that the Crupper be neither too ſtrait drawn, nor too ſlack and looſe: If with a ſingle Buckle, ſee that it do not reſt upon the *Horſe*'s Reins, which will dangerouſly gall him; and if you perceive it ruffle, adjuſt beneath it a Piece of Veal, or Roe-buck's Shin, with the Hair next the *Horſe*. Hunting-Cruppers are thoſe that have no Buckles, but faſten'd only to the Saddle by two Straps, tho' now not much uſed. The beſt are the *Engliſh* Cruppers with the Buckle, which may be ſlack'd or ſtraitned as you pleaſe. The Dock-piece of the Crupper ſhould be pretty large and full, that the *Horſe* may not ſo eaſily gall beneath the Tail. If a *Horſe* be low before, he ſoon galls, and *Mares*, which are uſually ſo, are more ſubject to it; and in this caſe 'tis convenient to have a Saddle that is higher before than ordinary, with a very little Stuffing in the Pannels behind, and a Crupper with two Buckles ſhould be alſo uſed. Others, to prevent the Inconveniency of Galling, ſew a Candle in the Dock-piece of the Crupper, whoſe melting ſoftens the Leather, and prevents the Infirmity.

As for the *Poitral*, or Breaſt-plate, it ſhould be of a juſt Length, and the Stays and Supporters neither too long, nor too ſhort. When it ſo happens that the Hair is cut and taken away in thoſe Parts of the Shoulders, where the Hulſters reſt, fix beneath them a Piece of Roe-buck, or Calf's Skin, well furniſk'd with Hair, or line the Part with very ſoft Leather ſtuffed with Wool: The Buckle alſo by which the Breaſt-plate is fixed to the Saddle ſhould be ſo placed, as neither to cut the Hair, nor hurt the *Horſe*; and if too far forward, put them back between the Saddle-bow and Pannel, or even upon the Bow it ſelf, with ſome Calf or Roe-buck's Skin beneath.

The *Girths* ſhould be large and ſtrong, and of good freſh Girthweb, and let there be no Knots upon them, which otherwiſe will gall and ſpoil the *Horſe*. The Saddle-ſtraps ſhould be of *Hungarian*, or elſe good, white, oil'd Leather, two on each Side of the Saddle-bow, with a good broad Surſingle.

The Stirrup-Leathers ſhould be of the ſame Leather, the Stirrup-Irons ſtrong, and either barr'd or grated where you place your Feet, and alſo pretty large, that you may ſooner quit them in caſe of a Fall. Some will have them to be fixed to the Stirrup-Leathers, without Swivels; thoſe that are lighteſt are moſt proper for a Courſe, or taking the Air.

The Iron which is put into a *Horſe*'s Mouth is called a *Bit* or *Bit-mouth*, in the Middle whereof there is always an arch'd Space for the Lodging of his Tongue, which is called the *Liberty*. It's the Opinion of the Duke of *Newcaſtle*, that as little Iron ſhould be put into a *Horſe*'s Mouth as poſſible; and we ſeldom uſe any other than Snaffles, Cannon-mouths jointed in the Middle, Cannon with a Faſt-Mouth, and Cannon with a Port-Mouth, either round or jointed.

As for the *Bits* now in uſe, beſides the Snaffle, or ſmall Watering-Bit, at *Fig.* I. there is the Cannon-Mouth jointed in the Middle at *Fig.* II. which always preſerves a *Horſe*'s Mouth whole and ſound; and though the Tongue ſuſtains the whole Effort of it, yet 'tis not ſo ſenſible as the Bars, which are ſo delicate, that they feel its Preſſure through the Tongue, and thereby obey the leaſt Motion of the Rider's Hand. The larger it is towards the Ends fix'd to the Branches, the gentler 'twill be. We ſhould make uſe of this Mouth to a *Horſe* as long as we can; that is, if with a ſimple Cannon-Mouth we can draw from a *Horſe* all the Obedience he is capable of giving, it will be in vain to give him another, this being the very beſt of all.

The Cannon with a Faſt-Mouth, at *Fig.* III. is all of one Piece, and only kneed in the Middle, to give the Tongue Freedom. It's proper to ſecure thoſe Mouths that chack or beat upon the Hand: It will fix their Mouths, becauſe it reſts always in one Place; ſo that deadning the ſame in a manner thereby, the *Horſe* loſes his Apprehenſiveneſs, and will ſoon reliſh this Bit-mouth better than the laſt, which being jointed in the middle, reſts unequally upon the Bars: This however, becauſe not jointed in the middle, is more rude. The middle of this Bit ſhould be a little more forward, to give the more Play to the *Horſe*'s Tongue, and the Bit ſhould reſt rather on the Gums, or Outſides of the Bars than upon their very Ridges.

The fourth Sort is called the *Cannon-Mouth with the Liberty*, after the Form of a Pigeon's Neck. When a *Horſe*'s Tongue is too large, ſo that the Thickneſs thereof ſupports the Mouth of the Bit, that it cannot work its Effects on the Bars, this *Liberty* will a little diſingage it, and ſuffer the Mouth of the Bit to come at, and reſt upon his Gums, which will make him ſo much the lighter upon the Hand.

The *Port-Mouth*, at *Fig.* V. is a Cannon with an upſet or mounting Liberty, proper for a *Horſe* with a good Mouth, but a large Tongue, working its Effects upon the Lips and Gums; and becauſe the Tongue is diſingaged, it will ſubject the *Horſe* that hath high Bars, and in ſome degree ſenſible. This uſeful Bit, if well made, will never hurt a *Horſe*'s Head.

The *Scatch-Mouth*, with an upſet or mounting Liberty, at *Fig.* VI. is ruder than a Cannon-Mouth, becauſe not fully ſo round, but more edged, and preferable to them in one reſpect; which is, that thoſe Parts of a Cannon-mouth, to which the Branches are faſtned, if not well riveted, are ſubject to ſlip; but the Ends of a Scatch-Mouth can never fail, becauſe of their being over-lapped, and therefore much more ſecure for vicious and ill-natur'd *Horſes*.

Mr. *Pignatel*'s Cannon-Mouth with the Liberty is proper for a *Horſe* with a large Tongue and round Bars, as being only ſupported a little by his Lips. Care ſhould be had never to work a *Horſe* with one Rein, as long as he has one of theſe Bit-mouths. The Deſcription Sir *William Hope* gives of this Bit is, that it has a gentle falling and moving up and down, and the Liberty ſo low, as not to hurt the *Horſe*'s Mouth, and certainly the beſt Bit for *Horſes* that have any thing of a big Tongue.

Some are of Opinion, that the beſt way to fit a *Horſe* exactly with a Bit, is to have a great many Bits by them, and to change till they hit the right; but at firſt be ſure to let him have a gentle one, and be rightly lodged in his Mouth, ſo as not to frumple his Lips, or to reſt upon his Tuſhes. Then let him be mounted, and pull'd two or three Steps back, whereby you will know if his Head is firm, if he performs frankly, or only obeys with Reluctancy, that ſo you may give him another Bit, which may gain his Conſent. If he inclines to carry low, you are not to give him a Liberty for the Tongue, which will riſe too high; for that, by tickling his Palate, would bring his Head down between his Legs. Note, That large Curbs, if they be round, are always moſt gentle.

We come next to the *Branches*, which are to be proportion'd according to the Deſign a Man has, either of bringing in, or raiſing a *Horſe*'s Head. They judge by the Line of the Banquet of its Effects, which diſcovers its Strength or Weakneſs. A hardy Branch is that whoſe Sevil-hole is placed upon the Outſide of the ſaid Line of the Banquet. [See Plate V. *Fig.* IV, V, VIII.] A gentle Branch is that, whoſe Sevil-hole is placed upon the Inſide of the ſaid Line. [See Plate *Fig.* VI.] The farther a Branch is from a *Horſe*'s Neck, the greater Strength will it have in pulling, and will bring it in beſt, eſpecially in the Hands of a Perſon that knows how to make uſe of it. Short Branches are ruder than long ones, if they have both the ſame Shape and Turn. The Branch muſt be proportion'd to the Length of a *Horſe*'s Neck; and one may ſooner err in chuſing one too ſhort than too long.

But to the Particulars of the ſeveral Sorts of Branches: 1. The *Strait Branch*, after the Form of a Piſtol [Plate V. *Fig.* I.] is commonly the firſt given to young *Horſes*, to form their Mouths, and make them to reliſh a Bit. 2. A *Branch*, after the Conſtable of *France*'s Faſhion, [at *Fig.* II.] proper for a *Horſe* that naturally carries his Head well, and in as becoming a Poſture as poſſibly he can. 3. A *Branch*, after the Form of a Gigot, or Leg, [at *Fig.* III.] proper for *Horſes* that naturally carry well, and will prevent them from carrying low when weary. 4. A *Branch*, after the Form of a bent Knee, proper for *Horſes* that arm themſelves againſt the Operations of the Bit; which is done firſt by bringing in ſo very much of their Heads, that the lower part of the Branches may reſt upon their Breaſts or Counters. The common Remedy is to give them ſhorter Branches, which does not rectifie the Matter, but makes them arm the more. Now this ſort of Branch, tho' ten Inches long, is ſo turn'd, that it cannot ſo ſoon reach their Counters as an ordinary one of ſix Inches, becauſe that inſtead of pulling down their Noſes, it raiſes them. The other ways *Horſes* arm themſelves is, to turn in their Heads ſo very much, when a Man would reſtrain them, that they immediately touch their Neck with their Chins, and ſo make the Branches uſeleſs. The only Remedy is, to place a Wooden Ball, cover'd with Velvet, or any other thing, to make it appear neat, betwixt their Jaw-bones, upon the Caulk-bands of the Bridle. Its Bigneſs ſhould be in Proportion to the Hollow between the upper part of the Jaws, and ſo adjuſted, that half the Ball may enter between the two Jaw-bones, and the other remain without, and meet with his Throat: It will then keep in its Place, and neceſſarily prevent the *Horſe*'s arming himſelf. 5. A *Branch*, after the *French* Faſhion, [at *Fig.* V.] to raiſe a *Horſe*'s Head, being a very difficult Work. This Branch, which is hardy, about a Third of an Inch at the Sevil-hole, and kneed an Inch and three Quarters at the Jarret or Ham, with the Eye of the Branch a little higher than ordinary, to give it the more Force, will do it a little. But, 6. [*Fig.* VI.] Another Branch hardier than it, being about two Thirds of an Inch at the Sevil-hole, and about two Inches at the Ham, is the beſt to raiſe a *Horſe*'s Head that carries very low. The falſe Ham, or part of the Branch, which is bruiſed or advanced forwards, more than the other part to which it is ſolder'd, is a great Help to it, becauſe it augments the Strength of that lower part. The Eye being of a good Height, will likewiſe add Strength to the Operation of the Branch; and the Shoulder, which is ſo turned, as not to conſtrain too much, will alſo aſſiſt the Branch to raiſe. 7. [*Fig.* VII.] Another Branch, that is hardy, about two Thirds of an Inch at the Sevil-hole, and has a falſe Ham, that is, the Branch is at that part a little bruiſed, or ſet forwards; ſo that the moſt advanced part is about an Inch and three Quarters, will bring in, as being hardy, to the very Sevil-hole. The Half-ham augments its Strength, and the lower part of the Branch, which inclines towards the *Horſe*'s Neck, makes it to raiſe a little; ſo that it will be good for a *Horſe* that carries his Neck ſtraight out, and difficultly brings in his Head to ſuch a Poſture as it ought: It brings in a great deal, and raiſes but little, which is juſt what we ſhould make uſe of for ſuch ſtraight ſtretched Necks, becauſe by ſtraining their Heads very much in, you oblige them to turn and bend their ſtraight Necks Archwiſe. But ſeeing it would be dangerous to bring them too much in, and thereby their Heads betwixt their Legs, the lower part of the Branch is made to incline backwards towards the Neck of the *Horſe*, which raiſes and places their Heads in the moſt beautiful Poſture ſuch Necks are capable of. 8. [*Fig.* VIII.] There is ſtill another Sort hardier than the laſt, being ſo about an Inch and a Sixth part, and equally hardy at the Ham and Sevil-hole, being proper for *Horſes* that carry their Heads high enough, but thruſt out their Noſes. If a Man makes good uſe of his Legs as he is pulling in a *Horſe*'s Head hard, there are very few *Horſes* but will be obliged to bring down their Noſes. But to conclude with one general Rule; you are to note, that the farther the Sevil-hole is without the

Line of the Banquet, the harder and ſtronger the Branch is; and the more it approaches, or even comes on this Side the ſaid Line, ſo much the more gentle it is. *Solleyſel*, &c.

CHAP. XV.

Of the Art of Shoeing, *or a true and exact Method of* Shoeing *all ſorts of Feet, tho' never ſo bad or deformed.*

OF the two Sorts, the firſt Method is to ſhoe for the Advantage of the Foot, and to fit ſuch Shoes to it, according to its Nature and Form, ſo as to better it, and if good, to preſerve it from becoming otherwiſe. The other Way does ſo diſguiſe the Foot, as to make it really appear better than it is. We treat of the firſt only, and ſhall here premiſe four Rules to be obſerved in ſhoeing all ſorts of Feet. 1. *The Toe before*, whereby is meant to give the Nails a good hold upon the Toes of the Fore-feet, the Horn being there very thick, but not ſo in the Quarters of them. *Quarter behind* is, that the *Horſe* has the Quarters of his Hind-feet ſtrong, I mean the Horn thick, and capable of ſuffering a good Gripe by the Nails; but at the Toes of thoſe Feet the Horn's thin, and therefore no Nails at all ſhould be put into them there. 2. *Never to open a Horſe's Heels*; which is, when the Smith in paring the Foot, cuts the Heel low, and almoſt cloſe to the Fruſh, and takes it down within a Finger's breadth of the Coronet or Top of the Hoof, ſo as to ſeparate the Quarters at the Heel, and thereby weaken the Subſtance of the Foot, making it to cloſe and become narrow at the Heels; and if there be any Weakneſs in the Foot, it will neceſſarily ſhrink and ſtreighten in the Quarters, which will quite ſpoil the Foot. 3. *Make uſe of as thin and ſmall Nails as poſſible*; for thick ones make a large Hole not only in driving, but when riveting, and being ſtiff, ſplit the Horn, and take it away with them. A tender Foot cannot neither be ſhod with ſuch big Nails, without the hazard of Pricking, eſpecially if there is but little Horn to take hold on. But Smiths, to prevent this, pierce their Shoes too near the Edge, which will in time ruine the Foot. 4. *Make the lighteſt Shoes you can*, according to the *Horſe*'s Size, becauſe heavy ones ſpoil the Back-Sinews, weary the *Horſe*, and, in caſe of an Over-reach, more eaſily come off.

Do not pare the *Horſe*'s Feet almoſt to the Quick, but if his Hoofs are ſmooth and tough, they may be done reaſonably near: Then fit a Shoe to them, neither too broad nor too narrow in the Web, nor let the Spunges extend any farther than the Heel; but follow the exact Compaſs of the Foot, juſt to the Corners of the Fruſh; neither muſt they appear much on the Outſide of the Hoofs at the Heels; but let the middle of the Spunge, which is that part of the Shoe next the Heel, be placed juſt upon the middle of the End of the Quarter, which touches the Corner of the Fruſh, which is called the *Heel*, and ought never to be pared. Now the middle of the Spunges being placed upon the Extremities of the Quarters, the *Horſe* will never become hoof-bound nor over-reach; whereas too long Spunges fatigue and weary them, make them to over-reach, ſpoil their Feet, *&c.* and too ſhort ones will make a *Horſe* go leſs at his Eaſe. The Shoe ought not to preſs at all upon the Sole, but reſt equally and exactly round the whole Hoof upon the Horn; and obſerve, if the Shoe upon the outer Edge of that Side next the *Horſe*'s Foot have any Raiſing or Unevenneſs therein, beat and level it with the reſt before 'tis ſet on, otherwiſe he'll infallibly ſpoil the Hoof. The Shoe reſting on any other part of the Foot but the Horn, will make the *Horſe* halt, unleſs in reſting upon the Sole it be thick and ſtrong.

Having fitted the Shoe, drive in two Nails; then let the Foot be put to the Ground, to ſee if the Shoe is right placed. This done, the reſt of the Nails are equally to be driven in; but more particularly obſerve to drive the Nails of the Heels of the Fore-feet low enough, for fear of the Quick, which in the Hinder-feet is quite contrary; for there the Heels are ſtrongeſt. Having drove in the Nails, and cut them over with the Pincers or Nippers; before you rivet them, take the cutting Knife, and cut the Horn that over-paſſes the Shoe, by ſtriking with the Hammer upon the Back of the Knife, till all the Horn be taken away that you deſire. Before the Nails are riveted, you muſt uſe the Knife again to cut away the ſmall Pieces of Horn made to riſe by the Nails in driving, which will infallibly prevent the *Horſe*'s cutting himſelf with the Rivets; but as the Nails ſink gradually into the Shoe as it wears, ſo that the Rivets looſen, and appear more above the Hoof, Care ſhould be taken to cut them as they riſe, elſe they will lame the *Horſe*.

In caſe of *low Heels*, pare only the Toe, and touch not the Heel at all, nor the Fruſh neither, unleſs it begins to corrupt, and then you muſt pare it flat. The Toe muſt not be cut with the Buttris, but the Cutting-Knife, or Raſped only. The Buttris is only uſed to give the Shoe a Seat, after the Toe has been cut with the Knife: For Example, the Breadth of one's Finger or Thumb, if the Foot be too long at the Toe; in which caſe the Shoe muſt alſo be pierced near the Edge at the Toe, for fear of Pricking; and ſo placing the Shoe after that manner, the too great Nouriſhment that went into the Toe will be forced to ſtrengthen the Heels, and in twice or thrice ſhoeing, the Foot will arrive to a good Shape, and the Heel alſo will ſtrengthen, in the time that you reſtrain the Toe by cutting it.

When the Heels happen to be low, and not narrow, and the Fruſh large or fat, ſo as, with much difficulty, to be kept from touching the Ground, the *Horſe* then will be liable to halt, eſpecially if rid on hard Ground: To prevent which you have nothing to do, but to give him Calkins, which is done by turning the Inſides of the Spunges the whole Breadth of the Shoes, and making them after the Faſhion of Calkins. Theſe kind of Calkins will do no great harm to his Feet, and he will go the more firmly with them in the Street, or on ſlippery Ground. Thus you will hinder his Fruſh to touch the Ground. Calkins after the Faſhion of the Point of a Hare's Ears are the leaſt dangerous, tho' no Calkins at all ſhould be uſed if poſſible.

No ſort of Calkins will do for low Heels that are alſo narrow near the Shoe, though the Fruſh be large, which is not uſual; but ſhoe the *Horſe* with Panton Shoes, with a narrow Spunge, and very thick on the Inſide; I mean, that ſlope very much from the Inſide of the Shoe next his Foot to the outer Edge, and place the Spunge of the Panton Shoes upon the Heels, ſo as that the thick Edge of the Spunge may enter within the Corners of the Fruſh, to preſs them out when they grow; cut his Toe with the Paring-Knife, as occaſion is. Keep his Feet in his Dung, moiſtned a little with Water, after ſhoeing, till he leave halting: The Heel, and even the whole Foot, will become ſhapeable after thrice ſhoeing. Horſe-courſers, to cheat the Buyer, ſupply the Want of the Heels by making the Spunges of the Shoes great and thick: They ſpoil the *Horſes*. In ſhort, there is no helping of low Heels with a very large Fruſh, by Shoeing.

Thoſe *Horſe* sthat have flat Feet, if they are young, will have them always ſpread, and be in danger of growing ill-ſhaped; to remedy which, bar the Paſtern Veins, by tying them near the Joint with a fine Thread, that you may not retard the Cure. A little Silk is very good for that Purpoſe; then cut the Vein beneath, and let it bleed; and if it bleed too long, bind up the Orifice with a large Band and a Compreſs.

As for Shoes proper for ſuch flat Feet, forge according to the following *Fig. H, C, D, E* [Plate V. *Fig.* IX.] Shoes very ſtrait in their Quarters; turn them not into a Circle, neither follow at all the Shape of the Quarters of the Foot; but whoſe Branches from the Toe *A, D,* to the Spunges *C, F,* muſt be very ſtraight; and you muſt pierce the Holes *G, H, I, L,* very near the Edge. The Shoes muſt be alſo ſo placed, that you may have about the Thickneſs of two Crowns of Horn to take away at the Toe *A, D,* with your Knife; and they having their Branches ſtraight, undoubtedly a good deal of Horn will remain to be taken off at the Sides *A, B, C,* and *D, E, F.* which are retrenched by the Shape of the Shoe within the pointed Line, as appears by the Figure.

The Shoe being thus prepared, fit it to the Foot, and it matters not though it reſt a little upon the Sole; faſten it with very thin Nails, taking but a ſlender hold; and the *Horſe* being thus ſhod, put a Reſtrictive into his Foot, made of Chimney-Soot and Turpentine boil'd together on a ſlow Fire, and always ſtirring it till pretty thick. Apply it ſcalding hot with Hurds above it, and tye a Cloth about the Foot to hold all faſt. This will hinder the Over-growing of the Sole, and, with ſtopping the Paſterns, very much contribute to put a Stop to all the ſuperfluous Nouriſhment that went to the Sole and Coffin-bone: Put alſo ſome Hoof-Salve, ſpread upon Hurds by way of Plaiſter, upon the Coronet, applying it to the Onſet of the Hoof, to make the Foot grow. Let the Plaiſter be renew'd every four Days. The *Horſe* muſt not be work'd for four or five Days, that he may be uſed to his Shoes, which at firſt will preſs his Feet. Continue to ſhoe your *Horſe* after the aforeſaid Method every New Moon, making the Shoes gradually ſtraiter, not much at the Quarters, but conſiderably at the Toe *A, D,* which muſt be retrenched by all imaginable means, as it is mark'd in the Figure by the Circular Line *A, D,* which is mark'd with Points. The Shape of the *Horſe*'s Feet will be changed much for the better, after thrice or four times Shoeing; and obſerve for a certain Rule, always to uſe this Way of Shoeing three or four Days after the Change of the Moon, that the Hoof may grow the better.

When the Feet grow too much at the Sole, and that the Heels are ſtraiter nearer the Shoe than above, then you muſt not retrench the Sides of the Foot *A, C, D, F,* as before; but to enlarge the Heels, let them be ſhod with Panton Shoes, which, beſides their opening the Heels, will prevent the Growth of the Sole too much downwards: But in ſhoeing with the Panton, follow the Circumference of the Foot, neither muſt the Branches be ſtrait. The Sole muſt be kept ſtrong, without taking any thing but the Cruſt from it; for the *Horſe* otherwiſe will halt. Always ſhorten the Toe, by cutting it with your Knife as there is occaſion. The Shoe muſt be made wholly flat and unvaulted. Cauſe the *Horſe*, after the Fore-feet are ſhod, to ſtand with them all Day long amongſt his own Dung a little moiſtned, and let him not work for eight or ten Days.

When the *Horſe*'s Sole is round, and lower than his Hoof, and grows ſometimes ſo ill-ſhaped, as to reſemble an Oyſter-Shell, and become in a manner reverſed; the beſt and ſhorteſt Way is to bar the Paſtern-Veins, and ſeven or eight Days after the Operation, to make him Panton Shoes, with ſtrait Spunges, and extraordinarily thick on the inner Edge: They muſt be likewiſe altogether flat, and not vaulted; for almoſt all the round and high ſoled *Horſes* have narrow Heels near the Shoe; for which uſually many, thro' miſtake, make hollow Shoes, which in reality conſtrain, and make the Foot grow daily ſtraiter at the Heel. The little Bone, which is in the middle of the Coffin, preſſes downwards towards the Sole; the Toe grows long, and the Feet become ill-ſhaped and unſerviceable: To rectifie which, the Panton Shoe being forged and pierced near the Edge of the Toe, as aforeſaid, cut more or leſs from the Toe with your Knife, as you judge fit; then fit the Shoe ſo, as that the Slopings, or thick Parts of its Spunges, may enter within the Corners of the Fruſh; and being flat at the Toe, that it may reſt on the Horn, if a little on the Sole it matters not, and faſten it with thin Nails: Then uſe the aforeſaid Reſtrictive, and let him reſt for twelve Days or more, till he leaves halting: Work him by degrees, and if the *Horſe* is not old, his Feet, after three or four Shoeings, will aſſume a good Shape.

It's a great Abuſe to vault Shoes, when it may be forborn, becauſe the Foot being nail'd, and made faſt to the Shoe, aſſumes the Shape of it; and Nature finding that Paſſage open, through the Inclination ſhe has to furniſh ſuperfluous Nouriſhment to the Under-part of the Sole, preſſes always that way, and is alſo helped by the hollow Shoe to give that round Form to the Feet that makes a *Horſe* unſerviceable for the Street, or upon hard Ground. If the *Horſe* have his Sole but a little raiſed, ſo as not to be yet abſolutely round beneath, it will be helped after twice or thrice Shoeing; but the more it is out of ſhape, the more time will it take to rectifie: But if the Foot be extraordinary high or round in the Sole, the Paſtern-Veins muſt be forthwith barr'd; and that is the only Means to give a good a good Shape to thoſe flat kind of Feet. The main Deſign being to ſtop the ſuperfluous Humour, as before, and to confine the Nouriſhment to the upper part of the Foot, which ſhoeing with Panton Shoes will do, even without retrenching the Hoofs at the Sides, but only a little at the Toe; but keeping the Sole ſtrong, without taking any thing from it. The Shoe muſt be faſtned with very thin Nails, then fill his Feet with Tar ſcalding hot, with the foreſaid Reſtrictive, or otherwiſe, keep them amongſt his moiſtned Dung.

The firſt Shoeing of *Coach-Horſes* is of Conſequence; the Horn being to be made level where the Shoe reſts, take nothing from the Sole, but only as it were clean and whiten it, becauſe it has been already made hollow; ſhoe him juſt, and let the Shoe be pierced at a pretty Diſtance from the Edge; but the Nails muſt be drove low: For ſhould the Shoe be pierced round the Edge, the Nails in driving would ſplit the Horn, already too much weakned by the *Horſe-Merchant*, who had no other Deſign but to make his *Horſe*'s Feet appear hollow. Drive a Nail juſt at the Toe, that the Shoe may ſtay longer on without ſhifting its Place, and may remain ſtraight upon his Foot. Retrench not his Quarters, nor open his Heels at all, but let the Shoe follow the Compaſs of the *Horſe*'s Foot, whereby you will preſerve his Feet, and they will be always good. Thoſe who think to give Eaſe to their *Horſes*, by enlarging their Shoes, or vaulting them a little, inſenſibly ſpoil their Feet, which follow the Form of the Shoe, and ſo become miſ-ſhapen: For the more the Shoe is enlarged at firſt, the more it muſt be the next Shoeing; and 'tis the Way abſolutely to loſe your *Horſe*.

Thoſe *Horſes* which have big and large Feet, though they be not flat, are more ſubject to have them eaſily ſpoil'd than any other, if People do not take care at every Shoeing to retrench them, till the Nature of the Horn be changed.

As for *Hoof-bound*, or *Narrow-heel'd Horſes*, the Manner of curing them, and the Receipts for it, you will meet with hereafter among the Diſeaſes incident to *Horſes*; we ſhall only treat here how far Shoeing becomes a Remedy: Wherefore take the Heels very much down, without hollowing the Quarters, and pare the Fruſh flat. This will prevent Hoof-binding, and the Sinews of the Legs will be alſo preſerved, eſpecially if they be *Horſes* which work in the *Manege* upon ſoft Ground. It's likewiſe a Precaution never to open their Heels with the Buttris, as Smiths do; for they weaken the Quarters, by preſſing the Buttris edge-ways forwards: They alſo cut the End of the ſaid Quarter or Heel, take it even away within an Inch of the Hair, which they call *Opening the* * *Heels*, which yet they are ſo far from doing, that they take away the whole ſtrength of the Foot, which ſhould have been left altogether whole: If there is any likelihood that the *Horſe*'s Heel will become narrow, the ſureſt Way then is to ſhoe him with a Half-Panton Shoe, which is to turn the Branch of the Shoe in towards the *Horſe*'s Foot; for that Shoe will keep his Quarters in a Condition to open, and become wider, the Horn growing, the Heel opens, and ſo the Foot will continue well-ſhaped. And ſeeing undoubtedly the Shoe gives Shape to the Foot, and that the Shoe being inflexible, takes no other Form than it hath already, it neceſſarily follows, that the Half-Panton muſt force the Horn onwards, and ſo enlarge the whole: But, above all things, remember that when you ſhoe with the Half-Panton, always to keep the Sole ſtrong.

Some will not have the Fruſh pared at all: The beſt way is not to make the Sole hollow betwixt the Fruſh and the Quarters, but only to pare the Top of the Fruſh with the Buttris, which they call *Paring the Fruſh flat*; For if they did not pare the Fruſh at all, it would corrupt, ſtink, and breed the Teignes or Moths; for then the *Horſe* looks as if the Moths had gnaw'd his Fruſh; beſides there is no Advantage in leaving it ſo high. In ſhort then, every time the Foot is pared, the Heel and Fruſh ſhould be made flat, without hollowing the Quarters; and that for the leaſt ſtreightning of the Heels, the Spunges ſhould be turn'd in towards the Soles, after the manner of the Half-Panton, of which by and by. Now for thoſe *Horſes* which are Hoof-bound, after you have par'd their Feet, and left the Sole extraordinary ſtrong at the Heels, you muſt have Panton Shoes in the Shape of *Fig.* X. Plate V.

In forging the Panton you muſt make the inner Edge of the Spunge *B, A, E, C, D, F*, a great deal thicker than the outer Edge *I, E, L, F*; ſo that betwixt *A, G*, and *D, H*, there may be twice or thrice the Thickneſs of the Spunge *A B, C D*. ſo that the Shoe riſes by degrees from *G* to *A*, and ſlopes equally from *A* to *E*, the whole Length *A G, E I*; and ſo you will find the inner Edge of the Spunge much thicker than the outer; for the Thickneſs within, mark'd *A B*, is three times thicker than *E*. It's the Inſide of the Shoe, and that which touches the Sole, that is ſeen in the Figure; but great care muſt be taken that the Thickneſs of the Spunge *A B, C D*, diminiſh always towards *G H*, as may be perceived in the Figure; and all the reſt of the Shoe from *I L, G H*, round the Toe of the Shoe, be quite flat as other Shoes are, that the *Horſe*'s Foot may reſt eaſily upon it. The Spunges ſhould be ſtraight, that they may reſt on the Inſide of the Corners of the Fruſh; and all the Outſide of the Shoe, which is next the Ground, muſt be quite flat like another Shoe. *See Plate* V. Fig. X.

It's neceſſary in placing the Spunges of this Shoe upon the End of the Heel, which is the Extremity of the Quarters, that the ſame Extremity reſt upon the Middle, betwixt *A E*, and *D F*; which is the ſloping part of the Spunge: But yet the inner Edge of the Quarter *A G*, muſt not wholly reſt upon the Sole, tho' you keep it ſtrong enough; which ſhould be always done in uſing thoſe kinds of Shoes, and eſpecially at the Heels. Being then ſhod, anoint his Feet with the Hoof-Salve before mention'd, or thoſe deſcribed hereafter among the Diſeaſes. This Method will infallibly open and enlarge his Heels. Theſe kind of Shoes are not indeed fitted with a little Time and Pains, and the Smith muſt not ſpare putting the Shoe into the Fire again, either to open or ſtreighten the Spunges, as there is Occaſion; for the Shoe muſt exactly follow the Shape of the Foot, as well at the Heel as at the Toe; and though the inner Edge of the Spunge does but enter within the Heel about the Thickneſs of two Crown-pieces, it ſignifies little; for the Heel opening, will in a Month's time cover it all. Now if you would know the Reaſon why theſe kind of Shoes open the Heels, and help Hoof-binding, is that when a Heel grows, it is forced outward by the Shoe, becauſe the Spunge, which is thicker a great deal in the inner Edge than the outer, hinders the Heel to cloſe and tend that way; but forcing it outwards, it muſt neceſſarily enlarge and open, if the Shoes are right placed.

You muſt continue ſhoeing the *Horſe* after this manner, till his Heels be well ſhaped and large: Twice or thrice ſhoeing at the change of the Moon, or four or five Days after, will do it. Theſe ſort of Shoes never ſhift upon the Feet, but remain firm in one Place; the *Horſe* indeed will be for ſome time unſerviceable, and People muſt not pretend to travel with thoſe kind of Shoes till the *Horſe* is accuſtomed to them. However, if you have a Journey to make with a *Horſe* that is hoof-bound, but does not as yet halt with it, His Heels, when he is ſhod, muſt not be taken down at all, but kept as ſtrong as poſſible, and the Nails are only to be drove in the Toe. 'Tis true, this will not be the Way to help his Hoof-binding, but on the contrary render it worſe, it being only to make him perform his Journey that you do it.

The Remedy for Hoof-binding, when you are put upon a Neceſſity of taking out the *Horſe*'s Soles, you will meet with hereafter: But there are ſome *Horſes* ſo very ill hoof-bound, that though the Soles have been taken out, yet they can ſcarce force out their Heels. The ſhorteſt way for Cure is, to cleave the Fruſh almoſt down to the very Paſtern, immediately after the Sole is taken out; and when the Shoe is faſtned on, and the Charge or Apparel for Cure put upon the Sole, let the Clift be very well filled with Bolſters or Rolls of Linnen, firſt dipt in the healing Charge, which muſt be put into it at the Under-part of the Paſtern: Tye afterwards all up with a Cloth to keep them faſt, and always keep the Clift very open, till the Sole be wholly filled up again. If after this you ſhoe your *Horſe* with a Half-Panton Shoe, it will make his Heel become very large and well-ſhaped.

For *Cloven* or *Falſe Quarters*, a Shoe muſt be made, called the *Half-Panton*, repreſented in *Fig.* XI. Plate 5. at *E F, G H.* It is to be put upon a *Horſe* that hath one or more falſe Quarters, and conſequently narrow Heels. The whole Branches, and alſo the Spunges *F, B, D, H,* muſt be made ſtronger than ordinary; afterwards turn them up ſo that *A, B, C, D,* may be higher than the outer edge *E, F, G, H,* and ſo you will find that betwixt *A, B,* and *E, F,* the Shoe will ſlope outwards; alſo the other Branch *C, D, G, H,* will do the ſame; and the Reſt of the Shoe, *F, E, G, H,* will be altogether flat upon the edge of the Ground as an ordinary Shoe; for here is repreſented the inner ſide of the Shoe, becauſe the under ſide of the ſame *F, E, G, H,* muſt reſt upon the Ground, the whole compaſs of the Shoe, *F, E, G, H:* The Spunges are turn'd quite contrary in Vaulted Shoes, *viz.* outwards, towards the Ground; but here inward into the Foot: And whereas the Hoof-binding Shoes, already accounted for, have the inner edge of the Spunges a good deal thicker than the outer, both the edges of theſe are of one equal thickneſs: the dexterity is to turn the Spunges, ſo as to give them a right ſlope, and make the Shoe Hollow or Vaulted next the Ground.

In fitting on the *Half-Panton* Shoe, let the Foot be pared, the Sole kept ſtrong at the Heels, and the Shoe ſet ſo that the middle of the Heel, which makes the Extremity of the Quarters, be exactly put upon the Spunges *F, B, D, H,* ever being careful that the inner edges of the Spunges reſt not wholly upon the Soles: Then let the Nails be drove in neatly, and be very thin in the Shank, when the Shoe is Nailed and Rivetted, pour into the Foot melted *Pitch* and *Tallow* together, with Hurds and Splinters of Wood above them, to keep all faſt; and it will be very proper, if you have it, to put Oyl of *Bays* alone ſcalding hot into his Foot, with Hurds and Splinters, or to pour *Tar* ſcalding hot into it: or without making uſe of theſe, keep his Feet amongſt his moiſtned Dung, till he leaves Halting, and in the mean time anoint his Hoofs with *Hoof-Salve* at the *Coronets*.

There are ſome more eſpecially of the light kind of Horſes, that have unequal Heels, one of them ſtanding higher than the other, and is eaſily diſcern'd by looking at the *Paſtern*, juſt to the Heel: This way of Shoeing with the *Half-Panton* is the beſt Remedy, or to take out their Soles, and cleave the *Fruſh* to the very bottom; that ſo when it grows up again, the Heels may be kept of an equal height.

Some Horſes Legs, from the Knees to the Coronets, appear in *a ſtrait Line*, when they ſtand in their natural Poſition: to recover theſe by Shoeing, the Heels muſt be taken very much down almoſt to the Quick, without hollowing the Quarters; and if then the Leg does not fall back enough, but that ſtill he carries his *Paſtern-joint* too far forwards, make the Shoe go beyond, or exceed the Toe half a Fingers breadth: It muſt alſo be made thicker in that than any other part. In the interim, let the Back-ſinews of his Legs be anointed with the Ointment of *Montpelier*, which will reduce them to their proper Poſition; and the preparation whereof you will meet at the end of this Tract of *Horſemanſhip*.

If you find the Paſtern-joint *bend too far forwards*, and go out of its place, take down the Horſes Heels to the very Quick, without opening it, and put on a Shoe that will appear all round his Toe, two Fingers breadth without his Foot, and anoint the Back-ſinew as before: It's in like manner proper at firſt, when he carries theſe kind of Shoes, to walk him gently up and down in ones Hand, to aſſiſt the Joint to fall into its right place, and by no means upon rough, uneven Ground.

If you cannot recover the Legs of Horſes that ſtand from the *Knee to the Coronet in a ſtrait Line*, by the foreſaid Method; after you have taken his Heels down very much, and ſhod him with *Planch-Shoes*, as the *Mules* are, let him carry thoſe Shoes three or four Days, and walk him abroad that he may be accuſtomed to them; and then you muſt come to a Manual Operation; and firſt obſerve, that Horſes much troubled with theſe Infirmities, have a Sinew or Muſcle at the Ars or Plat-veins, and a little below the place where they Bleed Horſes in that part, which is near to the Junction of the fore-Thigh with the Shoulder. It's about the bigneſs of ones little Finger, much ſtretched and ſtiff, and lies ſtrait up and down, all along the Leg: this is the Muſcle that makes the motion of the Paſtern-Joint, and being ſtretched in this manner, keeps it forwards, and hinders it to be in its ordinary ſituation: Having found out this extended Muſcle, which you will eaſily do, open with the *Inciſion-Knife* the Skin downwards four Fingers breadth below the fore-Thigh vein, then cut it quite through croſs-ways, not at once, but by degrees: then turn the Knife to the other ſide of it, and gradually perfect the Cutting, and when done quite thro', waſh the Wound with Brandy, with Salt in it; and Work the Horſe after he has no more ſwelling where you Cut him, and that the Wound is healed up: If the Operation be dexterouſly performed, the Horſe will bleed but little, and the Wound will ſoon heal: And that you may go through with it the more ſecurely, and not cut the fore Thigh, or *Plat-Vein*; be ſure to make the Operation four Fingers breadth lower than the Veins: the Horſe will recover in eight or ten Days.

The like Operation is made upon Horſes that have their *Paſterns altogether caſt forwards*, by cutting them four Fingers breadth higher than the Knee, juſt upon the fore-part of the fore Thigh: firſt the Skin is cut above the Sinew, which is very ſtiff and ſtretched on the fore-part of the Leg; then raiſe it with a ſharp Ox, or wild Goats Horn: afterwards cut it with the Inciſion-Knife, quite through to the Horn, thruſt beneath it, and fill the Wound with Salt, putting Hurds or coarſe Flax, dipt in warm *Turpentine*, above it; the Horſe muſt be kept from coming at it with his Teeth; the Leg in wraping muſt not be preſs'd too hard, for fear it ſhould ſwell: They dreſs him thus for ſome Days, but Bleed him the very next, and anoint his Leg with the Duke's Ointment, deſcribed at the end of this Treatiſe of *Horſemanſhip*: this is continued, and the Horſe walk'd up and down for eight Days, till the Wound heals and the *Paſtern* falls to its place. When a Horſe is in a ſtrait Line from his Knee to the Coronet, and the Sinew not much raiſed from the Bone, but exceſſively ſtretched; the Cure is longer before it is perfected.

Arched Legs are thoſe that bend forwards at the Knee, when a Horſe is in his natural Poſition. Begin the Cure with Shoeing; you cannot pare the Heels too low; but if the Leg, when you have done this, is not in the Condition you could deſire, but continues much Arched at the Knee; make a *Planch-Shoe* for him, which muſt exceed the Foot, at the Toe, two or three Fingers breadth, and riſe alſo a little towards the edge; when you have faſtned it on, anoint the Sinew with the Ointment of *Montpelier*: But if all this does not procure the deſired effect, cut the Sinew a little below the fore Thigh-Vein as before; and if it ſwells, anoint him with an Ointment made of *Populion*, *Honey* and *Black-Soap*, an equal quantity of each, mixed very cold, with a ſmall Glaſs of Brandy: Walk him every Day, but obſerve never to cut the Sinew till his Heels be taken down, and he Shod.

Thoſe Horſes which *tread upon their hind Toes* without reſting upon their Heels at all, are cured in part, after the ſame manner as thoſe Horſes who have their *Paſterns* bending forwards, as if they were out of Joint: They uſually take their Heels down very much, give them Shoes longer an Inch or two than the Foot at the Toe, and anoint well the Sinew of the hind Leg.

For a *Stumbling Horſe*, take down his Toe very much, before you Shoe him, and alſo ſhorten it, but if he has his Sinew troubled, Legs ſpoiled, or Shoulders weak; you will find other Remedies than Shoeing for him hereafter: If the Horſe *over-reach*, the Spunge of his Shoe muſt follow the turn of his Foot: Some People turn their hind Foot-Shoes at the Toe, and prevent the ſtriking off the fore-Shoe, tho' the Rider is frequently, for want of Skill, the cauſe of his over-reaching.

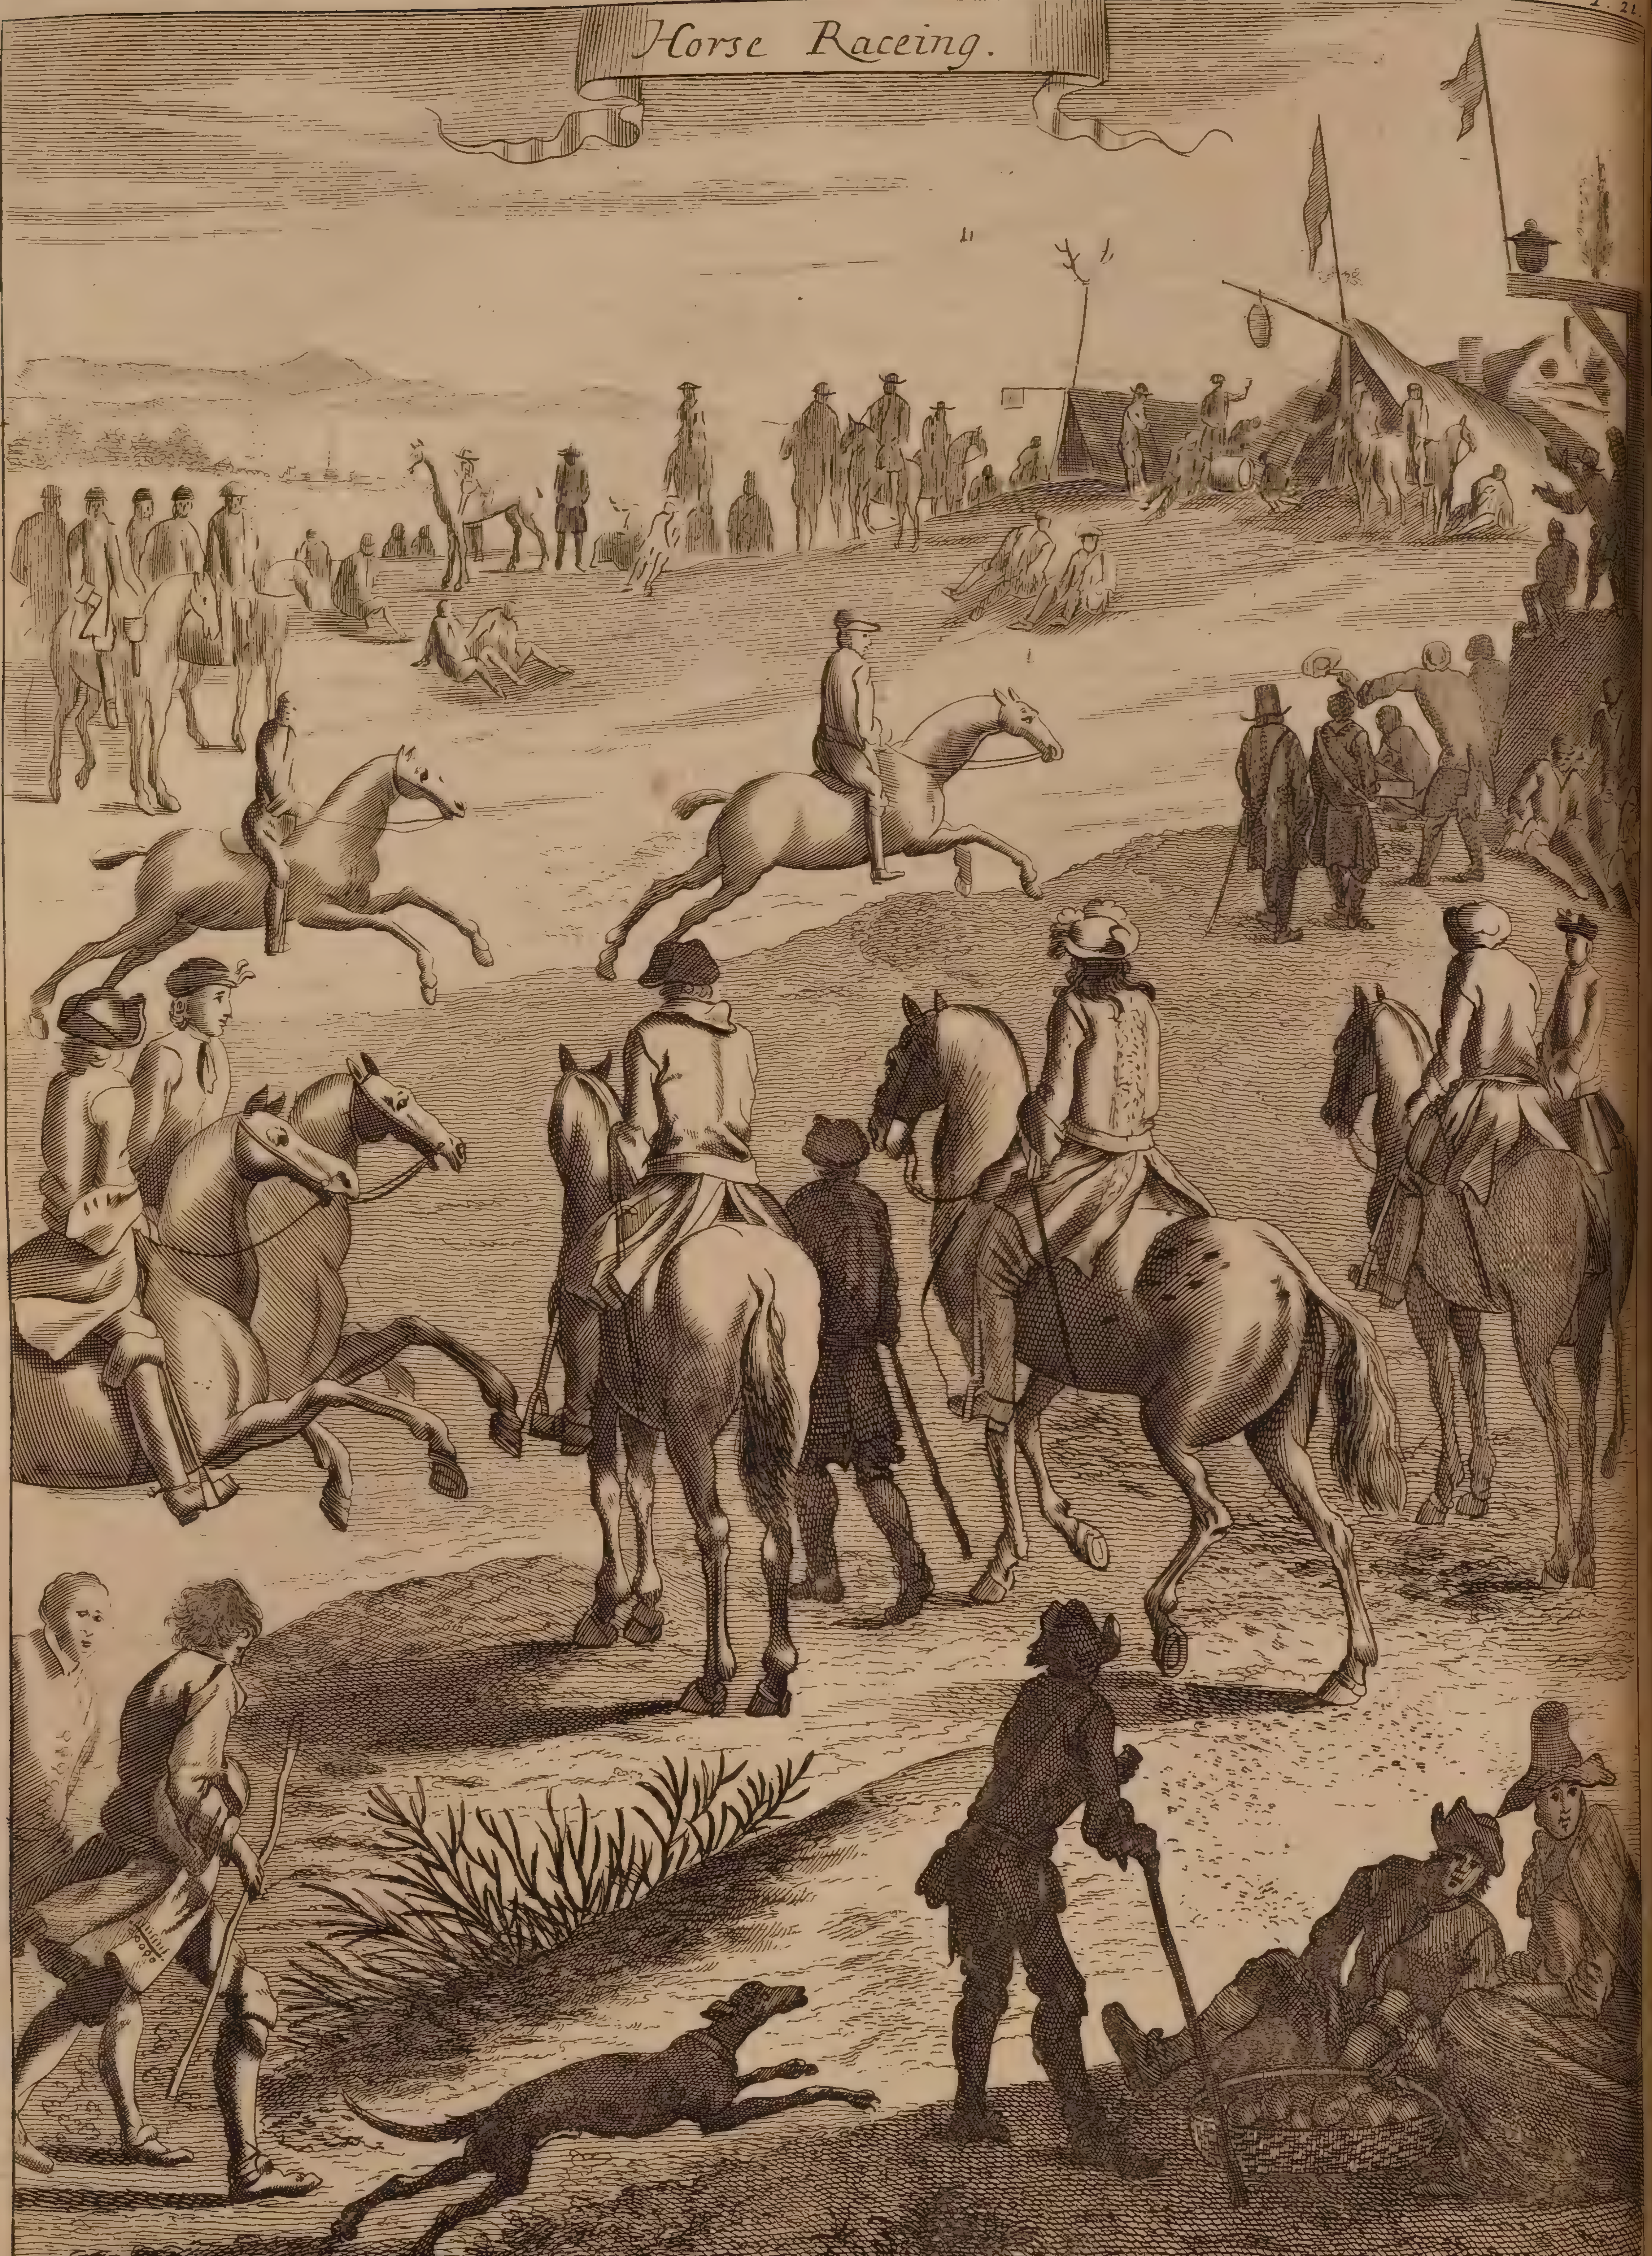
There are few Horſes that have been more than once Founder'd in the Body, which have not ſome of the Humour fallen down into their Feet, becauſe the point of the *Coffin-bone*, which is moſt advanced falls down and preſſes the Sole, and the middle of the Hoof above the Toe ſhrinks and becomes flat; and in this caſe the Horſe is ſaid to have *Creſcents*: Tho' they be really nothing but the Bones of the little Foot that hath left its place, and fallen downwards, and the Sole at the Toe appears round, and the Hoof above ſhrinks in: the ſame happens to Horſes that have had a Numbneſs in the *Coffin*, the Symptoms of which are alſo *Creſcents*: Such Horſes tread only on their Heels, ſetting down their Toe a pretty while after their Heel; neither can they reſt upon any part but the Heel: Horſes in theſe two Caſes, are a long time recovering: Now in Shoeing them, never pare a Horſe Founder'd in the Feet; becauſe the Sole in that part ſhould be always kept ſtrong; neither muſt the Heels be taken down too much: As ſoon as he is Shod, pour the Oyl of *Bays* ſcalding hot into his Sole with Hurds above it, and Wood Splinters to keep it faſt, and continue once a Day, to pour in the Oyl ſeven or eight times.

Calkings ſpoil the Feet, cauſe *Bleymes*, ruin the Back-ſinews, and make Horſes tread upon the Toes only of their hind Feet and trip: They are however convenient in time of Froſt: When you are neceſſitated to uſe them, let the *Smith* pare the Horn a little low at the Heels, and turn down the inner Corners of the Spunge into the Corner of the Anvil, and ſo make a Calking after the ſhape of the point of a Horſes Ear; which will do little prejudice, whereas the great ſquare one ſpoils the Foot.

There are ſeveral things that make a Horſe *Cut*; as Wearineſs, weakneſs in the Reins; not knowing how to go; not being accuſtomed to Travel; and laſtly, bad or too old Shoeing: Every Horſe that cuts after a long Journey, gives a favourable proof of his Goodneſs. It's eaſily diſcern'd by the Skins being cut on the inſide the Paſtern-Joints, and many times galled to the Bone, ſo as to have him frequently Halt, and have his Paſtern-Joints ſwell'd.

If a Horſe Cut before, take off his two fore Shoes, the Out-quarters of each Foot very much down, and place the inner edge of the Shoe ſo, that it may exactly follow the compaſs of the Foot, and no ways exceed it towards the Heel: Then cut the Spunges equal with the Heel, and ſo Rivet the Nails into the Horn, that they may not at all appear above it: Or elſe burn the Horn with the point of a hot Iron, a little below the hole of each Nail, and then beat down and rivet them in theſe holes: But if notwithſtanding this, the Horſe continue ſtill to cut himſelf, or Interfere, thicken the Inner quarters and Spunges of his Shoes, ſo as to double the thickneſs of thoſe upon the out ſide, and always pare down his Out-quarters very much, even almoſt to the Quick without touching thoſe within; but be ſure always to rivet the Nails very juſtly and cloſe.

Unſhoe the Horſe and pare down his Out-quarters as before, if he cut behind: Give his Shoes Calkings only on the inſides, and ſuch by turns as may make them exactly follow the compaſs and ſhape of his Foot without exceeding it, eſpecially in the Inner-quarters; and if the Nails be not exactly riveted, one ſingle Rivet will occaſion a great diſorder. But if



Horse Raceing.

To the Right Honourable Algernon Capell,
Earle of Eſsex, Viſcount Malden & Baron Capell of
hadham &c.t
This Plate is humbly dedicated by Richard Blome.

if after all this your Horſe continue to Cut, drive the Nails always upon the Inſides, only let a Beak be made at the Toe to keep the Shoe firm in its place: this will do in ſome time, tho' the Horſe be afterwards Shoed after the uſual way. Some faſten little Boots of Leather, or of an old Hat about the *Paſtern-Joints*, made faſt at top only, and narrower there, while others wrap a piece of Sheep-skin about the Joint, with the Woolley-ſide next the Horſe; and when worn out, apply a new one. Reſt and good Feeding is beſt for a Horſe that cuts thro' Wearineſs.

CHAP. XVI.

Of Hunting, *or* Hunting Horſes.

HUnting is (or at leaſt ought to be) a pleaſing and profitable Exerciſe, intended to make us ſtrong and active, and to recreate and delight the Mind: Therefore a *Horſeman* that is of a Warlike Nature, ought to chooſe ſuch ſorts of Hunting as are moſt capable to anſwer thoſe ends; ſuch as hunting the *Stag*, *Buck*, *Fox*, and the like; and in other Countries that of the *Wild-Boar* and *Wolf*. And as on the one ſide, I would not recommend to him deep mouthed *Hounds*, that ſort of hunting being too lazy an Exerciſe for one that would keep himſelf in vigour; ſo on the other ſide, I would not adviſe him to ſuch very fleet ones as ſome of the *Northern*, that the following them is more properly called Running than Hunting; and my Reaſon is, becauſe to follow thoſe extraordinary fleet ones, a Man muſt have ſuch light Horſes, and keep them ſo finely and nicely, that they are not fit for any other Service; not that I would have them put to any other, but when occaſion requires: As if a Man were to go to the Army on a ſuddain, if his Hunters be a good ſtrong ſort of Horſes, with firm Limbs, and not too tenderly kept, what a great convenience it is to him, I leave to any one to judge.

I ſhall not trouble you with any other directions for the chooſing a *Hunting Horſe*, than that (according to the Compleat *Horſeman*) he ſhould go ſmooth, and not raiſe his fore-Feet too high, that his Head and Neck ſhould be high and well placed; without reſting too much upon the Snaffle; and alſo giving a little ſnort with his Noſtrils, each ſtroke he makes, which is a Token that he has a ſound Wind: Our Author goes on, ſaying, be ſure that he has good Wind and Speed, that he is naturally of a healthful and hardy Conſtitution, and withal that he has ſo much ſtrength (that as I ſaid before) you may, if you have a mind to it, make uſe of him at the Army for Marching, and the like; and above all, keep him not too tenderly, leſt when you take him from *Hunting* for another uſe, you find his Body not hardy enough to ſuffer a new method of keeping.

Some of our well-bred Twelve-ſtone *Horſes*, that have been ſent abroad, have proved extraordinary good for the War.

It is very requiſite to make a *Hunting Horſe* acquainted with a Bit, and to teach him a little to ſtop and turn, which not only hinders him from galloping upon his Shoulders, and makes him ſurer footed than otherwiſe perhaps he would be, but renders him more capable of being fitted for the War whenever you have a mind to it.

I need not ſay much in telling you how to ride a *Hunting Horſe*, the great Saddle being the ground of all; in ſhort, you muſt mount him as directed in the Tenth Chapter, and ſit in the ſame poſture, only make your Stirrups ſhorter, and let your Legs fall nearer the *Horſes* ſides. In galloping lean forwards to eaſe him, and if you have a Snaffle Bridle, in hard Riding, lay your right Hand upon the Rein of the ſame ſide, the better to feel your *Horſe*, and becauſe ſometimes you can't turn him with one Hand.

In other Countries they hunt in light Bits, and though a Snaffle be very pleaſant and eaſie, yet I am of the Opinion that a Bit is much more advantageous, in that it makes the *Horſe* have a better Mouth, and the Rider a better Hand.

I would not have any thing in this Chapter offend ſuch Perſons as are wholly Strangers to Military Affairs, and not at all inclined that way, keeping their *Horſes* only for Pleaſure and ordinary Buſineſs, they may (if they pleaſe) go on ſtill in their own Road; what I have ſaid will be no inconvenience to them, and may be of ſervice to ſuch as love the War, and warlike Exerciſes.

CHAP. XVII.

Of the Race, *or* Race Horſes.

IF you would have good *Running Horſes*, they ſhould be thus ſhaped; let them be as light as poſſible, large and long, but well ſhaped, with a ſhort back, long ſides, and a little long legged, and narrow breaſted, for ſuch will gallop the lighter and nimbler, and run the faſter. *Solleyſell* ſays, he ſhould be ſomewhat long bodied, nervous, of great Mettle, good Wind, a good Appetite, very ſwift and ſenſible of the Spurs, that he ought to be of an *Engliſh Breed* or *Barb*, of a little ſize, with pretty ſmall Legs, but the back Sinews at a good diſtance from the bone, ſhort jointed, and neat well-ſhaped feet.

The excellent Breeds of *Running Horſes* that we have in *England*, though (through the ſeveral Abuſes which have been made) they have been unfortunately miſchievous to a great many Perſons, yet if rightly regulated, and made uſe of, might be very advantageous to the Kingdom, as well as pleaſant and diverting to Men of Quality.

The advantage is this; by having *Plates* run for at ſeveral times, and in ſeveral Counties, we come to know exactly the Speed, Wind, Force, and Heart of every *Horſe* that runs, which directs us infallibly in our choice when we have a mind to furniſh our ſelves for the War, Hunting, Breeding, the Road, and the like; whereas if we could ſee no ſuch Trial made, we muſt ſtand more to our hazards, and ſhould not be ſo ſure to meet with good ones: For a *Horſe* may Travel well, Hunt well, and the like, and yet when he comes to be pent hard, and forc'd to the top and extremity of what he can do, may prove not good at Heart; and what Perſon of Quality is not glad to breed or buy the beſt? The ſame failure in Nature which makes a *Horſe* faint-hearted when he is ſtrained to his utmoſt, and kept to it, will make him ſo if he is deſperately wounded: For ſome *Running Horſes* that have wanted neither Wind nor Speed, have been beaten only by their Hearts ſinking in them when they come to be hard preſs'd.

As for the regulating this matter, I could wiſh that our Nobility and Gentry would not make a Trade of Racing ſo much as ſome have done. When they run only for Plates, or their Matches are for no more than may be loſt without damage to their Eſtates, 'tis very innocent Diverſion; but to run for ſo great a Sum that the loſs can't be well born, and conſequently one muſt endeavour to win the ſame (if not more) back again, it draws one into vaſt Expences by way of preparation for a Revenge; and then if a ſecond ill Fortune comes, I need not relate the unhappy conſequence: But if one prove ſucceſsful, he is apt to fancy he ſhall prove ſo again, and ſo before he thinks on't, he is declared a *Jocky*, ſets up for a Brother of the *Spur*, and runs ſo faſt, that ſometimes neither his Eſtate nor Friends can keep along with him, turning his Diverſion into a Misfortune.

I ſhall ſpeak of the Methods of ordering *Running Horſes*, when I come to the following part of this Diſcourſe, which is of *Keeping*. We will therefore now ſuppoſe a *Horſe* ſet to run for a Plate, and that the Hour of ſtarting is at hand.

When the *Drum* beats, or the *Trumpet* ſounds (according to the Cuſtom of the place where you run) to give notice for Stripping and Weighing. In the firſt place be ſure to have your Stomach empty, only taking ſomething to keep out the wind, and to ſtrengthen you. If you are ſo light that you muſt carry weight, let it be Shot, equally quilted in your Waiſtcoat; but if you are juſt weight it is better, for then you have only to dreſs you according to your own fancy. Your Cloaths ſhould be of coloured Silk, or of white Holland, as being very advantageous to the Spectators. Your Waiſtcoat and Drawers muſt be made cloſe to your Body, and on your Head a little Cap tied on: Let your Boots be gartered up faſt, and your Spurs muſt be of good Mettal.

Thus equipped, you are to mount, and come to the place of Starting, where going off briskly or gently, as occaſion requires, make your *Horſe* perform the *Courſe* or *Heat* according to your deſign intended. For Example: If you would win the ſame, and your *Horſe* excels in goodneſs more than ſpeed, ſtart him off roundly, and run him to the very top of what he can do during the whole *Courſe* or *Heat*; and by that means, if the *Horſe* you run againſt be not ſo good at bottom, though he has more ſpeed, you ſhall beat him, becauſe he will be run off of it a great way before he comes to the end: But on the contrary, if your *Horſes* Talent be Speed, all that you can do is to wait upon the other *Horſe*, and keep behind him till you come almoſt to the Stand, and then endeavour to give a Looſe by him. Sometimes when you are to run more Heats than one, it will be your Policy to loſe a Heat; and in ſuch a caſe, for the eaſing and ſafeguard of your *Horſe*, you muſt lie behind all the way, as much as you can, provided you bring him in within diſtance.

As for your Poſture, place your ſelf upon your Twiſt, with your Knees firm, and your Stirrups juſt at ſuch a length, that when your Feet are thruſt home in them, you can raiſe your ſelf a little in the Saddle; for without that allowance your Legs will not be firm when you come to run: The counterpoiſe of your Body muſt be forwards to facilitate your *Horſe*'s *Running*, and your Elbows muſt be cloſe to your Body; but above all, be ſure not to incommode your *Horſe* by ſwagging this way or that way, as ſome do: For ſince Weight is a great matter in running, and a troubleſome Rider is as bad as ſo much more weight, I need not tell you how neceſſary it is to take great care of your Seat and Hand; you muſt therefore beware of holding your ſelf by the Bridle, or of jobbing your *Horſes* Mouth upon any occaſion; you muſt take your right Rein in the ſame Hand, holding up your *Horſe*, &c. as you find it neceſſary, and every now and then remove the Bridle in his Mouth. But theſe things are learn'd better by Experience and Practice than by Book.

When a Plate is run for by Heats, every Man that rides muſt weigh juſt at Starting in great Scales brought into the Field for that purpoſe, and at the end of the ſame Heat: For if you want of your weight at coming in, you ſhall loſe your Heat, although you are the firſt *Horſe*. Between the firſt and ſecond Heat, you have half an Hour to rub your *Horſes*, and then the *Drum* or *Trumpet* giving warning again, you mount, *&c.* as before, and ſo till you have finiſhed all, which is ſometimes three Heats, and ſometimes three Heats and a Courſe, according to the cuſtom of the Place.

I forbear ſaying any thing of the ſeveral Ceremonies relating to the Judges, and the Articles by which *Plate Races* and *Matches* are regulated, becauſe beſides that 'tis very eaſie to inform ones ſelf of them at a Minutes warning; they are more or leſs, according to the different Cuſtoms of the Place where you Run.

When you keep *Running Horſes*, which I would adviſe you to do only for Plates, and Matches of Sport and good Fellowſhip, and not for large Sums; if you do not breed them your ſelf, be ſure to buy no *Horſe* that has not extraordinary good Blood in his Veins: For a *Running Horſe* coſts a great deal of Money to keep, and a good one eats no more than a bad one, nor requires more attendance. Some Men to ſave twenty or thirty Guinea's in the Price of a young *Horſe*, have loſt Hundreds by him afterwards.

A *Horſe* that you have tried once or twice at a Twelve-ſtone Plate, you may be ſure to make an extraordinary Hunter of; or if he be well turn'd, and diſpos'd for it, a War *Horſe*: In ſuch a Caſe a Man has a great deal of Satisfaction, becauſe he knows what his *Horſe* is, and what he can do.

Note, That the Poſture, Manner of Riding, *&c.* is the ſame in a Match as in a Plate Race, only that there being but a ſingle Courſe to be run, you muſt puſh for all at that one time; whereas when there are ſeveral Heats, there is more ſaving, and variety of Play.

CHAP. XVIII.

Of the Faults and Imperfections of Horſes; *and firſt of the* Eyes, Jaw-Bones *and* Legs.

S*Olleyſel* and others inform us, that ſeeing all Eyes appear better than really they are in Sun-ſhine, you are to take a *Horſe* into the Shade, put your Hand above his Eye, keep off the too great Light, look ſlopewiſe upon him and then you will perceive the very Ground of them. Now to make a right Judgment, view them at Night in the Stable, placing the Eye between you and the Candle; tho' this is not infallible neither. The Chryſtal and Ground of the Eye, being the two Parts that conſtitute it, if the firſt be not tranſparent, but obſcure and troubled, ſo as that you cannot ſee thro' it, it's a Sign the Eye is not good. There ſhould be alſo a white Circle about it, but there are *Horſes* which have good Eyes without it. A reddiſh Chryſtal ſhews, that the Eye is inflamed or influenced by the Moon: A dead Leaf-colour'd Chryſtal upon the lower part is an infallible Mark that the *Horſe* is lunatick, and a Defluxion frequently attends it; but to know a lunatick Eye when there is no ſuch Defluxion actually upon it, if one of the Eyes only be ſubject to it, it will appear leſs than the other, the Chryſtal being troubled, and the Ground of the Eye black and browniſh.

As to the Ground or Apple of the Eye, it ought to be large and full, and ſo clearly perceived, that you may certainly know if there be a Dragon or white Spot in the Bottom of the Eye, which will blind him quickly. A tranſparent greeniſh white Bottom is a bad Sign: But here note, that if you look a *Horſe*'s Eye when oppoſite to a white Wall, the Reflexion will make it appear whitiſh, and a little inclining to Green, tho' indeed good. Again obſerve, if an Eye which is troubled and very brown be leſs than the other, it is loſt without Recovery, and the other is in great Hazard: But an Eye may be accidentally leſs than another, and in no danger of Blindneſs. Try if you can perfectly ſee through the Chryſtal of thoſe little Eyes, that are ſunk and very black: Then look to the Bottom, and that the Pupil be large; for the ſmall, narrow and long Pupils are in greater danger of loſing the Sight than any other.

General Obſervations about knowing the Eyes are, the Walking or Step of a blind *Horſe*, which is always unequal and uncertain, unleſs the *Horſe* be mettleſome, and mounted by a briſk Horſeman, in which caſe the Fear of the Spur will make him ſo free and reſolute, that his Blindneſs will be ſcarce perceivable. Again, a blind *Horſe* will always prick up his Ears, and move backwards and forwards when he hears any enter the Stable. Laſtly, For the Colours moſt ſubject to bad Eyes, they are the very dark Grey, the Flea-bitten, White ſpotted, Roan and Peach-bloſſom'd.

The next thing is to examine the Two Jaw-bones near the Throat, which being pretty large and hollow, and tapering gradually from the Throat to the Chin, will contribute much to the Goodneſs of the Mouth. Then you are to obſerve the Swelling, Hardneſs, or moving Kernels between thoſe two Bones, which in a *Horſe* that is above Six Years old are more to be fear'd than in thoſe that are younger; however, the *Horſe* may do very well for all that: But where there is a fix'd and painful Kernel, faſtned to the Jaw-bones, it's almoſt always a Sign of the Glanders, eſpecially in a *Horſe* paſt the Age of Seven, and a Diſtemper, whatever Secrets ſome have pretended to remove it, that is very rarely cured: However, a fixed Kernel may be cauſed by a Rheum or Cold, and by due Application be diſcuſs'd; but if neglected, for the moſt part it turns to a Glanders. Fixed and large Hardneſſes on the Inſide of one of the Jaw-bones are no Sign of the Glanders, which are beſt remov'd by tying them hard about the Roots, in the Decreaſe of the Moon, with a Thread of Crimſon Silk, and daily anointing 'em with the Juice of Purſlain. A fixed Kernel, that a *Horſe* cannot endure to be touched becauſe of the Pain he endures, is a ſufficient Indication that you ought not to meddle with ſuch a *Horſe*; but conclude, eſpecially if he caſts only at one Noſtril, that it is the Glanders.

Many are the Infirmities which a *Horſe*'s Legs are ſubject to, and ſhould therefore be diligently heeded. If they appear altogether ſtraight, or as it were all of a Piece, it's a Mark they are bad. A Leg may be ſaid to be right planted, when the Paſtern is placed about Two Fingers Breadth more backward than the Coronet. *Horſes* that are ſtrait upon their Members, are quite contrary to thoſe that are long-jointed; that is, whoſe Paſterns are ſo long and flexible, that the *Horſe* in walking almoſt touches the Ground with them, which is a greater Imperfection than the other, and irremediable. Some long-jointed *Horſes* indeed there are that do not bend their Paſterns in walking, and yet may prove ſerviceable: This Imperfection of having the Paſtern-Joint too much bended ſhould be as carefully taken notice of in the Hind-legs, as in the Fore, to which ſome *Horſes* are more ſubject; and if they have Wind-gales, they are more dangerous behind than if they were before; and therefore narrowly obſerve, that the Paſtern-Joint be neither too ſtiff, nor too ſmall, nor on the contrary too flexible and pliant. And as for thoſe *Horſes* which are ſhort legg'd, or ſhort jointed, they are ſubject to become ſtraight upon their Members, eſpecially if their Heels are left too high in Shoeing; and therefore they ought, by frequent Paring, to be kept very low. Before we leave the Inſpection of this Part of the uſeful Animal here treated of, it will be likewiſe neceſſary to take notice, that a *Horſe*, without being gall'd or hurt, is incident to a Swelling beneath the Skin round the Paſtern-Joint, in the Form of a Circle, and about half the Breadth of one's Finger, which they call Paſtern-crown'd, and proceeds from an Humour gather'd there through much Travel. Avoid the chuſing of thick, ſtiff, ſhort and unpliant Joints; for glib and flexible ones, if they are not too long, are one of the prime Qualities neceſſary in a *Horſe* of *Manage*.

The next Imperfection to be minded in a *Horſe*'s Legs, is when they are arched, that is, when his Knees are bended archwiſe. This Expreſſion relates to the Fore-Quarters, and the Infirmity is incident to ſuch *Horſes* as have their Legs ſpoil'd with Travelling. The *Horſes* called *Braſſicourts* have their Knees likewiſe bended Archwiſe; but this Deformity being natural to them, they are notwithſtanding ſerviceable; neither do I ſay, that the others are abſolutely uſeleſs. In the next place, you are to examine whether the back Sinew of the Fore-leg be large, firm and well-diſtanced from the Shank, and no Hardneſs to ſtop your Hand, or movable Gelly to ſlip between your Fingers: And if the back Sinew quite fails, as it were, juſt beneath the Ply, or grows very ſmall, this very much weakens the Strength of the Leg; and ſuch *Horſes* are, for the moſt part, ſubject to ſtumble, or trip and ſtrike with their Toes againſt the Stones. Wind-galls, or ſmall Swellings full of Water, may be eaſily perceived by the Eye on the Sides of the Paſtern, but are not prejudicial, unleſs hard and painful, which will ſoon lame the *Horſe*. In the next place, you may feel if there be a Splint or no, which is a callous Swelling upon the Shank-bone, on the Inſide below the Knee, and ſometimes on the Outſide. *Horſes* are alſo ſometimes troubled with a pegged or double Splint on the Outſide of the Shank, over-againſt one another: Whether the Splint mount upwards or no is an immaterial Queſtion; but this is certain, that when it joins to the Knee, it always lames the *Horſe*. *Fuzies* are Two Splints joined by the Ends, and ſo dangerous, that no body would have any thing to do with a *Horſe* that is troubled with them. The ſame thing may be juſtly ſaid of thoſe *Horſes* that have the *Oſſelets*, which are very hard Excreſcences, reſembling a little Bone on the Inſide of the Knee, and never on the Outſide, appearing to be of the ſame Subſtance with the reſt of the Knee, and only diſtinguiſhable from the Knee by its deſcending a little lower. Some *Horſes* have two of them, one upon each Foreleg.

Malenders are Chops or Chinks on the Bending or Joints of a *Horſe*'s Knee, which ſometimes ſuppurate, and as the *Horſe* grows old, the Pain of them will increaſe, and make him halt at firſt going out of the Stable. That which is called the *Form* is a Swelling in the very Subſtance of the Paſtern, and not in the Skin, and affects the Hind, as well as the Fore-legs; a Diſtemper not very common, but very dangerous. The *Crown-Scab* is an itching Scurf upon the Coronet, and is of two Kinds, moiſt and dry. It makes the Hair to ſtare, and the Coronet to ſwell, being an Infirmity which a *Horſe* very rarely recovers. When you find the Hams of a *Horſe* nearer to each other than the Feet, eſpecially the Hocks, this is called, *Cloſed Behind*; and ſuch *Horſes* have commonly a weak Hind-hand, and in great Deſcents are apt to ſtrike their Hams againſt one another. The *Ham* ſhould be large and full, nervous and dry. A *Capelet* is a moveable Swelling in the Tip of the Hock, which, when grown large, is painful, and makes a *Horſe* loſe his Belly. A *Voſtigon*, a pretty large Swelling of ſoft and ſpungy Fleſh, between the Fleſh and the Skin, in the Hollow next the Hock, ought not to be over-look'd; it comes on both Sides the Ham, and ſometimes on one only. On the Backſide of the Ham, below the *Capelet*, comes the Swelling called the *Curb*, which makes the *Horſe* frequently to halt, and is incurable. On the Inſide of the Ham there's a Bone ſomewhat high and elevate, below which the Ham ſometimes ſwells by a degorging of the great Vein, and this is called *Variſſe*; that does not make a *Horſe* halt, but by its exceſſive Swelling ſometimes ſpoils his Sale.

As for the *Spavin*, there are ſeveral Sorts of them, *viz.* the Ox, the Dry or Bone, and Blood or Wet *Spavin*. The firſt is a callous and griſly Swelling, as hard as a Bone, and ſo painful, that it makes a *Horſe* loſe his Belly. Some *Horſes* halt with it at firſt coming out of the Stable, when the *Spavins* are young. Theſe Sorts of *Spavins*, when they firſt ſeize a *Horſe*, are more difficult to be obſerved, becauſe they do not riſe much above the Subſtance of the Legs, which grow bigger in ſome *Horſes* than in others; but yet at their firſt piercing 'em, commonly make a *Horſe* halt, and when the Swelling increaſes, he halts no longer: But ſince they rarely happen in both the Hams alike, one is eaſily diſcern'd to be bigger than the other, and the more by placing your ſelf before the *Horſe*, a little towards one of the Shoulders, than if you were juſt behind him. As for the *Dry Spavin*, when a *Horſe* in Walking raiſes one of his Hind-legs higher than the other with a Twitch, he is ſaid to have it; nay, will have it many times in both Hind-legs: This after degenerates into an *Ox-Spavin*. The *Blood* or *Wet Spavin* is a Swelling on the Hoof, continually ſupplied with Blood from the Maſter-vein, and is eaſier cured than the laſt, which, as well as the *Ox-Spavin*, is produced much on the Inſide, beneath the Bending of the Ham.

The *Jardon* is a Swelling on the Outſide of the Ham, as hard as the *Spavin*, mounting up almoſt as high as the Part where the *Veſtigon* grows. It's not ſo common, but yet more dangerous than the *Spavin*; and if upon the Fore-Sinew of the Leg, between the *Spavin* and the *Jardon*, there is as it were a Circle that unites them, and ſurrounds the Nerve of the Inſtep, the *Horſe* is ruined paſt Recovery. *Spavins* and *Jardons*, when they are Hereditary, are incurable, and more to be in young than old *Horſes*. The *Selender* lies in the Ply of the Ham, though there are Chops and Creviſes ſometimes in the Fore-legs, which reſemble the *Malenders*, and are called the *Selenders*. *Rats-Tails* grow upon the Back-Sinews, being known by the Part's being hairleſs from two or three Fingers Breadth below the Ham to the very Paſtern-joint: They are ſometimes dry, ſometimes moiſt, but always cruſty, callous, and more elevated than the reſt of the Leg. 'Tis rare, tho' ſome *Horſes* have them only in their Fore-legs. Large *Coach-Horſes* are thoſe that are moſt ſubject to thoſe and the following Infirmities. There are a Sort of *Warts* or *Leek-heads* growing about the Paſterns and the Paſtern-joints, and Half a Finger thick above the Height of the Skin, ejecting filthy ſtinking Stuff, and hard to cure: Thoſe in the Paſterns are hid by the long Hair of the Fetlocks, ſome of which are very malignant, ſhed the Hair, and grow like Walnuts; others are flatter, but more dangerous than the biggeſt, being eaſily diſcover'd, and without Hair; but for the moſt part ſend forth Matter, which may be dry'd up for a Seaſon.

The Soles are ſometimes affected with mattering kinds of Warts, or rather Figs, upon the middle of the Fruſh towards the Heel, and commonly exceeding the ordinary Height of the Fruſh: Sometimes they grow on the Sides of the Fruſh, and when they are conſiderably raiſed above it, ſo as to touch the Ground as the *Horſe* rides, they make him to halt. You may know when a *Horſe* has been cured of the Figs, becauſe the Foot will be larger than the reſt, tho' the *Horſe* be well recover'd. *Traverſe Mules*, or *kibed Heels*, Chops and Clefts, ſurrounding the Back-parts of the Paſtern-joints, where they bend, are more painful than Figs: But this ſhould not hinder you to buy the *Horſe*, if his Legs are not gorged and ſwell'd, becauſe they may, though with ſome Difficulty, be dried up. A white, ſharp, and corrupt Humour, called *Waters*, affect the Hind, but rarely the Fore-legs, known by the Moiſtneſs of the Paſterns and Paſtern-joints beneath the Hair, and ſometimes mount up to the very Ham. They frequently cauſe the Paſterns to ſwell, the Legs to be ſtiff, the *Horſe* lean, and ſeparate the Fleſh from the Coronet: They are eaſily ſtopt at firſt, but afterwards with Difficulty. The Cure in Winter and cold Weather is not ſo eaſie as in Summer.

CHAP. XIX.

Of the Faults and Imperfections of the Feet, Body *and* Flanks.

YOU ought to know *Horſes* very well, to be able to judge exactly of ſome Sorts of Feet, ſome appearing to be weak, when they are not really ſo; the little Horn they have being tough, ſolid and capable to ſerve: Again, others appear good, which are pain'd, for being too fat and fleſhy. The ſureſt Way then is, to take them of a good Shape: The Hoof ſhould be very near round; the Horn tough, ſolid, high, ſmooth, dark-colour'd, and without Circles. You may likewiſe make a good Judgment of it, by obſerving the Manner of the Shoe's fitting it. If the Foot be circled, 'tis a Sign the Hoof is altered, or the Horn naught. Thin-footed *Horſes* halt, or mean their Feet a long time after they are ſhoed, before they recover Strength; but to know when a Foot is fat, or the Hoof thin, is the moſt difficult thing in the Knowledge of *Horſes*, the Horn being as beautiful as the beſt, only the Hoof is ſomewhat longer than the Size of the *Horſe* will allow of. You are alſo to conſider, if the *Horſe* has not a Cliff in his Foot, called a *Falſe Quarter*, occaſion'd by his caſting his Quarter, and having a new one; for then the Horn becomes uneven, ugly, larger and ſofter than the reſt of the Hoof; and if the Cliff be conſiderable, let it hinder you from buying. Thoſe Over-reaches, or calking Treads upon the Coronet, do not prejudice the *Horſe*, if no Swelling remains on the Coronet. You are by no means to omit lifting the Foot, whoſe Heel ſhould be pretty high, broad, large and open; the Fruſh proportionable to the Foot, *i. e.* not too little and dry, nor too large and fat; for thoſe which are little fall to the Share of the hoof-bound, or narrow-heel'd *Horſes*: But when the Fruſh is too large and fat, it's higher at the Heels than the Sole, and is always a Sign of a very bad Foot. Moſt *Horſes* which have low Heels have large Fruſhes. Proceed and conſider, whether the Sole be ſtrong, the whole Foot hollow, and at a pretty Diſtance from the Shoe, which are beſt: But for thoſe which People call *Weak Feet*, you are to heed, that tho' their Heels be indifferent high, they are but thin at the Point of the Fruſh; and that though the Sole be hollow, yet they have ſo little Strength in their Feet, that they eaſily halt, and hard Ways lame them; ſo that People are frequently obliged to let them ſtand oft, and give them but moderate Labour. In *Hoof-binding*, the Heels do not take a right Compaſs, but are narrow towards the Clift of the Fruſh; ſo that the whole Heel is a little more than two Fingers Breadth; whereas a *Horſe* ſhould always have about Four, little more or leſs, according to the Size. As for narrow-heel'd *Horſes*, which have high Heels, thoſe that have them not, and others that have the back part of their Paſterns next to the Heels, as if they were pointed, have commonly very bad Feet, and for the moſt part hoof-bound. Laſtly, There is another Imperfection attending *Horſes*, in *French* called *Crapaudine*, or Tread upon the Coronet, being a kind of Ulcer there, from whence iſſues filthy Matter, which by its Sharpneſs dries up the Horn, beneath the Part where the Tread is made, wherein is form'd a kind of Hollow or Groove down to the very Shoe. Feet too large, or too little, are a great Imperfection, and by no means to be choſen; and there is no body but will reject founder'd Feet, the Hoof whereof oftentimes ſhrinks and falls in towards the middle of the Foot, have many Circles quite round the Foot, and appear altogether altered and dry, with the Heels all circled.

In the next place you are to examine, whether a *Horſe* hath a good Body, and be full in Flank. It's no good Sign they are ſo when the laſt of the Short-Ribs be a conſiderable Diſtance from the Haunch-bone, or when the Ribs are too much ſtreightned in their Compaſs; whereas they ought to be as high as the Haunch-bone, or very little leſs when the *Horſe* is in good Caſe. A narrow-cheſted *Horſe* can never have a good Body, nor Breath well; and ſuch *Horſes* as have ſtraight Ribs, being great Feeders, and conſequently come to gulf up their Bellies, ſo as it not being poſſible for the Entrails to be contain'd within the Ribs, they will preſs down, and make a Cow's Belly. They are alſo difficult to be ſaddled, but yet they have generally good Backs; and though their Croups are not ſo beautiful, being for the moſt part pointed; yet to ſupply that they have excellent Reins: They are commonly called *Sow-Backs*. A light-body'd and fiery *Horſe* a Man ought never to buy; but Fierineſs ought never to be confounded with Vigour and high Mettle, which laſt does not conſiſt in fretting, trampling, dancing, and not ſuffering any *Horſe* to go before him, but in being very ſenſible of the Spurs.

Light-belly'd *Horſes*, which are very apt to be troubled with *Spavins*, *Jardons*, &c. you are to ſhun; and whereas painful Scratches in the Hind-legs ſometimes take away a *Horſe*'s Belly, this ought not to deter you from buying, unleſs they be in the Back-Sinew of the Leg a pretty way above the Paſtern-joint, which is one of the moſt troubleſome external Maladies a *Horſe* can have. Without a low caſed *Horſe* eats much Hay, he cannot be made plump, which will make him have a Belly like a Cow with Calf, and may be remedied with a Surcingle about a Foot and half broad, with two little Cuſhions to it, that may anſwer to the Top of the Ribs on each ſide of the Back-bone, to preſerve the Back from being gall'd.

As to the Flank in a *Horſe*, it may be full enough, and yet if it fall too low over-againſt the Stiffle, it promotes Purſineſs, eſpecially if the *Horſe* be not very young. If he makes a String or Cord in Breathing, by attracting the Skin of his Belly where the Ribs fail, his Flank begins to alter, or at leaſt 'tis a Sign his Body is over-heated, that he hath been ſick, or will in a ſhort time become ſo. Sometimes indeed this Cord appears in vigorous *Horſes*, that have been indiſcreetly over-rid, and there is no Sign of actual Purſineſs, but only that in a ſhort time it may become ſo. A Man may be readily deceived in this Diſtemper at the Beginning of it; and therefore you muſt conſider the *Horſe*'s Age, becauſe young ones are very rarely purſie: Then ſee whether his Flank be not ſwallow'd up, or fallen too low. To be the more certain, preſs his Wind-pipe near the Onſet of the Head, that ſo you may make him cough, and note the Sound of it: A dry one is naught, a dry one and reiterated is worſe; the moiſt is not ſo hazardous; if he farts and coughs, it's a certain Sign of Purſineſs. The ſureſt Way is to view him in the Stable immediately after he has drunk, or when he is eating his Oats. You cannot ſo well judge of him after travelling, when he hath not drank a pretty while, or when he is at Soil or Graſs. You ſhould likewiſe diligently obſerve if the *Horſe*'s Flanks redouble as he is breathing; as alſo, whether the Motion of his Flanks appear at the upper End of his Short-Ribs, which is a Sign they are altered; but ſtill much more if they beat, and make their Motion at the very Top, and juſt by the Back-bone; or too low, and over-againſt the flat part of his Thighs. If the *Horſe* be too far gone, his Lungs will be dried up, and he is paſt Cure. The Flank may be right and ſound, and yet the *Horſe* have a Wheezing or Blowing, which proceeds not from any Defects in the Lungs, but the Narrowneſs of the Paſſages between the Bones and Griſtles of the Noſe, which is diſpleaſing to People, though the Beaſt is not purſie. Thick-winded *Horſes* are thoſe that breath a little more freely than the former. There are ſome Wheezers that make a Noiſe thro' the Noſe, which is no Impediment to the Goodneſs of the *Horſe*. As to a *Coach-Horſe*, I would adviſe you not to buy him before you ſee him draw; for if ſo be he ſtoops with his Hind-parts, and raiſes his Fore, he will draw right; but if he does quite otherwiſe, it's manifeſt he will draw ill. Cheſt-foundring is known by the ſame Symptoms as Purſineſs, only young *Horſes* are ſubject to the firſt, as well as old ones; and 'tis a Diſtemper proceeding from Crudities in the Stomach, and other Infirmities, obſtructing the Paſſages of the Lungs, in which there are Hopes of Recovery, but not in Purſineſs.

CHAP. XX.

Of the Walking *or* Treading; *Of his* Mouth, Vigour *and* Agility; Mounting, Trying, Colour *and* Marks *of a* Horſe *you intend to buy.*

A *Horſe* ſhould ſtand equally on his Legs, and not one Foot advanced before another; only 'tis no ill Sign for him to advance one of his Hind-legs, letting the Toe only touch the Ground; but if he advances one of his Fore-legs, and point it only to the Ground, it's a Sign of his being pain'd in the Leg. Indeed there are ſome *Horſes* who can never plant themſelves right, though their Legs are good. In a true Poſition, the Diſtance between his Feet ſhould be leſs than between his Fore-Thighs, at that Part next to the Shoulders; the Knee ought not to be too cloſe, but the whole Leg ſhould deſcend in a ſtraight Line to the very Paſtern-joint; and the Feet ſhould be turn'd neither in nor out. Then for the *Jarrets*, or Hams, they ought not to be too cloſe; the Inſtep muſt be perpendicular to the Ground; put him back with your Hand, to try if he turns the Toes of his Hind-feet much outwards; in which caſe, eſpecially for the *Coach*, he will be of no great Service.

The next Thing is to obſerve, in his being trotted along the Street in one's Hand, how he lifts up, keeps up, and ſets down his Legs; alſo if he keep his Rein ſtraight and equal, his Head high, well placed and firm: Then let ſome body ride him a Foot-Pace, and if you find he raiſes his Legs hardily and with Eaſe, without croſſing them, carrying his Feet too much in or out, and alſo bends his Knees as much as is needful, 'tis well; the Stay is good, when he keeps them up as long as he ſhould, his Head and Body remaining in a good Poſture, and if he does not ſuddenly put down one Leg, to give Eaſe to another, which is weak and painful. The Trot is good, if firm, without reſting upon one Side of the Foot before the other, or ſetting down the Toe or Heel before the other. It is a Sign of Foundring if he ſets his Heels firſt on the Ground; but if his Toes, 'tis a Sign he has been a Draught-Horſe. Some *Horſes*, notwithſtanding they raiſe, ſtay and tread well, have a bad Walk; and therefore you are to ſee that he walks quickly, and alſo lightly on the Hand, not preſſing, nor reſting too much on the Bit, but always changing a Point, keeping his Head high, with a quick Motion of his Shoulders. He walks eaſily when his Fore and Hind-feet make as it were but one Motion; and ſurely when he treads firm and ſure, and lifts up his Legs indifferently high; but if he does not bend them enough, he will be cold in his Walk, (as they call it) and apt to ſtrike upon the Stones and Clods.

To have a good Mouth, a *Horſe* ought to have a well-raiſed Neck, and if it be ſomewhat large and thick, it ſhould be at leaſt well turned; his Reins ſtrong and well-ſhaped, as well as his Legs and Feet; but if his Jaws be too cloſe, and that he has alſo a ſhort thick Neck, ſo that he cannot place his Head right, his having a good Mouth will ſignifie little, becauſe you cannot make uſe of it. If you preſs the Bar in his Mouth pretty hard with your Finger, it's a Sign 'tis ſenſible, and his Mouth good. If the Bar has been hurt, tho' heal'd, it ought to be ſuſpected almoſt as much as a bad Mouth, becauſe the Scar will never have the Senſe of Feeling it had before, nor will the Mouth of the Bit reſt ſo equally upon it: But to be certain of a *Horſe*'s Mouth, you muſt put him on pretty ſmartly, and then preſently ſtop him; by his Parting you will ſoon know if he be ticklish mouth'd, by his chacking the Bridle, or throwing up his Head. Again, by his Stop, you will find if he ſtops eaſily, and by the leaſt Motion of the Hand, with his Head firm and well placed. He is a good *Horſe* that champs continually on the Bit: His Mouth ſhould be full of Froth, which, if thin and fluid, or of a pale Grey, or Yellowiſh Colour, it denotes a bad temper'd Brain; but if white, thick, cleaving to his Lips and Branches of the Bridle, the Mouth is freſh, the *Horſe* well conſtitution'd, and ſound in the Body.

To try the Vigour and Agility of a *Horſe*, when he is ſtanding ſtill, keep him faſt with the Bridle-Hand, pinch him, which is to apply your Spurs juſt to the Hair of his Sides, his Impatience, Struggling to go forwards, champing upon the Bit, without thruſting out his Noſe, is a good Sign; but you are not to think ſo of every *Horſe* that ſhews a great deal of Mettle when he is pinched, ſince that proceeds moſt from the Thinneſs of their Skin, yet are of a dull Nature: But a *Horſe* truly vigorous ſhould be calm and cool, ride patiently, and not diſcover his Mettle but when required. Some *Horſes* when you give them the Spurs, will not endure them, nor go forwards, but cleaving, and as it were faſtning to them, ſtrike out and go back ; and if you preſs them hard, they will then fall a Piſſing and not move out of the Place : In ſhort, every *Stone-Horſe*, *Gelding*, or *Mare*, that does not feel the Spurs, but obſtinately cleaves to and kicks againſt them, ought to be look'd upon to be of a croſs and ſullen Nature, and therefore rejected.

A Man ought never to buy a *Horſe* that has any other Will, ſave that of his Rider ; and therefore when you mount a *Horſe* to try, let him be ſuch as you find very apprehenſive of Strokes, and even of the leaſt appearance of them, and yet without Fretting, or Fierceneſs : A *Horſe* that Walks ſecurely and deliberately, without too often needing the Whip, and Fretting, paſſes from the Walk to the Gallop, and from that to the Step, without diſquietude ; but always Champing the Bridle, Trots with glibneſs upon his Shoulders, and Gallops eaſily, ſnorting a little through his Noſtrils : If you find him well upon his Haunches, his Head firm and well placed, and the feeling of the Bit equal and juſt, you will ſeldom have cauſe to complain of his Price.

As to the manner of mounting and trying a *Horſe* you have a mind to buy ; after you have ſeen another ride him, take him your ſelf, as he comes out of the Stable, and without frighting him in the leaſt with your Legs or Whip, ſlack the Bridle-hand about four Fingers breadth more than's neceſſary, to feel him on the Hand, letting him go at a Step, as he pleaſes, and even with the toſſing of his Head, even for a quarter of an Hour : If he is inclined to ſtumble, he will trip more than once, and perhaps ſalute the Ground with his Noſe ; If he be heavy on the Hand, he will reſt wholly on the Bit, and be a burden to the Bridle-hand ; if dull and lazy, he will flag inſenſibly, and at laſt ſtand ſtill : To put forwards again, you are gently to move your Body, Legs, and even your Arms, by which means you will better know him in half an Hour, than half a Day otherwiſe. Again, if after this Eſſay, you cauſe him to go an attentive Pace, and that he be under the Apprehenſion of your Spurs, he will unite all his Strength and Mettle to pleaſe you.

As for *Amblers*, they ſhould move roundly and equally, their Hind quarters exactly accompanying their Fore ; and if the Perſons that ride them make but a little motion with their Bodies, 'tis a certain Sign that they go well, not only the Amble, but the Step : But the beſt Obſervation of all concerning them, is to take notice if they Over-lay, that is, with their hind Feet over-paſs a foot and an half or two foot the print of their fore Feet, for the more they do it, the better they Amble, becauſe they muſt conſiderably ply the Haunches, which is the perfection of the Amble : Shuffling and mix'd Paced *Horſes* are generally worth nothing, and the ill Cuſtom proceeds from their firſt Fierineſs or Weakneſs in their Reins and Legs ; but if you find thoſe inclin'd to it of their own accord, that were never guilty of it before ; it's a ſign their Legs are ſpoil'd, or grown weak.

All thoſe that regard either Colours or Marks in a *Horſe*, as being compoſed and nouriſh'd by the four Elements, are laugh'd at by the Duke of *Newcaſtle*, yet to give the Names and a brief Explication of Colours *Horſes* uſually are of, and which are vulgarly eſteemed beſt, will not be amiſs in this place. *Bay* is the moſt common of any, and thoſe are called *Dappled Bays* that have dark Spots on their Croup : the *Dark Bay* is almoſt Black, with a little brown Hair upon the Flanks and Tip of the Noſe, and therefore by ſome called *Brown Bay* : the Mane's and Tails of all theſe are Black, and there never was a Bay but the Extremities were ſo : There are ſeveral ſorts of *Gray's*, as 1. the *Branded*, that has large black Spots diſperſed here and there. 2. The *Silver Gray*, with a very ſmall mixture of black Hairs, and ſo much only as may diſtinguiſh it from the White. 3. The *Sad*, or *Powdered Gray*, that has a large mixture of black Hairs in it, and very pretty, when the Mane and Tale are White. 4. The *Black Gray*, almoſt the ſame, with a great deal of Black, and but little White. 5. The *Browniſh*, or *Sandy colour'd Gray*, being Bay colour'd Hairs mix'd with Black. 6. The *Dapple*, commonly known. As to *Pyebalds*, there are *Black*, *Bay* and *Sorrel*, and the leſs White the better Sign of their goodneſs. The *Wine*-like Roan, and that with a black Head, Mane and Tail, are agreeable Colours : There are thoſe alſo of a *Starling* Colour, not unlike the browneſt Gray, only more Freckled and much Whiter. Others of a *Peach*, or *Bloſſom* Colour, which tho' pleaſing to the Eye, yet they are very rarely pliant to the Spur.

As for the *Sorrel*, there are few *Horſes* of this Colour, which is a kind of Bay, of a Brown, or rather Reddiſh Colour, but are good, eſpecially if they have black Manes, Tails and Legs : Tho' there are ſeveral Kinds of them, the difference principally conſiſts in their Manes or Tails, 1. the *Red*, or *Cow-colour'd*, the Mane and Tail white, or the ſame with the Body. 2. The *Bright* or *Light*, the Mane and Tail white, and not much worth. 3. The *common Sorrel*, a medium between the Red and Bright, and called Sorrel without any diſtinction. 4. *Burnt Sorrel*, deep Brown and Reddiſh, and ſhould have the Mane and Tail always white : A beautiful and good Colour. Theſe *Horſes* in general anſwer readily to the Spurs, but are moſtly of a Cholerick Conſtitution. To ſay nothing of the *Rubicon*, which is a Black or Sorrel with white Hairs here and there on his Body ; the *Mouſe Colour* or *Dun* is well known, and thoſe with black Liſts on their Backs, are called *Eel-back'd* : others have black liſted Legs and Hairs ; as alſo black Manes and Tails. Some are of a *bright Dun*, but the dark are moſt ſerviceable, eſpecially with black Extremities.

Thoſe of a *Wolf* Colour, whether bright or dark, are for the moſt part very good *Horſes* : The *Tyger* is the ſame with the *Branded Gray*, only the ſpots are not near ſo big : The *Deer* colour is well known, and thoſe are beſt that have black Manes, Tails and Legs, and thoſe that have a black Liſt on their Backs are ſtill better.

It's certain there are good and bad of all Colours, but the *Bay*, *Cheſnut*, *Dapple-Gray*, *Roan* with a blackiſh Head, the burnt and dark *Sorrel*, the *Black* with a Blaze in the Forehead, are reckoned all good Colours ; the *Flea-bitten*, eſpecially in their fore-parts, are commonly excellent, and if they are ſo all over their Bodies, the Mark is ſtill ſo much the better, but rarely good, that have them only on their Hind-quarters.

As to the particular Marks of *Horſes*, thoſe are eſteemed good that have the far Fore-foot, and the near Hind-foot white : But a white far Hind-foot, and the two fore-feet white are eſteemed bad: The two hind-feet, eſpecially if there is a Star in the Forehead, are reputed good Marks: The two fore-feet and one hind-foot white, are ſomewhat better than the two fore-feet alone: Four white Feet are not commonly ſtrong: Two white Feet of a ſide, and to be croſs-white-footed is a bad Mark: Ermin'd white Feet are excellent; the higher the white aſcends on the Leg, ſo much the worſe is the *Horſe*: A Feather which is only a turning of the Hair, like an Ear of Barley, or Oylet-hole, when far extended along the upper part of the Neck, near the Mane, is a good Mark, and ſtill better, if on each ſide the Neck: So likewiſe if there be two or three of them ſeparate from each other in the Forehead, or the like on the Ply of the hind Thigh. As to thoſe that have white Faces, or Blazes; they will have that *Horſe* to be of an odd Diſpoſition, that has a Blaze divided in the middle croſs-ways, but that his near hind Foot being white, will rectifie the Blemiſh; a White or Grey *Horſe* without a Star is eſteemed the better for it; and when it has been made by Art, you will find not only no Hair grow in the middle of it, but the white ones will be much longer than the reſt: the manner of doing it in *Holland* is thus; They roaſt a large Onion in hot Aſhes, divide it into two parts, and dipping it in ſcalding hot Walnut Oil, immediately apply the flat ſide of it to that part of the Forehead, where they deſign the Star ſhould be; and having kept it there for half an Hour, take it off, and anoint the ſcalded place with the Ointment of *Roſes*; and as ſoon as the Scarf-skin falls off, ſome white Hair will grow up there.

CHAP. XXI.

Of the Marks of a good Horſe, *to know his Age, and judge of his Shape.*

THE Marks of Beauty and Goodneſs in a *Horſe* are theſe; his Ears ſhould be ſmall, thin and ſharp, carrying them well; or if they be long, but well ſet on, upright and moving, it is not amiſs. His Face ſhould be lean and bony, his Forehead ſwelling outwards, and the Feather of his Face ſet pretty high, that is, above his Eyes, or at the top of them; and if he is mark'd with white (provided it is not too much) upon his Face, or the ſnip of his Noſe, ſo much the better. His Eyes ſhould be round, black and ſhining, ſtanding out from his Head: His Cheek-bones or Chaps, ſhould be lean and thin, with the ſpace between them wide, and free from Knots and Kernels; and his Wind-pipe large. His Noſtrils ſhould be dry and wide, ſo that upon the leaſt ſtraining a fiery Redneſs is ſeen in them. His Muzzle ſhould be ſmall, his Mouth deep, and his Lips ſhould ſhut tight and well, the Upper being about an Inch longer than the Lower.

To know the Age of a Horſe.

YOU muſt remember that a *Horſe*, when he has all his Teeth, hath juſt Forty; that is, four and twenty Grinders, twelve on each ſide, ſix above, and ſix below, on the ſame ſide; then twelve Gatherers, ſix above and ſix below, on the fore-part of his Mouth, which makes ſix and thirty; and laſtly, four Tuſhes, one above and one below on each ſide, which makes up the Forty. The firſt year he has his Foals Teeth, which are only Grinders and Gatherers, without any Tuſhes; they are ſmall and white. The ſecond year the four foremoſt Teeth will appear browner and bigger than the reſt. The third year he changes the next to them, and leaves no Foals Teeth before, but two upon each ſide above, and the ſame below. The fourth Year he changes the next to them, and leaves but one upon each ſide above, and the ſame below. The fifth Year his foremoſt Teeth are all changed, his Tuſhes being compleat on each ſide, and the Teeth that came in the room of the laſt Foal's Teeth which he caſt, are hollow, having a little black Speck in the middle, which is called the Mark in a *Horſe*'s Mouth, and ſo continues till the Eighth Year, or thereabouts. The Sixth Year he has new Tuſhes, about the bottom of which you may ſee a little Circle of new Fleſh, and the Tuſhes will be white, ſmall and ſharp; But, ſays *Solleyſell*, the upper Tuſhes will be a little Channel'd, and ſomewhat hollow'd and grooved on the inſides; but when he is above Six they will fill up, and become a little round on the inſides, which is an Obſervation that rarely or never fails. The Seventh Year all his Teeth are grown to perfection, and the Mark in his Mouth (as we call it) is very plain to be ſeen. The Eighth Year all his Teeth are full and ſmooth, the Mark being ſcarce viſible, and his Tuſhes grow yellower. The Ninth Year his foremoſt Teeth ſhew longer, yellower and fouler than before, and his Tuſhes grow blunt.

But tho' theſe Obſervations are juſt enough, the Matter may be more particularly ſtill illuſtrated from *Solleyſell*, who ſays, that after a *Horſe* has Razed, you cannot judge of his Age, but by the Length of his Teeth; that as the Gums in time grow lean, they make the Teeth to appear the longer, and 'tis certain the longer they are, the older the *Horſe*, and they'll contract, ruſt, and grow yellow; only ſome old *Horſes* have very ſhort and white Teeth, and ſome will have a black ſpeck like the true Mark, after they are paſt Eight or Nine, but 'tis hollow.

Not to repeat any thing that has been ſaid before of the Tuſhes; when you find by your Fingers that thoſe of the upper Jaw are worn equal with the Palate, the *Horſe* is then at leaſt Ten Years Old; An Obſervation that ſcarce ever fails, unleſs the *Horſe* when young, carried a bigger mouth'd Bit than was proper for him: Young *Horſes* have always their under-Tuſhes ſharp pointed, pretty long, ſomewhat edg'd on both ſides, and without Ruſt: But as they increaſe in Years, they grow big, blunt, round, and ſcaly, and even extremely thick, round and yellow in very old *Horſes*: To have long Teeth and black Specks in them, is to be Shell-Toothed, a Mark that laſts all their Life; the ſame appearing on the other fore Teeth as well as in the corner'd one's. In Age the points of the Gatherers ſtand out a little, and when very old point almoſt ſtraight forwards; but when young near ſtraight up, and juſt equal with the outer edges of thoſe above.

Thoſe who do not require exactneſs, but would only know if a *Horſe* be Old or Young, let them lift up the upper Lip, and if his upper Teeth be long, yellow, and are paſſing thoſe below, its a

Sign of Age, as the contrary betokens Youth. As there are ſome *Horſes*, whoſe Teeth continue always white and ſhort; theſe when they fall into Cheats Hands, are frequently counter-mark'd by them, by hollowing the corner Teeth with an engraving Iron, and putting ſome double Ink immediately into that Hole, and there letting it dry, will hold as long as the Teeth remain hollow. Others have the dexterity to burn a grain of *Rye*, with a red hot Iron, in the hollow of the Teeth, which will make them perfectly black. But to obviate ſuch Cheats, you may conclude, if you find any Scratches on the outſides of the hollow of the Teeth, becauſe the Graver ſometimes ſlips and ſcratches the other part, that they are countermark'd: Obſerve in like manner, the inſides of the upper Tuſhes, which ſhould be grooved till the *Horſe* be Seven: Neither are the Signs of Old Age to be over-look'd, *viz.* the upper Teeth long, over-paſſing the lower, and yellow; the lower part of the nether Jaw-bone ſharp and edged; the under Tuſhes uſed, big and ſcaly.

As for the filing of a *Horſe's* Teeth to make them ſhort, 'tis ſcarce a practicable Cheat; but to proceed therefore to ſome other Rules on this weighty Head; ſome have recourſe to the Joints of the Tail, paſſing their Hand along it, to feel for a Knot in the upper part, which comes forth when he is between Ten and Twelve, and a ſecond when he is fourteen: Others there are that put back his under Lip, and ſo many Years old they ſay he is as there are Plys therein; but theſe are no ſure Marks, the beſt way after the Mark is gone, is to obſerve whether his Legs be neat and good, his Flank well truſſed, but not too full and ſwallowed up; and laſtly, narrowly to examine his Feet, and take notice of his Appetite.

But before *Solleyſell* concludes, he adds ſome other Obſervations to know a *Horſe*'s Age that is paſt Mark, to this effect; that when the Pits above the Eyes are extremely hollow, 'tis for the moſt part a Token of Old Age; tho' *Horſes* begot by old Stallions have them very deep at four or five Years old; as alſo their Eye-lids and Eyes wrinkled and hollow; that contrary to young *Horſes*, the nether Jaw in old one's is always ſharp and edged: So that a Perſon who is uſed to it, will before he opens a *Horſe*'s Mouth, judge pretty near his Age. That there are ſome who will pull the ſkin of the nether Jaw Bone or Shoulders a little to them, and ſay, if it continues long without returning to its place, the *Horſe* is not young, and the longer in returning the older. On which, however, there is no great dependance, by reaſon the Skin of a Lean *Horſe*, tho' young, will be longer in returning to its place, than the Skin of an old one that is Fat and Plump. That Seeling, or the growing of white Hairs, mix'd with thoſe of his natural Colour on his Eye-brows, is another Token of old Age: That a *Horſe* never Seels till Fourteen, and always before Fifteen, or Sixteen at fartheſt; but that the light Sorrel and Black ſooner Seel than others: That however *Horſe* Courſers have the Addreſs to pull out thoſe white Hairs with Pinchers, but that if it cannot be effected without making the *Horſe* look bald and ugly, they colour their Brows to make the Buyer believe they are young: That 'tis no bad Method to judge of his Age by inſpecting his Palate, for the older he is, the leaner grows his Roof, and drier towards the middle, and the high and plum Ridges in young *Horſes* are diminiſhed by Age: So that in very old *Horſes* the Roof of the Mouth is nothing but Skin and Bone; and this is a good Remark, eſpecially in *Mares* that ſeldom have any Tuſhes, by which you may know their Age: He concludes that the Grey become white, as they grow old, and white all over, when very Aged; but that thoſe which are Foal'd Grey, are known by their Knees and Hams, that continue for the moſt part of that Colour. *Soleyſell.*

The Shape of a Fine Horſe.

From his Head look down to the Breaſt, which ſhould be broad and beautified with Feathers. His Fore-Thighs to the Knees ſhould be firm and ſinewy without any ſwelling, and his Knees ſhould be cloſe knit, carrying an equal proportion. From the Knees to the Paſterns his Legs ſhould be clean and nervous, and the Inſide of his Knees ſhould be free from any Seam, Scar or Scab. His Paſterns ſhould be well knit, and not too long, and he ſhould tread right upon them. His Hoofs ſhould be black, ſmooth, tough and hollow, and rather a little long than round. For the ſhape of his Neck and Creſt, and the ſetting on of his Head, I refer you to what has been ſaid before. The Chine of his Back ſhould be broad, even and ſtraight; his Ribs round in compaſs and bending outwards, and his Fillets ſtrong and ſhort. He ſhould be Home-ribb'd, and his Body ſhould be well let down. His Buttocks ſhould be round, full and plump, lying in a level with the reſt of his Body. His Gaſcoyns ſhould be full and brawny, being well let down as far as the middle Joint, which ſhould be nothing but Skin, Bones, Veins and Sinews; and his Hind-Legs clean and ſinewy. Theſe are generally Marks of Beauty and Goodneſs, and the more a *Horſe* has of them the better; for I never yet ſaw a *Horſe* compleatly perfect.

To obſerve theſe things exactly, you ſhould do well to have the *Horſe* you intend to buy, ſtript naked and led out before you; and when you have viewed him all over, having ſome able and truſty *Farrier* with you to make enquiry into thoſe hidden Maladies, which might eſcape your own or another's ſearch, you have only to examine his Goings, which muſt be true and nimble, with eaſe to himſelf as well as his Rider.

But the ſureſt way of Buying is to be acquainted with good Breeders, and taking young *Horſes* that are but juſt Backt, to have them Manag'd and order'd according to your own Fancy.

If you have lived altogether in the Country, or have never learnt to Ride of a Maſter, nor indeed never deſign any ſuch thing, as having no Inclinations to Military Affairs or Martial Exerciſes (as it is not neceſſary all Gentlemen ſhould) however it is very commendable and Gentile to ſee you get up your *Horſe* with a good Air, and to ſit handſomly; tho' it be only upon the Road, or a Hunting, Hawking, or the like; and to hold your Reins like a Horſeman, knowing which way to guide, and ſtop without Jobbing and ſpoiling his Mouth, and making ſuch odious and ridiculous Poſtures that ſome are apt to do. To which end you may be pleaſed to take notice thereof, and to conſider what has been already ſaid concerning the Art of Riding, and endeavour to put ſo much of it in practice as you ſhall find ſuitable to your Inclinations, eſpecially that which relates to Mounting, and the true Poſture of a good Horſeman; and if you would have that Character, never Ride upon the Road in a Jockey-Cap or Snaffle-Bridle; but with a Bit and Piſtols well adjuſted and fitted to your Pad.

I ſpeak this to ſuch that are not at leiſure, or unwilling to learn in an *Academy*; for though I think it abſolutely neceſſary for thoſe that are Martially inclined, and requiſite for all the reſt of the Nobility and Gentry, as it is a Manly and Gentile accompliſhment to Ride well: Yet it is better to know ſomething, than to be ignorant of all; and for thoſe that will not learn of others, to get what they can of themſelves.

If you are a compleat Horſeman, you will take delight in having your Pads ſtop, and turn readily, and to make them be put a little upon the Haunch, which will render them infinitely agreeable.

CHAP. XXII.

Of the Way to preſerve Horſes *ſound in and after Journeys; and how to recover them when harraſs'd, and lean after Travelling.*

BUT juſt to mention, that his Shoes ought by no means to be too ſtraight, but exactly ſhaped; and that he ſhou'd be ſhod ſome Days before you ſet out: Let him, in the next place, have a Bit that is not too heavy; the Mouth of it ſhould reſt upon his Bars, about Half a Finger's Breadth above the Tuſhes; the Curb as the Hollow of the Beard, a little above the Chin, and if it galls him, let the Place be defended with a Piece of Buff, or ſoft Leather. Let not the Saddle reſt upon his Withers, Reins, or Backbone. Its Stuffing ſhould be of Deers-Hair, or the long Hair of *Horſes* Manes or Tails, or even of Ox-Tails, which does not harden near ſo much with the Sweat as the ordinary Hair of Oxen and Cows: And ſome there are who uſe well-dried Moſs, as leaſt apt to harden with Sweat. If the Saddle be placed too forwards, the Fleſh of the Shoulder will appear raiſed at the Point of the Fore-bow, when the *Horſe* is in Motion: The ſame will happen if the Pannels be too much ſtuff'd before, or that the Toes of the Fore-bow be too narrow and ſtraight. The Fore-bows ſhould be always diſtant from the Withers two or three Fingers breadth; and when they lie too near, rectifie it by ſtuffing that Part of the Pannel called their *Breaſts* or *Paps*. If, by reaſon of the Lowneſs of the *Horſe* before, or otherwiſe, there is a Neceſſity of a Crupper, let it be neither too ſtraight down, nor too ſlack. As for the Dock-piece, it ſhould be large and full, and greaſed every Day, if he gall underneath, waſhing the Sore with Water and Salt. The Breaſt-plate ought to be of a juſt Length, and the Buckles muſt not gall. The Stirrup-Leathers ſhould be ſtrong, as alſo the Stirrup-Irons, and pretty large.

Being thus precaution'd, begin your Journey with ſhort Marches; ſuffer your *Horſe* to piſs as often as you find him inclined, and even invite him to it; but do not do ſo by your *Mares*. Let him drink of the firſt good Water you meet with, after Seven in the Morning in Summer, and near Ten in the Winter. Draw up his Head five or ſix times while he is drinking, moving him a little betwixt every Draught; and if he be very warm, make him redouble his Pace to warm the Water in his Belly. On the other hand, ride him very ſoftly for about half an Hour before you come to your Inn, that being not too warm, or out of Breath, you may immediately unbridle him, or elſe let him be walk'd in a Man's Hand till he cools. Let his whole Body, after he is ſtabled, be well rubb'd and dried with Straw; ungirt him, take off the Crupper, ſlacken the Breaſt-plate, and put ſome Straw betwixt the Saddle and his Back; then let ſome freſh Litter be ſhak'd down beneath him, to oblige him to ſtale or piſs. Here 'tis worth obſerving, that the moſt People think to ſupple their *Horſes* Legs, by rubbing them down as ſoon as they are put into the Stable, imagining that the ill Humours, which may be ſtirr'd thereby, may be diſſipated by Tranſpiration; it's a groſs Miſtake. 'Tis true, it does in ſome meaſure rarifie, but not all diſcuſs; ſo that the remaining part, inſinuating it ſelf as a Vapour amongſt the Nerves, is afterwards condenſed by Cold into a Water, or viſcous Humour, that cannot be diſpell'd by Rubbing; and therefore let not your *Horſes* be rubb'd down till they are perfectly cooled.

Being arrived at your Inn, as ſoon as your *Horſe* is partly dry'd, and ceaſes to beat in his Flanks, let him be unbridled, his Bit clean'd, and let him eat his Hay at pleaſure; and if there was no Conveniency to let him drink on the Road, if he be very warm, you will find him eat very ſparingly; in which caſe give him his Oats waſhed in Ale or Beer, or ſome of them only, if you intend to feed him again after he has drank. Duſt and Sand will ſometimes ſo dry the Tongues and Mouths of *Horſes*, that they loſe their Appetite; in which caſe let them have ſome Bran well moiſtned with Water, to cool and refreſh their Mouths, or elſe let their Mouths and Tongues be waſhed with a wet Spunge. That Water which is leaſt quick and penetrating is beſt for them; and if you are under a Neceſſity of giving them ſuch a Drink, let it be warm'd in the Sun, or over a Fire, ſtirr'd with the Hand, or mix'd with a little Hay. River is preferable to Spring, and Spring to Fountain or Draw-Well-Water.

Theſe Directions will do after moderate Riding, but when you have rid very hard, unſaddle him, ſcrape off the Sweat with a Sweating-Knife or Scraper, and always go with the Hair: Then rub his Head and Ears with a large Hair-cloth, wipe him alſo between the Fore and Hind-legs; rub him ſo all over, till he be thoroughly dry; then put on the Saddle, and cover him, and if the Place be warm, let him be gently led up and down in it for a Quarter of an Hour. He muſt not drink till he be thoroughly cool'd, and have eat ſome Oats. The Saddle ſhould be dried in the Sun, or by the Fire, and not upon his Back, and the Pannels beaten with a Rod, that they may not harden, and hurt his Back.

As to the Galling of his Back, you diſcover it beſt when he has ſtood an Hour or two unſaddled, by the Swelling of the Part; and if it be only ſwell'd, tye a Bag with warm Dung upon the Swelling, or rub and chafe it well with good Brandy, or Spirit of Wine, and then ſet Fire with a lighted Paper to what remains upon it: But if the Skin be cut, waſh it with warm Claret, mix'd with a Fourth part of Sallet-Oil, or freſh Butter, or bathe it frequently with Brandy, if the *Horſe* will endure it.

Care ſhould be taken when a *Horſe* is put up, and before he is unbridled, to examine and clean his Feet; and at his Return, if watered abroad, let his Feet be ſtopp'd with Cow-Dung; and if in the Evening, let them remain ſo all Night, to keep them in a good Condition: But if his Feet are brittle, let his Fore-feet, at the Onſetting of the Hoof, be anointed with Butter, Oil, or Hogs Greaſe, in the Morning before Watering.

If your *Horſe* eats his Oats too greedily, let them be ſpread in the Manger; and for ſuch a one, that as ſoon as unbridled, inſtead of eating, will lie down to Reſt, if his Eyes be lively and good, you may conclude he is not ſick; however, his Feet pain him, and great Care muſt be taken that he be eaſed, by taking off his Shoes, or otherwiſe, as you find Occaſion. Thoſe *Horſes* have tender Feet that have low Heels, or but a ſmall Thickneſs between the Sole and the Hoof, in that Part which is about two Fingers Breadth, or leſs, above the Toe, or Fore-part. The *Horſe*'s Dung ſhould be alſo examined; if too thin, 'tis a Sign the Water he drank was too cooling; if there are Grains of Oats amongſt it, either he hath not chew'd well, or he has a Weakneſs in his Stomach; if his Dung be black, dry, and in hard and ſmall Pieces, he has over-heated his Body.

After a Journey is over, draw the two Heel-nails of the Fore-feet, and if it be a large Shoe, Four. Bleed him two or three Days after in the Neck; feed him for ten or twelve Days with wet Bran only, without giving him any Oats; and keeping him well litter'd, ſtop his Feet with Cow-Dung: And to preſerve his Legs, take Cow or Ox-Dung, thin it with Vinegar, add to it a Handful of ſmall Salt; rub his Fore-legs from the Knees, and Hind-legs from the Gambrils, by chafing them with and againſt the Hair; and thus leave him till Morning, not wetting his Legs, but giving him Water that Evening in a Pail. Waſh his Legs next Morning in a River, or with Well-Water. Cow-Dung ſpoils a *Horſe*'s Hoof; and therefore to recover him, fill a Hole with a wet blew Clay, and make him keep his Fore-feet in it for a Month. If you are afraid you have founder'd your *Horſe*, mix two Quarts of Vinegar cold, together with as many Pounds of Salt, and bathe and rub hard his Fore-legs with it for about half an Hour, then pour ſome Oil of Bays ſcalding hot into his Feet, about which put Hurds, or coarſe Flax, with thin Slices of Wood fix'd croſs-ways above it, to keep all faſt. For want of the Oil of Bays, thoſe of Walnuts, Rape-ſeed and Fiſhes will do.

If your *Horſe* be harraſs'd and lean after a long Journey, the beſt way to recover him is to give him half a Pound of Honey, very well mix'd with ſcalded Bran; and when he has eat that well, give him next a whole one, and then two Pounds every Day, and continue it till you find him empty, and purged well with it. Some give them Powder of Liquoriſh in ſcalded Bran for a conſiderable time, and to cool their Blood, three or four Gliſters will not be amiſs. Wet Bran is good for a lean *Horſe* every Night, above his Proportion of Oats. Graſs is excellent for him, if he be not purſie. If a *Mare*, give her a *Horſe*, and if ſhe never had a *Foal*, it will enlarge her Belly. Exceſſive Feeding ſhould be prevented: Cut Straw, mix'd with Oats, will hinder a *Horſe* from eating too greedily, and is very wholſome; and when a *Horſe* begins to drink heartily, it's a certain Sign he will in a ſhort time recover.

CHAP. XXIII.

Of Horſes *for the Coach, Waggon, Burthen,* &c.

I Need not ſay much concerning the Coach, Waggon, Carriage, Burthen, and the like, it being not quite ſo difficult to find *Horſes* proper for thoſe uſes, as for what hath been ſaid in the foregoing Chapters.

For your Coach in Town, *Dutch* or *Flanders Horſes* are beſt. Now in the chooſing of theſe obſerve that they be well quarter'd and ſhort Backt; that they have ſtraight and ſound Limbs; that they Trot well and nimbly; that their Eyes be good, and that they carry good Bodies: Not but that I would have you examine them at large, according to all the Rules of Beauty and Goodneſs: But becauſe the contraries to what I here particularly name are the moſt frequent and uſual Faults in theſe kind of *Horſes*.

In the Country, or for Travelling, our *Engliſh Horſes* are the beſt, if well choſen; for their ſize the beſt is about Fifteen Hands and an half high, and they muſt be Squat and well Truſt, with ſound Legs and Feet, *&c.* In obſerving their Trot, take notice if they lift up their Feet nimbly and evenly, and keep their middle Joints behind wide aſunder, 'tis very good.

For Carriages, Waggons, Servants, and all ſort of Drudgery, you have nothing to do, but to make choice of plain and ſtrong *Horſes* that are in Health and Vigour, and withal free from Maladies, their Buſineſs being nothing but Servile Labour; only be ſure that your Baggage *Horſes* above all have ſhort and ſtrong Backs, and be of a pretty large Size.

CHAP. XXIV.

Of Riders, Keepers, Grooms, &c.

THE Buſineſs of a Rider being to Back, Mouth and Manage young Horſes, he ought to be very skilful and adroit, bold and firm on Horſe-back, with a juſt and even Hand, being exactly perfect in all the Leſſons, Aids, and the like, that are to be taught a Horſe, either for the War, Pleaſure, *&c.* He ought to ſuit to every Horſe ſuch a Bridle and Saddle as is fitteſt for him. He ſhould be a Man of Temper and Judgment, never beating a young Horſe, but when he is forced to it, and this with Diſcretion, endeavouring if poſſible to win him by Sweetneſs and good Uſage; and with all this, he ſhould be ſober and diligent, for without that he will not be able, and unleſs he is diligent, he will be unwilling to perform his Duty with that Exactneſs which is requiſite in ſuch an Employment.

By *Keepers*, I mean ſuch as have the keeping of Running Horſes; and that you may the better know their Buſineſs, I will give you the Method of a Running Stable. You muſt have for every Running Horſe, a little a little Boy to ride him his Airings, Water-courſes, and the like: And over all theſe a Keeper, who orders and overlooks the whole buſineſs of Dieting and Exerciſing; for which end he muſt underſtand all that which belongs to the keeping of a Running Horſe, of which ſee more hereafter.

A *Groom* ſhould be ſturdy, healthful and ſtrong; His buſineſs is to underſtand the ordinary ways of keeping all ſorts of Horſes; that is, for the War, Pleaſure, Travel, and the like. And above all, he ought to be free from Drinking; for the beſt Groom in the World, when he is Drunk, is in danger of ſpoiling his Horſe by Heats, Colds, and their giddy brain'd Extravagancies.

In general; As for all ſorts of Servants in and about your Stables, be ſure that they underſtand their reſpective places, and deport themſelves well therein; for good Servants (well ordered) conduce very much to the Preſervation of your Horſes, and have always a good Equipage.

CHAP. XXV.

Of Keeping, Dieting and Ordering the Running Horſe.

A Horſe that is deſigned for Racing ſhould be tractable, and no ways Reſty or Skittiſh; his Head ſhould be ſmall and ſlender, with very wide Noſtrils, and a large Thropple; he ſhould alſo have a pretty large Reach, and good Feet: his Age ſhould be ſix Years at leaſt; no Horſe under that having a ſufficient Strength for a Four Mile Courſe, without running the hazard of being over-ſtrained. In the keeping of Running Horſes, unleſs a Man has Experience and Practice, the beſt Rules imaginable are inſufficient; but becauſe it is impoſſible to ſet up a Fund, and build without a Foundation, I ſhall give you ſome Directions, leaving you the liberty to vary or add according to your own Obſervation, as occaſion requires.

There are three States of Body in which a Horſe may be.

1. Fat and Foul.
2. Lean and Poor.
3. In a moderate State between both.

Now you muſt be ſure to proportion and order the Diet and Exerciſe of your Horſe ſuitable to the ſtate and condition he is in. You muſt alſo (for the ſame end) have a ſpecial regard to the particular Nature and Conſtitution of every *Horſe*: But your own Remarks (upon due Practice) and common Reaſon will direct you ſufficiently in thoſe Points. For is it not very reaſonable to take more time to bring a foul *Horſe* to ſharp Exerciſe, than one that is already in a pretty tolerable Condition; and that a *Horſe* of a ſpending nature ought not to have ſo violent Exerciſe, as one of a harder Temperament? I will therefore pitch upon a Fat *Horſe*, that being the difficulteſt of the Three, and examine how to bring him into ſuch a good order, that he ſhall perform his Courſe to the beſt advantage; and by diſcourſing of this, you will know how to deal with the other two.

If therefore you match a *Horſe* that is fat and foul, either by running at Graſs, or ſtanding at Soil, by too high keeping, or by any other means of reſt, for the firſt fifteen days at leaſt, riſe by Day-break, and having put on his Bridle waſh'd in Beer, and tyed to the Rack, clean the Stable from the Dung, and then dreſs him very well, that is to ſay, firſt Curry him all over from the Head to the Tail, from the top of his Shoulder to his Knee, and from the top of his Buttock to his hinder Gambril, then duſt him all over with a *Horſe*'s Tail; or a clean duſting-cloth, then curry, or rub him all over with the *French Bruſh*, beginning at his Forehead, Temples and Cheeks, ſo down his Neck, Shoulders and Fore-legs to his Hoofs, then along his Sides, and under his Belly, and laſtly his Buttocks, and Hinder-legs; then rub him all over with your wet Hand, not leaving as near as you can one looſe Hair about him, nor one wet Hair, becauſe you muſt keep rubbing him until he is rub'd dry with your Hands. Then with your wet Hand clean his Sheath, his Yard, his Stones and his Tuel, and indeed you muſt not leave any ſecret place uncleanſed, as his Ears, Noſtrils, Fore-Bowels, and between his hinder Thighs. This done, take a Hair-cloth and rub him all over, but eſpecially his Face, Eyes, Cheeks, between his Chops, the Nape of his Neck, and down his Legs, Fetlocks, and about his Paſterns. Having done all this, rub him all over with a clean Woollen-cloth, beginning at his Head, and ſo to every part of his Body as before directed; then take a wet *Mane-comb* to comb his Mane and Tail; when you have thus dreſs'd him, put over him his Body-cloth, which muſt be thicker for the Winter Seaſon than for the Summer, for which fine Cotton is moſt fit; then put on his Saddle, girting the foremoſt Girt pretty ſtrait, and the other a little ſlack, and wiſp it on each ſide of the *Horſe*'s Heart, that both the Girts be of equal ſtraitneſs; then put on a warm Breaſt-cloth, which may cover both his Shoulders.

When the *Horſe* is thus dreſs'd, and made ready, take a little Beer in your Mouth, and ſquirt it in his, and ſo lead him out of the Stable and mount him, leaving ſome of the Helpers to clean the Stable, and ſhake up the Litter; for be ſure that your *Horſe* ſtands upon a good ſtore of freſh dry Litter both Night and Day, which Litter ſhould be Wheat-ſtraw, if poſſible, or for want of that uſe Oat-ſtraw, but Barly and Rye-ſtraw are eſteemed unwholſome, the one cauſing Heart-burning, and the other Scouring.

When you are thus mounted, walk forth your *Horſe* a Foot-pace (which is called Rakeing) for about two Miles upon ſound and ſmooth Ground, and if you can, upon hilly places, where gallop him gently, but rack, or walk him down gently that he may cool as much as you heated him, and by this time the Sun will be riſen, ſo that you may walk him to ſome River or clean Pond, and permit him to drink his fill; then bring him gently out of the Water, and walk him away very eaſily; not as Ignorant Grooms do, who as ſoon as a Horſe comes out of the Water force into a Gallop, which either teaches him to run away with you as ſoon as he is Water'd, or makes him refuſe to Drink, fearing the violence of his Exerciſe which is to follow; having walked him a pretty ſpace, offer him more Water; if he drink, then gallop him again, but if he refuſeth gallop him to occaſion thirſt, and always exerciſe him before and after drinking. And when he hath ſufficiently drunk, bring him gently home without a wet Hair; when you are come to the

Stable Door alight, (his Litter being prepared for him) and by Whiſtling, ſtretching the *Horſe* upon the Straw, and raiſing the Straw up under him, ſee if you can cauſe him to Piſs, which if at firſt he doth not, yet by accuſtoming him to it, he will ſoon be brought thereunto; for it is not only wholſome for him, but cleanly for the keeping the Stable.

Theſe things being performed bring him into his Stall, and firſt tie his Head up to the Rack in his Bridle; then with hard Wiſps rub down his Fore-legs as hard as you can, then unlooſe his Breaſt-cloth, and rub his Head, Neck, and Breaſt very well with a dry Cloth; then take off his Saddle and Body-cloth, rubbing his Body very well, eſpecially his Back where the Saddle was, and ſo Cloath him up with a Linnen-ſheet, over which caſt a good ſtrong Houſing-cloth, and over that his Woollen Body-cloth, which in the Winter may be lined with thin Cotton; then girt theſe Cloths on with his Surſingle, which ſtuff round, with reaſonable big and ſoft Wiſps, which is more eaſie for him to lie down with, than with thoſe ſmall hard Wiſps.

After he is thus Clothed up, pick his Feet, and ſtop them up with Cow-dung; then caſt into his Rack a little bundle of Hay well duſted, and hard bound up, for him to tear out as he is bridled up, and having ſo ſtood about an Hour and a half come to him, and firſt rub his Head, Face, and the Nape of his Neck, with a clean Rubber made of new rough Hempen-cloth, which is excellent for his Head, diſſolving all groſs and filthy Humours; then draw his Bridle, and with a clean Cloth make the Manger ſo clean as poſſible, taking away all the ſcattered Hay, and caſt it into the Rack; then take about a Quart of ſweet, dry, old, and clean Oats, the whiteſt and heavieſt being the beſt, for thoſe that are muſty breed Infirmities, the Moiſt cauſeth ſwelling in the Body, the New breeds Worms and pain in the Belly, and thoſe half-dreſt deceive the Stomach, and ſpoileth the *Horſe*. The Black Oats are not ſo good as the White, becauſe they make foul Dung, ſo that one can't ſo well know the State of his Body.

This Quart of Oats put into a Sieve that is ſomewhat leſs than a Riddle, and bigger than a *Reeing-Sieve*, which will let the light Oats go through, but keep in the full plump ones: In this Sieve, ree, dreſs, and toſs them very well, that there be no duſt or foul thing therein, and ſo give them your *Horſe*, and if he eats them with a good Stomach, you may give him as much more ſo ordered; and ſo let him reſt till about eleven of the Clock, and then viſit him again, and having rub'd his Neck, Head and Face, give him about the ſame quantity of Oats ſo dreſt and ordered as aforeſaid; then ſhutting up the Light that he may be in Darkneſs, leave him till about One of the Clock: For the darker you keep him in your Abſence, the better it will occaſion him to feed, and to lie down and take his reſt; and therefore it is cuſtomary to arm the Stalls where the *Horſes* ſtand, round about, and over the Rack with ſtrong Canvaſs, as well for darkneſs as for warmth.

About One of the Clock give him the like quantity of Oats dreſt as aforeſaid, and after you have rub'd his Face, Head, the Nape of the Neck, and cleaned the Stable from the Dung, give him a little Knob of Hay, and ſo leave him till about Four a Clock if in the Summer, and three if in the Winter; then come again, clean the Stable, and bridle him up, having wet the Snaffle with Beer, and ty'd him up to the Rack; then take off his Cloths and dreſs him in all points as before directed for the Morning; then Cloath and Saddle him as aforeſaid, and bring him forth, uſing what means you can to make him piſs and dung at the Stable Door upon the foul Litter; then mount and ride him forth as in the Morning, but not to the Hills, chooſing plain Grounds near ſome River, and ſo give him his Airing, Galloping him before and after his Water, then raking him gently up and down. In your raking you muſt obſerve in all your Paſſages (eſpecially when you would have him empty himſelf) to let him ſmell upon all the old and new Dung you meet with, which will make him empty his Body, and repair his Stomach.

After you have Water'd him, and ſpent the Evening in Airing him (for nothing is more wholſome, or ſooner conſumeth foulneſs than early or late Airing) ride him Home, and obſerve to do all that you did to him in the Morning as well within doors as without, and ſo leave him on his Bridle for above an Hour; then go to him, rub him well, draw his Bridle, clean his Manger, put up his ſcattered Hay, give him about a Quart of Oats well dreſt and ſifted, and ſo leave him till about Nine a Clock; then viſit him again, firſt rubbing down his Legs with hard Wiſps, then with a clean Cloth rub his Face, Head, Neck, and Fore-parts, then turn up his Cloths, rub his Buttocks, Fillets, and Hinder-parts, which done, put down his Cloths, give him another Quart of Oats, and put into his Rack a little bundle of Hay as before directed, then toſs up his Litter to make his Bed ſoft, and ſo leave him till the next Morning, and then come to him early as before directed, and do every thing as you did before. And thus keep him for the firſt Fortnight; in which by this double daily Exerciſe his Fleſh will be ſo hard, and his Foulneſs ſo conſumed, that the next Fortnight (if you be a Temperate Man) you may venture to give him gentle Heats. But whereas ſome might object, that many *Horſes* that have good Appetites, would be half ſtarv'd, or grow very weak, if they were ſcanted to a Quart of Oats at a Meal: It's anſwer'd, that this Proportion is not ſet down as an Infallible *Rule*, for if he eats it with a good Appetite, you may give him another; and ſo the Proportion is left to your Judgment and Diſcretion.

As concerning his Heats obſerve theſe directions; Firſt that two Heats in a Week is enough for any *Horſe* of what ſtate of Body ſoever. Secondly, that one Heat ſhould be given upon that Day in the Week, on which he is to be run his Match: As for Example; If your Match is to be run upon a *Monday*, then your fitteſt Heating Days are *Mondays* and *Fridays*, and the *Monday* to be always the ſharper Heat, becauſe it is the Day of the Match, and there is three Days reſpite betwixt it and the other Heat: If the Match Day be on a *Tueſday*, then the Heating Days are *Tueſdays* and *Saturdays*: If on *Wedneſdays*, then the Heating Days are *Wedneſdays* and *Saturdays*; and if on *Thurſdays*, then the Heating Days are *Thurſdays* and *Mondays*, and ſo of the reſt. Thirdly, give no Heat (except in caſe of extremity) in Rainy or Foul Weather, but rather differ Hours and change Times, for it is unwholſome and dangerous; therefore in caſe of Shours and uncertain Weather, be ſure to provide for him a warm lin'd Hood with linnen Ears, and the Nape of the Neck lin'd to keep out Rain, nothing being more dangerous than for cold wet to fall upon his Ears, the Nape of his Neck, and his Fillets. Fourthly, give your Heats (provided the Weather be ſeaſonable) as early in the Morning as poſſible, that is, by Day-break.

As to your ſecond Fortnight's keeping, obſerve all things, as before directed for the firſt Fortnight, only before you put on his Bridle, give him about a Quart of Oats clean ſifted, which as ſoon as he has eaten, bridle him up, and dreſs him in all particulars as in the firſt Fortnight, alſo Cloth, Saddle, Air, Water, and bring him home in all points as in the firſt Fortnight, only put no Hay in his Rack to tear out, but only draw with your Hand as much fine ſweet Hay well duſted, as you can well gripe, and let him as he ſtands on the Bridle tear it out of your Hand; which if he doth greedily, then give him another, and another, and ſo let him ſtand on the Bridle about an Hour; then come to him, and after rubbing, and other Ceremonies performed as aforeſaid; ſift and dreſs about a Quart of Oats, and ſet them by; then take a Loaf of Bread that is three Days or more old made after this manner.

Take three Pecks of clean Beans, and one of good Wheat, mix them together, and grind them to fine Meal; then ſift it through a fine Sieve, and knead it with a little Water, and a good quantity of Yeſt to make it light, and ſo let it lie for ſome ſpace to make it light before you make it up into Loaves, which muſt be well Bak'd.

At three Days old you may give your *Horſe* ſome of it, but not ſooner, new Bread being dangerous, occaſioning Surfeits; but if you are conſtrained to give it ſooner, or that it is then damp or clammy, then cut it into thin Slices aad lay it to dry, and ſo crumble it amongſt his Oats.

But to return to our former Diſcourſe. This Bread of three Days old chip very well, and cut into thin ſlices (as much as may countervail the quantity of Oats) very ſmall, and mix'd with the Oats, and ſo give them your *Horſe*. You may give him as much Bread as may countervail the quantity of Oats, or more if you think fit.

About Eleven a Clock viſit your *Horſe*, and having perform'd your By-ceremonies before treated of, give him the ſame quantity of Bread and Oats as you did in the Morning, and ſo let him reſt till the Afternoon; and about One of the Clock, or after, if you intend to give him an Heat the next Day, feed him with Bread and Oats, as you did in the Forenoon, and ſo conſequently every Meal following for that Day, obſerving every thing as before directed you,

But if you intend the next Day to give him an Heat, then only give him a Quart of good clean ſweet Oats, and as ſoon as he has eaten them, put on his Bridle, and tye him up, not forgetting all the aforeſaid Ceremonies; then Dreſs him, Cloth him, Saddle, Air and Water him as before directed; and when you bring him home, order him as before ſhewed, only give him no Hay; after he hath ſtood about an Hour on the Bridle, give him another Quart of clean Oats, which when he hath eaten, put on his Head a ſweet clean waſh'd Muzzle, and ſo let him reſt till about Nine of the Clock at Night.

As concerning the uſe of the Muzzle, and which is the beſt, you muſt know that as they are moſt uſeful, being rightly made, ſo they are hurtful if falſly made: The true Uſe of them is to keep your *Horſe* from eating up his Litter, from gnawing upon Boards and Mud-walls, and to be ſhort, from eating any thing but what he receives from your Hand. Theſe Muzzles are ſometimes made of Leather, and ſtampt full of Holes, or elſe cloſe, but they are not wholſome; for if it be alom'd Leather, the Alom is offenſive, if liquor'd, the Greaſe and Ouze are as bad; beſides, they are too cloſe and too hot, occaſioning oft-times Sickneſs in your *Horſe*, and to keep his Dung longer in his Body than otherwiſe he would do.

The beſt Summer Muzzle is the Net-muzzle, made of ſtrong Packthread thick knit, with ſmall Maſhes at the bottom, and waxing wider and wider up to the middle of the *Horſe*'s Head, and bound about the top with ſtrong Tape, having on the near ſide a Loop, and on the far ſide a long String of Tape to be faſtned to the *Horſe*'s Head.

The beſt Winter Muzzle is made of ſtrong double Canvas, with a round bottom, and a ſquare Lettice Window of ſmall Tape before his Noſtrils, down to the bottom of the Muzzle; and this muſt alſo have a Loop and a String to faſten it to his Head as the other.

At Nine of the Clock at Night viſit your *Horſe* again, and having performed your By-Ceremonies as aforeſaid, give him a quart of clean ſifted Oats, and as ſoon as he hath eat them, put on his Muzzle, toſs up his Litter, and leave him for that Night. The next Morning very early go to him, and if he is laid, do not diſturb him, but imploy your time until he riſeth, by ſifting and cleaning a quart of Oats, which rub between your Hands, and waſh them in a little Ale or ſtrong Beer, but not too moiſt, and ſo give it him; as ſoon as he has eaten them, bridle him up, hang by his Muzzle, uncloath him, and dreſs him as before directed; then put on his Body-cloth, his Breaſt-cloth, and ſo Saddle him; then being ready to go forth, take his Bridle Rein, draw it over the top of the Rack, then raiſe up his Head; then take a new laid Egg waſh't clean, which break in his Mouth, and cauſe him to ſwallow it; after which waſh his Tongue and Mouth with a little Beer, and ſo lead him forth, obſerving the former Directions to cauſe him to Piſs or Dung; then mount him, and rake him gently to the Courſe; and every while make him to ſmell upon other *Horſes* Dung, whereby to cauſe him to empty himſelf the better.

When you are come within about a Mile of the Start-poſt, alight and take off his Body-cloth and Breaſt-cloth, girting on his Saddle again; and having ſent away your Groom with thoſe Cloths, and the clean dry Rubbing-cloths, let him ſtay at the laſt End of the Race till you come; then rake him gently up to the Starting-poſt and beyond; make him ſmell to that Poſt, as alſo to the firſt Poſt, which is called the *Weighing-Poſt*, that he may thereby take notice of the Beginning and End of his Courſe.

And now that we are come to giving of Heats again, it's proper to add the following Directions, as ſet down in the *Compleat Horſeman*, to what has been already offer'd upon this nice Subject, *viz.* That if the Weather be ſeaſonable, as aforeſaid, let the Heats be taken at Break of Day, but by no means in the Dark, as being unwholſome and dangerous. When you begin your Heat, let your *Horſe* be ſtarted round and ſharply, at near a Three Quarters Speed; and if it be on the Day of the Week that his Match ſhall go on, then, according to his Strength, Goodneſs of Wind, and Chearfulneſs of Spirit, run him the whole Courſe through; and by no means do any thing in Extremity, or above his Wind; but when you find him a little to yield, then draw a little and give him Eaſe, that he may do all with Pleaſure, and not with Anguiſh: For this manner of Training will make him take Delight in his Labour. The other Heat in each Week muſt be more gentle, the Deſign of it being only to increaſe Wind and cauſe Sweat, that ſo the Scouring you are to give him after his Heat may have ſome looſe Greaſe to work upon and bring away. You ſhould therefore let him go over the Courſe at a ſlow and gentle Gallop; for if both the Heats were ſmart, the *Horſe* would not be able to hold out, there being ſo ſhort an Intermiſſion between them for him to reſt and recover his Vigour. Likewiſe in Courſing, you ought to obſerve upon what Ground he runs beſt, whether up Hill, or down Hill, upon ſmooth or rough Ground, wet or dry, a level, or ſomewhat riſing Ground, that you may manage him for your Advantage.

Having thus courſed the Courſe ſtrongly and ſwiftly, after a little time ſlightly galloping him up and down the Field to rake his Wind, and chear his Spirits (your Groom being ready with your Cloaths and other Neceſſaries) ride to ſome warm Place out of the Wind, as under ſome Tree or Hedge, where alight, and with a graſing or ſcraping Knife, which is commonly made of ſome broken Sword-blade or Sythe, or for want thereof, of a thin Piece of old, hard Oaken Wood, faſhion'd like a broad long Knife, with a ſharp Edge; and uſing it with both your Hands, ſcrape off all the Swet from every Part about him; and thus do until you find there is no more Sweat ariſes; and ever and anon move him up and down, and then with dry Cloaths rub him very well all over; then take off the Saddle, and having ſcraped and rubb'd his Back, put on his Body-cloth and Breaſt-cloth, then his Saddle, well girted on; then gallop him gently forth, and again a little Space after, rub his Head, Neck and Body, as you ſit on his Back; then walk him about the Fields or Downs to cool him, and when you find that he dries apace, rake him gently homewards, ſometimes raking, and ſometimes galloping; but do not bring him to the Stable until he is quite dry; and when ſo, then diſmount, and endeavour to make him piſs and empty himſelf; then lead him into his Stall, and gently tye his Head up to the Rack with his Bridle; which done, preſently, as having prepar'd it before, give him this following Scouring.

Take a Pint of good Canary, an Ounce of pure clear Roſin, bruiſed to fine Duſt, and brew them together very well, until incorporated together; then put thereto a Pint of good Sallad Oil, and brew them alſo well together; and, laſtly, take an Ounce and an half of brown Sugar-candy, finely beaten to Powder, and mix them together; then mull all upon the Fire, and being luke-warm, and your *Horſe* newly come in from his Heat, as before ſhew'd you, draw his Head up to the Rack, and with a Drenching-Horn give him this Scouring, which is ſtrong, and takes away all manner of molten Greaſe and Foulneſs whatſoever.

As ſoon as you have given him this Scouring, preſently let his Legs be rubb'd, and take off his Saddle and Cloaths, and finding his Body dry, run ſlightly over it with your Curry-comb, and after with a Bruſh; then duſt well, and laſtly rub over his whole Body with dry Cloaths, eſpecially his Head, Nape of the Neck, and about his Heart; this done, cloath him up warm, as at other times, and wiſp him round with great warm Whiſps; and if you throw over him a little looſe Blanket, it will not be amiſs, eſpecially if the Seaſon is cold.

Your *Horſe* muſt faſt two Hours after taking the Scouring, all which time continue with him, and keep him ſtirring, uſing ſome Noiſe; for nothing is worſe than to ſleep or reſt at ſuch a time, and it hindereth the Operation of the Medicine; whereas ſtirring enliveneth the Spirits, and ſtirs up thoſe Humours that ſhould be removed. After he has thus faſted upon his Bridle, take a Handful of Wheat-Ears, (being your Pollard that is without rough Beards;) but before you give it him, put your Hands under his Cloaths againſt his Heart, alſo upon his Fillets, Flanks, and on the Nether-part of his Thighs; and if you find any new Sweat to ariſe, or any Coldneſs of Sweat, or if you find his Body to beat, or his Breath to move faſt, then do not give him any thing; for it is a Sign that there is much Foulneſs ſtirr'd up by the Medicine, and ſo makes him ſick; therefore in ſuch caſe only take off his Bridle, put on his Collar, and toſs up his Litter, that he may lie down, and ſuffer him to take his Reſt for about two Hours, leaving the Stable dark, and free from Noiſe. But if you find no ſuch Symptoms of Sickneſs, then proffer him the ſaid Ears of Wheat by two or three at a time, and if he eats the Handful, give him another; then give him a little Bundle of Hay, as before directed, and draw his Bridle, rubbing his Head well. About an Hour after he hath had his Hay, ſift him a Quart of good Oats, to which put two or three Handfuls of ſplitted Beans, which muſt be very clean dreſt from the Hulls, ſo that there may be nothing but the ſplitted Beans themſelves: To theſe Oats and Beans break two or three good Shives of Bread, clean chipt; which give him, and ſo leave him for two or three Hours. At Evening, before you dreſs your *Horſe*, give him the like Quantity of Oats, Beans and Bread; and when he has eaten them, bridle him up, and dreſs him, as before directed; then cloath him up, but neither ſaddle him, nor ride him forth for this Evening after his Heat, (he being inwardly foul, and the Scouring yet working in his Body) neither muſt he drink any Water. But after he hath ſtood about an Hour and a half upon his Bridle, take three Pints of clean ſifted Oats, and waſh them in ſtrong Ale or Beer, and ſo give it him; which will inwardly cool and refreſh him ſo well, as if he had drunk Water. Then having reſted a little while, feed him well that Night at his feeding times with Oats and ſplit Beans, or Oats and Bread, or altogether, or each apart, as you find his Stomach beſt inclined unto; then put ſome Hay in his Rack before you leave him, and go to Bed.

The next Day very early firſt feed, then dreſs, cloath, ſaddle and air him abroad, giving him Water, as hath been ſhew'd before; then bring him home, and feed him with Oats, Beans and Bread, as aforeſaid; but give him very little Hay, and keep your Heating Days, and the Preparation the Day before, as hath been ſhew'd, without any Omiſſion or Addition. Thus you ſhall ſpend the ſecond Fortnight, in which your *Horſe*, having received four ſound Heats, and as many Scourings, there is no doubt but his Body will be inwardly clean; then the third Fortnight order him according to the following Rules.

The third Fortnight make his Bread finer than before, after this manner: Take two Pecks of clean Beans, and as many of fine Wheat, grind them on the black Stones, ſearce them thro' a fine Range, and knead it up with Yeſt to make it light, then work it up, and bake it as the former.

With this Bread (having the Cruſt cut away, and being old) with clean ſifted Oats, and clean ſplit Beans, feed him this Fortnight, as you did the former Fortnight; alſo you muſt obſerve his Heating-Days, and the Day before his Heat, as in the former Fortnight, only with theſe Differences:

Firſt, Give him not his Heats ſo violent as before, but with a little more Pleaſure, and not overſtrain him: Next, do not after his Heats, when he comes home, give him any more of the former Scouring; but inſtead thereof, immediately upon the End of the Heat, after he is a little cool'd and cloathed up, and in the ſame Place where you rub him, by drawing his Head up aloft as you ſit in the Saddle, or raiſing it up otherwiſe, give him a Ball ſomewhat bigger than a *French* Walnut with the Rind and all, of that Confection before mention'd, being the true Manner of making the Cordial Balls.

But to return to our former Diſcourſe: Having thus ſpent the three firſt Fortnights, the fourth and laſt Fortnight you muſt make the Bread much finer than either of the former; as thus: Take three Pecks of fine Wheat, and one Peck of clean Beans, grind them to Powder on the black Stones, and bolt them thro' the fineſt Bolter you can get; then knead it up with very ſweet Ale-Yeſt, and new ſtrong Ale, with the Whites of about Twenty Eggs. Do not put in any Water, but inſtead thereof you may put in a little new Milk; then work it up, kneading it well; then bake it, and order it according to your former Directions.

With this Bread (the Cruſt being cut clean away, and with Oats ſunned, beaten, and rubb'd over with your Hands, then new winnow'd, ſifted and fine dreſt, and with the pureſt ſplitted Beans) feed your *Horſe* at his ordinary Feeding-times, after ſuch manner as you did the laſt Fortnight.

Keep his Heating-Days the firſt Week of this laſt Fortnight as you did in the former Fortnight, only forbearing one Heat the laſt Week, and give him not any Heat, at the leaſt for five Days before his Match; but give him long and ſtrong Airings, to keep him in Wind, nor need you give him this Fortnight any Scourings.

If in this Fortnight, Morning and Evening, you burn in your Stable, upon a Chafing-Diſh of Coals, ſome good Frankincenſe or Olibanum, mix'd with Storax and Benjamin, to perfume and ſweeten the Place, it is very good for him, and he will take great Delight therein. And in this Fortnight, when you give him any waſh'd Meat, waſh it not in Ale or Beer, but in the Whites of Eggs, or Muſkadine, which is leſs purſie. Alſo in this Fortnight give him no Hay, but what he takes out of your Hand after his Heats, except he is a very bad Feeder, very tender, and a great Belly-loſer.

The laſt Week of this Fortnight, if he is a foul Feeder, uſe the Muzzle continually; but if he is a clean Feeder, and will touch no Litter, then three Days before your Match it is convenient to uſe the Muzzle.

In the Morning before the Match, feed well both before and after Airing and Watering, as at other times before Noon; and after Noon leſſen his Meat a little.

Before and after Evening Airing feed him as at Noon, and water as at other times; but be ſure to come home before Sun-ſet.

This Day cool him, ſhoe him, and do all extraordinary Things of Ornament about him, provided there be nothing to give him Offence, or to hinder his Feeding, or any other material or beneficial Action: For ſometimes it happens, that when they have been ſhoed with light Shoes, and other Actions of Ornament done about them the Night before the Courſe, they have taken ſuch Notice thereof, that they have refuſed both to eat and to lie down; but ſuch *Horſes* are old, and long experienced in this Exerciſe: For as to the nice and ſtrait Platting up of their Tails, altho' ornamental, yet I do not much approve thereof, by reaſon it may give Offence to the *Horſe*; therefore forbear thoſe unneceſſary Ornaments. And as to the neceſſary things to be done to him, rather do them the Day before, becauſe on the Morning of the Courſe he ſhould find no Trouble or Vexation.

On the Match Day come to him very early, take off his Muzzle, rub his Head well, and give him a pretty Quantity of Oats, waſhed in Muſkadine, or in the Whites of Eggs; but if he refuſes them, then give him fine dreſt Oats dry, and mix'd with a little Wheat, or with your lighteſt Bread; and as to Beans, give him none. Of any of theſe Foods give him but ſuch a ſmall Quantity, as may keep Life and Soul together: Then if he be a *Horſe* that is an evil Emptier, retaining his Meat long, walk him abroad, and in the Places where he uſeth to empty, there entice him to empty; which as ſoon as he hath done, bring him home, put on his Muzzle, and let him reſt, until you have notice to make ready, and lead forth; but if he be a free Emptier, then you need not ſtir him, but ſuffer him to lie quiet.

When you have notice to prepare for leading him forth, then come to him, and having waſh'd his Snaffle in a little Muſkadine, take off his Muzzle, and bridle him up; but if you think him too empty, you may give him three or four Mouthfuls of the waſh'd Meat laſt mention'd, and then bridle him up, and dreſs him. After you have pitch'd your Saddle and Girts with Shoe-makers Wax, put it on his Back, girting it as gently as may be, ſo as he may have a Feeling, but no Straitneſs; then lay a Sheet over the Saddle next his Skin, and over it his ordinary Cloaths, wiſping them about with ſoft Wiſps; and if you have a Counter-pane, or Cloth of State, for Shew ſake, faſten it above all. All theſe things being done, you are ready to draw out, take half a Pint of the beſt Muſkadine, and give it him in a Horn, and ſo lead him away.

In all your Leadings upon the Courſe of gentle and calm Motions, ſuffer him to ſmell upon every Dung that thereby he may empty himſelf; and in ſpecial Places of Advantage, as where you ſhall find Ruſhes, long Graſs, Heath, or the like, walk him and entice him to piſs; but if you find no ſuch Help, then in ſpecial Places upon the Courſe, and principally towards the latter end, and having uſed the ſame Means before, break ſome of your Wiſps under his Belly, to cauſe him to piſs. And in your Leading, if any white or thick Froth or Foam ariſe about his Mouth, wipe it away with a clean Handkerchief, carrying a ſmall Bottle of clear Water with you to waſh his Mouth now and then with.

When you come to the Place of Starting, before you uncloath him, rub and chafe his Legs with hard Wiſps; then pick his Feet, and waſh his Mouth with Water; this done, uncloath him, mount his Rider, and ſtart fair, and ſo wiſh Succeſs unto him.

The Courſe being perform'd, you muſt order him as after a ſharp Heat; for which I refer you to my Directions about Heats.

Notwithſtanding all that has been ſaid upon this Head, it will not be improper to add a few more uſeful Obſervations out of *Solleyſel* in this place, about preparing a *Horſe* for a Match: Note then, that if his Dung be neither ſo thin as it will run, nor ſo thick but that it will a little flatten on the Ground, and be of a pale yellow Colour, then the *Horſe* is clean, and well fed: It denotes inward Heat if in round Pellets, and it be blackiſh or brown; if greaſy, it ſhows Foulneſs; if red and hard, then he hath had too ſtrong Heats, and Coſtiveneſs will follow. It indicates an internal Coolneſs of Body, or too moiſt Feeding, if it be pale and looſe.

As to his Urine; it's a Sign of Health when it is of a pale yellow Colour, and rather thick than thin, and of a ſtrong Smell. If it be of a high Complection, clear and tranſparent, like old *March* Beer, then he has taken ſome Surfeit, and is inwardly inflamed. If it be like Blood, or inclining to a Blood-colour, he hath had too ſore Heats, being over-ridden, or ridden too early after Winter-Graſs. It denotes a Conſumption of Body when of a green Colour, and if attended with bloody Streaks, there is an Ulcer in the Kidneys. Black, thick and cloudy Dung is a Preſage of Death.

When a *Horſe* that ſtands ſtill in the Stable, or walks a Foot-pace, or the like, ſweats, or if his Sweat be white and frothy, like Soap-ſuds, then he is foul, and wants Exerciſe; but when the Sweat is black, and ſeems to be no other than if Water had been thrown upon him, it's a Sign he is luſty, and in a good Caſe. Laſtly, Though there are Directions already given for Watering in the Evening after a Heat, yet you may in the three laſt Fortnights (finding your *Horſe* clean, and his Greaſe quite conſumed) give him a reaſonable Quantity of Water made Milk-warm, ſomewhat late at Night, and let him faſt about an Hour after.

Again, if the Weather be unſeaſonable, you ſhall at your Watering-Hours water in the Houſe with warm Water, throwing an Handful of Wheat-bran, or Oat-meal into it; but the laſt is the beſt.

CHAP. XXVI.

Of Keeping a Horſe *for* Pleaſure, Hunting, Travel, *&c.*

I Would have your Keeper of theſe *Horſes* to riſe early in the Morning by Day-break, or before, according to the Seaſon of the Year, and to ſift your *Horſe* about three Pints of good dry old Oats, and put thereto one or two Handfuls of ſplitted Beans with the Husks, and give it him. After he has eaten them, let him dreſs him according to the Order of good Horſemanſhip; that is, firſt curry with the Comb, then duſt, then rub with the Bruſh, then duſt and rub with your wet Hands, after that with a clean Wollen-cloth, next with a clean Linnen-cloth; next pick all obſcure Places, and laſtly comb down his Mane and Tail. Having thus done, ſaddle him, and ride him forth to Water, warming him very moderately both before and after Water, and ſo bring him home without Sweat. Then after you have rubb'd him all over, cloath him, and let him ſtand on his Bridle above an Hour; after which give him the former Quantity of the ſaid Provender, and when he hath eaten it, give him in his Rack a pretty Bundle of Hay, and ſo let him reſt till after Dinner, and then give him the former Quantity of the ſaid Provender, and ſo let him reſt till the Evening; only give him more Hay, if Occaſion requires. At Evening dreſs him well, according to the Directions for the Morning: Then ride him forth to Water, obſerving the ſame Method as in the Morning; and when you come home, dreſs and cloath him up, as aforeſaid, and let him ſtand on his Bridle as before; then give him the former Quantity of Provender, letting him reſt till about Nine of the Clock, at which time give him the former Quantity of Provender, and a pretty good Bundle of Hay, and ſo leave him till the Morning.

This Method obſerve concerning his ordinary Keeping at Home where he hath Reſt, and that you may diſpoſe of Hours at your Pleaſure; but if you are on a Journey, or the like, ſo that you cannot obſerve theſe Times, then divide the main and whole Quantity of Meat into Four Parts, and by Conſequence into greater Quantities, and give him them at the beſt Conveniency, always obſerving to give the leaſt Quantity before Travel, as a Third part before taking *Horſe*, and the Two others after you come to Reſt.

The reaſon of my dividing his Meals is, becauſe it is very advantagious for the *Horſe*; for to give it him at twice fills the Stomach more, makes the Digeſtion worſe and the Appetite weak; whereas to give little and often, makes the Stomach always craving, the Digeſtion always ready, and the Appetite never wanting. I muſt confeſs it is a greater Trouble, requiring more Attendance; but who will be ſparing of his Groom's Pains for the benefit of a good *Horſe*.

If you intend to give him an Heat, as to Hunt, Travel, Gallop, or the like, which were not amiſs to do two or three times a Week; then obſerve all your former Obſervations, only the Night before give him little or no Hay. In the Morning early before his Heat, and before his Dreſſing, give him three or four handfuls of clean ſifted Oats, waſh'd either in ſtrong Ale or Beer; then Dreſs him, Saddle him, and give him his Heat. But if it be ſudden and violent, then let it be when he hath very well emptied himſelf.

After his Heat rub him very well, and bring him dry into the Stable; then Cloath him up warm, and let him ſtand on his Bridle about two Hours; next give him a little Bundle of Hay to tear out upon his Bridle, and an Hour after feed him, as hath been already ſhewed, only with the firſt Oats give him a handful or more of *Hempſeed* well duſted and mixed.

At Night warm him a little Water and give it him luke-warm; then about an Hour after give him his Provender, with a pretty good Bundle of Hay, and ſo let him reſt till the next Morning.

The next Morning do all things as in his ordinary Keeping.

Let him ſtand on Litter both Night and Day; but change it often, and keep the Planks clean.

If you intend to Travel a Journey in the Morning, then give him no Hay, or but little the Night before: If you take your Journey in the Afternoon, then give no Hay, or but little in the Morning.

In your Journey ride moderately the firſt Hour or two, but after according to your Occaſions or Fancy. Water before you come to your Inn, if poſſible; but if you can't, then give warm Water in the Inn after he is fully cooled.

Oil of *Trotters* is excellent, being applied very warm and well chafed in, for the keeping of his Sinews and Limbs nimble, as alſo to help Lameneſs and Stiffneſs.

Neither Waſh your *Horſe* nor Walk him; for the firſt endangereth Foundering in the Body or Feet, and breedeth all Surfeits; and the latter is the ground of all ſtrong Colds, which turn to Glanders and Rottenneſs: But if neceſſity compel you to either, as foul Ways and long Stays, then rather waſh his Legs with Pails of Water at the Stable Door, than waſh him in a Pond or River. And for Walking, rather ſit on his Back to keep his Spirits ſtirring, than lead him in the Hand.

Theſe are ſufficient Directions for clean and ordinary Keeping of a *Horſe*.

CHAP. XXVII.

Of ſeveral Excellent Medicines for curing Maladies moſt frequent in Horſes.

TO Treat at large of *Medicines* and *Farriery* would take up a Volume it ſelf; *Markham*, *Snape*, and others have done it already; and all Gentlemen that keep good *Horſes* have their particular *Farriers*, in chooſing of whom they ought to be very cautious. This Chapter gives you ſome particular Medicines and Directions for ſuch Maladies and Miſchances that very often happen, being ſuch as have been Approved of by Perſons of Quality, and very good Horſemen. But for as much as he is eſteemed a better Horſeman, that can keep his *Horſe* in good Health (by preventing ſuch like Maladies) than he that can cure them, I ſhall begin with ſome Obſervations relating thereunto. And firſt,

Of Sickneſs in General.

WHenſoever you perceive your *Horſe* to forſake his Meat, to Droop, or ſhew any Symptom of Sickneſs, if it be not great, forbear letting Blood, which is a great weakening of the Spirits; but if the Signs be great and dangerous, then let Blood immediately; and for three Mornings together (the *Horſe* being Faſting) give him half an Ounce of a Powder called *Diahexaple*, brewed either in a Pint of fine Syrup of *Sugar*, or for want thereof the like quantity of *Moloſſes*; alſo a Pint of *Dragon Water*, or *Carduus-Water*, or a Quart of ſweet ſtrong *Ale-wort* will do as well; This Drench give him in a Horn, and if he is of Ability of Body, Ride him after it in ſome warm Place, ſuffering him to Faſt about two Hours: At Noon give him a ſweet *Maſh*, Cloath him warm, and let him not drink cold Water.

This *Diahexaple* Powder being not commonly known, and by conſequence not rightly prepared, I ſhall here give the Receipt to make it.
